[This is the abstract of a lecture, the last of the spring series given at the Carpenters' Hall. Mr. Thackeray Turner is, of course, well known as the Secretary to the Society for the Protection of Ancient Buildings, whose chief aim is set forth as follows:—"To put Protection in the place of Restoration, to stave off decay by daily care, to prop a perilous wall or mend a leaky roof by such means as are obviously meant for support or covering, and show no pretence of other Art, and otherwise to resist all tampering with either the fabric or ornament of the building as it stands."]

There is a striking difference between the present-day views of architecture and the views taken of it by our forefathers in any of the great periods of the past. Everybody then understood architectural work, which stood in much the same position then as science does at the present day. But very little "architecture" is now being done compared with the enormous amount of building. At the present time, only the buildings of the past excite our admiration, and it is clearly our duty to protect these old buildings left to us, and to preserve them in an authentic state.

Common Causes of Decay.

This being so, I am justified in laying before you how buildings may be made substantial without robbing them of those qualities which make them valuable. Decay is caused in many ways: timber roofs by the snow and rain getting in and decaying them; stone walls by moisture in the joints, which are expanded by the frost and particles forced away; ivy getting into the joints of the stonework, forcing them apart, and by covering roofs keeping them damp and preventing the sun getting in to dry them. Another cause is the subsidence of the ground upon which the walls rest. The ground giving way is of course a great danger to any building, and one very insidious cause is the water from the roofs being allowed to run off and sink into the ground around the walls. Bad mortar is often the cause of decay. Old builders of the past always used the native lime for their mortar, consequently where good lime was found the mortar is invariably in good condition, and where blue lias lime was used, is as hard as, if not harder than, the stone. There is yet another cause which did not exist in old times, namely, the surface decay of stonework and mortar caused by the enormous and wasteful consumption of coal. This affects not only buildings in towns but also those in districts miles away from them.

Sutton-on-Trent Church.

Take for example Sutton-on-Trent tower, Nottinghamshire. This is a building of the thirteenth century, which had been in a bad state of repair for a long time owing to bad mortar. Both the architects and the engineers had said that the only recourse was to pull it down and rebuild. It is no disgrace to them that this advice was given. Those who said so, said it would be dangerous even to pull it down. Mr. William Weir said he could repair the tower without spoiling it, and he did so.

[Slides were shown illustrating the cracks which occurred not only on the face but splitting vertically through the thickness of the wall.]

Mr. Weir argued that the walls could not fall down if they did not fall outwards, and so he planked the whole of the face of the tower. When this had been done the work was started on the inside, beginning at the ground level. The loose stones were removed as far as the face would allow, part at a time and the space filled with new brickwork and concrete, care being taken to strut up the part over. The tower is 60ft. high, and the total expense was less than two-thirds the cost of re-building. Remember that the whole of the original outside wall was left as the original builders left it, except in one or two places where it bulged so badly the part had to be taken out, toothing left, and the new work bonded in. The essential to the proper carrying out of this work is to have a man on the spot in constant supervision over the work who has had previous training. He must have a clear head for construction, and must know all about materials; so it can be seen that it cannot be carried out from the office, and a specification is an absurdity.

Sutton Courtenay Church.

Another church at Sutton Courtenay, Berkshire, was covered with plaster, in which the water had got behind the plaster and had kept it wet. It was decided in this case to point the work and not replace the plaster. In pointing old work, the joints should first be raked out, then thoroughly washed out, and when the new mortar is put in, well pressed in, not just laid in, and flush with the face. All modern joints as far as I can see—and there are many of them—are bad. The raised joint not only looks bad, but the wet hangs on the top—could anything be worse than tuck pointing? All good pointing is flush with the wall face, and even then if frost comes while the wall is still damp, the mortar will expand and come out. The mortar should be composed of four or five parts washed river sand to one part blue lias lime. It is well known that blue lias lime has slow-setting properties, and so should be kept wet for two weeks if possible with a syringe. The chancel arch, also at Sutton Courtenay, was badly cracked. Here the first thing to be done was to secure the arch with a strong wood frame. Then the loose earth was removed at the foot of the walls until a good foundation was found about 6ft. down. From this new brickwork was built up in cement, and finally covered with plaster and limewhited.

Coln St. Denys Church.

The next example is the interior of Coln St. Denys, Gloucestershire, which, though extensive repairs have been carried out, preserves its character practically unchanged. In this case the western arch of the tower had gone, and by a process of replacing little by little the old work by new, a solid band of brickwork the thickness of the wall except the facing was put in

Imbury Church.

Imbury Church, Shropshire, has been made fit for divine worship without any loss of interest. The only change noticeable is that the belfry windows now have louvres in them, and if you visited the church you would find a stone channel all round the building. This is not so nice as the turf, but is necessary. These channels should be made of concrete about 2ft. wide, sloped to gullies leading into surface water drains: they should have a slow slope from the walls and a quick slope up to the turf, and should be faced with stone; if faced with cement, it invariably cracks and perishes.

West Walton Church.

We now come to West Walton Church, near Wisbech, in Norfolk, which is a thirteenth-century building with fourteenth century windows. Here the lead roofing was taken off and relaid. Mr. Crickmay has told me he recollects a building in which part of the cast lead in the building which was in a bad state of repair, was replaced by milled lead; later on in life he saw it and found the new milled lead was in a far worse state than the cast lead on the part which had not been touched. When repairing the timber roofs, it is a great gain to do the work in situ, then the bad wood can be cut away and the new wood spliced on. The rafters in this roof had oak battens and wide oak boarding. We placed deal battens and then boarding, as it is well known that lead perishes if in contact with oak, owing to the "tannin" in the oak. One thing to remember in repairing roofs is that, if the carpenter can't see his way to make a strong job of it, the blacksmith will do it.

West Stow Hall.

We will now turn to some domestic building. [West Stow Hall, near Bury St. Edmunds, was shown on the screen.] You will not see a finer piece of brickwork anywhere in England. Whatever was necessary for preservation was renewed, but what was mere ornament was left untouched. One of the questions in this building was whether to remove the roughcast from the upper part of the building. Underneath was half-timber work, and the danger we feared was the decay of the oakwork, after being so long covered up. There is a wall painting over the fireplace in the guard room [of which a slide was shown] representing the four ages after childhood. These old paintings are neither frescoes nor in tempera, but simply distemper paintings; size only being used for a medium. There is one thing you must not do, and that is, varnish them. This keeps all the gases and moisture between the walls and plaster, and the latter is sure to break away. The best thing to do is to spray with size, but if the subject is an important one, read Professor Church's advice on the subject.

Some General Advice.

[Two views of West Ham Church Tower were shown, and attention was drawn to the scaffolding.] This is "double" or independent scaffolding, and used to avoid making holes in the walls for the putlogs. In this case the tower was found to be substantial, but it was faced with Kentish ragstone, which was in a particularly bad condition, as the acid had eaten its way into the surface. What was done was to rake out the joints and cut out decayed stonework, filling the joints with tiles finished about flush with face of stonework, and where the stone face had been taken out vertical pieces of tile were inserted, and all flushed up with lime mortar. There are some technical points in these methods. For instance, we always use lime mortar instead of cement. One reason is that when cement has been used we find it hard when we cut away, but it is not homogeneous with the old work. When pointing has been done with cement it generally comes away. Blue lias lime gives better results and hardens with years, provided it has moisture at first. Tiles are good because they hold water like a sponge.

Several other buildings at which repairs had been carried out were shown, including Wilby Church, Norfolk; Denton Church, near Grantham; Wilby Hall, and North Stoke Church, Berkshire. A view of Marton Church Tower, Lincolnshire, showed the Saxon herring-bone work, the tower being a Saxon one.

Abstracts of the interesting series of lectures at the Carpenters' Hall, of which the above is the last, have been published in The Architects' and Builders' Journal during the spring. For the convenience of readers who have not closely followed them we give a list of the reports and the dates on which they appeared as follows:—

"What is Artistic Craftsmanship?" by Professor Beresford Pite. Jan. 19. "The Art of building with special reference to the use and abuse of materials," by M. H. Baillie-Scott. Jan. 26. "The Carpenter's Craft," by Banister F. Fletcher. Feb. 2. "The Joiner's Craft," by Sir A. Brumwell Thomas. Feb. 16. "Native Craftsmanship in Timber, Brick, and Stone, before the eighteenth century," by Arthur Stratton. Mar. 2. "The Art of the Lead-worker," by Lawrence Weaver. Mar. 2. "The Art of the Plasterer," by Geo. P. Bankart. Mar. 9. "Coloured Materials in Building," by Halsey Ricardo. Mar. 23. "Castles in the Air," by C. F. A. Voysey. Mar. 30. "Coloured Mosaics and Reliefs," by R. Anning Bell. April 20. "The Craft of Repairing Buildings," by Thackeray Turner. May 4.

PORTABLE SCAFFOLDING FOR STEEL-FRAMED BUILDINGS.

By G. McARTHUR and A. G. H. THATCHER.

Steel-framed buildings cannot now be considered new. Nevertheless, they are so sufficiently modern that the means of scaffolding for these erections is not generally known or properly used in many instances where an effort is made to cope with the difficulties which arise. The general practice is for the framework to proceed much in advance of the filling in. Consequently pole scaffolding is not in request until most of the steel is in its place. There are reasons for this, one of the principal being that at all times steelwork is difficult to handle. It is unsymmetrical in that the length of the members is considerable in proportion to the other measurements. This difficulty necessitates the builder giving space in order to move his material freely, and as it is obvious that pole scaffolding minimises this greatly the practice has been to do with the least possible extraneous erection. It does not necessarily follow that the workmen can do entirely without platforms to work from. A much greater freedom from accident risks is ensured if these are provided, and, in consequence, builders and others concerned in the erection of steel have devoted some thought as to how a greater degree of safety can be attained without limiting the required freedom of action. A general agreement has now been reached in that the desired end can be gained by the use of portable steel hangers. They can be of practically any design, are easily made, and of great adaptability. A platform of two boards wide—that is, 18ins.—is usually given, although this can be increased. The illustrations herewith show those most generally in use, but it will be seen, if a consideration is given to them, that a lack of ingenuity would be the only bar to many others, which may be wanted in special circumstances.

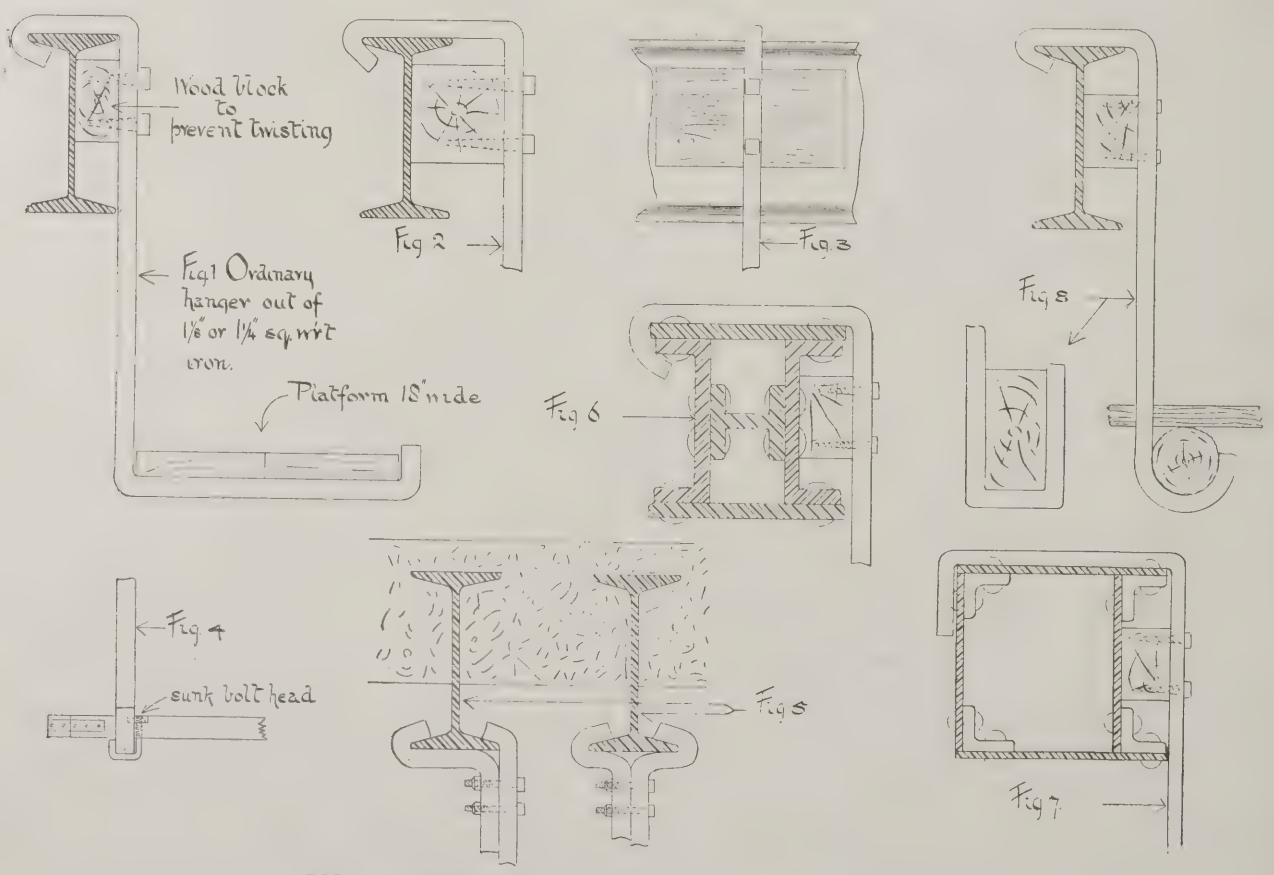
Fig. 1 illustrates the ordinary wrought iron hanger carrying a platform 18ins. wide. The hook end in this case has just sufficient depth to clip over the top flange of the girder. If simply hung in that position there would be a tendency for the hanger to roll or twist when loaded. To prevent this a wood block is placed where shown on the sketch. This block is about 18ins. in length, being of such other measurements as are necessary. Wood screws through the hanger should be used to keep the block in position, although wedging is sometimes trusted to hold firmly. It is needless to say that this practice is not wise: vibration will loosen a block not firmly fixed, and therefore the screws should be considered as necessary as the block itself.

Fig. 2 shows how a hanger too deep in the clip for the flange can be used and kept firm. This is achieved by using a block of sufficient thickness to take up the superfluous depth of the hanger clip. In this instance the screws are absolutely necessary, as the liability of the block to move is increased.

Fig. 3 is a side view of the girder showing the wood block in elevation instead of in section.

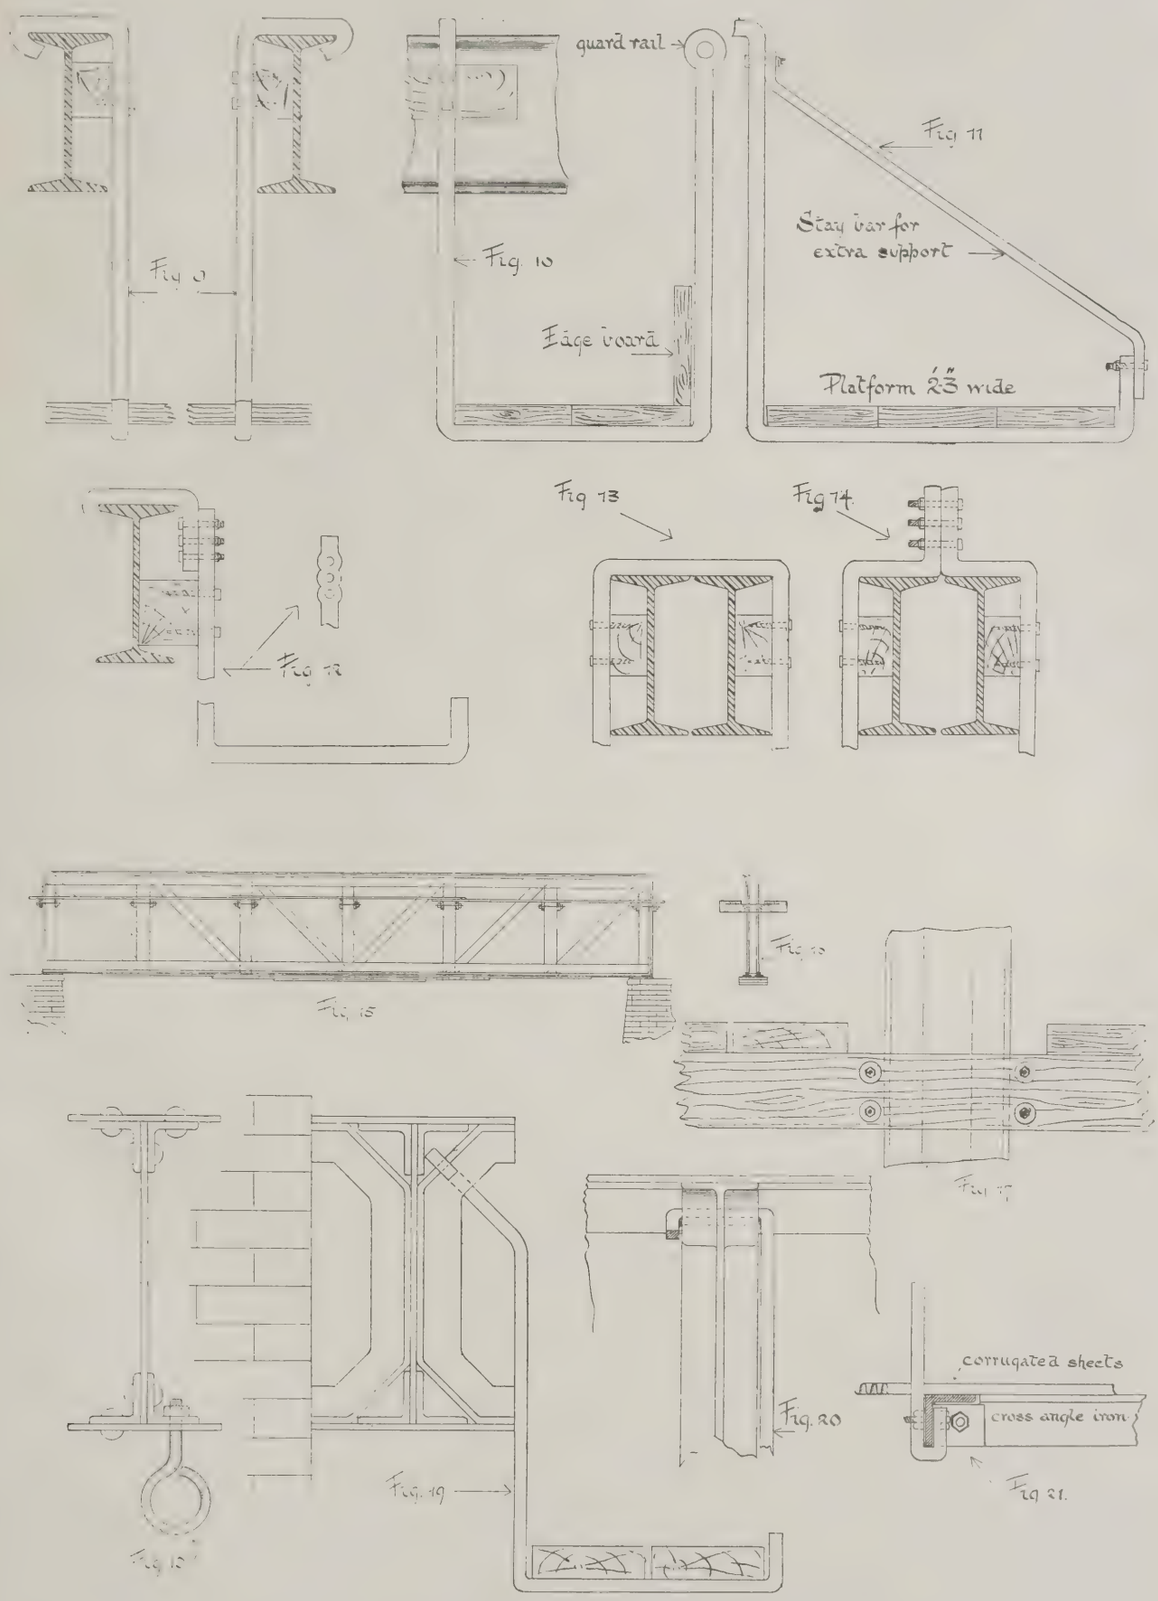
In many cases the boards for the platform are simply laid on the hangers, being lapped in their run. This method is often secure enough. If any doubt arises, however, the boards can be fixed by means of a clip, as shown on Fig. 4. If the bolt projected at all it might prove to be a cause of tripping. To obviate this in thicker timbers, the bolt head can be sunk as shown.

Fig. 5 illustrates clips which are useful where the top flanges of the girders are not available. As will be seen, the hanger need not be immediately under the centre of the girder, but either to the right or left, as necessary. In the diagram the haunching which supports the flooring is supposed to be cut away to free the lower flange.



With compound girders the same methods can be adopted, as shown on Figs. 6 and 7. In the latter figure the top flange does not afford a purchase, but, providing the block is well and truly fixed, no disadvantage need accrue from this.

At times it may be found useful to lay a platform at right angles to the run of the girder. To enable this to be done the hangers can be made to carry a pole or a length of quartering of sufficient strength, as shown on Fig. 8. Two poles hung from different girders are necessary, and on these the boards can be laid. A particular advantage is gained by this method, which is useful in many cases. It allows of the platform being laid to a width which is only limited by the effective length of the bearer poles. If a platform of 18ins. only is wanted, it can be gained by arranging the hangers as shown in Fig. 9. Fig. 10 illustrates a section of the platform when arranged in this manner, and also shows how the end of the hanger can be continued upwards to carry a guard rail or rope, and permit the edge board being fixed. The edge board is particularly necessary on steel construction works. Bolts and nuts, spanners, and other tools often fall, partly due no doubt to the extremely narrow platform on which the men work. To prevent this in a practical way nothing better than an edge board has been used in this country, although matting is used abroad—notably in Northern Italy.



The ordinary hanger, as already stated, is usually made to carry two boards, and this platform with its loads are considered sufficient for its strength. If, therefore, three boards are wanted, additional support must be provided, and this is given by fixing a stay bar as shown on Fig. 11.

A disadvantage can be urged against the hanger in that it is cumbersome. They can, however, be made in two parts (see Fig. 12). This also permits of differently sized clips being used to suit the flanges, the remaining portion of the hanger remaining of the standard size. Three bolts are wanted to make the connection, and the bars where joined should be slightly flattened out before the holes are drilled, to give sufficient material round the bolt-holes to withstand the stress that arises.

Figs. 13 and 14 are illustrations of how the hangers can be made to cover double girders and carry a platform on each side. Fig. 13, being in two parts, is, of course, the most portable. When used in this way the wooden blocks are doubly needed, for by keeping the

PORTABLE SCAFFOLDING FOR STEEL-FRAMED BUILDINGS.

PORTABLE SCAFFOLDING FOR STEEL FRAMED BUILDINGS.

whole arrangement rigid they act in effect as if the hangers were braced.

Fig. 15 shows a method of erecting a platform for heavy lattice girder work. It will be noticed that on the top boom of the girder flange plates have still to be put on, similarly to those on the lower boom. These plates could not readily be put in position if ordinary hangers were used, therefore a method of glanding timber cross-heads to the struts is found most desirable. In the figure the cross-heads, or needles as they are sometimes termed, are shown fixed at the required distance from the top boom, in order to allow of easy reach by the workmen. Fig. 16 is a cross-section showing the planking resting on the needles, and Fig. 17 gives an enlargement of the detail.

Fig. 18 is a method often adapted to carry scaffolding. Rivets are cut out of the bottom flange at suitable distances apart, say, every 8ft., and ring bolts inserted in their place. From these depend chains or cordage to carry whatever scaffolding may be required.

Figs 19 and 20 show a hanger which is useful where a girder of the type shown is hard against a wall, or some other obstruction, which will not allow an ordinary hanger to be fixed.

Fig. 21 illustrates a method of supporting a fireproof scaffold on which fires for heating rivets are to be used.

The hanger is adapted to carry angle irons, and they in turn carry cross angle irons covered with a corrugated sheeting deck.

Fig. 22 is a sketch showing a safe hanger for supporting planks on their flat, which in turn carry cross planks. It is, owing to the amount of bolting required, rather slow in adjustment, but when once put together, is certainly reliable.

By removing the plate and bent flat from the holes marked A to those marked B, the planks can be made to lie at right angles to the position first shown, see Fig. 23.

Figs. 24, 25, 26, and 27, show a scaffold capable of carrying a number of men, and is useful for fixing corrugated sheets or painting or similar purposes on the vertical sides and ends of buildings. By trussing it as shown on Fig. 24, with a ½in. wire rope and two hook bolts, a fairly long platform is obtained, enabling a considerable amount of work to be done before the removal of the scaffold is necessitated. For ease in hoisting or lowering, a wheel of about 9ins. in diameter is fixed at each end (Fig. 25). This lessens the friction arising when the scaffolding and wall come in contact.

Fig. 26 shows a section of the arrangement with the hanger entire, but without the lower strut, a detail of which is given in Fig. 27.

The manufacture of these hangers is easily accomplished by any ordinary smith. They call for no particular skill, but care must be exercised for the production of good workmanship. A common fault is shown on Fig. 28, and is a source of weakness which should be carefully guarded against.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

Licentiates R.I.B.A.

SIR,—May I ask why the R.I.B.A. fixed 30 as the age limit for licentiates. Are there no distinguished men under 30? What about our Ralph Knotts and Gilbert Scotts. I myself am 28 years of age, have been in practice four years, am a winner of competitions, and yet am debarred from this distinction in favour of my neighbour who combines a little house planning with his rent collecting and estate selling, but had the good fortune to be born two years previous to myself. Is not actual work of more importance than a mere matter of age.

AD. REM.

PRACTICAL NOTES.

Cleaning Buildings.

The inefficiency of either hot or cold water for cleaning buildings in towns which have become dirty through exposure is well known, and though the use of weak acid may be satisfactory for some kinds of brickwork, it cannot be used on stone without seriously attacking the material and producing white patches of scum, owing to the soluble salts produced, unless the washing after the application of the acid is far more thorough than usual. Even with brickwork, there is a strong tendency to produce scummed surfaces.

The use of a sand blast has been carefully investigated, and though the sand is driven against the surface with such force that it certainly cleanses it, a portion of the surface of the material is removed in addition to the dirt. With natural stone this is not often important, but with bricks and terra-cotta the results may be serious, as these latter have naturally a denser surface than interior, and if this protective "skin" is removed the more porous and open interior will absorb the dirt all the more readily. Consequently, the use of a sand blast is distinctly limited.

Many attempts have been made to use steam as a cleansing agent, but unless the pressure is considerable, and the steam is impregnated with a cleansing chemical, the results are not satisfactory. With a suitable detergent, however, and a sufficient force of steam, followed by a good rinsing with water, excellent results may be obtained. The steam having no abrasive action on the brickwork or masonry cannot damage it, and consequently with its use a building when once cleaned remains so for a much longer time than when the surface has been obtained by an abrasive such as sand or a corrosive such as acid.

PORTABLE SCAFFOLDING FOR STEEL-FRAMED BUILDINGS.

RAILWAY RATE OVERCHARGES IN CONNECTION WITH THE BUILDING TRADES.

By S. WHETTALL.

The railways in Britain receive about £40,000,000 annually for goods being carried over the railways. This enormous sum no doubt includes many overcharges in rates, which are made owing to various reasons. It would doubtless surprise many people if they knew what a lot of overcharges are made in railway accounts every year; but when one reflects on the immensity of such accounts, it is not at all surprising. Some of the principal reasons why the traders are overcharged are given below. Many others could be cited if we had sufficient space to enumerate them all.

(1) The public not consigning properly.

(2) The public not having sufficient knowledge of railway matters to enable them to check the accounts.

(3) The railway clerk having insufficient knowledge of the classification book.

(4) The unwritten rule, "If in doubt, always charge high enough."

(5) Not allowing cartage and other rebates unless applied for.

(6) Charging ordinary rates when there are special (and lower) rates in operation.

(7) Frequently charging a higher class than the goods are actually chargeable under.

(8) Errors made in weights which often occur.

A fair and moderate estimate of the amount which is annually overpaid to the railway companies in overcharges would be 1-5 per cent. of the total carriage on merchandise, and this figure would be under rather than over the mark. The overcharges are mainly made inadvertently, but the same cannot be said when referring to the unclaimed rebates, of which there are many thousands lying unclaimed. From a moral standpoint, it reflects to a certain extent against the railway company, but still more does it reflect on the business capacity (or otherwise) of the public that the rebates are allowed to go unclaimed. For the benefit of the trader a list of some of the articles used in the trade is given herewith:—

Carpenters' tools, Class 3H.

Gas stoves, if not properly packed, only to be accepted at owner's risk, 3Z.

Joiners' tools, 3A.

Joiners' work (common wood): Beadings, and mouldings (not gilt lacquered or varnished), doors and door frames, fittings and fixtures for buildings, staircases, balusters, and hand rails, window sashes, and frames and shutters, 3Y.

Doors, door and window frames, made of mahogany, walnut and other expensive timber, 4Y.

Joists iron or steel, CI.

Gas fittings in parts, except brass and copper tubing, 3H.

Builders' implements, not new, and consisting of barrows, centreings, crab winches, hoists, ladders, mortar-boards, mortar-mills, ropes, scaffold boards, steps, struts, trestles, planks, etc., I.

Flooring boards and other planed or prepared boards, etc., or at 1 per cent. above any special rates noted for deals, C.

Deals, etc., battens, and boards, unprepared, generally special rate lower than C, in operation, C.

Nails and Spikes, iron and steel, Ci.

Bolts and Nuts, iron and steel, Ci.

Bolts, door, 3H.

It will be seen that the goods are divided into classes, and for the benefit of the reader it may be said that railway rates are divided into eight sections or classes; the names they go under being given below.

Classes A, B, C, 1, 2, 3, 4, 5. Class A is the lowest rate, and the charges in the rate include conveyance and station terminals (for use of station).

If the railway company provide wagons, or do the loading or unloading, or cartage, a charge is made for each in addition to the rate.

Class B is the next lowest rate, and the charges included in the rate are the same as A, but wagons are provided, in this case, by the company. Unloading and loading and cartage to be found by the trader, or else paid for in addition to the rate.

Class C is next as regards price, and this rate includes conveyance charges, loading and unloading, covering and uncovering, use of companies' wagons, station terminals for use of stations; in fact, all charges with the exception of cartage (at both ends).

Classes 1, 2, 3, 4, 5, include in the rate all the charges mentioned in class C and also cartage at both ends, unless specially provided for in the railway companies' rate books. An exception that may be mentioned is the City of Liverpool, and cartage in Liverpool is generally charged for in addition to the rate in any of the classes 1, 2, 3, 4, 5.

Commencing with "A" as the lowest rate, the classes get higher by degrees, until they reach class "5," which is the highest.

Should the trader perform any of the services which are given above as being included in the rate, he must make application to the railway company for an allowance on rebate. The service which the trader most frequently performs is that of cartage, and the allowance usually given to the public varies from 10d. to 1s. 6d. per ton at each end carted.

In the list given, the reader will have noticed a letter against some of the classes, the meanings of these letters are:—

"I" signifies that these articles are included in the iron and steel list, and whenever there are any special rates in operation they will apply.

"H" signifies that "gas fittings" are in the hardware list, and any special rates apply.

These special rates are generally lower than the ordinary class rates, and it frequently occurs that the railway clerks charge the ordinary class rate instead of the special and lower rate. This is a thing which the trader should keep a check on, as the difference between the special rate and the class rate often equals 10s. per ton.

"Y" means that should the trader sign an owners' risk note for this particular traffic, he will obtain a reduction of a sum equivalent to 15 per cent. off the rate.

"Z" signifies that if an owners' risk note is signed, the rate will be reduced by 20 per cent

If the goods are well packed, it will often pay the trader to send at owners' risk, and so obtain the benefit of the reduced rate.

Another place where the trader is overcharged is in the articles under 3 cwts. The railway companies may charge from 3d. to 1s. 6d. per package, in addition to the tonnage charge for lots 3 cwts. or under. For the purpose of charging this traffic, a scale, termed the "Small Scale," is used.

Frequently the railways charge separately instead of lumping together.

Right way—					
1 gas oven..	2	2	0	at 65s.	
1 pkge. gas stove ftgs. ..		2	0		
	3	0	0	at 65s. =	10 6
Wrong way—					
1 gas oven..	2	2	0	at 65s.	8 11
1 pkge. gas stove ftgs. ..		2	0	,,	2 4
					11 3

Bear in mind that the articles can only be lumped together when sent on the same day from the same sender to the same consignee.

By watching the points enumerated herein, and by paying particular attention that no article mentioned is charged at a higher class than given, there is not much doubt but what some saving to the trader will accrue.

The trader should also see that all articles consigned be properly described. When an article is not described at all the railways charge the highest possible rate.

HINTS ON PAINTING AND DECORATION.

By ARTHUR SEYMOUR JENNINGS.

White Lead and Zinc White.

It is a remarkable fact that perhaps ninety-nine out of a hundred practical house painters believe firmly that no paint is or can be superior to pure white lead, although scientific investigation has shown quite definitely and clearly that a mixture of pigments produces a paint that is much more durable. As a matter of fact there is no pigment in existence which can correctly be described as perfect. White lead, for example, possesses the advantage of a splendid "body" or covering property, and also of being easily applied because of its "slippery" nature when mixed with oil, when it might be correctly described as a lead soap. But white lead is very susceptible to the action of sulphuretted hydrogen and sulphur compounds generally, and as these are present everywhere it is not a desirable paint for every purpose, to say nothing of its poisonous qualities. Again, oxide of zinc, although beautifully white and exceedingly durable under conditions which would totally destroy lead, is by no means so easily applied. It lacks body to some extent unless it is mixed with great care, and under certain circumstances it is apt to become brittle. But a mixture of the two pigments in effect causes the shortcomings of one pigment to be supplied by the strength of the other, and vice versa. Recently reported experiments made on an extensive scale in the United States of America show conclusively that in every case mixed pigments produce a more durable paint than a single pigment used by itself. Most first-class decorators would be horrified if one were to suggest that they should use "No. 1" white lead, that is, a lead mixed with some 10 per cent. of barytes, yet the experiments referred to show that such an addition actually improves the durability of the paint, although a large percentage would doubtless be detrimental because it would lower the "body" to a serious extent, and an extra coat might be required. I was once present at a trial in which the question of the durability of a "reduced" or adulterated lead was involved, and among the witnesses was an old and experienced house painter who became very indignant when it was suggested by counsel that the small percentage of barytes did no harm. He said that every man of experience knew that no paint in existence could be superior to white lead, but when he was asked whether he had ever used anything else as a white paint base he acknowledged that he had not.

It is here that we arrive at a solution of the problem. Most painters have never used anything but white lead, and are hopelessly ignorant of the quality and value of mixtures. As a matter of fact architects and engineers permit the painter to adulterate his white lead, although probably they do not realise the fact. This adulteration arises from the practice of using large quantities of patent or paste driers. Most of such driers consist largely of barytes, whiting, etc., often with as little as 5 per cent. of actual drying material, and yet no restriction is placed on their use. Liquid driers are always preferable because the quantity used can be accurately measured, but they are not popular because there are so many brands that are worthless. The highest-class varnish houses produce splendid liquid driers, and the builder cannot go wrong in using them, or the architect in specifying them, provided always that they are employed in strict moderation and on the principle that the smaller the quantity of driers used in paint the better.

Testing Varnishes.

A few weeks since I said something in these columns about testing varnishes. These remarks have brought a request for information concerning the testing of ready-mixed paint. It is practically impossible to test quickly such paints for durability, and the only way

is to paint three or four coats on boards and to expose them for a year or so to the action of the weather. It is useful at the same time for the purposes of comparison to paint a board with pure white lead and another with a paint made of half lead and half zinc oxide. Of course, an examination of the paint when the can is opened will tell something as to its quality. If it has been at rest for any length of time, the greater part of the pigment will be found at the bottom of the can, but if the paint is a good one this can readily be mixed by stirring with a stick. In the case of a very common ready-mixed paint the pigment at the bottom may be quite hard, even like cheese in character, and this will be amply sufficient reason for rejecting it. When brushed out the paint should possess good body, and two coats should be sufficient to obliterate all signs of knots, etc. The third coat should make a good finish, free from brush marks and somewhat glossy in appearance when dry. It is always well to have the paint applied by a skilled painter because the architect who attempts to do his own testing is apt to put on too much paint instead of brushing it well out. Sometimes resin oil is used in cheap ready-mixed paints, and this is always objectionable. A chemist will be able to detect its presence without difficulty, but when his services are not called upon a rough test is to warm the hand and place it upon the surface of the paint when dry. The heat will have the effect of softening the resin oil and rendering it more or less "tacky." In addition to this objection resin oil after some time causes the paint to become brittle, so that it quickly decays.

Church Decoration.

The decoration of churches, chapels, etc., often involves so much expense that the work is held over from year to year until the necessary sum can be raised to meet the expense. I am speaking now of cases where a considerable amount of ornamentation is required, and here wall papers may be used with great advantage. I am well aware that in the average pattern books there are not more than two or three designs suitable for the purpose, but most manufacturers have patterns used in former years which would be available. Recently I was delighted at coming across in the showroom of a very old firm of wall-paper manufacturers a whole book full of wall papers designed long ago by Pugin, nearly every one of which is suitable for church work, while many would answer admirably for masonic temples, council chambers, etc. I was not aware that Pugin designed wall papers at all, but there the papers are, and very fine some of them appear. They are not kept in stock, but the old blocks are still available, and in a week or so any of them could be printed—they are all hand-printed goods—to order.

NOTES ON COMPETITIONS.

Endcliffe Park Congregational Church, Sheffield.

Thirty-three architects submitted designs in the above competition, which was assessed by Mr. Charles Hadfield, F.R.I.B.A. The award was given as follows:—

1. Messrs. Morgan and Brace, London.
2. Messrs. W. Waddington and Son, Manchester.
3. Messrs. Withers and Meredith, London.

In his report Mr. Hadfield informed the committee that in his judgment the first design was of a higher order of merit and superior to any other submitted. There was a spaciousness and dignity about the laying-out of the plans which showed that the author had grasped the difficulties of the site. The four entrances and exits were admirably planned, while both exterior and interior were designed on dignified lines with full appreciation of architectural effect. The style had apparently been suggested by the use of reinforced concrete for the dome, roofs, and general construction. It was based upon the architecture of the brick churches of Northern Italy, the Adriatic, and the Levant, all of which were influenced by the Emperor Justinian's great Church of the Holy Wisdom of Constantinople, erected in the sixth century, at which period, following the break-up of the Roman Empire, it marked a new departure in Christian architecture.

LIST OF COMPETITIONS OPEN.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

TRADE AND CRAFT.

British Fireproof Partitions.

The slab which forms the unit of these partitions appears on examination (for which opportunities had been afforded us) to substantiate the claims that they are proof against fire, sound, and vermin; that they can be rapidly erected without skilled labour; that, as compared with lath-and-plaster partitions, they effect a considerable saving of floor-space; and that the design of the slab ensures perfectly sound construction and extraordinary strength.

The slabs, which interlock by means of fillets and grooves, are further furnished with screwed holes, running both vertically and horizontally. It is obvious that the grouting poured into the former and gravitating into the latter must form on setting, a perfect lock joint, the fact that the holes are screwed ensuring monolithic stability. It is therefore impossible for these partitions to buckle.

The slabs are made rough on both sides, affording a good key for plastering, or can be supplied with a smooth finished face. The material affords a good grip for nails; and a groove in the top fillet of each slab, which is provided for the insertion of a strip of white metal, wire, or other suitable material, might, we imagine, be turned to account for electric wiring. The slabs, which are uniformly 29in. by 15in. are made 2in., 2½in., and 3in. thick; but any special requirements as to size can be met. These partitions, which are patented in Great Britain, America, Germany, the Argentine, etc., are specially adapted to meet the requirements of the new London Building Acts Amendment Act, 1905; more particularly that clause relating to fireproofing over protecting shops, staircases, lavatory enclosures, etc; and they are obviously well suited to the construction of bungalows and similar buildings. Particulars and samples may be had from British Fireproof Partitions. Ltd., contractors to H.M. Government, 69 and 70, Mark Lane, E.C.

Lifts and Cranes.

A new illustrated list that has just been issued by Messrs. R. Waygood and Co., Ltd., Falmouth Road, London, S.E., shows lifts, cranes, and gear for various services, and actuated by electric, hydraulic, and hand power. The illustrations are all photographic, and that which adorns the cover is an excellent specimen of three-colour work, showing the offices of the Royal Liverpool Friendly Society, Liverpool, which are being fitted with seventeen Waygood lifts, including fifteen for high-speed electric passenger service. The Palace of the President of the Brazils at Rio de Janeiro, which is fitted with a Waygood electric passenger lift, is also shown, and a remarkably up-to-date-looking elevation it is. The firm also state that a Waygood hydraulic passenger lift has been supplied for the Turkish Houses of Parliament, Constantinople.

"Pyramid" Portland Cement.

In a pamphlet describing the Knight, Bevan, and Sturge "Pyramid" brand of British Portland cement, it is recalled as illustrating the improvements in manufacture that have taken place within recent years, that whereas a cement that was ground to a degree of fineness not exceeding a residue of ten per cent. on a 50 by 50 mesh sieve (2,500 holes to the square inch) was some fifteen years ago considered a finely ground product, to-day all "Pyramid" brand cement passes this sieve, and only a trace is found on a 76 by 76 mesh sieve (5,776 holes to the square inch), whilst on a 100 by 100 mesh sieve (10,000 holes to the square inch), the residue is less than half of one per cent., and on a 180 by 180 mesh sieve (32,400 holes to the square inch), it does not exceed six per cent. The brand complies strictly with the standard specifications, contains no admixture other than the purest chalk, and the most suitable clay, and every stage of its manufacture is supervised with scrupulous care. The "K.B. and S." brand was first established in 1853, and was transferred in 1900 to the Associated Portland Cement Manufacturers (1900), Ltd., the present proprietors, who adapt to its production their up-to-date processes, such as that of hydration, which obviates the delay and expense of aeration. The booklet, which contains several interesting illustrations, as well as much useful information, can be had from the Associated Portland Cement Manufacturers (1900), Ltd., Portland House, Lloyds Avenue, E.C.

COMING EVENTS.

Wednesday, May 4.
R.I.B.A.—Art Committee meets.
Thursday, May 5.
ARCHITECTURAL ASSOCIATION.—Members' dinner.
ARCHITECTURAL ASSOCIATION DEBATING SOCIETY, 7 p.m.
Friday, May 6.
NATIONAL HOUSING AND TOWN PLANNING COUNCIL.—Conference of Local Authorities on Greater London Town Planning. Caxton Hall, Westminster. 10.30 a.m.

J. E. Whiter and Co., £2,347 3s.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 5. **WARLEY TOWN.**—Masons', joiners', plumbers', slaters', plasterers', and concretors' work required in the erection of a detached residence. Plans and specifications may be seen and bills of quantities obtained at the office of Walsh and Nicholas, Architects and Surveyors, 10, Harrison Road, Halifax, from April 28 to May 5.

May 5. **DOUGLAS, I.O.M.**—Mason's work, etc., required in the completion of tower and spire at Rose-Mount Wesleyan Church. Send names to Josiah Goldsmith, Westwood, Somerset Road, Douglas, not later than May 5, after which date bills of quantities and other information will be supplied. A deposit of £2 2s. to be made with the application.

May 9. **GLASGOW.**—Erection of industrial hall and offices, for the Executive of the Scottish Exhibition of National History, Art and Industry. Plans may be seen at the offices of the architects, Walker and Ramsay, 123, Wellington Street, Glasgow.

May 9. **BRADFORD.**—Shed, warehouses, etc.—Erection of woolcombing shed, warehouses, engine and boiler house, chimney, etc., Canal Road, Bradford. Drawings may be seen, and bills of quantities obtained at offices of Moore and Crabtree, architects, York Chambers, Keighley.

May 9. **DUMFRIES.**—Mason, carpenter and joiner, plumber, slater, plaster, and iron and smith work of new female hospital and male closed block proposed to be erected at the Crichton Royal Institution, Dumfries. Apply for schedules of quantities to Sydney Mitchell and Wilson, Architects, 13, Young Street, Edinburgh.

May 9. **PONTYPRIDD.**—Alterations, additions, and renovations to Tabernacle Chapel, Pontypridd, for the Trustees. Plans and specification can be seen at the offices of A. O. Evans, Williams, and Evans, architects, Pontypridd, and bills of quantities obtained on deposit of £2 2s. Tenders to be sent to the Rev. W. A. Williams, 12, Mackintosh Place, Pontypridd.

May 9. **NOTTINGHAM.**—Erection and completion of sliding shutters at the Female Sanatorium, Bagthorpe Workhouse, for the Guardians. Specifications and all particulars may be obtained on application to Arthur Marshall, A.R.I.B.A., architect, King Street, Nottingham. Tenders must be delivered at the Poor Law Offices, Shakespeare Street. Persons whose tenders are accepted must regularly pay the standard rate of wages to all workmen in their employment, and conform to the working rules of the district applicable to this trade.

May 9. **KILLADREENAN (Ireland).**—Erection of a doctor's residence and dispensary for Newcastle Dispensary District at Killadreenan, near Newtownmountkennedy, for the Guardians, in accordance with plan and specification prepared by the architect and engineer, G. T. Moore, C.E., etc., 1 and 2, Foster Place, College Green, Dublin, who will show same and explain all particulars to intending contractors. Tenders, giving the names of two sureties for the performance of the contract, will be received by B. Manning, clerk, Board Room, Workhouse.

May 9. **HEANOR (Derby).**—Erection of proposed secondary school to accommodate 250 students for the Derbyshire Education Committee. Drawings, specification, agreement, etc., may be seen at the office of the architect, St. Mary's Gate, Derby. A copy of bill of quantities, specification, conditions of contract, and forms of tender can be obtained at the architect's office, upon deposit of £1 1s. Tenders must be delivered to George H. Widdows, A.R.I.B.A., architect to the Committee, County Education Office, St. Mary's Gate, Derby. Two approved sureties as security for the performance of contract will be required.

May 10. **CHORLEY.**—Part or whole tenders for the erection of four houses in Congress Street, for the Chorley Co-operative Society, Ltd. Plans, etc., may be seen on application to W. H. Dinsley, architect, Chorley.

May 10. **EBBW VALE.**—Erection of 11 pairs of semi-detached villas and 34 houses near Intermediate Schools, Ebbw Vale, for the Blaen Ebbw Building Club. Plans and specifications may be seen at the office of Wm. Harris, architect and surveyor, Bank Chambers, Bargoed. Tenders to be sent to the Secretary, G. W. Stephens, solicitor, St. Bride's, Ebbw Vale.

May 14. **HAY (Hereford).**—Erection of public buildings. Plans, specification, and form of tender, may be seen at the Crown Hotel, Hay, upon payment of £1 10s. For further particulars, apply to J. J. Price, Architect, Hardwick House, Clifford, Herefordshire.

May 10. **KILLESHANDRA (Co. Cavan).**—Erection of a large central creamery (brick-built and slated) at Killeshandra, Co. Cavan, for the Co-operative Dairy Society, Ltd., in accordance with plans, etc., to be seen at the office of the Manager, Killeshandra.

May 10. **WHALLEY.**—The Committee of Visitors of the Lancashire Asylums Board are about to erect an asylum at Whalley which may involve an expenditure on the first contract of about £300,000. Contractors who are desirous of having an opportunity of tendering must send in their names and addresses to the Architect, County Offices, Preston, on or before May 10.

May 10. **DARLASTON.**—Erection and completion of a new Council school for 304 infants, at Salisbury Street, and for the enlargement of Dorsett Road Council school by 120 places, for the Staffordshire Education Committee. Apply to Graham Balfour, Director of Education, County Education Offices, Stafford. Quantities will be supplied upon receipt of a deposit of £1 1s., which should accompany the application to tender.

May 10. **TYLORSTOWN (Wales).**—Erection of new premises at Tylorstown, for the Ferndale Industrial Co-operative Society. Plans and specification can be seen at the offices of W. Morgan Lewis and T. Naunton Morgan, architects and surveyors, Pontypridd, and bills of quantities obtained at their Pontypridd and Tonypandy offices, and 12, Edward Terrace, Cardiff, on deposit of £2 2s. Priced bills of quantities, with tender, to be sent to the Pontypridd office of the architects.

May 10. **EPSOM.**—Erection of a Nurses' Home, and for alterations to the Girls' Home at Woodcote, Epsom, for the Guardians. Drawings and specification may be seen at the office of A. C. Williams, 53, Doughty Street, W.C., where also bills of quantities and form of tender can be obtained on deposit of 10s. 6d. A contract and bond with two approved sureties in the sum of £200 will be required. Tenders are also invited for the carrying out of certain alterations in the kitchen and adjoining offices. Copies of the drawings and specification and form of tender may be obtained on application to the architect as above upon deposit of £1 1s. A contract and bond with two approved sureties in the sum of £100 will be required. Tenders, addressed to Alick G. Ebbutt, clerk, are to be delivered at the Guardians' Offices, Waterloo Road, Epsom.

May 11. **TOTTENHAM, N.**—(See "Painting.")

May 12. **CHESTER.**—Foundations for purifiers and sheds, with drains and boarding, slating, glazing, and flashing to roofs, comprising about:—1,250 cube yards of excavation, 380 cube yards of cement concrete, 430 super yards of brickwork, etc., at the Roodee Gasworks, for the Directors of the United Gas Company. Drawings may be seen at the Gasworks, and specification, bill of quantities, and form of tender obtained on deposit of £1 1s. Tenders to be delivered to Fred. A. Pye, secretary and general manager, Gas Company's Offices, Cuppin Street, Chester.

May 14. **HALIFAX.**—Erection of a police station with three cells, inspector's house, and quarters for six single constables at the junction of Burnley Road and Warley Road, King Cross, for the Watch Committee, viz.:—(1) Mason's, excavator's, and bricklayer's; (2) carpenter's and joiner's; (3) plumber's and glazier's; (4): slater's and plasterer's; (5) concretor's; (6) painter's; (7) electrician's; (8) steelwork; (9) reinforced concrete and asphalte roofing; and (10) heating. Plans and specifications may be seen and forms of tender obtained on application to James Lord, M.I.C.E., borough engineer, Town Hall, Halifax, upon deposit of the following sums:—£10 for No. 1, £5 each Nos. 2, 3, and 9, and £1 each for Nos. 4, 5, 6, 7, 8, and 10. Tenders must be sent to Herbert Ashling, town clerk. The persons whose tenders are accepted will be required to observe the fair contracts clauses adopted by the Corporation.

May 17. **DURHAM.**—Alterations and improvements at East Hedley Hope, Springwell, Lanehead, South Church and Etherley infants' Council schools, for the C.C. Sole tenders are required. Plans specifications, and general conditions of contract may be seen at the office of F. E. Coates, Shire Hall, Durham. Tenders to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

May 17. **BRIDGEND.**—Erection of a new boardroom and offices at the workhouse, for the Guardians. Plans, etc., may be seen, and all particulars obtained at the office of P. J. Thomas, architect, Bridgend. Tenders to be sent to R. Harmar Cox, Clerk, Union Offices, Bridgend.

May 17. **HARTLEBURY.**—Provision of all materials for, and the erection of new schools, in accordance with the drawings and specification prepared by the Architect to the Governors, S. S. Reay, F.R.I.B.A., 4, Unity Street, College Green, Bristol. Drawings and specification may be seen at the offices of the Architect. Quantities may be obtained on deposit of £2 2s. Tenders to be delivered at the office of C. Hugh Watson, Solicitor, Stourport, Clerk to the Governors.

May 18. **LEEDS.**—Demolition of the existing bridge and the construction and erection of a temporary timber bridge, together with other accommodation works, and the masons', bricklayers', excavators' and ironfounders' works in connection with the construction and erection of a new 50ft. wide bridge, in three spans, across the River Aire at Kirkstall, Leeds, for the Corporation. Drawings may be seen, and a copy of specification, conditions of contract, and bill of quantities obtained at the office of W. T. Lancashire, city engineer, Municipal Buildings, Leeds, on deposit of £5 5s. Tenders must be received at the Town Clerk's Office.

May 30. **CHELMSFORD.**—Alterations and additions to King Edward VI. Grammar School. The drawings and specifications may be seen on application to the architects, Charles and W. H. Pertwee, Chelmsford. A deposit of £5 is required. Quantities will not be supplied. Tenders to be delivered to William Stunt, solicitor, Clerk to the Governors, 71, Duke Street, Chelmsford.

ENGINEERING.

May 9.—**WOLVERHAMPTON.**—Supplying and fixing heating apparatus at Red Cross Street Girls' School (accommodation 359) for the Education Committee. Firms desirous of tendering must send in their names to "The Secretary, Education Committee, Town Hall, Wolverhampton."

May 9. **SHREWSBURY.**—Construction of a dam or weir across the river Severn, near the Castle Fields and Cherry Orchard ferry, also for dredging the shoals in the five miles length of river between Cherry Orchard and Berwick House, for the Corporation. Contract drawings, terms and conditions of contract, specification, bill of quantities, and form of tender may be seen on application to the Borough Surveyor, The Square, Shrewsbury. Copies of the documents (but not drawings) may be obtained from the Borough Surveyor upon deposit of £2 2s. Tenders, endorsed "Shrewsbury Dam or Weir and Dredging," are to be addressed to H. C. Clarke, Town Clerk, Guildhall, Shrewsbury.

May 9. **CHELMSFORD.**—Subsidiary works in connection with the Trinity Road Council school, which is now in course of erection:—Supplying and fixing floors of steel and coke breeze concrete, in conformity with the architect's specification, for the Borough Education Committee. Plans of the school building may be inspected at the office of the architect, W. H. Pertwee, the Institute, London Road, Chelmsford, from whom all particulars may be obtained. The contract for the erection of the school building has been let to Henry Potter and Son, of Chelmsford, and the person whose tender is accepted for the before-mentioned works will be, and act as sub-contractor to, and will be paid by, that firm. Tenders must be addressed to W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

May 11. **WOOD GREEN.**—Schemes and tenders for a reinforced concrete swimming tank, heating of the bath, private baths, etc., and steel roof trusses and sliding lantern over same, from firms who are respectively specialists in such work for the U.D.C. Forms of tender, preliminary specifications, and copies of plans may be obtained at the office of Wm. P. Harding, Clerk of the Council, Town Hall, Wood Green, on payment of a cash deposit of £3 for each set. The general conditions, and all further information may (on the production of receipt for deposit) be inspected and obtained from the architect, Harold Burgess, Capel House, 62, New Broad Street, E.C., between the hours of 3 and 5 p.m. Tenders must be delivered to the Clerk of the Council. The contractor will be required to pay the wages and observe the hours of labour in accordance with the scheme, a copy of which will be annexed to the contract.

JUST A WORD ABOUT WHITEWASH.

No one denies that the old method of preparing whitewash was both insanitary and wasteful. It is now rendered **obsolete.**

"CEELINKOTO"

(Registered)

does away with it.

WHY? Because just mixed with a little clean cold water it forms a **perfect sanitary whitewash** for ceilings and friezes.

When an article of sterling merit has been successfully placed on the market imitations are bound to spring up.

Protect your own interests by making sure that you use

"CEELINKOTO"

(REGISTERED)

It is made in White Cream, and Ivory, and is packed in casks weighing about 1¼cwt. It is sold by all Builders' Merchants and Colour Houses. If any difficulty is experienced in obtaining

"CEELINKOTO"

the Proprietors will be glad to furnish the name of their nearest local agent.

Sole Manufacturers:

Try "CEELINKOTO." Its great advantages will be at once apparent.

May 11. **BELFAST.**—Supply and erection of apparatus for the aeration, purification, filtration, and heating of the water used in plunge baths at Templemore Avenue and Falls Road Baths, for the Baths and Lodging-House Committee. Plans of buildings, specifications, and other particulars may be obtained at the City Surveyor's office. Tenders to be delivered at the office of R. Meyer, town clerk.

May 14. **HALIFAX.**—(See "Buildings.")

May 14. **BROOKLAND (Kent).**—Erection of a steel girder and concrete bridge over the White Kemp main sewer at the Flats, near Brookland, Kent, on the road from Rye to Brookland, for the Commissioners of the Level of Walland Marsh and Elderton's Innings. Drawings and specifications can be seen at the office of J. T. Welldon, Clerk, 11, Bank Street, Ashford, Kent.

May 18. **LEEDS.**—(See "Buildings.")

SANITARY ENGINEERING.

May 9. **SOUTHAMPTON.**—Construction and erection of a cast-iron sludge tank, with steel substructure and foundation piles, at the Corporation Wharf, for the Corporation. Plans, specification, and conditions may be inspected, and form of tender and schedule of prices obtained, at the Borough Engineer's office on production of the borough treasurer's receipt for a deposit of £1 1s. Tenders must be delivered at the Town Clerk's office.

May 9. **MARGAM (Port Talbot).**—Completion of the following works for the U.D.C.:—(1) Main intercepting sewer; (2) flushing pond and penstock chamber. (The main intercepting sewer above high-water mark, and the flushing pond, are nearly completed). (3) Main outfall, 42in. cast-iron pipes, to 55 yards beyond low-water mark. (Of the main outfall to low-water mark 1095 yards have been laid out of a total of 2,034 yards, and no part of the work beyond low-water mark has been done). (4) Subsidiary works. The drawings may be seen and copies of the specification, form of tender, and schedule of quantities may be obtained on application to William Fox and La Trobe Bateman, 5, Victoria Street, Westminster, S.W., on deposit of £10. The drawings may also be seen at the office of the Council's Surveyor, Taibach, Port Talbot. Tenders must be addressed to D. E. Jones, Solicitor, Clerk to the Margam U.D.C., Port Talbot.

May 10. **ROTHERHAM.**—Construction of sewers and the laying out of land, together with the necessary machinery for sewage disposal works in the parish of Laughton-en-le-Morthen, for the Rotherham R.D.C. Plans, sections, and specifications can be inspected and quantities obtained at the office of Fowler and Marshall, engineers, 3, Hartshead, Sheffield, on deposit of £1 1s. Tenders to be sent to Oxley and Coward, Clerks to the Council, 6, Westgate, Rotherham.

May 10. **SHEERNESS.**—Provision and laying of about 4,540yds. of 12in., 9in., 8in., and 7in. stoneware pipe sewers, together with manholes and flushing tanks, and about 1,560 yds. of 12in., 9in., 7in., and 6in. cast-iron pipes, comprising a sea-outfall syphon, and two rising mains; also for the construction of two pumping stations, storage, liquefying and storm tanks, percolation beds, humus tanks, and sundry other works in connection therewith, for the Sheppey R.D.C. Plans may be seen, and specifications, bills of quantities, and forms of tender obtained at the London office of the engineer, F. W. S. Stanton, A.M.I.C.E., 3, Victoria Street, Westminster, S.W., till April 30, on deposit of £4 4s. (cheques only). Uncoloured prints of the drawings may be purchased from the printers on production of a signed permit, which prints must be delivered with the tender before the deposit fee of £4 4s. is refunded. Tenders to be forwarded to the office of John Copland, clerk, Sheerness.

May 12. **WATERLOOVILLE (Hants).**—Construction of sewerage works, for the Havant R.D.C. For all particulars apply to Wilberforce Cobbett, Civil Engineer, Fareham, Hants.

May 13. **HANFORD.**—Hanford sewerage and sewage-disposal works—contract No. 1, for the Stone (Staffs.) R.D.C. Drawings, etc., may be seen, and bills of quantities obtained, at the office of the engineers, Willcox and Raikes, M.M.Inst.C.E., of 63, Temple Row, Birmingham, on a deposit of £3 3s.

May 13. **STONE (Staffs).**—Provision, laying and jointing of about 2,820 yards of stoneware pipe sewers, together with manholes and lampholes; the construction of about 920 yards of 5in. and 6in. cast-iron rising and hydraulic main; also the construction of pump-well, engine-house, liquefying tanks, bacteria beds, laying-out of irrigation area, and other incidental works in accordance with the drawing and specification prepared by the engineers, for the R.D.C. Drawings and specification may be seen and bills of quantities obtained at the office of the engineers, Willcox and Raikes, MM.I.C.E., 63, Temple Row, Birmingham, on deposit of £3 3s. Tenders to be delivered at the office of J. Buckley Norris, clerk, Union Offices, High Street, Stone, Staffs.

May 18. **BIGGLESWADE.**—Construction of about 7¼ miles of stoneware pipe sewers, varying in size from 15in. to 6in., together with manholes, lampholes, ejector chambers, and other works; also for the laying of about 1¼ miles of cast-iron and steel rising and compressed air mains, from 10in. to 2¼in. diameter, for the U.D.C. Plans and specifications may be seen, and bills of quantities and schedule of prices obtained, at the offices of the Engineer, J. T. Eayrs, M.Inst.C.E., 39, Corporation Street, Birmingham, April 25 to April 30, and also at the office of the Surveyor to the Council, Market Place, Biggleswade, from May 2 to May 7, on deposit of £3 3s. Tenders to be delivered at the office of Henry Chaundler, Clerk to the Council, Council Offices, Biggleswade, Beds. It is hoped that only substantial contractors with extensive experience in similar works will apply.

May 28. **WIGSTON MAGNA (Leicester).**—Construction of sewage works:—Contract No. 1, sewers, pumping station, and outfall works; the construction of about 1¼ miles of concrete, brick, and stoneware pipe sewers, varying from 6ft. by 4ft. to 9in. diameter, the laying and jointing of about ¼ of a mile of 13in. cast-iron pumping main, the construction of a pumping station, tanks, two continuous filters, distribution, and other works. Contract No. 2, cast-iron pipes: the supply and delivery of about 190 tons of coated cast-iron pipes and specials, varying in diameter from 18in. to 4in. Contract No. 3, sewage ironwork: the supply, delivery, and fixing of two rotary sewage distributors, 70ft. in diameter, floating arm, screen with power rake, and the supply and delivery of about 130 various sluice valves, air valves, and penstocks. Drawings may be seen at the offices of the engineers, Everard, Son and Pick, 6, Millstone Lane, Leicester, from whom conditions, specification, quantities, and form of tender may be obtained on deposit of £2 2s. for each contract. Tenders upon the form supplied to be sent to A. H. Burgess, Clerk, 2, Wycliffe Street, Leicester.

May 30. **WAKEFIELD.**—Alterations and additions to existing precipitation tanks, etc., the construction of about three acres of percolating filters, containing approximately 31,000 cubic yards of filtering material, effluent settlement tanks, liming and ferric sulphate houses, offices, mess-room, culverts, carriers, drains, and other appurtenant works at Calder Vale, for the Corporation. The contract drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of the engineer, J. P. Wakefield, A.M.I.C.E., city surveyor, Town Hall, Wakefield, on deposit of £5 5s. (Bank of England Note). Tenders must be delivered to W. W. Greenhalgh, Town Clerk.

IRON AND STEEL.

May 10. **SEVENOAKS.**—750ft. of 4in. and about 150ft. of 3in. socket and spigot cast-iron water pipe, with hydrants, etc., at Union Workhouse at Sundridge, near Sevenoaks, for the Guardians. Also for supplying a telescopic ladder, hydrant, cases, hose, etc. Specification may be obtained on application from F. H. Vibert, Clerk to the Guardians, Bank Chambers, Sevenoaks, and a plan seen at the Workhouse.

May 12. **GUILDFORD.**—Supply, delivery, and erection of the iron and steel work required for their new retort-house at the Gasworks, Onslow Street, for the Guildford Gaslight and Coke Company. Specification, blue prints, and further particulars can be obtained on deposit of £1 1s. from P. C. Cleasby, Gasworks, Guildford. Tenders, addressed to the Chairman of the company, to be delivered at the office of William Titley, secretary, Gas Offices, Onslow Street, Guildford.

May 14. **HALIFAX.**—(See "Buildings.")

May 14. **BROOKLAND (Kent).**—(See "Engineering.")

May 17. **LINCOLN.**—Supply of 2,260 tons approximately 21in. pipes and special castings, for the Corporation. Specification and form of tender may be obtained and drawings seen at the office of the Engineer, Neil McK. Barron, Waterworks Engineer, Lincoln. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Town Clerk, Guildhall, Lincoln.

May 30. **DARLINGTON.**—Corrugated iron roofs to tar macadam sheds, for the Corporation. For all particulars apply to George Winter, Borough Surveyor, Town Hall, Darlington.

PAINTING.

May 9. **GREATHAM.**—Painting about 100 houses and cottages, for the Hospital Trustees. Specifications may be had on application to W. H. Mawson, Estate Offices, Greatham.

May 9. **WAKEFIELD.**—Painting the exterior of the workhouse and infirmary, for the Guardians. Forms of tender and specifications may be obtained from the Workhouse Master, and must be returned to H. Beaumont, Clerk, Union Offices, Tetley House, Wakefield.

May 9. **SALFORD.**—Painting of all the exposed wood and iron work at the Frederick Road Electricity Works and offices, for the Corporation. Particulars may be obtained from the borough electrical engineer, Electricity Works, Frederick Road, Pendleton. Tenders to be sent to the electrical engineer.

May 11. **GOOLE.**—Painting of Dutch River bridge, for the U.D.C. Form of tender and other particulars may be obtained on application to the Town Surveyor. Tenders to be delivered to Robert Tyson, Clerk, Council Offices, Goole.

May 11. **TOTTENHAM, N.**—Cleaning and painting and repairing work at the North-Eastern Fever Hospital, St. Ann's Road, Tottenham, N., for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. The conditions of contract, bills of quantities, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board.

June 12. **KIRKBY-IN-FURNESS.**—Re-painting the cottages at Herschell Terrace, for the Kirkby-in-Furness Co-operative Society. Specifications can be seen at the stores on application to the manager.

May 12. **CUCKFIELD.**—Cleaning, stopping, distempering, preparing, and painting at the Workhouse. Specification can be seen at office of Edward J. Waugh, Clerk, Union Offices, Haywards Heath, or at the Workhouse. Persons tendering must be ratepayers in the Union.

May 12. **TOOTING.**—Decorations and repairs to the church, chapel, and lodges at Lambeth cemetery, Blackshaw Road, Tooting, S.W., for the Lambeth Borough Council. A copy of the specification and form of tender may be had on application to Henry Edwards, C.E., Borough Engineer, Lambeth Town Hall, Brixton Hill, S.W. Tenders must be delivered to Henry J. Smith, Town Clerk, Lambeth Town Hall, Brixton Hill, S.W.

May 12. **LONDON, W.**—Painting and cleaning at the Infirmary, Marloes Road, Kensington, for the Board of Guardians. Specification and form of tender can be obtained at the office of the Guardians, Marloes Road, Kensington, or by post by sending a stamped addressed foolscap envelope, to which address tenders must be sent. Fair wages clause. Two sureties required.

May 14. **HALIFAX.**—(See "Buildings.")

May 17. **LONDON, S.E. and S.W.**—Cleaning and painting at the Lambeth parish school, Elder Road, West Norwood, S.E., and No. 220, Brixton Road, S.W., for the Lambeth Guardians. Tenders must be sent to James L. Goldspink, Clerk to the Guardians, Guardians' Offices and Board Room, Brook Street, Kennington Road, S.E., or placed in a box provided for their reception in the office of the Clerk to the Guardians, by May 17, and will be opened at the Board Room at noon on the following day, when all persons tendering, or their authorised agents, must be in attendance. Forms of tender may be obtained at the office of the Clerk. Specifications will be supplied on personal application on deposit of £2.

May 19. **STIFFORD (Essex).**—Distempering and painting works, at the Children's Home, at Stifford, near Grays, Essex, for the Guardians of Stepney Union. Specification, forms of tender, etc., can be obtained on application at the office of T. G. Stacey, Clerk, Guardians' Offices, Barnes Street, Stepney, E., to whom tenders must be sent.

LUMBING AND SANITARY.

May 13. **BRIGHTON.**—Supply of such glazed drain pipes as may be required by the Corporation during the period ending June 30, 1911, for the B.C. Specification and form of tender may be obtained on application at the office of the Borough Surveyor at the Town Hall, Brighton. Tenders must be sent to Hugo Talbot, Town Clerk, Town Hall, Brighton.

ROADS AND CARTAGE.

May 9. **CHURCH.**—Supply of kerbs, setts (grit), limestone, granite, pitch, glazed socketed pipes, etc., for the U.D.C. Forms of tender, etc., may be obtained on application to W. E. Wood, Surveyor, Surveyor, Church.

May 9. **SUDBURY (Derby).**—Supply of granite and limestone during year ending March 31, 1911, for the R.D.C. Forms of tender and full particulars may be obtained from the surveyor, John Barker, Cubley, Derby. Tenders must be delivered at the office of F. S. Hawthorn, Clerk, Uttoxeter.

May 9. **BILLERICAY (Essex).**—Supply of Guernsey granite, Queenast granite, Kentish rag, flints and gravel, up to Mar. 31, 1911, for the R.D.C., according to forms of tender, which may be obtained of the surveyors, F. E. Ennals, Shelley Road, Hutton, Essex, and R. J. W. Layland, Billericay, Essex. Tenders to be sent to C. Edgar Lewis, Clerk, New Road, Brentwood. Samples must be sent to the Union House, Billericay.

May 9. **LEEDS.**—Paving and flagging of the following private streets:—Kepler Grove, East Park Mount, Eyre's Terrace, and Eyre's Grove. Also for the tar-macadamising and flagging of St. Ive's Mount and Heathfield Terrace, for the Highways Committee of the Corporation. Drawings may be seen at the City Engineer's Office, Municipal Buildings. Forms of tender and bills of quantities may be obtained, and copies of the documents forming the contracts inspected, on application at the Highways Office, 155, Kirkstall Road, Leeds. Tenders addressed to the Highways Committee, must be delivered at the Town Clerk's Office, Town Hall, Leeds.

(For further Contracts see page xvi.)

BUILDING.

May 9. **HEMINGFIELD (Barnsley).**—Pulling down of the Milton Arms Hotel, and rebuilding the new hotel. Forward names to Stubbs and Brown, Architects, etc., 74, High Street, Shefield, not later than May 9, together with a deposit of £2 2s., after which quantities and other information may be obtained and plans inspected.

May 10. **TREHARRIS.**—Erection of a masonic lodge and caretaker's house, for the Forest Lodge of Freemasons. Plans and specification can be inspected and all particulars obtained at "Bryntaf," John Street, Treharris. Tenders are to be sent to D. Myrddin Williams, Myrddinfa, Pontypridd.

May 10. **HIGHTOWN.**—Erection of a working men's club at Hightown, for the Heights Working Men's Club, Liversedge. Plans may be seen and bills of quantities obtained at the offices of Howorth and Howorth, Architects, etc., Old Bank Chambers, Cleckheaton, to whom tenders must be sent.

May 10. **THURLSTONE.**—Alterations and additions to the Crystal Palace Hotel, Thurlstone, for Brooke and Co. Plans can be seen, and quantities may be obtained on application at the offices of R. and W. Dixon, Architects, 5, Eastgate, Barnsley, to whom tenders must be delivered.

May 10. **DURHAM.**—Erection of two farm houses and steadings on Bracken Hill Farm, Shotton Colliery (sole tenders) for the Durham C.C. Plans, specifications, and general conditions of contract may be seen at the office of the Clerk to the County Council, Shire Hall, Durham. Tenders to be sent to Wm. Fleming, Jr., County Land Agent, Tudhoe, County Durham.

May 11. **BODMIN.**—Erection of dwelling house and repairs to outbuildings, etc., at "Penquite," near Bodmin. Plans and specifications can be seen at the office of the architect, Menear Olliver, Bodmin, from whom all particulars can be obtained, and to whom tenders must be sent.

May 12. **GOSPORT AND ALVERSTOKE.**—Erection of a cottage and certain gates, wall, etc., at the air compressing station, Westfield Road, for the U.D.C. Further information may be obtained at the office of the surveyor to the Council, where plans and specifications may be seen. Tenders to be delivered to E. Talbot Palmer, Clerk to the Council, Gosport.

May 13. **BARNSLEY.**—Pulling down and rebuilding the Corner Pin, Peel Square, and Wellington Street, for Clarkson's Old Brewery, Barnsley, Ltd. Plan and specifications may be seen, and bills of quantities obtained on application, from R. and W. Dixon, Architects, 5, Eastgate, Barnsley, to whom tenders must be sent.

May 14. **TRIM (Ireland).**—Repairs of Innfield Dispensary Residence for the Board of Guardians. For full particulars as to terms of contract, see hand-bills, which can be obtained on application to Vincent J. Sheridan, Clerk of the Union, at the Workhouse, Trim.

May 14. **MOUNTMELICK (Ireland).**—Erection of 58 single labourers' cottages and 12 double labourers' cottages; also the fencing of 45 plots, for the R.D.C. For full particulars see posters.

May 17. **STORNOWAY.**—Erection of a spire on the U.F. English Church. Plans are to be seen with Alexr. Macdonald, architect, Municipal Buildings, Stornoway, from whom schedules of quantities may be obtained. Tenders to be lodged with Neil M'Callum, merchant, Cromwell Street, Stornoway.

May 20. **WATH-UPON-DEARNE (Yorks.).**—Erection of Park Road Council school: new infants' department (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

May 21. **PORT-CHESTER (Hants).**—Erection of two semi-detached small holdings dwelling houses. Plans, specification, and conditions of contract (no quantities), may be seen, and other information obtained, at the office of W. J. Taylor, County Surveyor The Castle, Winchester, on and after May 17. Tenders, on form to be obtained from the County Surveyor, are to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

May 24. **WEDNESBURY.**—Erection of Holyhead Road Council school, for the Education Committee of the Borough. Plans of the proposed buildings may be inspected, and bills of quantities obtained, not later than May 10, at the office of the Architect, C. W. D. Joynson, Springhead, Wednesbury, on a deposit of £2 2s. Tenders to be sent to E. Foster Knowles, Secretary to the Education Committee, Education Offices, Wednesbury.

No date. **WHITBY.**—Erection of (1) Villa residence in Carr Hill Lane, Whitby; (2) villa residence in Ruswarp Lane, Whitby. Quantities will be sent to applicants when ready. Harold G. Walker, Architect and Surveyor, Golden Lion Bank, Whitby.

ENGINEERING.

May 10. **LONDON (for India).**—Supply of girder bridges, for the Directors of The Bombay and Central India Railway. Tenders must be made on forms, copies of which, with specification, can be obtained at the office of C. Crommelin, secretary, Offices: Gloucester House, 2, 3, and 4, Bishopsgate Street Without, E.C., on payment of 21s. each (which will not be returned).

SANITARY ENGINEERING.

May 9. **SELBY.**—Laying of pipes for sewer, at Back Lane, Cawood, for the Selby R.D.C. For particulars apply Thomas Braithwaite, Surveyor to the Council. Tenders to be received by E. Townend, Clerk, 1, Abbey Place, Selby.

May 9. **CHEETHAM (Manchester).**—Diversion of a sewer, for the Paving, Sewering, and Highways Committee of the Corporation. Plans may be seen and specification, bill of quantities, and form of tender obtained on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of deposit of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders to be addressed to the Chairman of the Paving, etc., Committee.

May 10. **SALFORD.**—Silt elevator and sewage screen and rakes. Particulars may be obtained at the Borough Engineer's Office, Town Hall, Salford.

May 17. **LIMEHURST.**—Extension of sewage works in the townships of Bardsley and Waterloo, which comprise the construction of storm-water tanks, bacteria beds, final settling tanks, and other appurtenant works, for the R.D.C. Plans, sections, details, and specifications may be seen at the office of the Engineer, H. Leonard Hinnell, M.InstC.E., 41, Corporation Street, Manchester, and also at the District Council Offices, 250, Oldham Road, Waterloo, between 9 and 12 o'clock on Monday, Tuesday, and Wednesday, in each week, on or after May 7, and quantities obtained from the engineer on deposit of £1. Tenders to be delivered to J. Taylor, Clerk, Limehurst R.D. Council Offices, Ashton-under-Lyne, addressed to the Chairman of the Council.

May 17. **TIVERTON.**—Laying and jointing of about 3,000 yards of stoneware pipe sewers, including the construction of manholes, lampholes, and flushing chambers in connection therewith; also the construction of two sewage sedimentation tanks, carriers, and other incidental works, in accordance with the plans, sections, detail drawings, and specification prepared by the engineers, for the R.D.C. Drawings and specification may be seen and bills of quantities and form of tender obtained at the offices of the engineers, Willcox and Raikes, 63, Temple Row, Birmingham, on deposit of £3 3s. Copies of the drawings and specification may also be seen at the office of J. Follett Pugsley, Clerk to the Rural District Council, Tiverton, to whom tenders must be sent.

IRON AND STEEL.

May 10. **MANCHESTER.**—Supply of steel tie bars for tramway rails, for the Tramways Committee of the Corporation. Specifications and forms of tender may be obtained on application to J. M. McElroy, general manager, Corporation Tramways, 55, Piccadilly, Manchester. Tenders to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester.

PAINTING.

May 9. **ISLINGTON.**—Repairs and painting at the Coroner's Court in the St. Mary Magdalene Gardens, Holloway Road, N., for the Islington B.C. Conditions may be seen, and specification and other particulars obtained, upon application to the Borough Engineer, J. Patten Barber, at the Town Hall. Upper Street, N. Tenders must be received by Wm. F. Dewey, Town Clerk, Town Hall, Upper Street, N.

No date. **CONSETT.**—Painting, etc., of business and other premises at Dipton, Flint Hill, Iveston, and Consett. Specifications may be seen on application to W. Ward, Balfour Street, Consett, to whom tenders are to be sent.

No date. **WHITBY.**—White-washing the exterior of the Royal Hotel. For particulars, apply to H. Walker, Khyber House.

PLUMBING.

May 11. **NAAS (Ireland).**—Keeping the plumbing work of the Workhouse in repair for one year ending April 30, 1911, in strict accordance with specification, which can be seen at the office of D. J. Purcell, Clerk of Union, Naas, to whom tenders (naming sureties) must be sent.

ROADS AND CARTAGE.

May 9. **TENDRING (Essex).**—Supply of about 2,500 tons of granite, broken to go through a 1½in. ring, and delivered as required on to the wharves or into trucks, free of all dues, at the following places, viz.:—Harwich, Wivenhoe, and Mistley; also for the supply of the following quantities of red Kent flints, broken to a 2in. gauge, and delivered alongside the wharf, hard or beach, at the following places, as and when required by the surveyor, for the R.D.C.:—Beaumont 500 cubic yards, Harwich 400, Clacton 200, Kirby 200, St. Osyth 200, Great Oakley 200, Mistley 300, Landermere 300, The Flag, St. Osyth 200. A quantity of above will be loaded on rail to different stations, and will be paid for according to railway weight, i.e., 1 yard—21 cwt. Tenders must be sent to A. J. H. Ward, clerk, 42, Church Street, Harwich and samples should be sent addressed to the Clerk, Workhouse, Tendring Weeley. R.S.O.

May 9. **CHESHAM.**—Roadmaking works in Essex Road, for the U.D.C. Plans, sections, and specifications may be seen upon application to Percy C. Dormer, Engineer and Surveyor, to whom tenders must be sent. The person whose tender is accepted will be required to enter into a contract and bond in an approved guarantee society as surety for the due performance of the contract, a copy of which may be seen at the office of John Gibbon How, Clerk to the Council, High Street, Chesham.

May 10. **SALCOMBE.**—Supply of 1½in. broken forder stone, 2in. broken limestone, forder shippings, and limestone chippings, for the U.D.C. Particulars may be obtained on application to Frank Swinburne, surveyor, Fore Street, Salcombe. Tenders to be forwarded to C. E. Turner, clerk, Salcombe.

May 10. **BRIDLINGTON.**—Formation of Clifton Street, for B. T. Harland. Drawings, specification, and conditions of contract may be inspected at the office of J. Earnshaw, Architect and Surveyor, Carlton House, Bridlington, to whom tenders must be delivered.

May 10. **LIVERSEDGE (Yorks.).**—Sewering, levelling, kerbing, flagging, channelling, macadamising, etc., of Railway Street, off Quarry Road, for the U.D.C. Plans, sections, and specification may be seen, and bill of quantities and form of tender obtained, at the office of F. Langley, M.S.E., engineer and surveyor, Council Offices, Liversedge, upon deposit of £1 1s. Tenders to be delivered to Thos. Mitcheson, clerk, Council Offices, Liversedge. The successful contractor will be required to observe the fair contracts clauses, and to provide security for the due fulfilment of the contract.

May 11. **BALBY (Doncaster).**—Supply of concrete flags, 2½in. thick, for the U.D.C. Full particulars and forms of tender may be obtained from George Gledhill, Engineer and Surveyor, Council Offices, 61, Low Road, Balby, Doncaster, to which address tenders must be delivered addressed to the Chairman of the Stores Committee, accompanied by samples.

May 11. **DARTFORD.**—Road repairing and other work at the Gore Farm (Convalescent) Fever Hospital, for the Metropolitan Asylums Board, in accordance with drawings, conditions of contract, and specifications prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., Engineer-in-Chief. Drawings, conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1 Tenders must be delivered at the office of the Board.

May 11. **KINGSTON-UPON-THAMES.** — Levelling, paving, metalling, flagging, channelling, sewering, and lighting Rowlls Road and Piper Road respectively, from the Corporation, in accordance with the plans and specifications prepared by the Borough Surveyor, R. Hampton Clucas, which can be seen at his office, Municipal Offices, where forms of tender can be obtained. Tenders, on a separate form for each road, to be sent to Harold A. Winser, Town Clerk, Municipal Offices, Kingston-upon-Thames. The persons whose tenders are accepted will be required to enter into contracts and bonds, with two sureties, for the due performance of the work.

May 12. **CARLOWAY (Stornaway).**—Completion of the new road between Stornoway and Carloway with the branch to Breaselete, measuring 13 miles or thereby, parts of which are firmed and stone-bottomed. Specifications and plans can be seen in the office of Hugh Miller, Lewis District Committee Chambers, Stornoway, to whom tenders must be sent.

May 12. **RAWTENSTALL.** — Sewering, paving, flagging, etc., of nineteen streets situate at Crawshawbooth, Rawtenstall, Cloughfold, and Waterfoot, all within the borough, for the Rawtenstall Corporation. Plans and sections may be seen and forms of tender, general conditions, specifications, and quantities obtained on application to James Johnson, C.E., Borough Surveyor, Municipal Offices, Rawtenstall, on deposit of £2 2s. Tenders to be delivered to James Whalley, Town Clerk, Municipal Offices, Rawtenstall.

May 12. **OGMORE AND GARW.**—Supply of broken limestone and limestone chippings, equal in quality to the "Ewenny Blue Mountain Limestone," and also broken granite and chippings for road metalling within the Urban District of the Ogmore and Garw, for the period of twelve months, commencing May 16, 1910, and to be delivered in such quantities and at such times as the surveyor may direct from time to time at the following stations: Brynmenyn, Pontyrhyl, Pontycymmer, Blaengarw, Blackmill, Gilfach, Goch, Ogmore Vale, and Nantymoel. All limestone and granite shall be broken cubically and sufficiently small to pass through a 2½in. gauge by its largest dimensions. All chippings shall be broken to pass through a ¾in. screen, and must be free from dust when loaded into the trucks at the quarries. The approximate quantities of limestone and granite will be about 10,000 tons. The council will undertake to pay the railway freight. Specifications and forms of tenders and all other particulars may be obtained from the Surveyor, Council Offices, Brynmenyn. Tenders to be sent to the Clerk of the Council, S. H. Stockwood, solicitor, Bridgend.

May 14. **HOYLAND NETHER.**—Supply and delivery of the following road materials for the year ending March 31, 1911, for the U.D.C.:—Slag, granite, tar macadam. Full particulars and form of tender may be obtained on application to Frank Hewitt, Engineer and Surveyor, Town Hall, Hoyland, near Barnsley, to whom tenders must be sent.

May 14. **HASTINGS.**—Supply of 500 yards (in two separate contracts of 200 and 300 yards each) of best unbroken blue stone, delivered in the parishes of Guestling and Fairlight, for the R.D.C. Forms of tender may be obtained of A. R. Inskipp, Clerk, 11, Wellington Square, Hastings; or of the District Surveyor, D. Paine, Stonelynk Farm, Fairlight, Hastings, and must be returned to the Clerk.

May 18. **ALRESFORD.**—Grading, draining, and tar-paving the playgrounds at the new Alresford Council School. Plan and conditions of contract may be seen, and specification and other information obtained at the office of W. J. Taylor, County Surveyor, The Castle, Winchester. The plan and conditions of contract can also be seen at the school. A deposit of 10s. 6d. will be required for a copy of the specification and form of tender. Deposits must be made by cheque, payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

May 23. **STREATHAM.**—Making-up and paving of that part of Becmead Avenue, Streatham, for the Wandsworth B.C. The specification and drawings may be seen, and forms of tender obtained, of the Borough Engineer, at the office of the New Streets Department, No. 56, East Hill, Wandsworth, S.W., upon deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Persons tendering must in the case of all workmen employed by them pay wages at not less and observe hours of labour not greater than the rates and hours recognised by the associations of employers and employees and in practice obtained in the district where the work is to be executed. If required, the contractor must provide two sureties for the due execution of the contract.

May 25. **RUNCORN.**—Supply of macadam for the R.D.C. Forms will be supplied on application to Geo. F. Ashton, Clerk to the Council, 71, High Street, Runcorn.

May 30. **CAMBERWELL.**—Kerbing and York paving the footways in Peckham Rye West Side (from Barry Road to Nigel Road); also for roadway paving (patent or otherwise) to specification as submitted by contractors, for the B.C. Full particulars and form of tender can be obtained from Wm. Oxtoby, Borough Engineer, Town Hall, Camberwell, S.E. Contractors are invited to state the roadway paving they are prepared to lay and their conditions as to maintenance for a term of years. Tenders to be delivered to the Town Hall, Camberwell, S.E., addressed to the Works Committee.

May 24. **STROUD.**—Supply of Clee Hill stone, Tytherington stone, and Chepstow stone, for the twelve months ending March 31, 1911, for the U.D.C. Tenders should be sent to E. Northam Witchell, Clerk. Samples of the stone to be supplied should be sent to the Council Offices, Town Hall, Stroud, for inspection.

No date. **KEIGHLEY.**—Tar-macadamising Mayfield Road.—Particulars from the Borough Engineer.

MISCELLANEOUS.

May 9. **LONDON, W.**—Supply and delivery of about 830,000 3in. by 5in. by 9in. best Swedish yellow deal creosoted paving blocks, for the St. Marylebone B.C. Forms of tender may be obtained on application at the Town Hall, Marylebone Lane, Oxford Street, W., and any further particulars may be had of the Borough Engineer and Surveyor, J. Paget Waddington, M.I.C.E. Tenders must be sent to James Wilson, Town Clerk, Town Hall, Marylebone Lane, Oxford Street, W.

May 10. **RICHMOND.**—Supply of Buxton lime, grey lime, etc., for the Main Sewerage Board. Specifications, etc., may be obtained, on personal application only, at the office of the Engineer to the Board, West Hall Road, Kew Gardens, S.W.

May 13. **BRIGHTON.**—Supply of Portland cement for the year ending June 30, 1911, to be delivered at any of the Brighton Railway Stations as ordered in quantities of from 6 to 20 tons at one time, for the B.C. Specification and form of tender may be obtained on application at the office of the Borough Surveyor at the Town Hall, Brighton. Tenders must be sent to Hugo Talbot, Town Clerk, Town Hall, Brighton.

NEW BUILDINGS.

PROPOSED.

Cardiff.—Mr. A. G. Drury, M.Inst.C.E., an inspector of the Local Government Board, has held an inquiry at the Glamorgan County Council's offices, Cardiff, into the application of the County Council for sanction to borrow £76,500, for the erection and equipment of the new county offices in Cathays Park.

Ilkeston.—The Ilkeston Corporation having applied to Local Government Board for permission to borrow £3,700 for providing chapels, lodge, etc., at the Park Cemetery, a public inquiry has been held in the Town Hall, by Major J. Stewart, R.E., one of the Local Government Board's inspectors.

Reigate.—It is proposed by the Town Council to acquire the Lodge estate of 28 acres on which to build a Grammar School, in conjunction with the Surrey Education Committee.

Shirebrook.—A company has been formed to provide a public hall for Shirebrook, and has a capital of £2,000. The site of the

JELLSO

JELLY SOAP.

THE LABOUR SAVER

LESS WORK, BETTER RESULTS

THE PAINTERS' SOAP

WHAT IT IS!

"JELLSO" is soap in the form of jelly. But that is not all. "JELLSO" is not an ordinary soft soap of doubtful composition, objectionable smell and destructively alkaline propensities; "JELLSO" is what the painter has hoped for, but till now not yet realised—**a pure jelly soap,** harmless to the hands and to the most delicate enamel or varnish surface, with cleansing properties described by some enthusiastic decorators as "magical."

WHAT IT DOES!

"JELLSO" is emphatically a cleanser, cleaning paint, varnish, enamel, marble, mosaic, tiles, leaded glass, stonework, etc., quickly and well without injuriously affecting the surface. It is the ideal soap for spring cleaning, yielding satisfaction to householder and decorator alike.

Can be obtained from all the leading Builders' Supply Merchants, or from—

The Jellso Co.,

49, HATTON GARDEN, LONDON, E.C.,

who will send free sample on application.

GAY'S PAINTS do credit to

the Architect who specifies them,
the Builder who applies them,
the Property-owner who buys them.

They have a reputation extending over 50 years, and have been used on practically every important Government Building, on hundreds of large Estates, on Hospitals, Infirmaries, Seaside Piers, etc., etc.

GAY'S "IMPENETRABLE" & "ETRUSCAN" PAINTS

Exceptionally durable and damp-proof, they give a handsome, smooth, hard, glossy yet elastic surface, retained for a number of years. The careful and skilful manufacture ensures uniformity of quality, colour, and consistency. Free from obnoxious smell, they dry hard in a few hours, and do not crack, fade or blister. Economical owing to great covering capacity. Sent out ready for use.

In full Gloss, Semi-flat or Flat. Large range of Colours and Shades shown in our Booklet, "A RECORD OF COLOUR," sent free by—

Engineers & Sanitary Specialists,

Cambridge Street, Birmingham; London; Leeds; Cardiff.

The "Forward" Patent Automatic Sash Holder.

BRITISH MANUFACTURE.

It acts automatically, and holds in any position required both lower and upper sashes of window.

It is invisible, being inserted into the stile of the sash, thereby eliminating the unsightly appearance of ropes and pulleys.

By dispensing with sash weight pockets a maximum amount of light space is obtained.

It prevents windows from rattling while in any position—a very great annoyance heretofore.

It can easily be adapted to old Window Frames.

It is manufactured of the finest material obtainable.

The price is considerably lower than the cost of weights, cords and pulleys.

There is a decided saving of labour and material in making Sashes and Frames by doing away with the pockets, grooves, etc. A set of four holders with full particulars will be sent upon application.

PARKER, WINDER & ACHURCH, Ltd.

Patentees & Manufacturers,

Broad Street, BIRMINGHAM.

proposed new hall is in Main Street, and the plans provide a "picture palace" on the ground floor to hold about 500 people, while upstairs there will be an assembly room capable of holding 400 to 500 persons. The building will be of brick.

Thirsk.—Messrs. Barclay's Bank premises in the Market-place are to be considerably enlarged by the pulling down of the existing bank and the adjoining shop, and the erection of a new bank on the site, from the designs of Mr. W. H. Brierley, architect, York. The new building will consist of two storeys, the lower portion faced with stone, and the upper part of red brick with stone dressings. The contract for the work has been let to Messrs. William Jackson and Son, Thirsk.

Tredegar.—The Local Government Board has sanctioned the loan, of £4,811 for the extension of the Gasworks, and the Town Council has approved the plans of streets and sites of 137 houses at the rear of Park-row, and of 76 houses on the site.

Upper Renfrewshire.—The following plans have been submitted to the Buildings Committee:—Church hall in Kilmarnock Road, Newton-Mearns; terrace of 10 cottages in Cromartie Avenue, Newlands; double villa at the corner of Merrylee Road and Kilmarnock Road, Newlands; motor garage at Newark, Corsebar, Paisley; dye house at Broadlie Works, Neilston; gardener's cottage in Old Coach Road, Giffnock; two double cottages in Linwood Road, Elderslie; three tenements at the corner of Old Mearns Road and Busby Road, Clarkston; store and workshop in South Street, Scotstoun; and terrace of 12 houses in Victoria Drive, Scotstoun.

Wallasey. — The Harrison Memorial Church, of which the foundation-stones were recently laid, is in course of erection from the designs of Mr. J. Francis Doyle, architect. The church will be in the Perpendicular Gothic style and the interior will consist of nave, north and south aisles, north and south transept, narthex, chancel, clergy and choir vestries, organ chamber, and morning chapel. There will be two main entrances opening into porches at the east end, with exit door from the morning chapel. The whole of the building, including the tower, will be of Storeton stone, and will provide seating accommodation for between 600 and 700 people. The builders are Messrs. J. Thomas and Sons, of Oxton, Birkenhead.

IN PROGRESS AND COMPLETED.

Aberdeen.—The Town Council has approved the following plans:—Elgin Street, cellars; Fairfield Road, stable, etc.; Forfar Road, addition to villa; North Lindsay Street, addition to property; Panmure Street, addition to property for the Dundee Chamber of Commerce; West Wynd, warehouse for James Scott and Sons, Ltd.; Lynnewood Place, alteration on stable; Laburn Street, motor shed.

Ashburton.—The Borough Council has accepted the following tenders for contracts for the projected waterworks:—Supply of pipes, Mason, Struthers, and Co., Christchurch, £5, 893 17s. 2d.; engine and pumps, John Chambers and Son, Dunedin, £2,459 10s.; erection of water tower, Scott Bros., Christchurch, £2,380; laying pipes, Russell and Co., Ashburton, £1,915 6s. 1d. The total sum of the tenders amounts to £12,648 13s. 3d.

Ayr.—The following plans have been passed by the Ayr Dean of Guild Court on behalf of the Town Council Pavilion on the Low Green to cost £6,000; Vestry and organ loft in Newton Parish Church to cost £500.

Bishop Auckland.—The new Girls' Secondary School, which the Durham County Council are erecting on a site in South Church Lane, will cost over £14,000, and is to be of stone. Mr. Thos. Lumsden, of Jarrow, is the contractor, and it is anticipated that the building will be completed by September next.

Blackpool.—The new Baptist Church in Hornby Road East has been opened, Mr. F. Keighley, M.S.A., of Blackpool, being the architect. The contractors were Marsh and Fretwell, of Darwen; Sudall and Heap, South Shore, plumbers; J. Richardson, roof tiler, South Shore; S. Butterworth, mason; J. and T. Livesey, heating engineers, Accrington; and George Morrison, of Birley Street, electric lighting.

Bo'ness.—The Town Council have agreed to proceed with an extension of the waterworks, including the laying of 2¼ miles of 8in. pipes from their service reservoir at Bomains to the burgh, and the addition of two batteries of Bell's mechanical filters. The estimated cost of the extensions is £2,500, and it has been agreed to lay the main street of Grangepans for a distance of 2,560 superficial yards with whin setts on a concrete foundation at a probable cost of £1,060.

Clydebank.—The Clydebank Dean of Guild has passed the following plans:—Seven tenements of one room and kitchen houses in Glasgow Road, Yoker; for Brown and Co., Ltd., shipbuilders; testing-house in North Albion Street for Dawson and Downie, engineers.

Dunoon.—The plans of the Roller Skating Pavilion, which is to be erected in the Castle Gardens have been passed by the Dean of Guild Court, and building operations will be commenced immediately to ensure the completion of the work by the middle of June. The building is 210ft. by 90ft., and has a skating surface of some 14,000 square feet, and is constructed on a steel frame, finished in wood and fibre plaster and roofed with red felt. The estimated cost is £3,000, the architect being Mr. Albert Fountain, 68, Gordon Street, Glasgow, and the measurers Messrs. Shearer and Marr, I.M., 217, St. Vincent Street, Glasgow.

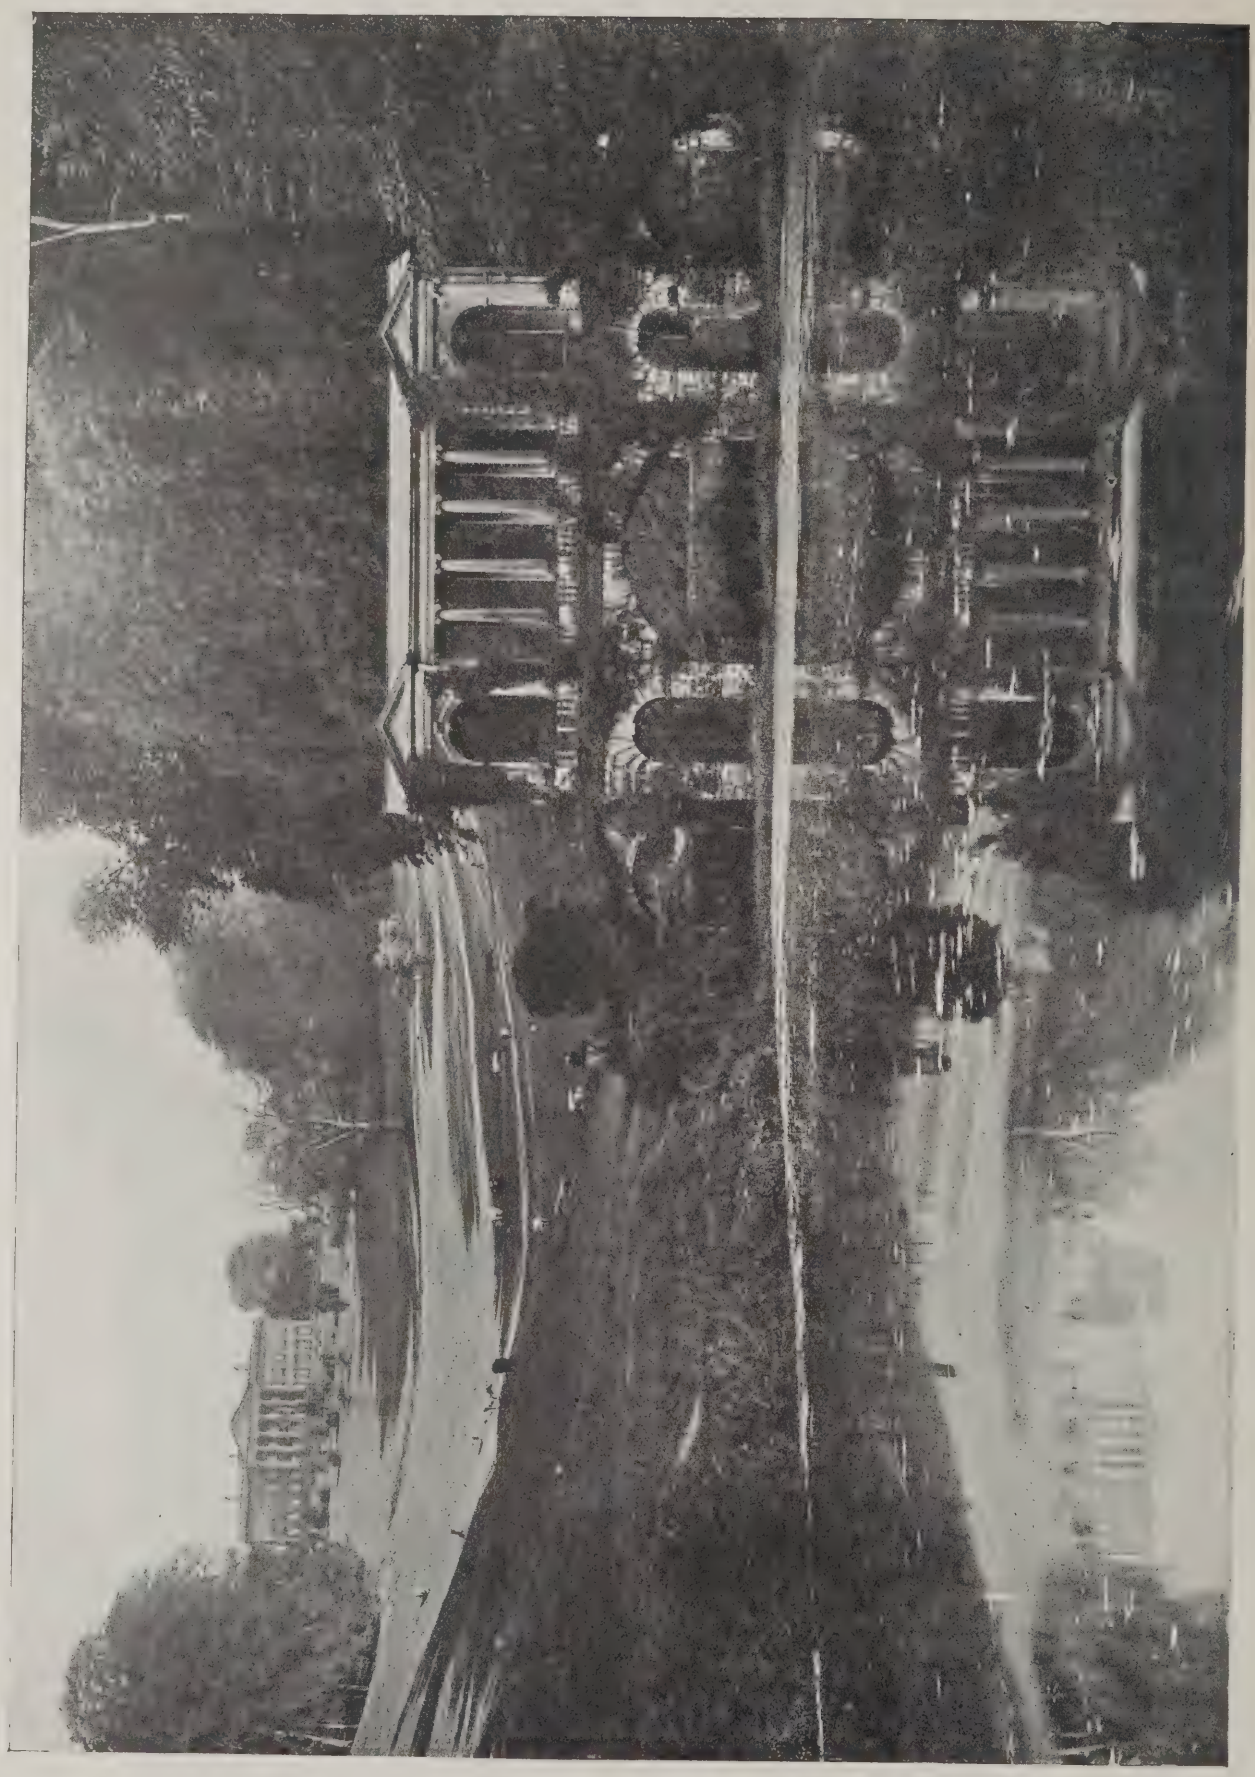
THE ARCHITECTS' & BUILDERS' JOURNAL.



WEDNESDAY,
MAY 11th, 1910.

Volume XXXI. No. 797

BATH STREET, BATH, AS IT APPEARED BEFORE THE RECENT DEMOLITION.

(See "The Eighteenth Century Architecture of Bath," p. 444.)

Photochrom.

This was the country seat of Ralph Allen, and is said to have been built in 1737 to advertise his stone quarries. The bridge (built in 1756) is almost an exact copy of the one built by Robert Morris at Wilton House in 1736.

PRIOR PARK, BATH: SOUTH FRONT OF THE HOUSE, JOHN WOOD (SENR.), ARCHITECT, AND THE PALLADIAN BRIDGE.

Note : The List of Contents will be found on Page V of the front advertisements in this and subsequent issues.

In Memoriam—King Edward VII.

THE lamented and unexpected death, on Friday last, of King Edward, is an event which affects all classes of British subjects, without distinction of profession or occupation; and while more detailed commentary on the historical and political aspects of the subject may suitably be left to the general Press of this country, we naturally feel called on to express, on behalf of the profession which we represent, their share in the general sorrow at the great loss which the nation has sustained. Edward VII., owing to the prolonged reign of his illustrious predecessor, came to the throne comparatively late in life, and his reign of a little over nine years is a short one among the annals of British Sovereigns; but it has been long enough to afford proof of some remarkable qualities both in his political and personal character; of a great deal of tact and wisdom in his relations with the rulers of other countries, whereby he has done much to promote the interests of peace and friendly feeling between British and Continental Powers; and of an unfailing kindness of heart and courtesy of manner which gained him the affectionate regard of those whom duty or occasion brought into personal relations with him. Without any claim to be considered a man of genius, the King had the quality of sterling good sense which enabled him always to say the right thing at the right moment. He may be said to have been a typical English gentleman, in his tastes, his love of field sports, and in his general spirit of courtesy and fair play to others. And his good sense and perception of the fitness of things were shown also in his invariable recognition of his political position as a constitutional sovereign. Whatever the King's private wishes or inclinations on a subject of public policy might be, he was never known to overstep the limit of action which the British constitution imposes on the Sovereign. When, as Prince of Wales, he was once asked by Bismarck, in conversation, why England did not frankly take possession of Egypt and govern that country for its good, he replied at once, "You must put that question to Mr. Gladstone, not to me" (Gladstone being then in office), and turned the conversation. But the King has always shown a desire to promote important schemes for the public good. Both the Imperial Institute and the Royal College of Music owed their foundation mainly to his influence. The latter has proved a great success; and if the former has failed, it was through no fault of his. The King has shown also especial interest in all schemes for the promotion of public health, and he was to have been Patron of the Conference on Town Planning to be held in London in July. His care for the public interest in lesser things was touchingly shown in his desire, in spite of a painful illness, to have the Coronation ceremony at the date originally fixed, saying "I cannot disappoint the people"; and it was only when warned that the consequence of the effort might be fatal to him that he consented to abandon it. It is to be feared that he hastened his own end by the same kind of determination not to give way to illness—by continuing to transact business (even on the day of his death), when he was really not fit for the exertion; a kind of imprudence which, at all events, does honour to his courage and his sense of duty. There can be no doubt that the late King leaves behind him the general regard and sorrow of his people in Great Britain and the Colonies. It is to be hoped that there will be some project to erect a suitable monument to his memory.

Architecture at the Paris Salon.

THERE could hardly be a greater contrast than is experienced in going from the Architectural Room at the Royal Academy to the Architectural Gallery at the Salon. In the former we find a small room full of more or less pretty pictures of buildings, from which plans are either excluded or only admitted apologetically and on a minute scale, and which for the most part represent the current building of the day. At the Salon we find a long range of galleries occupied by sets of drawings, many of them of immense size, in which plans are invariably shown to a large scale, and are evidently regarded as of equal importance with elevations and perspectives; indeed, the last-named type of drawing is quite in a minority, elevations and sections alone illustrating many of the works. And the nature of the exhibits differs equally from those at the Academy. At Paris the exhibitors aim at presenting great ideas in architecture, or at restorations of great monuments of antiquity; works executed or in progress are comparatively few—fewer, in fact, than they ought to be; the inadequate representation of contemporary architecture at the Salon has been a subject of frequent criticism, not without reason. Still, there are great ideals suggested, and represented by drawings which are great both in size and in splendour of execution. There is, it must be admitted, no place for such drawings at the Academy—there is not room to hang them. The drawings of one exhibitor alone, M. Hebrard, would more than fill the Academy room. The misfortune for architecture is that while all other paintings and drawings exhibited at the Salon are on the upper floor, the galleries for architecture are on the ground floor, and rather outside of the general traffic of spectators, consequently they are very little visited. The one advantage for architecture at the Academy is that the room devoted to it is, at all events, *en suite* with the picture-galleries, so that there is no need to go out of the way to reach it; and in proportion to its size it is, in fact, much better attended than the Salon architectural gallery.

The Feature of the Collection.

THE exhibit of M. Hébrard, already alluded to, is the great feature of the collection. It consists of a great series of drawings of a restoration of the Palace at Spalato, including, of course, as usual with French restorations of

this kind, large and careful drawings of the existing remains and their adjuncts, made on a scale and with a minuteness of detail such as we never see in England. The drawing of the sea-front as existing, with Diocletian's wall-arcades partly showing and partly engulfed in later utilitarian erections, is of great interest, for it will be found, on careful examination, that it really affords data for the whole of the author's effective restoration of this front. There is a splendid bird's-eye view, in water-colour, of the whole palace in its presumed original state; a perspective section of the Mausoleum showing its structure; a restoration of the temple, and a number of beautiful drawings of details from both temple and Mausoleum. M. Hébrard has also made a series of studies of the public square of Siena as it was in the middle ages, girt round with an encircling array of the tall narrow towers, cut off square at the top, which formed the outward symbol of the internecine strife of mediæval Italy, and of which San Gemignano alone possesses a surviving handful. But the Spalato drawings are the chief exhibit, and the set ought to be seen in London. The drawings, being made by the author (we presume) as a Prix de Rome student, are the property of the French Government, which would, no doubt, be willing to lend them if applied to.

Drawings of Restorations.

AMONG other drawings showing restorations of ancient buildings is a fine set by M. Lucien Magne, of the Abbey of Fontevrault. A section of the nave shows the well-known construction of a series of domes carried on massive transverse arches, the voussoirs of which are cut to the curve of the dome section, which thus starts from the intrados and not from extrados of the arch. A remarkable set of drawings of the Tour d'Evrault shows the whole structure of this curious building, octagon on plan, with a semicircular apse on each face, and a great conical stone roof covering the whole; but how much of this is restoration and how much *in situ*, the drawings do not convey. The seventeenth century cloister of the Abbey, with its coupled columns between round arches, makes an effective contrast with what Ruskin would have called "wolfish" Gothic of the twelfth century work. Another noteworthy set of restoration drawings is that by M. Levard of the basilica of San Clemente at Rome. Here, of course, there is less to restore; the interior is complete, but the original exterior aspect with its white plaster and small windows under the eaves is shown. M. Lucien Magne has, besides Fontevrault, another large set of restoration drawings of the Palais de Justice at Poitiers. The main portion of the building, which in its complete state must have been one of the most picturesque and characteristic of mediæval piles, is a nearly rectangular plan round a courtyard, with round towers at the external angles; all this part had been at some period cut down to little more than half its original height, and covered with a flat-pitched roof put on anyhow. M. Magne's restoration of the conical roofs and galleries is probably as near the truth as can be, since there are plenty of examples of the kind to go by. A more imaginative piece of restoration is the attempt of M. Camille Formigé to reconstruct the ancient erection in honour of Augustus at Turbia, above Monaco. A fine water-colour drawing shows the strange and confused mass of building still existing, alluded to in Tennyson's poem, "The Daisy":—

> "What Roman strength Turbía showed
> In ruin, by the mountain road."

There was more than "Roman strength" concerned, however, for it seems evident that in mediæval times the upper circular portion of the monument, or whatever was then left of it, was developed into a round tower with battlements. The evidence of an original square base with a circular superstructure remains, and M. Formigé restores the upper portion as a circular erection with an exterior colonnade and a pyramidal stepped roof, somewhat of the same nature as that which must have crowned the mausoleum at Halicarnassus. The restoration is only conjectural, but it is not improbable. A small restoration by M. Favry, of Amiens, shows the "Porte du Ravelin de Montrescu," at Amiens; there is nothing very conjectural in the restoration, for it is a French Renaissance structure, dated 1531, of which the upper portion with the entablature had been destroyed. It is a curious piece of work, of very regular ashlar masonry; on every alternate stone the device of the salamander is carved in relief.

"Projets" and Illustrative Drawings.

IT will be seen that the contents of the architectural room at the Salon afford (as they usually do) considerable opportunity for the study of points in architectural history. The other exhibits may be divided into three classes: what are called *projets*, designs for imaginary buildings, often of the most Utopian dimensions and grandeur; illustrations of buildings actually erected or intended to be erected; and purely illustrative drawings and sketches—a very numerous section. A good many of the *projets* have resulted from subjects set to the students of the Ecole des Beaux-Arts. These are always of most ambitious character, both in the actual size of the drawings and in the scale of the proposed buildings, and they tend to run very much into one style, that of modern French Free Classic—the style evidently favoured at the Ecole. It has its defects, among which is the obvious effort to show *cleverness* in detail, which seems to be more thought of than beauty. Nevertheless, there is always a sustained style in these works; they do not run into eccentricity (which would probably be fatal to the prospects of the eccentric one); and the careful treatment of plan and the effective manner in which the plans are drawn are remarkable. The small elevations and plans sufficient to secure medals at the Royal Academy seem child's play beside these monumental drawings. Among some of the *projets* which are worth attention is the tremendous scheme by M. Jacques Droz for "Un Port d'attache pour dirigible militaire"—a design looking ahead to the time when a "dirigible" shall be as large as an ocean liner, and providing for it an enormous stone arched kennel, as one may say, with vast folding doors at the entrance, and appearing externally as an artificial hill laid out in terraces. Of course, a complete plan is given on the same scale as the elevations. It seems a preposterous scheme now; yet we do not know that the future may not require some such provision as is shown here. M. Pin's scheme of "le Salle Principale du Musée d'un Grand Etat" is a noble conception, at all events, shown in a plan and in one of those pictorial sections in which the French excel. There is a domed vestibule first, with a colossal antique statue in the centre; then a flight of steps flanked by columns and large windows, leading up to a great hall with a coved roof, and paintings arranged in architectural compartments on the walls. A more practical and possible kind of *projet* is that of M. Albert Bray, for a new Palace of the Institut de France, in the event of the long-talked-of prolongation of the Rue de Rennes. This is shown as continued over a new bridge across the river, and the Institute building, as at present, faces the quay with a concave line of frontage and a dome, but on a larger scale than at present. A square *Place* is formed in the rear, one side flanking the new road. This is a fine architectural scheme, and kept within reasonable dimensions. The author is a pupil of M. Pascal.

Current Work.

AMONG the illustrations of current architectural work one of the most important is M. Masson-Detourbet's Commercial School in connection with the Chamber of Commerce of Paris. This is a remarkably original building in red and grey brick, with a staircase pavilion at each end in which the raking lines of the staircase show externally between narrow grey brick mullions of great height, and which must have required first-rate execution on the part of the bricklayers. These terminate in three arches combined under a main arch, of which the archivolt is decorated in a chequer of white and black (probably marble). The whole design is

a piece of architectural polychromy in brick and other materials, very well carried out. M. Chaussemiche's "Etablissement Thermal de Châtel-Guyon" is the largest scheme in practical architecture exhibited. The plan is the finest part of this. A large hall with an apse at each end runs across the front, behind which is a square garden with fountains, surrounded by the smaller apartments of the building, forming the other three sides of the quadrangle. An immense splendidly executed elevation is shown, and a section on the same scale showing the whole arrangement of baths and water service in detail. The complete manner in which such practical details are illustrated in the French architectural drawings is to be noted. Another exhibitor, M. Choret, exhibits a large bird's-eye view of a great set of oil-mills, but he does not, like an English architect, confine himself to a bird's-eye view. There are large drawings showing the whole arrangement and work of the mills and oil-wells, so that one can see what the bird's-eye view really means. Indeed, in this case the view is evidently quite a secondary element in the exhibit. It serves to show, however, that the element of attractiveness has not been overlooked even in so utilitarian a kind of building, for the principal open space between the buildings is planted round three sides with a mass of clipped trees.

Domestic Architecture.

THERE are some private houses, interesting from their plans, showing the French habit of grouping the rooms in house-planning. The French country house usually consists, architecturally, of rather low stone walls, with immense masses of steep roof above them. You cannot, apparently (to the French mind), give the true character to a country house without making two-thirds of it roof. Formerly this was always combined with portentous barge-boards of the most rampant character, but there has been some improvement in taste in this respect of late years, and country houses are somewhat less like exhibitions of fireworks than they used to be. But they are mostly very well and systematically planned. M. Bitterlin's "Maison de Campagne en Normandie," for instance, shows on the upper floor the "Chambre de Maîtres," with its two large and commodious "toilette" compartments en suite; then the "Chambre des Amis," or what would be called in England, "the spare bedroom," with its "toilette" compartments, forms a separate suite in the left wing, and the day nursery and night nursery and governesses' room form a suite in the right wing. It is noticeable how almost universal, in the French upper-class house plan, is the separate "toilette" or bathroom; the bedroom is not regarded as a room for lavatory operations. M. Gaudon's "Château de Vaux-le-Vicomte" is a French house on a larger scale; it is possible that it is an enlargement or alteration of an older house, but this is not stated. Externally it is a high-roofed château, with pilasters on the walls; but the arrangement of plan is at all events modern and very effective; a square vestibule leads to a great oval hall, with windows towards the garden side; the high roof of this hall makes rather an ugly feature in the elevation, but the room should be a noble one. A "Proposed House," by M. Rutté, shows again an interesting and symmetrically worked plan; the entertaining rooms and living rooms arranged in the centre block, with considerable attention to internal effect, while the lower wings, partially connected with the centre, contain on the one side the owner's business rooms, on the other side the servants' quarters. Among the drawings of executed work, that of a new boys' school at Noisy-le-Sec shows unhappily the usual programme of a Government school building—the brick pilasters and segmental-headed windows and general mill-like appearance. The idea of giving a school a domestic and home-like appearance never seems to have occurred to the French; their schools have the aspect of teaching-mills; and, from all accounts, their architecture perhaps accurately expresses the nature and system of instruction carried on in them.

Drawings of Old Work.

THE drawings merely illustrative of old work are, as before observed, very numerous. The smaller and slighter ones, generally catalogued as "croquis du voyage," are not on the average as good as English sketching of the same type. We have nothing to learn from the French in that way. But there are larger illustrations, of a more elaborate and finished kind, which are quite beyond what is generally to be seen in English exhibitions. Among these is the fine collection of drawings of the old Byzantine churches at Arta (Greece), with their brick cupolas and walls of brick and stone in alternate courses, drawn and coloured with the greatest exactness and verisimilitude. Among other interesting details is the restoration of Vauban's design for the architectural framework of the drawbridge of the Porte de Brisach at Belfort, with copies of Vauban's original drawings; and, by the same exhibitor (M. Damis) the drawing of the curious old fountain at Belfort, a baluster-shaped column and capital with masks of human faces at the base, from which project horizontal spouts delivering water into the fountain basins.

Three Architectural Pictures.

IN the Salon Nationale (New Salon) three pictures connected with architecture may be worth mention. One is M. Rachon's "La Cité de Carcassone," a very large architectural picture of the mediæval city ramparts restored, a work which has been bought by the Government. Another is the portrait by M. Renouard of M. Binet, the eminent architect, who is now carrying out the new building of the Magasins de Printemps in Boulevard Hausmann. M. Binet is represented in a rough working costume, clinging to the rail of a scaffold on a building in progress; a good suggestion, one may say, of the architect as he ought to be, looking personally after the work on his building. The third is a small picture by M. Guillaume, entitled "A l'Architecture," a title calculated to excite one's curiosity, seeing that M. Guillaume is known as a very refined painter of small figure subjects, and has never touched architecture. "A l'Architecture" turned out to be an amorous scene between a young couple who had found the architectural room the only one which afforded the solitude desirable for such an interview. But the architectural gallery of the Old Salon is not so deserted; nor should be. It would be worth while for the Architectural Association to organise a trip for the students of its classes to visit the Salon. They would get some new ideas as to the height to which architectural drawing and architectural illustration can be carried

New Use for Old Door-knockers.

"A NEW use for old door-knockers" is said to be their application to the doors of bedrooms. A dealer in antiques informs a contributor to a provincial newspaper "that builders of the modern houses constructed on the Early Victorian style of architecture, which are brightening the suburbs, are using the knockers especially for the bedroom doors." We are further informed that some of the knockers are silvered over, or the black iron is painted; but brass knockers, especially those of grotesque design, are in great demand, and command good prices. That the practice is not exactly new may be inferred from its having got down to the level of those suburb-brightening modern houses in the Early Victorian style; and one has become only too familiar with internal knockers from their persistence in chambers, flats, colleges, hotels, and other unhomelike buildings; which associations, however, do not strongly recommend them as an ideal adornment for the bedroom doors of the ideal home. But though their value as an adornment may be questioned, their sheer utility is undoubted. A discreet cough outside the chamber door has its well-marked limitations; and if, as not infrequently happens, one *must* knock at the door, it were well to provide some convenient means for the better avoidance of abrasion of knuckles or of paint.

THE EIGHTEENTH CENTURY ARCHITECTURE OF BATH.

By MOWBRAY A. GREEN, F.R.I.B.A

[*The most complete and convincing history of the Architecture of Bath is that written by Mr. Mowbray Green, published some years ago. His lecture to the Architectural Association, of which the following is the second and concluding part, will be found full of interesting facts and information.*]

Many of the ceilings at this time were panelled in plaster, but the decorative low relief enrichments of foliage and other conventionalised natural forms had not yet come into general use. The charm of the house is the staircase, and the finest one in Bath is to be found in the house on the west side of this square. The handrails, newels, balusters, and dado are all of Spanish mahogany; the newels are worked as fluted Corinthian columns, and the baluster caps are partially enriched. There are, as usual, three balusters to each tread, and the stairs themselves are formed of pieces of oak dowelled together so as to form solid steps; these are moulded underneath and enriched on their outer ends, and there is a double strip of mahogany inlaid on the treads. The quarter-space landings are also inlaid. At the bottom of the stairs is a lazy-tongs gate of mahogany, to be used if necessary to prevent dogs from going upstairs.

The west side of the square was originally completed with three detached piles of buildings, the centre one being set back a considerable distance with a large forecourt in front.

The last house of Gay Street, which faces diagonally across Queen's Square, forms part of the Queen's Square scheme of building, and was in later years the residence of the younger Wood. The circular bay window has very fine detail at the first floor, where the coupled Ionic columns in the Venetian window are divided by blocks, and the arch in the centre is similarly treated. The unique plan of the interior shows the principal rooms formed of a rectangle with an apse at each end, and with this the rest of the house has to conform. On the ground floor the angles of the apses are marked by Ionic pilasters, and on the first floor by three-quarter Corinthian columns. The interior is panelled in wood, and the carving is very freely done. The embossed brass finger-plates are of the same date as the house.

The staircase is of oak and Spanish mahogany, and the quarter spaces are inlaid.

Wood's Work Around Bath.

Eagle House, Batheaston, though reputed to have been the work of the elder Wood, was certainly not built by him, and it has been altered at least twice since its erection. In a recess upon the side facing the road the date, 1729, is cut upon a shield under the eagle, and it was about this time that Wood is said to have gone there. Perhaps he added the excellent porch, but even here the moulding round the door is quite unlike his usual work, though a common one in the neighbourhood. At any rate, the columns and entablature have been applied to the wall, and do not form part of its original construction. The younger Wood died here in 1781.

One of Wood's best works in the neighbourhood of Bath is Belcombe Brook, Bradford-on-Avon. It was merely an addition made in 1734 to the older clothworks of Francis Yerbury, and was intended as a residence for the owner. At this time there was a very flourishing cloth trade in Bradford-on-Avon. The buildings on the right are a dovecote and stabling, and the forecourt which lies between them and the house is paved with local Bradford stone set on edge, the centre being in circular courses. Upon the dial of the clock in the gable end of the stables is the date, 1770, and the initials J. Y. (one of the Yerburys). The house contains a hall, a drawing-room 20ft. square, and an octangular study with a coved ceiling and fine enrichments in plasterwork. The grounds of this house were laid out without formality, but a stone balustrade runs diagonally from the two angles of the house to the lawn. The little domed building of stone was erected by a working mason, whom Wood praises for his ability. Close to the river bank is an octagonal structure about the same size, which was used by the owner for mixing his dyes in.

In 1735 Wood made a survey of the city, which was published by J. Leake in the following year. This map shows the connection of the new buildings on the north with the city by way of Trim Bridge and John Street, leading into Wood Street and Queen Square, the latter being also connected with the main London road by means of Quiet Street, which thus joins up Wood Street and Queen Street. Thus far Wood's scheme was intended to be not only complete in itself, but to have proper and definite connections with the older work.

Beyond the West gate another scheme of building was in progress planned by John Strahan, who was the builder of Redland Court in 1730 and Redland Chapel in 1740-43, both in Bristol. It is to be regretted that perhaps through jealousy Strahan comes in for some disparagement from Wood. Strahan's work is chiefly found in Kingsmead Square, Avon Street, Kingsmead Street, and Beaufort Buildings, the best fronts being those on the south side of Kingsmead Square. All this work was going on from 1727-36. Rosewell, or Londonderry House, built for T. Rosewell, whose rebus, a rose and a well, is under the circular pediment with the date 1736, is reputed to be by Strahan, but it is not at all in his manner. Internally it has a wide, handsome staircase, and the rooms were mostly panelled. Not the least interesting of the houses in this neighbourhood is Keene's "Bath Journal" Office, where a newspaper was established in 1742 which flourishes at the present day. Both inside and out this house has suffered scarcely any alteration since the day it was built.

In Avon Street and Beaufort Buildings Strahan adopted a more definitely Classic manner with a Doric entablature, though the houses are quite small two-storey buildings.

Wood's chief work was Prior Park. Ralph Allen, whose country seat this was to be, desired to advertise his stone, and nobly he did it. The scheme, as first designed, placed the house in the centre with a pavilion and groups of offices at intervals on either side, all united by a colonnade. The outbuildings were to have been set at a wide angle with the mansion itself, but in the execution they formed two curved wings. The pavilion on the west gave way in 1844 to a Roman Catholic Chapel (by J. Scoles), and the best part of the stables now remaining is that which is vaulted in stone with small saucer domes. The stables were very large and sumptuous and had a frontage of 170ft., with stabling for twenty-four horses.

The south front of the mansion, which faces up the hill towards Combe Down, is much more simply treated than the other side, which is the principal front. But the work was conceived on a fine scale suitable to the surroundings, and the house measured 147ft. long by 55ft. wide. It was built in 1737. The long façade is relieved by an attached portico of six Ionic columns, and all the openings, ranging to fifteen in number, are kept quite plain.

The north front looking towards the City has dressings round the window openings and a projecting Corinthian portico. The portico has six columns on the front with one full column and one three-quarter column on the return. These are 3ft in diameter and 32ft. high, and the stone is in wonderful preservation, with a beautiful colouring from the growth of lichens upon it. Wood had intended to have flights of steps on each side, but they seem never to have been carried out. The basement of the house is all vaulted and paved in stone.

Photo: E. Dockree.

This is an excellent example of what could be done in the last decade of the eighteenth century. It has the characteristic treatment of Baldwin's work, and was, no doubt, designed by him.

A PORCH IN SUNDERLAND STREET, NEAR PULTENEY STREET, BATH.

("*The Eighteenth Century Architecture of Bath.*")

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

The sweeping flights of steps which lead down to the lower ground were the work of Henry E. Goodridge, M.R.I.B.A., for Bishop Baines, and were executed about 1830-36.

I do not think there is much interest in the interior as it at present exists, because there were many alterations after the fire of 1836, but I should mention the plans from Wood's original drawings, which may be compared with those of the house at the present time. The draughtsmanship is very fine, and it seems incredible to us how such drawings could be made with the naked eye. They are finished with a simple monochrone wash, and the ceilings and vaulting are dotted in with fine lines. The balustrades between the columns in the portico were omitted for access to the garden steps. The large hall did not run up through the floor as at present, and at the first storey there was a long gallery leading from Allen's business room to the private pew in the gallery of the chapel.

The sections are also from Wood's original drawings. All the walls were originally finished in stone, including the ornamental parts, though some of these latter were afterwards cut off and the walls of the rooms lined with wood.

At the foot of the slope below the mansion lies the Palladian bridge; it is almost a copy of the one built by Robert Morris at Wilton House in 1736. The architect is not known, since at the time it was built (in 1756) Wood was no longer in Allen's employ. The balusters are of a type scarcely known in Bath. Allen died in 1764, aged seventy-one years, and was buried in Claverton Churchyard.

Up to the year 1714 there was a law entitling the poor of England to travel to Bath and use the baths there. This law then ceased, but as the poor continued to come a scheme was started to find accommodation for them. In 1723 a subscription list was opened, and amongst those who worked hard for the proposed scheme was Richard Nash. Wood was employed to draft plans, and at first a site in the Ambry was proposed for a building to hold sixty beds. This all fell through, however, and it was not till 1737 that definite drawings were made by Wood for a site at the north-east corner of Parsonage Lane. The front extended 99ft. along the borough walls. In the old days, before Union Street was made, the east side faced the stableyard of the Bear Inn, and this was the only thoroughfare between the borough walls and Westgate Street, and was ordinarily used by visitors to and from Queen Square and the baths. The hospital was built to take 108 beds, exclusive of those for the nurses. The building was opened in 1742, and in the following year it was resolved that the inhabitants of Bath should be excluded from admission, but this was rescinded in 1835. Nearly the whole of the cost of management from the commencement to the completion was defrayed gratuitously. Subscriptions amounted to over £8,000, in addition to there being considerable gifts in kind. Ralph Allen gave all the wrought freestone, paving stones, wall stones, and lime, in addition to large sums of money, and Wood gave his plans and supervision free. In 1795 John Palmer added two wards over the north front.

When the thoroughfare on the south side of Queen Square, which had been planned by Wood as 93ft. wide, was reduced to its present width, and the idea of making it into a Grand Parade was abandoned, Wood found a site just outside the City boundary on the south-east that would answer his purpose. He therefore, in 1740, commenced building. Near here on the east of Terrace Walk were Harrison's Rooms, and on the west Lindsay's Assembly Rooms. The Grand Parade is now the North Parade, and the Royal Forum became the South Parade. This thoroughfare is now 70ft. wide. The land originally lay at a low level and was the site of the Abbey Orchard, and so, leaving the triangular piece of ground between Harrison's walks and the river at the old level, he raised the houses to approximately the same height as those on the Terrace Walk, and planned out the piece of waste ground into public gardens called St. James's Triangle, and approached from the Parade by a stone staircase. The retaining wall of the Grand Parade was finished at the top with a stone balustrade, as shown in the aquatint by Malton and Gandon in 1779. The length of the walk was over 500ft. by 42ft. broad. The blocks of houses, as usual with Wood, were placed north and south, and on the extreme east the basement of the houses had an exit on to a lower walk and the riverside. The first stone of this building scheme

ROYAL CRESCENT, BATH. *Photochrom.*

was laid on March 10, 1740, and the whole of the works were completed in about eight years' time. The central block of twenty-seven houses, which formed a square of 210ft. each way, were originally to have been treated with columns and pilasters, but this was afterwards abandoned. An engraving from an old fan shows the treatment of the South Parade as it was completed, and in this may also be seen the balustrading round the areas of the houses. This part of Bath soon became fashionable, and amongst others Edmund Burke, Oliver Goldsmith, William Wilberforce, and Miss Linley resided or stayed there. There are two houses on the Terrace Walk which still retain much of their old character, both of which seem to have been designed for shops or the like purpose. No. 1, Terrace Walk, has three large openings separated by Ionic columns with ornamental spandril pieces, all executed in stone. Almost adjoining this is an Ionic doorway with the original glazing, and this is believed to have been one of the coffee-houses where the upper classes were wont to assemble to read the papers and to discuss the news.

Close to these buildings is a fine court of houses known as North Parade Buildings. Although they adjoin the North Parade they are probably not Wood's work. Nearly all the doorways have Corinthian porticoes, and the houses are well finished internally. The top house on the right was once the residence of John Palmer, Controller of the General Post Office and the introducer of the mailcoach system. But these days are past, and the buildings are now for the most part let out as tenement houses. The last house on the west side has a wide hall vaulted in plaster, a very ample staircase, and many good rooms.

At Bathford in 1748 a house was built by Wood for a Mr. Southwell Pigott, and was called Titan Barrow Loggia. The north front, which stands on the top of a considerable slope, has been treated without a sufficient basement storey, so that it loses considerably in dignity. An interesting comparison may be made between this and the house at Belcombe Brook, the façade of which is treated with flat Ionic pilasters, and which is quite satisfactory in its proportions. There can be no doubt that when columns or three-quarter columns are used, especially if it be with the Corinthian order, they should stand on a storey or sub-base of some height. The front of Titan Barrow was very ornate, and the mouldings were enriched. Unfortunately, the ground-floor windows have been cut down. The elevation and plan are copied from Wood's drawings, and exhibit, together with the contract, the conditions under which the employer, architect, and contractor worked in those days. As usual, there is no scale on the elevation or on the plan, but the dimensions are figured and the specification is written within the walls of each room, the contract containing what else was necessary as to supply of plant, etc., to insure the carrying out of the work. The ground-floor plan has the signature of the employer, Southwell Pigott, together with those of John Ford, the mason, George Hatherell, the carpenter, and Robert Parsons, the carver, the contract alone mentioning the name of John Wood as the architect. The contract states that Ford contracted to dig the foundations, and to do all the mason's, plumber's, tiler's, plasterer's, and painter's work for £396 12s. 2d., with an additional £16 for making two cellars; that Hatherell estimated all the carpenter's, joiner's, glazier's, smith's, and ironmonger's work at £283 18s. 6d.; and Parsons, the carving of the Corinthian capitals, the pineapple ornaments, with the heads and festoons in the west front, the enriching of the mouldings in the same front, in the architrave chimneys, in the Corinthian entablature round the drawing-room and staircase, and in the cornice round the hall, the cutting the trusses for the front-door case, and all the other carver's work necessary, at £55 19s. 4d.; making a total of £752 10s., with a penalty of £100 apiece for each of the three contractors if the work were not finished to the time. A curious method is shown in the payments, where the odd sums are included in the first payment, leaving clear balances to be paid at the end, showing that extras were not considered. The work had to be completed in just over nine months. The cost of such a building to-day would be not less than £2,500.

(" *The Eighteenth Century Architecture of Bath.*")

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

The plan of Bath, dated 1750-51, shows the condition of the city after Wood and others had been at work upon it, the greater part of the newer schemes having been executed within twenty-five years.

In 1742 Wood had been engaged by the Corporation to prepare plans for a new King Edward Grammar School, which was then being held in a disused school of St. Mary, *intra muros*, in High Street. In the first edition of his book he gives an account of the building, and the money to be spent, but this description is not to be found in the succeeding editions, and the present school is not his work. He says that the site which was first chosen was in the Town Acre. It would have covered about two-thirds of the present site of Edgar Buildings. The present school is on the site of the Black Swan in Broad Street, and was begun ten years later, in 1752. It too has undergone some changes since it was first built.

Gay Street and the Circus were evidently part of the great scheme of the elder Wood, and the whole of the laying-out, from Queen Square to the Crescent, expresses so much the thought of one mind that it seems not unlikely that his son carried it out in conformity with the lines laid down by his father. Gay Street itself rises quickly, the Circus is level, with a slight rise in Brock Street, especially just at the end on entering the Crescent, and the Crescent itself is also level. Gay Street was in building between 1750 and 1760, and here the houses have much smaller frontages. In 1753 Wood had engaged to build a house in the Circus, now No. 7, for the Right Hon. William Pitt, and in the following year, on February 18, 1754, Wood himself laid the first stone of the new buildings, then known as the King's Circus. Just over three months afterwards, however, he died, on May 23, 1754. He had been a busy man, commercially successful, and not forgetful of his interests, but leaving behind such a record of buildings as few could boast of.

Twenty-seven years before he had found Bath emerging from the squalor of a mediæval city, and far from being what it should have been as an important inland watering-place, and during this period he had seen erected some of the most palatial groups of dwelling-houses which any city can boast of. The planning of this part of Bath marks the genius of a man who laid out his schemes with a sense of nobleness and fine effect, adjusting every part to the whole, and the whole to the surroundings—surroundings which had to be considered both in relation to their present aspect and their future development. Masterly and bold in design, he grouped up the façades of his buildings in such a manner as to produce harmony and a feeling of proportion, and he added to the interior that ingenuity of planning and decorative design which has made them so full of interest to ourselves. Wood was a man who took a very capable insight into the turn events might be likely to take, and he tried to persuade others to see with him, but did not succeed far in this respect. Thwarted time after time, he pushed ahead, and insisted on the people of his day accepting what they certainly did not always understand. He was, as was customary, frequently his own contractor, but though the building was speculative it was, at this particular time, at any rate, not shoddy. The method of procedure was this. The builder, who leased the plot on a perpetual fee farm, or ground rent, secured a tenant for the house which he proposed to build, and as the tenants were wealthy or responsible people, and the lease was for a long term of years, it was not difficult for the builder to get his banker to finance him, and in this way most of the houses were built. For much of the good interior detail we are indebted not only to the talent of Wood but to those builders who worked under him, and who seemed to know no detail that was not correct. The Circus was divided into three instead of the more usual four groups, a point which does not seem to have been caused by the exigencies of the levels or other circumstances, as the ground beyond seems to have been nothing but fields. The particular value in this arrangement is evident to anyone who will compare the Circus in Bath with Oxford Circus in London, for from whatever point you enter it an unbroken line of buildings faces you and insures the continuity of the circular form which is lost in the case of the quadrants. The best-planned group of houses is that first built between Gay Street and Brock Street, where the adjustment to the radiating lines is well contrived, with a further diversity of planning to suit the tastes of the prospective tenants. Wood must have fully appreciated that the range of vision in the Circus would be small, and he has therefore with justice elaborated the work in it. The three orders, Doric, Ionic, and Corinthian, are all treated with coupled columns, and the circular lines are admirably sustained by the three unbroken cornices. The height of the façade is about 42ft., and the parapet was originally plain, but elliptical openings and some balusters have been added here and there. The diameter of the Circus from house to house is 318ft., or slightly larger than Queen Square. The buildings were completed in fifteen years.

At the end of Brock Street stands the stately Crescent, with its ample and beautiful surroundings of lawn and park. The work was begun in 1767, and finished in about eight years' time. It was carried out by the younger Wood. The Crescent is elliptical on plan, and is 538ft. across its major axis. The central and two end houses are emphasised by the coupling of the Ionic columns. A plain basement storey supports a large Ionic order 2ft. 6in. in diameter and 22ft. 6in. high, running through two storeys over, with an entablature 5ft. high, the total height from pavement to parapet being 47ft., or 5ft. higher than the Circus. Over this is an open balustrade, and originally the roof was covered with stone tiles, as were all the other houses in Bath. In the elevation I have shown the window openings with the original bars, and it is to be noticed that neither here nor in the Circus are there any mouldings round the openings. The face of the masonry between the columns is worked square, and not to the sweep of the curve, as might be supposed; the effect of the flat face is, however, scarcely noticeable, and an enormous saving of labour is effected. The same principle is applied to the Circus, where it cannot be detected at all.

In the interior the increased height of the rooms produces a much colder and less comfortable appearance, and the window-heads are generally 2ft. below the ceilings, which causes the upper part of the room to be dark. About twenty-seven years before this plasterwork had begun to take the place of wood panelling upon the walls, the panels being generally divided by a cable moulding, and the oak staircases were fast disappearing, giving place to those of iron and stone. The ornament of the internal finishings and decorations became most elaborate, though the cornices occasionally degenerated into meaningless compositions. The ceilings are the most beautiful features, and vary from strictly geometrical patterns to a quite naturalesque treatment.

The fireplaces are often entirely of marble, statuary and Sienna being most frequently used.

About the year 1762 Milsom Street was begun, and soon became the principal shopping centre of the city, and noted for many miles round. The ground floor, especially on the west side, had at first segmental bow windows. The central windows of the first floor have pedimented or other ornamental heads. The most important group of houses, and probably that first built, is on the east side, and was called Somersetshire Buildings. In this group of five houses the centre and two end ones are projected forward from the main line of street sufficiently to take a three-quarter column of the Corinthian order, and the middle house has, in addition, a segmental projection. In this house there is a magnificent ceiling, one of the finest in Bath.

Behind the houses just below this group stood the Octagon Chapel, built by T. Lightholder, or Lightoler, as he is styled on the engraved plans, which are to be seen in the British Museum. It was opened in 1767. The interior is planned as an octagon of about 53ft. in diameter, with four

FROM THE DRAWING BY HAROLD FALKNER.

semicircular recesses, the whole being contained within a square. The gallery was supported on eight stone Ionic columns, some 10ft. high, with finely carved caps, and the cove above the octagon springs at about 29ft. from the floor, with a smaller cove, a drum and a semicircular roof on the top, but the roof was not executed exactly as shown in the original section. The plaster decoration is in the Adams manner. In Old Bond Street, near here, there is another good ceiling.

The younger Wood's chief work was the Assembly Rooms, built in a dignified and simple style, and with the chimneys more carefully designed than in the earlier buildings of the century. They were begun on May 4, 1769, and finished in October, 1771, being built with a capital of seventy shares of the value of £300 apiece on the Tontine principle, the building thus costing over £20,000, which was a large sum for that day. The plan is an admirable one, with an outer portico, an inner hall flanked by retiring-rooms on either side, leading into an octagonal vestibule beyond, from which the large ball-room is entered on one side, the tea-room on the other, and the octagon-room on the third, all these rooms being *en suite*.

The ballroom, 104ft. long by 41ft. wide and 42ft. high, is divided into three parts. The substructure and the order over are hollow behind to allow of the raising and lowering of vertical sliding shutters for darkening the room in the daytime. The great cove is 11ft. 6in. high, and from each of the five flat panels in the ceiling are hung magnificent cut-glass chandeliers. The three divisions of this room are too nearly alike to be satisfactory, and the order is dwarfed by the immense cove at the top.

The tea, or concert, room is 66ft. long, and of the same width and height as the ballroom, with an orchestral gallery at one end, running the whole width of the room, where there is a fine ironwork grille of the period.

Alfred Street was built by Wood about the year 1768, and there is an interesting doorway here known as King Alfred's Doorway, from the bust of the monarch over, who is supposed to have surrounded the city of Bath with walls and gates. The ironwork shows the stand for the oil-lamp at the top, and the extinguishers on either side, in which the link boys might "do out" their torches. The delicate treatment of the stone carving round the doorway shows quite a new departure from what we have seen up to the present.

Pulteney Bridge seems to have been the only work of the famous Robert Adam in Bath. It was erected about 1770 for the purpose of giving access from the city to the Bathwick Estate, which belonged to William Pulteney, and for the laying out of which Robert Adam got out many designs which are now in the Soane Museum. The present Pulteney Street is upon the very line laid down by him. It is probable that political reasons influenced Pulteney in favour of local talent, for he was at this time standing as a member for Bath. The drawings [shown] are from Robert Adam's collection in the Soane Museum. Three segmental arches span the river, and are turned in single rings of stone. The upper part is occupied by a range of shops. The porticoes at the ends, long since taken down, must have formed a fine approach to the bridge. Fortunately, one of Malton's drawings remains to show us what it was like. There have been many alterations, both on the river and street side of this bridge.

About 1765 the Corporation had determined to build a new town hall and markets in High Street in place of Inigo Jones's hall, which stood in the middle of the Market Place, and amongst those who were asked to prepare plans were Lightoler, John Wood, Jones, the City Surveyor, and Thomas Attwood. That Attwood had considerable capacity is shown by a building which he erected in 1772 as a prison in Grove Street, and in which he follows an earlier manner. The building must be judged of as a three-storey building only, for it was intended that a road should lead up to the central opening in the rusticated portion, which was designed not as a window opening but as the main entrance to the building.

Attwood was by trade a plumber, and amongst his other works he carried out the Paragon, Oxford Row, and the City Waterworks. There was considerable discussion about the plans for the Guildhall, but on February 11, 1768, the foundation-stone of the new building, which had been designed by him, was laid by William Chapman, Mayor. The cost was to be £6,500. After this work went on slowly for six or seven years, because some of the tenants on the site were unwilling to give up their leases. In addition to this a question was raised as to the advisability of proceeding with the plans in hand. All this was, however, ended by the unhappy death of Attwood, who was crushed by falling timbers while some of the old houses on the site were being pulled down. Shortly afterwards Thomas Baldwin, who appears to have been a clerk in Attwood's office, offered a new plan. This was accepted, and the building was completed about 1778. Baldwin's work is strongly influenced by that of Robert Adam, but its detail is debased, and it lacks the strength and vigour of that of the two Woods. Still, as a whole it is a distinctly fine building, on almost entirely new lines, and with excellent proportions. The basement is rusticated, with the central portion vermiculated as well, and the order over this part is a blending of the Ionic and Composite styles. A good feature is the recessing of the two outer windows. The figure of Justice at the top is of lead. The width of the façade is 85ft.

Although the mouldings are attenuated and poor, they lend themselves satisfactorily to the internal treatment. Here there is much fine plasterwork, well preserved, and there is a very characteristic iron baluster in the staircase, which is of oak.

The banqueting-hall is treated with a low sub-plinth, 3ft. 5in. high, and the engaged columns, which are of the Corinthian order and exhibit a Greek feeling in the capitals, are set on pedestals which stand forward from the rest of the wall. There are quarter-columns in the four angles, and all the columns are widely spaced, with arched recesses and large plaster discs set alternately in the spaces over. Above is a cove which is ornamented in parts by a group of sunk lines, and the ornamentation in the large circular panels on the ceiling is very elaborate. The proportions of the wall treatment are exceptionally good.

In 1775 Wood rebuilt the Hot Bath at the end of Bath Street, and two years later published a small monograph on it. In 1779 he built Hardenhuish Church, near Chippenham. It is square on plan with an apse at the east end and a steeple at the west end. Neither the elder nor the younger Wood was, however, much employed in ecclesiastical work.

Reverting to the buildings in Bathwick, Argyle Street was in building in 1789, and here there still remain two good shop fronts executed in woodwork, and in one in a fine wooden fireplace, together with an original basket grate. Of the same character is one in Nelson Place East.

Laura Place was begun in 1788, and Pulteney Street about the same time. The former was by Baldwin, and on the latter both he and Eveleigh were engaged. The street is imposing in general effect, but poor in detail. It is 100ft. wide from house to house, and 1,100ft. long, and is terminated at the end by the Sydney Hotel, which was built by Harcourt Masters in 1796, when the Sydney Gardens were also laid out by him.

Among other works by Eveleigh were Grosvenor Hotel and Bailbrook House. The former was built in 1790 and had immense gardens attached. It cost upwards of £10,000, but lay unfinished for many years.

The history of the Pump Room is too long to be given in detail. In 1785 Baldwin erected the northern colonnade at a cost of 130 guineas, and in May, 1788, the foundation-stone of the new private, or King's, baths was laid by the Mayor, and the building begun by Baldwin. The original drawing, which shows the façade facing Stall Street, is done in line, with the masonry tinted in light stone colour and the shadows washed in with blue black. The scale is an arbitrary one, and the drawing is undated, but the name of T. Baldwin appears on the back.

It is not known who designed the west end of the Pump Room. William Reveley, a pupil of Sir William Chambers, gave drawings to the Corporation between 1791 and 1793, and the sum of £27 9s. 6d. was paid to him for these, but he probably did nothing further. It is more than likely that the general scheme is Baldwin's, but that after his dispute with the Corporation John Palmer finished it; and so says a guide of 1823. Palmer almost certainly added the portico on the north side.

The interior of the Pump Room has a Corinthian order with segmental recesses at each end and elliptical lights at the top of the room between the columns. This room would have shown a better proportion had the columns been less heavy and set upon a sub-plinth.

Under the great scheme for rebuilding this portion of the city by the Act of 1789, Bath Street, Cheap Street, and Union Street were all built by Baldwin. Of these Bath Street is the most interesting piece of work, with its Ionic colonnades forming a covered walk from one end of the street to the other.

The Cross Bath at the west end is also by him.

Among some of the latest buildings of the century were Camden Crescent, built on an elevated piece of ground overlooking the London Road, and a great deal of work on the northern slopes above the Royal Crescent, where John Palmer built St. James's Square, Lansdown Crescent, and All Saints' Chapel. He also designed the façade of Kensington Chapel on the London Road. Some years earlier he had, together with his partner Jelly, rebuilt St. James's Church.

The styles of the eighteenth century may be divided into three groups—that of the first twenty-five years, when the houses had gabled roofs and façades, with large sash windows, surrounded by bolection mouldings, and when the interiors were panelled with wood and the rooms small and

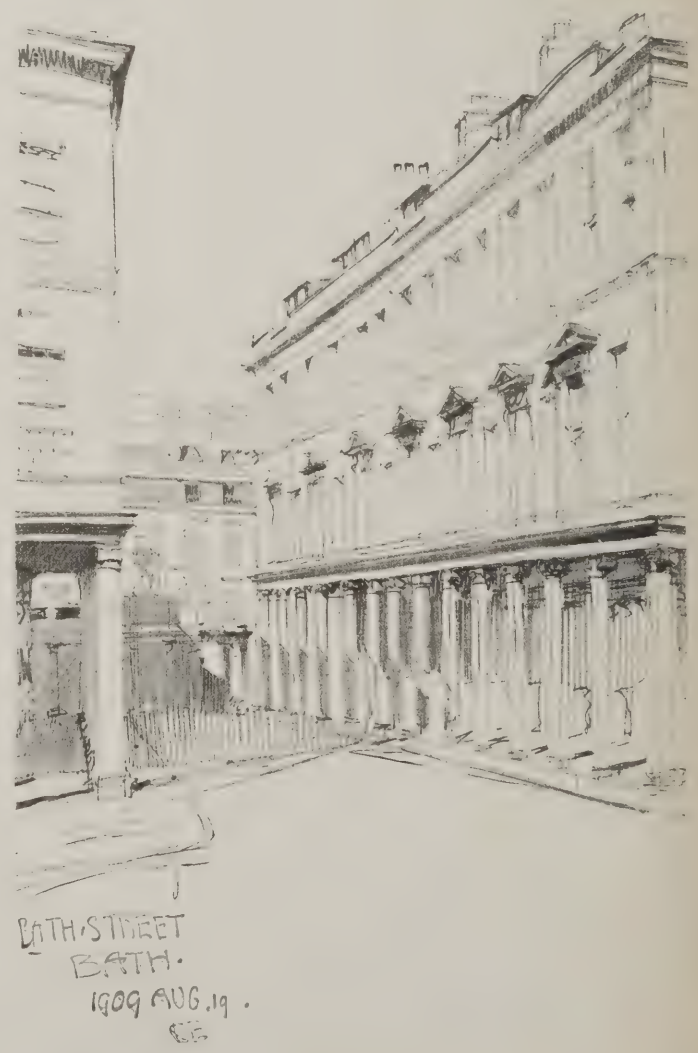
FROM THE DRAWING BY HAROLD FALKNER.

comfortable; the next fifty years, when the work was modelled on the Classic Palladian manner, with a rusticated basement, a two-storeyed order, a crowning cornice and parapet, and a mansard or curb roof over, while the interior became spacious and dignified, and plasterwork was brought into general use; and the last twenty-five years, when the free manner of Robert Adam came into vogue, and the strong methods of the earlier times gave way to detailed and abundant decoration.

DISCUSSION.

Mr. Mervyn E. Macartney proposed a vote of thanks, and expressed his indebtedness to Mr. Green for his lecture, which would have been rendered even more interesting, had a contour map of Bath been shown giving the original lay-out of the city, and showing how Wood had taken advantage of the disposition of the town. Wood had obviously planned the work according to the contour of the ground. It would be interesting to know, continued Mr. Macartney, whether Wood had worked out the scheme alone, or by the aid of, and in conjunction with the Corporation. (Mr. Green: "The work was quite speculative, I think.") Continuing, Mr. Macartney asked whether the other portion by the Abbey was also a private scheme, and Mr. Green replied in the affirmative. Mr. Macartney then asked, Did Mr. Green know anything about the old buildings lying behind the Cross Bath? He thought they were older than the examples that had been shown upon the screen.

Mr. Green replied that he would have liked to show the old houses that lay behind St. John's Hospital. One house, in particular, which was located in Broad Street, just beyond St. John's Hospital to the west, was of unusual interest, bearing the date 1709, and appearing exactly as originally built. He did not know the name of the builder. It was difficult to say how the houses situated on the rapidly rising ground in Gay Street should be treated. Wood's solution was by no means happy. Wood had intended to rebuild the whole city, but the Corporation had prevented the realisation of his plans. He had prepared a scheme for laying out the ground to the south-east of the city, but to no effect. He had met with opposition even in the planning of Queen's Square, but being a determined man he had carried through his scheme, and, in addition, had made some caustic remarks about his critics in his book.



Mr. C. H. B. Quennell seconded the vote of thanks, and observed that no mention had been made of the delightful work of Brydon contained in Bath. He had been with Brydon when the additions to the Pump Room were being made, and the new work harmonised very well with that of Wood. It was well to bear in mind the fact that Bath contained the first houses to be joined together in blocks, and was also notable by its introduction of the method of planning in terraces and crescents. Bath, to him, always recalled the "School for Scandal" set of people. The houses were as unsavoury to him as they possibly could be, and he wondered how people could live in them. Domestics were not considered at all. As a model for the architectural student, Bath was to be seriously and studiously avoided. Wood designed houses for an unquestionably immoral people; and he hoped A.A. students would not follow the example set by Wood, but would design in reinforced concrete.

Mr. H. A. Hall agreed with Mr. Quennell. The outward appearance of the streets was extraordinarily dull, and seemed quite incomplete without Sedan chairs and brilliant costumes. In Bath he felt that life must be very gloomy. He had often been down Grand Parade, and had never seen a single person, unless he had arranged to meet a man there. One felt that something had gone out of life at Bath. As a retrospect it was all very charming; but as a reality it was impossible of appreciation.

The President, Mr. Henry Tanner, said there seemed to be a dull monotony about the street architecture of Bath. He wondered why the Circus was divided into three parts. Was in that Wood found the "jumpy" effect of the house frontages by no means satisfactory when he arrived at the top of Gay Street, and, in order to avoid the continued reproduction of the same features, turned off at a sharp angle? Bath was almost Continental in appearance, and recalled some of the older parts of Paris.

Mr. Mowbray A. Green, in reply, observed that Wood was obliged to design in the characteristic style by the stately manners of the period. They were the days for entertainment, when large rooms were required—not for the purpose of sleeping, for men, for the most part, slept under the table—but for the accommodation of guests. The ingenuity of the man was clearly evidenced by his ability to scheme interiors in accord with the demands of the period. The type of house was necessitated by the manner of the life. He failed to see the dull monotony to which previous speakers had referred. The upper side of Queen's Square was a wonderful composition, and expressed on the outside the internal arrangements. What had given a feeling of dreariness to the rooms was the exigencies of Classic architecture, the window-heads coming down about two feet under the ceiling of the room, and causing a dark patch. He thought they should regard Wood as a man who represented in the houses the manners of the period.

Before the reading of Mr. Green's paper, Mr. F. Dare Clapham proposed a vote of thanks to Mr. Henry Tanner and the retiring members of the Council. Mr. Tanner briefly replied.

FROM THE DRAWING BY HAROLD FALKNER.

TOWN PLANNING NOTES.

The Bradford Garden City Principle.

In the Bradford Corporation Omnibus Bill now before the Select Committee of the House of Commons, the clauses dealing with the laying out of streets for buildings on the garden city principle came in for some criticism. Mr. Jeeves (with Mr. Honoratus Lloyd, K.C.), who appeared for the promoters, explained that at present they in Bradford were required to have streets 36ft. wide, and the Corporation wanted to be able to allow streets in certain cases to be laid out 6ft. in width, so as to make the building of houses in this particular form as cheap as possible. One of the conditions was that there should be a considerable amount of space to each building abutting on the 6-ft. road.

Evidence in support of the proposal was given by Mr. Dawson, the City Surveyor. It would not be possible, he said, to allow estates to be laid out on the garden city principle, unless these additional powers were granted. Producing plans, Mr. Dawson proceeded to explain in detail the actual proposals of the Corporation. The first scheme, said Mr. Dawson, was to lay out terrace houses not more than 72ft. in length, on the garden city plan, with a narrow front street six feet wide, and a back road or street eight yards wide. The object of this was to enable builders to utilise land for gardens that ordinarily would be required for the formation of the street, and it would also save the cost of the formation and paving of a wider front street. Provision was to be made for the laying out of two streets fourteen yards wide at the ends of the short front street. The second proposal related to the intended construction of grouped cottages or houses erected in blocks of four. Houses fronting the street would be set back five yards from the street line, and an open space would be provided at the side of the houses, and the space behind the rear houses would be used as gardens, with the necessary footpaths leading to each house from the front street.

After the Committee had deliberated for some time in private, the Chairman referred to the report by the Local Government Board and criticism by Mr. Boyce of the Local Government Board, and said they thought that criticism held good. These were practically groups of four back-to-back houses, and consequently the scheme infringed the Housing and Town Planning Act.

Mr. Jeeves: But you have two doors, back and front. Certainly the rear entrance is at one side, but with an ordinary back-to-back house that could not happen.

The Chairman: The whole point is that there is no through ventilation.

Mr. Jeeves: I can scarcely agree in that view.

The Chairman: Well, it is a very circular ventilation.

Mr. Jeeves: But you are able to get a through current.

The Chairman: The Committee have considered the matter very carefully. We are very sorry to upset these plans, but we feel we cannot let the clauses go through in their present form.

The Rosyth Garden City.

In connection with their town-planning scheme for the district at Rosyth the Local Government Board have, it is understood, communicated with the Glasgow syndicate who recently acquired for building purposes a piece of land at the hamlet of Pattiesmuir from Provost Husband, Dunfermline, with a view to ascertaining how they intend to lay out the ground.

A New Garden City in Essex.

The building of a new station on the G.E.R. between Romford and Harold Wood has been promptly followed by the announcement that the Gidea Hall Estate, Romford, will shortly become the site of a new garden city. Gidea Hall stands a little way back from the high road between London and Brentwood, near Romford. It was originally built by Sir Thos. Cooke, in 1467, and the rear portion was added 100 years later. In the eighteenth century the old house was demolished, and the present structure was built by Sir John Eyles. It is a fine mansion, but probably derives its principal picturesqueness from the splendid park land by which it is surrounded. These six hundred acres or so are to be utilised as the site for a garden city of some 3,600 houses of attractive style, each standing separate and detached. The mansion, which is not so old as mansions go, will be left standing, and may in time, following the example proposed in connection with Valentines at Ilford, become a club, museum, and social centre for the new community. The prospect is an attractive one for progress of the best kind for the Romford district.

By-law Reform.

At the Worcester Provincial sessional meeting of the Royal Sanitary Institute, Mr. William Ransom, lecturing on "Building By-laws Reform," said that the development of building estates was, as a rule, hampered by the cost of new streets, and the landowner naturally endeavoured to recoup himself by splitting his land into as many marketable lots as possible. Mr. J. S. Nettlefold, in his book on "Practical Housing," explained how it was possible to comply with the by-laws and yet build fifty-six houses to the acre. Streets were, of course, necessary for the community at large, as well as for the estate owners, and where a town-planning scheme had been adopted and the landowners worked in conformity thereto, it would seem reasonable that the community should share in the cost of making the necessary new streets. This would then justify more stringent regulations limiting the number of houses to an acre. The building by-laws could be so regulated as to safeguard the community against jerry-building, while allowing dwellings to be erected more economically upon garden city lines.

The Port Sunlight Competition.

Mr. W. H. Lever, M.P., has paid £100 to Mr. E. Prestwich, a third-year student of the School of Architecture, for the right to use his scheme for laying out the central portion of the village round the church at Port Sunlight. Mr. Prestwich's design was placed first in the recent competition held in the school for the prizes Mr. Lever offered for this subject. Mr. Prestwich, therefore, in addition to his prize of £20, gets a further £100, and has the pleasure of seeing his work actually carried out. Mr. Prestwich is the son of Mr. J. C. Prestwich, architect, of Leigh, Lancashire.

Greater London Town Planning.

Representatives of local bodies in Greater London and distinguished architects and surveyors attended a conference held at Caxton Hall, Westminster, last Friday, to consider town planning in Greater London. In urging the need for co-operation between the local authorities concerned and the landowners, the chairman, Alderman Thompson, of Richmond, suggested the linking up of the great parks and open spaces by a system of park ways, like those of Vienna, and also the formation of a ring of open spaces round London to protect the outer areas from the expansion of bricks and mortar without intervening spaces. Professor S. D. Adshead, of Liverpool University Chair of Civic Design, said that the first things to be tackled were the "disease spots," which were being treated on wrong lines. Mr. Percy Harris, L.C.C., spoke in favour of co-operation with the authorities outside the county of London. In the county itself there was not much scope for town planning. Mr. H R. Aldridge, secretary of the conference, said that there were ninety local authorities within fifteen miles of Charing Cross which possessed powers under the Act. It was imperative that all should appoint committees and try to understand the Act and the regulations. It would take a town-planning committee six months to understand the powers. Resolutions were passed urging all the authorities affected to appoint committees, and suggesting a later conference to consider joint action in regard to features of town planning which affect the development and amenities of Greater London.

NOTES AND NEWS.

The New Government Buildings.

In the House of Commons Mr. Lewis Harcourt, in reply to Mr. Vincent Kennedy, stated that the actual cost to date of the new Government buildings for the Education Department and the Local Government Board in Whitehall is as follows:—Purchase of site £556,015, redemption of land tax £2,221, erection of buildings and works connected therewith £656,790—total £1,215,027. The above figures do not include any further sums which may be due to the contractors in respect of the balance due to the builders on their contract. No further expenditure is contemplated. A claim of £106,112 has been put forward by the contractors, and is now under consideration.

The Late John Quincey Adams Ward.

By the death of Mr. Ward, of New York, the United States loses one of her foremost sculptors. Born in 1830, he studied under H. K. Browne, and afterwards visited the Indian country, ultimately settling in New York. He was elected a member of the National Academy of Design in 1863, and was President of the National Sculpture Society from its incorporation in 1896. Among his principal works are "The Indian Hunter," "Shakespeare," and "The Pilgrim," all in Central Park, New York. He also executed the statue of Washington in Wall Street, that of Henry Ward Beecher in the City Hall, Brooklyn, and the crowning group of "Victory" on the Naval Arch for the Dewey reception in New York. He likewise produced statues of Generals Sheridan and Hancock.

The Reconstruction of the Erechtheion.

Within the last few years a partial reconstruction of the Erechtheion, on the Acropolis at Athens, has been in progress. An elaborate study of the stones strewn around the building, a sorting-out of them, and the replacement of them, one by one, in the walls of the fabric, has produced an astonishing result, as may be seen from the unique series of photographs reproduced in the May issue of "The Architectural Review." Mr. Lionel B. Budden, B.A., who contributes the valuable article on this subject, says that the investigations of Professor Dörpfeld, Dr. T. W. Heermance late Director of the American School at Athens), and Mr. G. P. Stevens (former Fellow in Architecture of the School) have rendered necessary a considerable readjustment of previous conceptions with regard to the original form and character of the Erechtheion.

The technical direction of the reconstruction has been in the hands of M. Balanos, the architect and engineer attached to the Ministry of Education. The north portico has been restored, the west wall built up, and the celebrated caryatid porch on the south front renovated. Photographs are given in the "Review" showing the condition of the several parts before and after the reconstruction. Among these it is to be noted that the original cornice and architrave blocks of the south porch have been restored, as well as fragments of the podium, while, of the caryatid figures, the one next the entrance is chiefly a restoration, in marble, made in 1846, when the portico was in danger of falling, and another is a terra-cotta copy intended to replace the one removed by Lord Elgin in 1804. Mr. Budden's article is a valuable contribution to an important subject, and the concluding portion of it, which is to be published in the June issue of the "Review," will be awaited with interest.

Other features of the May issue are some notes on the gates, gate-piers, bridges, and arcades of the Cambridge colleges, abundantly illustrated; a continuation of the "Historical Town Houses," the subject this month being No. 15, St. James's Square—one of James Stuart's houses, dating from the latter part of the eighteenth century; Old English and French furniture, fully illustrated; the "Exemplar"—devoted to a sixteenth-century chimneypiece and a fragment of ironwork probably taken from one of Wren's City churches; "Current Architecture," which includes some good illustrations of Mr. Alexander N. Paterson's National Bank of Scotland, St. Enoch Square, Glasgow; and, in the Town Planning and Housing Supplement, an authoritative article on the plan of Edinburgh, which shows what an excellent scheme was left to the city by the architect, James Craig, and how haphazard has been the development in latter days. "To those who would belittle the important position which the architect should take in the consideration of town-planning problems it may be sufficient answer that the only examples of planning in Britain regarding which we can feel proper pride or satisfaction are those which have been controlled under architectural initiative and advice."

Business Representation in the Lords.

Lord Wemyss's resolution that it would be for the public good that important trading and other representative societies should each name three members of the existing peerage in the current and each succeeding Parliament to speak and act on behalf of such societies on all questions in which they are interested, met with small sympathy when it came up before that House. Among the bodies approving were the Royal Institute of British Architects, Royal Academy of Arts, Society of Authors, Building Trades Federation of the United Kingdom, Society of Engineers, Junior Institute of Engineers, Gas Companies Protection Association, Imperial Merchant Service Guild, Land Agents' Society, London Chamber of Commerce, Machinery Users' Association, Manchester Oddfellows' Friendly Society, Royal College of Physicians, Railway Companies' Association, Royal Sanitary Association, Chamber of Shipping of the United Kingdom, the Shipping Federation, the Surveyors' Institute, Society of British Gas Industries, Society of British Sculptors, Employers' Parliamentary Council (representing thirty central associations connected with the chief industries of the United Kingdom).

In the course of the discussion, Viscount Morley ridiculed the suggestion on the ground that Lord Wemyss's list included only thirty out of probably two to three hundred bodies who could claim the right of nomination, and that the peers would not be independent, and would not speak their own minds. Lord Lansdowne, who followed, thought the idea an admirable one in principle, on the ground, defined by Lord Morley, that special interests should have special representation. He discerned very considerable difficulties, however, in giving legislative effect to the suggestion, and hoped the noble earl would be satisfied with the discussion that had ensued, and not ask them to commit themselves indefinitely to the proposal made. The matter then terminated.

The Effect of the Land Taxes.

The probable effect of the land taxes is the subject of an article in a recent issue of the "Pall Mall Gazette," in which the writer expresses the opinion that the ultimate effect will be heavy appreciation in rent. He argues that though the increment duty and the undeveloped land duty may be payable by the owner, it is inevitable that their burden will eventually be included in the price at which the land is sold. "What," he asks, "will be the effect of this? It will add an additional burden to the poor and lower-middle classes, for, as the price of land advances, ground rents will increase, and rack rents correspondingly be raised. A tenant formerly occupying an eight-roomed house will consequently find himself compelled to seek a six-roomed house, and dwellers in tenements who have been able to afford three rooms will have to content themselves with two. Unless the State commits itself to the institution of compulsory measures, either confiscating property entirely or confiscating it in part by forcing owners to sell at stated prices, the more land is taxed the more it will cost, the higher rents will become, and the more difficult will life be found for those classes which the Budget pretends to serve. . . . A high tax upon spirit would render that article the luxury of the few, and a high tax upon land would place the purchase of it beyond the

powers of the many; for, in the one case as in the other, the tax would go to swell the price. It is lamentable, but none the less a fact, that now the Budget is passed into law we are face to face with an increase in price of the one item in our cost of living that has remained low, and that is house-rent. The cost of food has of late years advanced by leaps and bounds, but rents have not followed the general tendency. Unless the Land Taxes have a far different effect from what we are justified in expecting, this will no longer be the case."

The Geffery Almshouses.

We learn that the statement recently published that a virtual agreement has been arrived at between the London County Council and the Ironmongers' Company for the sale to the Council of the latter's almshouses, and the site, is premature, and that up to the present no decision has been come to. The matter has for some time past been under the consideration of the Parks and Open Spaces Committee of the Council, but they have not yet presented a report on the subject to the full body. The question, however, has been again considered at length at a special meeting of the committee, at the close of which Mr. Walter Reynolds, the chairman, stated that matters were proceeding quite smoothly, and that the committee, acting in conjunction with the Shoreditch Borough Council, were making every effort to acquire the site as an open space for the use of the public. The almshouses were erected in 1716, under the will of Sir Robert Geffery, and consist of 14 houses and a chapel, the area of the site being about 1¾ acres, chiefly open space. The buildings have many of the characteristics of good 18th century architecture, and are decidedly worth preserving.

Obituary.

We regret to announce the death, at the age of 71, of Mr. T. H. Healey, senior partner in the firm of Messrs. T. H. and F. Healey, of Bradford, who have designed a large number of churches and chapels in Bradford and district. Among them may be mentioned All Saints', Horton Green; the Bardsley memorial extension and restoration of the Parish Church, and work in St. Columba's and St. Oswald's; St. John's, Great Horton; St. Luke's, Victor Road; St. Michael's, City Road; St. Barnabas's, Heaton; St. Bartholomew's, Bowling; and St. Augustine's, Otley Road. The Synagogue in Bowland Street was built from their plans, and they designed the Eccleshill Congregational Chapel, the new St. Peter's Church, Shipley; Thornton Church, St. Luke's, Harrogate; Tockwith Church, near York; Worsborough Church, near Barnsley; Otley Congregational Chapel, Matlock Bank Church, Haworth Church, Steeton Church, Milton Chapel, Huddersfield; St. Andrew's, Yeadon; and Harden Church.

The A.A. Dinner.

The annual dinner of the Architectural Association took place on Thursday evening last in the Balmoral Room of the Trocadero Restaurant, Mr. Henry Tanner, the President, in the chair.

Mr. John W. Simpson, in proposing the toast of the Architectural Association, said he was sheltered by the President's licence to say what he liked, and in view of this free speech he was glad it was not the custom in England to bring fire-arms to the dinner-table. We were all getting too "arty"—they would observe that he did not say "artistic." On the notepaper of the Association was their device; two athletes, clothed in what were known technically, he believed, as "shorts," doing a double trestle act. He assumed them to be the President and Mr. Allen Potter. Under this they found the irrevelant words about Designing in beauty and building in truth. Architects must have a double qualification—a twin purpose. An architect must be not only an artist, but also a man of affairs. He drew their attention to the tale—not, he believed, in the Arabian Nights—of the History of the two Butchers and the Naked Truth. Once upon a time there were two butchers. The first butcher, who was a common man, chose one Smith, a Licentiate, to build his shop. And that butcher sold tons and tons of meat, wherefore he said, "Smith is a great architect." The second butcher was a man of art, and he commissioned Percy to design him a shop. And Percy gave him a study, all in white, of the year 1750—with swags. The butcher had read in a book that Art should colour our daily life—and he despised his neighbours. When the bailiffs took possession he approached Percy, and remonstrated with him; but Percy said the design was Georgian—he did not refer to his friend, Mr. George, who sat beside him—and that the small panes gave such character to the meat. The moral—and this was the only part where the naked truth appeared—was that St. Paul was a good cathedral but a bad master. The truth was not to build palaces for their own edification; but to give their clients what they wanted so that they might keep a home and defy a budget. It was not to solve problems in the easiest manner, but to so study their difficulties that they could clothe their buildings with beauty. With the toast he associated the name of Mr. Henry Tanner, their President.

Mr. Tanner said he was sorry they had entrusted the toast to Mr. Simpson—he spoke too well. But he agreed that they were bound to give their clients what they wanted, and he thought they must take advantage of every modern system of construction. They had to be both artists and scientists. In their training they should be both, and in the A.A. schools, under their able Headmaster Mr. Maule, they aimed to teach our young idea to shoot in both directions at once. He had been accused of undue pessimism because in his presidential address he had drawn attention to one or two points that he thought demanded consideration. But their men had not been depressed or dismayed. They had taken up and remedied the very matters to which he had referred. One was finance. They had had a very prosperous time at the A.A., and they had been a little bit inclined to finance for good times instead of suiting themselves to the present bad times. This had received consideration, and in consequence he predicted that they would come out for the year on the right side. They had also dealt with the by-laws and constitution. Another point was the poor attendance last year at the ordinary meetings, and this year the attendance had been very good An innovation in regard to meetings next year would be the invitation of the Camera Club and Discussion Section to alternate ordinary meetings. The Athletic Section was going strong, and he had been asked to announce that the sports would take place at Bickley on June 11. He hoped they would soon possess a ground of their own. In conclusion, he thanked the Council for their support, especially Mr. Clapham, who had been more than a right-hand man to him, Mr. Keen, who was succeeding him as President, and Mr. Elkington, the Editor of the Journal.

Mr. Arthur Keen proposed "The Royal Institute of British Architects," coupled with the name of Mr. Ernest George, concerning whom he made some eulogistic remarks, congratulating him on his remarkable address to the students. Mr. George, in reply, referred to the energy and life of the A.A., which he said supplied the Institute with some of its best elements.

Mr. Maurice Webb occasioned a remarkable outburst by suddenly rising and exclaiming that he wouldn't give sixpence for an Association that didn't drink Tanner's health, the best President they ever had! The toast was drunk with musical honours, amid great enthusiasm.

Mr. Walter Cave proposed the toast of "The Visitors," to which Mr. David Murray, R.A., and Mr. W. D. Scott-Moncrieff responded. The latter created considerable amusement by referring to his old friend Mr. Murray's condition of bachelordom, which he said would bring him under the ban of ex-President Roosevelt. He thought there was yet time for Mr. Murray to reconsider his position. As the father of a student in the A.A. Schools, he could testify to the great value of the work done there, and to the beneficent influence of Mr. Maule, the Headmaster.

ART NOTES.

[*Note.—Our article on the pictures of the year at the Royal Academy and the Paris Salon is unavoidably held over until next week owing to pressure on our space.*]

Wright of Derby. A loan exhibition of works by Joseph Wright of Derby, got together by Messrs. Henry Graves and Co., in Pall Mall, affords an unexampled and a very welcome opportunity of studying almost all the characteristics of that "sturdy and downright English painter; who, however, apparently owed much to his emulation of certain of the Dutch masters of the seventeenth century. The collection includes such popular favourites as "The Orrery," the "Farrier's Shop," and the Arkwright portraits.

The Coope Majolica and Enamels. The sale of the collection formed by the late Mr. Octavius E. Coope occupied a whole week at Messrs. Christie's, and realised some high prices. An old Italian Siena dish, elaborately decorated, and 10¼ ins. in diameter, was bought by Messrs. Duveen at £3,700, and Mr. Harding gave £1,200 for a Gubbio dish, decorated and signed by Maestro Georgio, and dated 1527. Among the enamels a tazza, 10in. in diameter and 4in. high, painted with figures of Melchizedek blessing Abraham, by Susanne Court, went to Herr Goldschmidt at £2,050. The prices realised represented generally a huge advance on those paid by the collector, and are said to have gone far beyond anticipation.

Artists' Benevolent Institution. Earl Carrington presided at the ninety-fifth anniversary dinner of the Artists' General Benevolent Institution, held in the Whitehall Rooms last week, and the speakers included Sir Hubert von Herkomer and Sir Charles Holroyd. Sir Aston Webb, R.A., was present as treasurer, and to him the chairman made a graceful reference, saying "He (Earl Carrington) took special interest in the fund because he knew what good service had been put into it by Mr. Cope (the hon. secretary) and Sir Aston Webb." Last year there were 220 applicants, who received a total of £4,426. The subscription lists on the present occasion showed a total of £2,444.

Minor Exhibitions. The ninety-seventh exhibition at the French Gallery includes works by the Dutchman Anton Mauve and James Maris, and some flower pieces by Fantin Latour, as well as his portrait of the artist. Both the Dutchmen show mastery of the forms and effects created by light. At the Maclean Gallery, Haymarket, Venetian paintings by Felix Zeim should tend to a higher appreciation in this country of a painter who is better known on the Continent.

The Rokeby Venus. The committee invited by the Editor of the "Morning Post" to investigate the supposed signatures on the Rokeby Venus, having met twice to examine photographs and lantern slides submitted by Mr. Greig and Mr. Barber, and having heard those gentlemen's explanation of their views, and having examined the picture itself on two separate days, have issued their report. The committee consisted of ten gentlemen—namely, Messrs. F. G. Kenyon, Sidney Colvin, Hugh Lane, Solomon J. Solomon, J. McLure Hamilton, Walter Sickert, A. J. Finberg, William McKay W. G. Rawlinson, and Fabian Ware—and six are of opinion that the markings indicated by Mr. Greig are not deliberate and do not form a signature. As to the alleged date, the majority of the committee believe that there are deliberate markings present, but they differ as to the reading of them.

Mezzotints. At the sale by Messrs. Christie of Mr. H. S. Theobald's engravings, one day's sale of mezzotints realised a total of £5,867, and there were many "record" prices. The highest price of the day was paid for a specimen of the first state of W. Dickinson's engraving of Romney's portrait of Miss Benedetta Ramus, which fetched 640 guineas. A loan exhibition of mezzotint engravings of exceptional interest, which has been opened at the Whitworth Institute, Manchester, includes Von Siegen's portrait of the Landgravine Amelia Elizabeth, reputedly the first work produced by the process, and some examples by Prince Rupert.

Whitechapel Art Gallery. The summer exhibition of the Whitechapel Art Gallery was opened last Monday by Sir Charles Holroyd, Director of the National Gallery. It represents Twenty Years of British Art (1890-1910), and contains the nucleus of the collection of works of modern art selected by Sir Hugh Lane for the Johannesburg Art Gallery. The trustees report that while, in response to their suggestion, 200 friends have promised to give 10s. a year, thus assuring an income of £100, this is not enough, and they ask for further support. About three million persons have visited the gallery during the last ten years, and every year there has been a deficit.

Early Italian Masters. The Medici Society, Ltd., is arranging an exhibition of 93 facsimile reproductions after drawings by the early Italian Masters at its Galleries from May 7th until June 4th. The drawings, which are from the Royal Print Cabinet, Munich, and the Uffizi Gallery, Florence, are reproduced in the exact tones and dimensions of the orginals and on paper matching that originally used.

The Drucker Collection. The First Chamber of the Parliament at the Hague has passed the Bill sanctioning the acceptance by the State of the art gallery of Mr. and Mrs. Drucker, of London. The collection consists largely of paintings of the modern French and Dutch schools. Some of these are on loan at the National Gallery.

The Trapnell Glasses. At the sale, at Sotheby's, of the Trapnell Goblets, from Bournemouth, high prices were bid for Jacobite glasses. A glass that Mr. Trapnell had bought for £45 from a Derbyshire Jacobite family is 7½in. high, and shows the Stuart Rose with seven petals, and Prince Charlie's motto, "Audentior ibo." This fetched £53 at the sale, and others ranged from £9 10s. to £37. A pair of tall cups of the eighteenth century, with baluster stems and sporting and musical emblems, went for £21 10s., and old beer glasses and tumblers were sold for about a guinea a piece. The sale realised £720.

OBITER DICTA.

Sir Hubert von Herkomer's Dream. He hoped that the Royal Academy would always be strong enough to hold the balance between wholesome and rational art and the unwholesome and irrational art which they saw on the Continent. But they were choking for breathing room in the backyard off Piccadilly. His dream was of a noble building of vast dimensions placed in the middle of Hyde Park surrounded by trees. That would be a worthy setting for the yearly output of British art, and it only needed the co-operation of the nation with individual artists to make his dream realised.—*Sir Hubert von Herkomer at the Annual Meeting of the Artists' Benevolent Institution.*

"Condemnation in Advance." The letter sent to the "Times" by a number of eminent artists and architects in reference to St. Paul's Bridge is somewhat uncalled for. It presupposes the idea that the Corporation will accept the first design submitted to them, regardless altogether of its artistic merit. What possible justification is there for any such condemnation in advance?—"*City Press.*"

* * *

A "Letch for Vistas"? It appears that much more lies behind the appeal in the "Times" by Sir Aston Webb and his fellow-artists than the mere question of a good design for the new bridge near St. Paul's. The central idea is the provision of a fine new vista, with the Cathedral as its terminal.—"*Daily News.*"

* * *

Art and Price. There seems to be confusion in the minds of many as between the value and price of works of art; so that a man may have a Matthew Maris, and only see the frame hanging on his wall, with £5,000 in large figures covering the canvas. He regards the picture like an investment in oil shares. If the figures change to £4,000 it hurts him, but if they rise to £6,000 he rubs his hands and says, "This is a magnificent work of art." The architect, like other artists, is compelled very often to do things he would much rather not do. If he does what he would choose to do he would starve. The defence of pot-boiling is that in its absence there may be no way of living. But many men have to go on at the practice till the pot boils over and extinguishes the fire of art within them.—*Mr. James Salmon, F.R.I.B.A., to the Glasgow School of Art.*

* * *

The Main Entrance to Erechtheion. As to whether the north door was the main entrance to the temple, there is still too much ground for controversy for a final decision to be pronounced. Fürtwaengler is disposed to regard the main entrance as being on the north side. Professor Dörpfeld, interpreting Pausanias differently, takes the east end as the most probable. In any case, the south porch may be eliminated from the question. The stairs leading down from it into the west chamber were only intended for occasional and special use, and the whole feature was designed rather as a mass necessary to the composition of the south façade than as a means of access to the building. The same uncertainty may be said to exist with regard to the question of internal communication between the east and west cellæ.—*Mr. Lionel B. Budden, in the "Architectural Review" for May.*

STOKE-UPON-TRENT TOWN HALL EXTENSION.

The contract for this group of buildings in the extension of the existing municipal premises has been placed with Messrs. Wilcock and Co., of Wolverhampton, for the sum of £25,791, which is equal to 5d. per foot cube, and the work is being carried out from the designs of Mr. J. A. Bowden and Mr. T. Wallis (the joint architects). The new buildings will contain a large hall, to seat 3,200 persons, and the principal entrances are in Tower Street. The balcony will be approached from the central entrance, and two staircases lead direct to a large foyer on the balcony level. Adjoining the foyer are the cloak-rooms, with lavatory accommodation. Above the balcony, at the south-west end of the hall, a gallery has been placed to seat 400 persons, and this gallery has a separate staircase of its own. The orchestra has been placed at the north-east end of the hall, the lower and upper tiers being approached from the rear by corridors communicating with the artists' rooms. The existing staircase of the Town Hall will be entirely remodelled to allow of a principal entrance to the new banqueting-room, and also to provide a better approach to the existing assembly hall. The court room is at the rear of the existing county court offices, and is approached from Aqueduct Street. The judge and the registrar are in direct communication with the bench, and have separate lavatory accommodation. The lecture hall has its entrance from Tower Street The heating of the building will be by low-pressure hot water. The construction throughout is in reinforced concrete, and the frontage to Tower Street will be faced with white Hollington stone.

LETTER FROM PARIS.

The thirty-eighth Congress of French Architects, which is to be held this year in Paris, will open on June 20th by visits to the Hôtel Populaire in the Rue de Charonne, and to the foundations of the new buildings at the Palais de Justice, carried out under M. Tournaire. On the 21st there will be a visit to the Palais Royal, the Théâtre Français and the Bibliothèque Nationale. On the 22nd there will be visits to the "galerie dorée" of the Bank of France, the work of Mansard, and to the new gas factory near St. Denis. The 23rd is to be devoted to a visit to Fontainebleau, including a walk in the forest and lunch at Barbizon. On the 24th, at the Ecole des Beaux-Arts, M. Paul Wallon will read a memoir on the late M. Raulin, and MM. Hulot and Gustave Fougères will lecture on Selinonte, with illustrations. On the 25th will be held the closing sitting and the distribution of awards by M Dujardin-Beaumetz, the Secretary of Fine Art.

The Minister of Public Instruction has just inaugurated a "Maison des Etudiants," a kind of students' club, installed in an old house in the Rue de la Bûcherie, behind Notre Dame, formerly occupied by the Faculté de Médicine. This house, now classed as a "Monument Historique," was very near being destroyed, and has only been saved by the persistent efforts of the "Commission de Vieux Paris," which has now extracted a promise that nothing in the building shall be altered. It is surmounted by a curious rotunda built by Winslow, and contains a large gallery of fifteenth-century date, known formerly as the "Salle des Actes."

The state of the Paris Metropolitan Railway since the floods has necessitated the expenditure of some two million francs in repairs.

An interesting collection of medals has been arranged in one of the rooms in the Petit Palais at Paris, which will represent a complete history of the art in France from the beginning of the Renaissance to the present day.

M. Nénot, the eminent architect, is to undertake shortly the construction of a large annexe to the Sorbonne, between the Rue Gay-Lussac and Rue St. Jacques, with a façade to the latter street. This new building will be devoted to the chemical classes of the Faculté de Science, and to the Radium Institute.

M. Girault, the architect to the Louvre, is to commence shortly the rearrangement of the Pavillon de Flore, which the Colonial Minister and his staff have now at last abandoned. The works of great decorative artists and sculptors will occupy the ground floor, and on the first floor about twenty rooms will be devoted to the works of Delacroix, Ingres, Courbet, and others, as well as to works of the Impressionist school. The second floor will be reserved for works recently left by legacy to the Louvre.

The committee appointed by the Government to consider the means of guarding against another flood have had under consideration a scheme proposed by M. Eyerre, architect-engineer, and M. Guillotin, formerly a large contractor for public works. This includes the formation of three canals, partly open to the air and partly in tunnels, starting from the Colline de Charenton and ending opposite the Ile Saint-Ouen. The cost is estimated at 240,000 francs—a large sum certainly, but not as great as the loss of property that a second flood would cause. The establishment of these canals, for a distance of 19 kilometres, besides helping to carry away flood water, would greatly assist the river navigation.

The new building contains a large public hall to seat 3,200 persons, lecture hall, concert room, and an assembly room. The building is faced with white Hollington stone.

STOKE-ON-TRENT TOWN HALL EXTENSION: TOWER STREET ELEVATION. WALLIS AND BOWDEN, ARCHITECTS.

The Municipal Council of Paris has once more under consideration a scheme for suppressing the fortifications and utilising the ground for the formation of a chain of parks and gardens. If the proposal is adopted by the municipality and the Government, a very large amount of open space will be secured to Paris in perpetuity.

The death is announced, at the age of seventy-seven of François Ehrmann, a pupil of Gleyre, who had devoted himself entirely to decorative and architectural painting. He has executed numbers of wall-paintings, ceiling paintings, and cartoons for Gobelins tapestries and obtained various official honours and medals for his work.

NEWS IN BRIEF.

The site of the Duke of York's School at Chelsea is to be sold, it is said, for about £320,000, if the Government can find a purchaser for it. At a public meeting held on April 22nd, at Chelsea Town Hall, under the presidency of the Mayor (Mr. Christopher Head), a resolution was proposed by General A. Turner protesting against the sale and supporting the proposal that the site and building should be utilised as the headquarters of the London Territorial forces. This resolution was passed in face of an amendment moved and supported by representatives of the local tradesmen's association, who were against the maintenance of the site as an open space.

* * *

Mr. Walter Runicman, President of the Board of Education, has appointed a Departmental Committee to consider and report upon the functions and constitution of the Royal College of Art and its relations to the schools of art in London and throughout the country. The committee is constituted as follows: Mr. E. K. Chambers, one of the principal assistant secretaries of the Board of Education (chairman); Sir Kenneth S. Anderson, K.C.M.G.; Professor Frederick Brown; William Burton, M.A., F.C.S.; Douglas Cockerell; Sir George J. Frampton, R.A.; Sir Charles Holroyd, Hon. Litt.D.; Halsey Ralph Ricardo, F.R.I.B.A.; and Frank Warner; with Mr. A. H. Sidgwick, a Junior Examiner of the Board of Education, as secretary.

* * *

It was estimated that while Berlin was still outside the conflict, the number of men locked out was quite 200,000. The employers do not conceal their desire for a trial of strength. There is some probability that the lock-out will extend to industries associated with the building industry, especially the cement industry. The employers are completing a ring of cartel treaties, which will prevent German workmen from finding employment in neighbouring countries, and will ensure for German employers all possible support from abroad. It is said that Switzerland and Austria were to conclude treaties yesterday on the same conditions as Sweden, Norway, Denmark, Holland, and France, and that Belgium and Italy will come in, so that there will be complete co-operation on the part of all Germany's neighbours except Russia The employers have long been preparing for "a trial of strength." The official organ of the employers says in so many words that any intervention is useless until "the forces have been measured in open battle."

* * *

Owing to the increase of their business, the Easton Lift Company, Ltd., have vacated their workshops at College Street, Lambeth, and their offices at Broad Sanctuary Chambers, Westminster, and have taken new premises for both offices and workshops at "Express" Works, Short Street, Southwark, S.E., five minutes from Waterloo Station. Telephone, Hop 4050 (two lines). Telegrams: "Glidingly, London."

* * *

Under the illustrations of two reinforced concrete water towers for the North-Eastern Railway Company at York, given in our issue of April 27th, it was mentioned that these towers were constructed by the Trussed Concrete Steel Co. It should have been stated that these towers were constructed with Kahn reinforcement by Messrs. William Moss and Sons, Ltd., of Queen Anne's Chambers, Westminster, S.W.

* * *

According to Professor Gustave Klitscher, an art expert, the excellent old picture of the Madonna in the little Alpine church of Acletta, situated at a height of 4,236ft. in the Grisons Oberland, is a Murillo. The painting, which is in an excellent state of preservation, has long attracted the attention of tourists and experts. Recently a foreign museum offered £1,200 for it, but the offer was refused by the church authorities, who requested Professor Klitscher to make an examination.

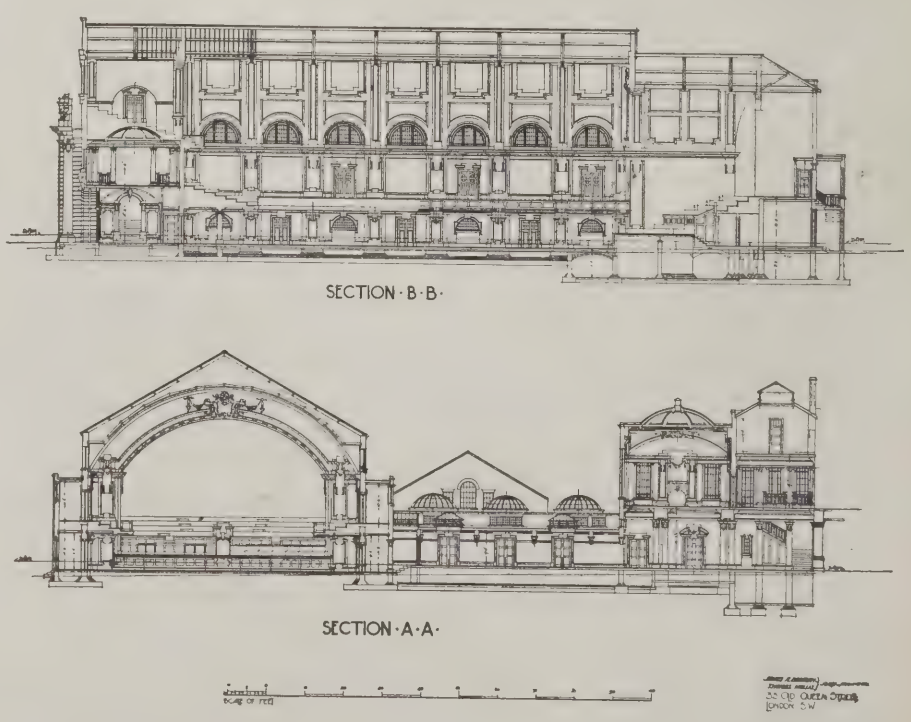
* * *

The Council of the Institution of Civil Engineers have made the following awards for papers during the session 1909-10:—A Telford gold medal to Mr. C. M. Jacobs (New York); a Watt gold medal to Mr. J. D. Watson (Birmingham); a George Stephenson gold medal to Mr. D. A. Matheson (Glasgow); and Telford premiums to Messrs. F. C. Buscarlet (Sunderland), A. Hunter (Glasgow), I. C. Barling (Tynemouth), J. Dalziel and J. Sayers (Derby); and J. Shaw (Birkenhead). The thanks of the Council have been conveyed to their colleague, Dr. C. A. Harrison, for the paper contributed by him. The awards for papers published in the proceedings without discussion and for students' papers will be announced later.

THE R.I.B.A. PARLIAMENTARY BILL.

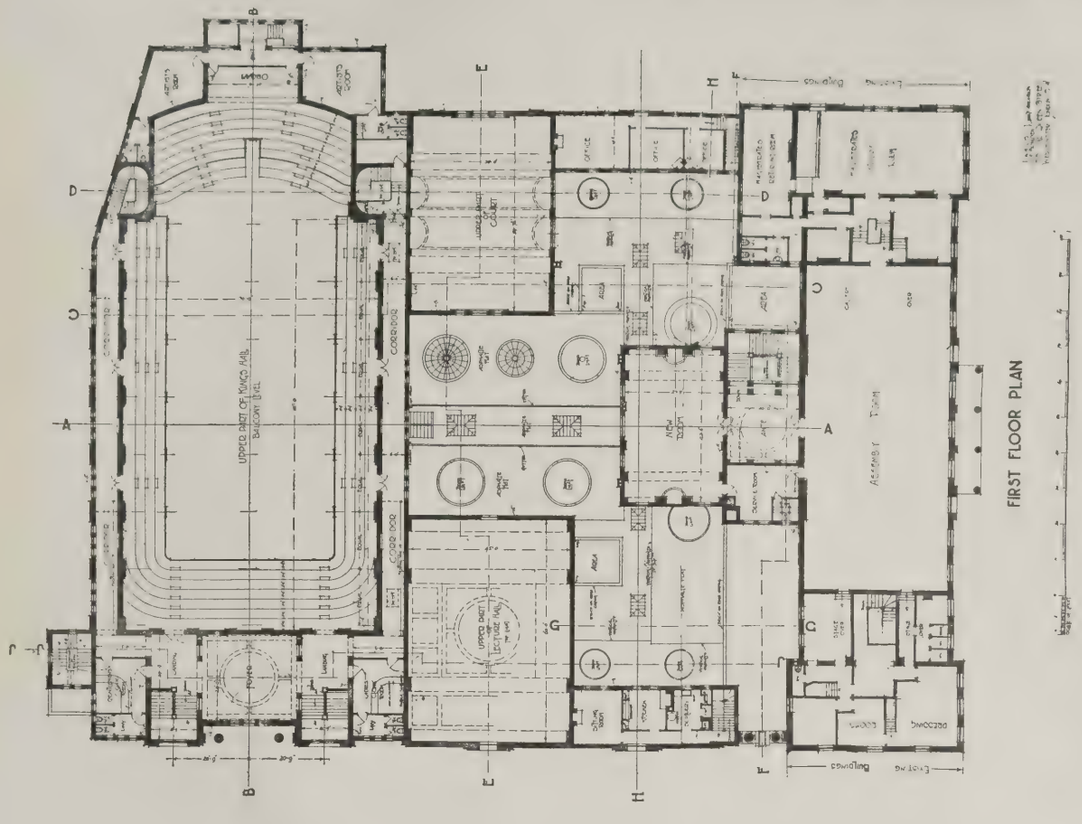
By order of the Council, a circular in the following terms was issued from the Institute to all members residing in the United Kingdom:—

The new by-laws having just received the approval of the Privy Council, it is thought desirable by the Council of the Royal Institute to take this opportunity of stating the progress already made with regard to the new Bill. The Special Parliamentary Bill Committee has reached the final stages of its work, and the Institute Solicitors are now drafting the Bill. After it has been considered by the Council it will be laid before the General Body for their approval. Its objects, as defined by the resolution of the general meeting of 4th March, 1907, are as follows:—

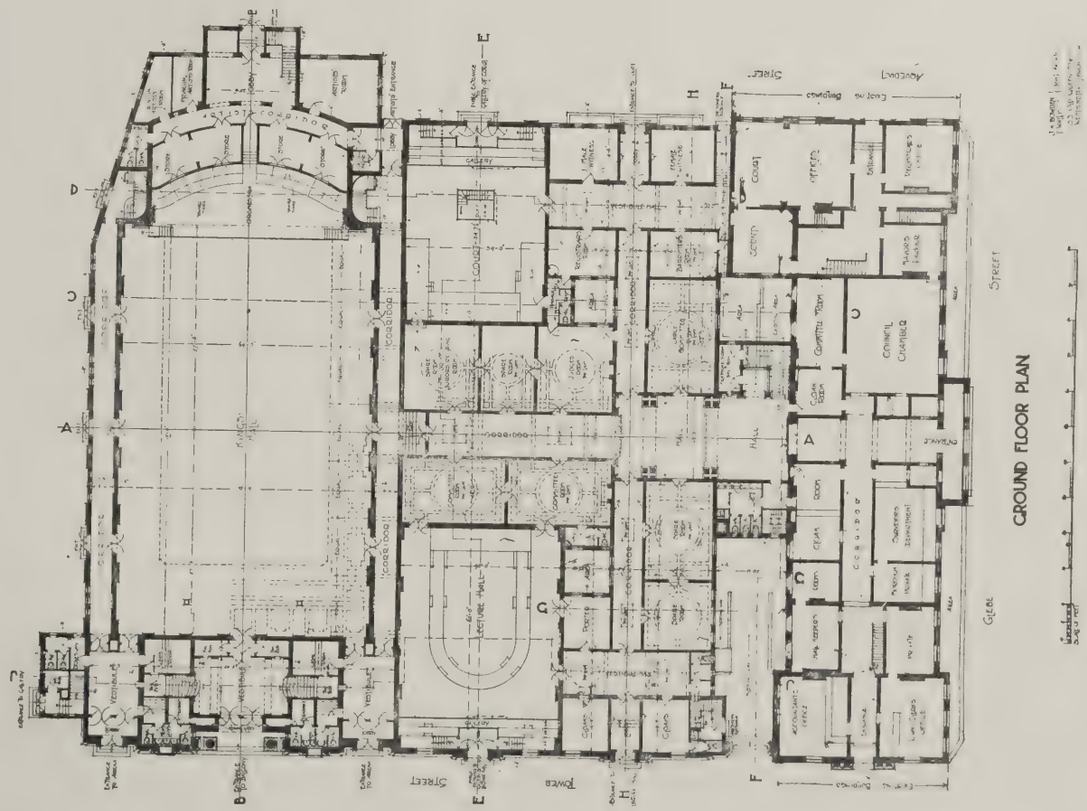


(1) To declare that it is in the public interest to enable the public to distinguish architects recognised as qualified by a competent authority from those not so recognised.

(2) To extend the present chartered privileges of the R.I.B.A., making it the statutory authority for the education and examination of architects for admission to the Institute.



(3) To legalise a scale of charges.



The Council desire to point out that it is now prepared to receive applications from those architects desirous of becoming Licentiates, and that, as the period for their admission expires within twelve months from 23rd March, it is essential that the earliest opportunity should be taken to secure the advantages offered.

Up to this point the response to the invitation to apply for the Licentiateship has been most gratifying. The numerous applications that are being received daily show that the action of the Royal Institute in this matter has been found acceptable by the general body of architects throughout the country.

[STOKE-ON-TRENT TOWN HALL EXTENSION: SECTIONS. WALLIS AND BOWDEN, ARCHITECTS.

STOKE-ON-TRENT TOWN HALL EXTENSION: PLANS. WALLIS AND BOWDEN, ARCHITECTS.

THREE POINTS OF FIREPROOF CONSTRUCTION.

The Architect and the Engineer.

Fireproof construction can properly be divided into three portions. The first will be that dealing with marble, terra-cotta, and other materials which are handled primarily by the architect, and which only concern the structural engineer indirectly as they add to the loads with which he has to deal. The second will consist of such matters as are finally decided by the insurance companies or by the building code without the allowance of discretion on the part of the structural engineer. Such, for example, would be the arrangement of fire doors, construction of partitions around elevators, and the use of metal frame and wire glass windows. The third general head in which fireproof construction might be divided will be that which concerns fireproofing engineers in ordinary practice. This consists of the construction of the framework of the building, and the construction of partitions.

Mr. Clarence W. Noble, of Toronto, in the course of a sketch of the history of modern fireproof construction, starting with office buildings of the present type as first constructed in Chicago, explained that south of Chicago there is an endless deposit of most excellent fire clay to which engineers and architects naturally turn for the solution of their fireproofing problems. Tile made from this clay was therefore used for floor construction, for the fireproofing of beams and columns, and for partitions.

Tests of Various Types of Construction.

The speaker then reviewed briefly the excellent tests made by the New York building commissioners on various types of modern fireproof construction. He pointed out that these tests, which consisted of applications of intense fire to small isolated structures about nine feet on the side, was a first-rate test of the fireproof qualities of the materials thus used, but an inadequate test of the type of construction. The failure of fireproof construction when used in actual buildings is not due so much to the heat as to the expansion stresses generated by the heat. In a small isolated structure these expansion stresses are necessarily slight or absent, as the structure has ample room to expand in every direction. When, however, the fireproofing material surrounds a steel frame, and thus protects the frame from expansion, the conditions are markedly different from those under which the tests were made. The speaker reviewed several of the great fires which have occurred testing modern fireproof construction, and pointed out that in every instance the failure of the type of construction used showed characteristic features which indicate failure by reason of expansion stresses. The destruction of partitions in tile or plaster blocks is the result of their crushing against the ceiling. The failure of terra-cotta floors is due to the spalling off of the bottom webs in the blocks.

Fireproof Partitions.

The use of metal lath and metal stud fireproof partitions was then discussed by Mr. Noble, who explained that these partitions are not subject to the usual difficulty, as they buckle when they expand, instead of crushing. Their failure is due to the failure of the plaster, which disintegrates in the heat and is apt to be washed out by a stream of water thrown on it. Mr. Noble suggested that something better than any of the present types of fireproof partitions would result if metal lath and metal stud frames were to be plastered with Portland cement plaster. Partitions thus constructed would not crush, and the plaster used would not be washed out by a hose stream.

Reinforced Concrete Design.

The speaker then took up several much-discussed points connected with reinforced concrete designs. Relative to the often-used specification regarding the straight line formula for obtaining the moment of resistance of a concrete beam, he explained that both the straight line and parbolic formulæ have much to be said in their favour. Under actual working stresses the straight line formula used very closely approximates the facts, while at the point of failure of the beam the parabolic formula very closely represents the facts. If the factor of safety is considered as representing a relationship to the actual stresses in the beam under working conditions, the straight formula should be used, while if it is regarded as a relationship between the point of failure of the beam and its working load, the parabolic formula should be used. Mr. Noble expressed a personal preference for the parabolic formula, but stated that it made very little difference which was used. He explained, somewhat humorously, the specification in favour of the straight line formula by stating that there is a general tendency on the part of people who have to decide these matters to avoid a careful technical investigation of such points by accepting the most expensive alternative, on the assumption that it is the best.

Bending Moment Formula.

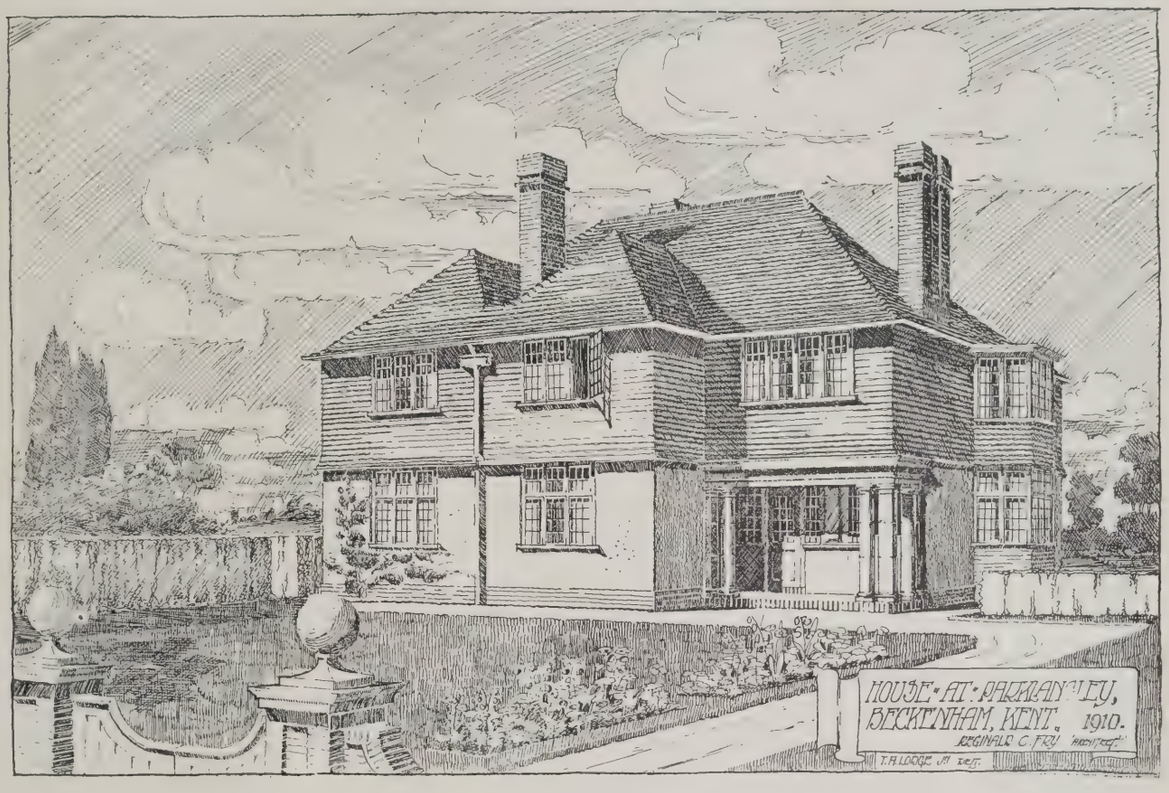
Two other open questions in reinforced concrete illustrate this tendency. One was the denominator to be used in the bending moment formula. Mr. Noble explained that while $\frac{wl^2}{10}$ was the formula first advanced, it is not by any means the only one which can be used. The denominator in the formula for a moment at the centre of the span depends entirely on what denominator is used for the moment over the point of support. The sum of these two must always equal $\frac{wl^2}{8}$. $\frac{wl^2}{10}$ implies a bending moment so small for the points of support that the material necessary to resist it will, on account of the sharp curvature at this point, be stretched beyond its elastic limit. When this occurs the bending moment on the centre of the span will necessarily reduce to $\frac{wl^2}{8}$. Mr. Noble therefore strongly urged the use of a greater amount of material over the points of support, and explained that when such material is used the use of $\frac{wl^2}{10}$ at the centre of the span is excessive.

The continuance of the use of $\frac{wl^2}{10}$ in the face of the fact that better practice would indicate a different arrangement, Mr. Noble attributes to the general tendency to take the most expensive alternative rather than to make a careful technical investigation.

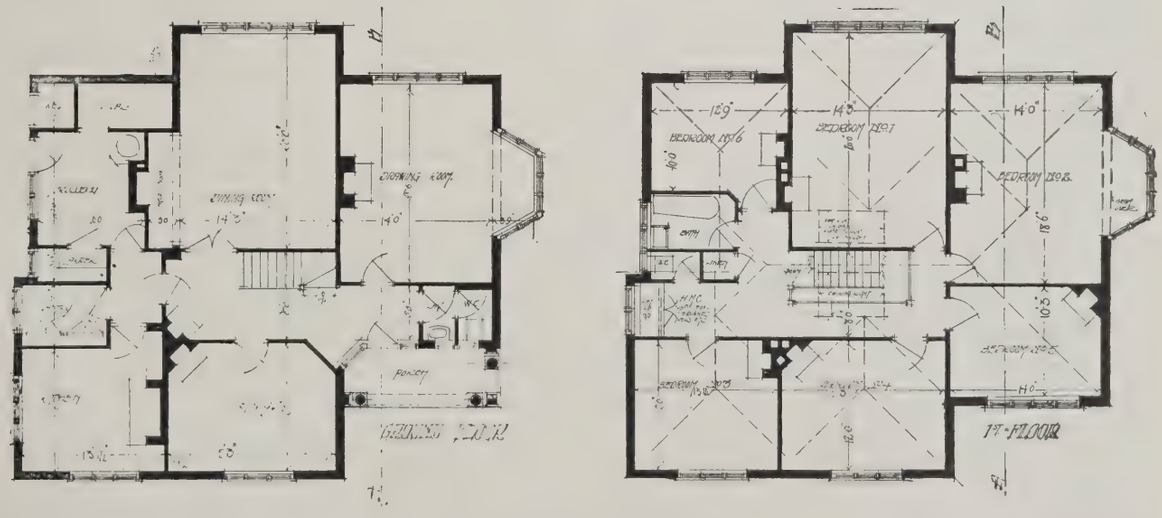
Medium and High Carbon Steel for Reinforcement.

Mr. Noble also discussed the relative advantages of the use of medium and high carbon steel for concrete reinforcement. He pointed out that medium steel is generally used in the construction of the steel framework of buildings owing to the fact that material so used has to be punched, sheared, and riveted during the process of fabrication.

High carbon steel, if used for such purposes, would have a cost for shop work so high as to make it more expensive than medium steel. Bars used for concrete reinforcement are not subject to this limitation. Yet as the majority of engineers now engaged in reinforced concrete designs gained their experience in structural steel, they continue the habits which they acquired while designing steel structures, and still use medium steel as the standard concrete reinforcement. The speaker pointed out that the elastic limit is now universally regarded as the criterion for the factor of safety of a reinforced concrete beam, and therefore the question to be decided as between medium or high carbon steel is merely one of the cost of a given amount of elastic limit in the two kinds of material.



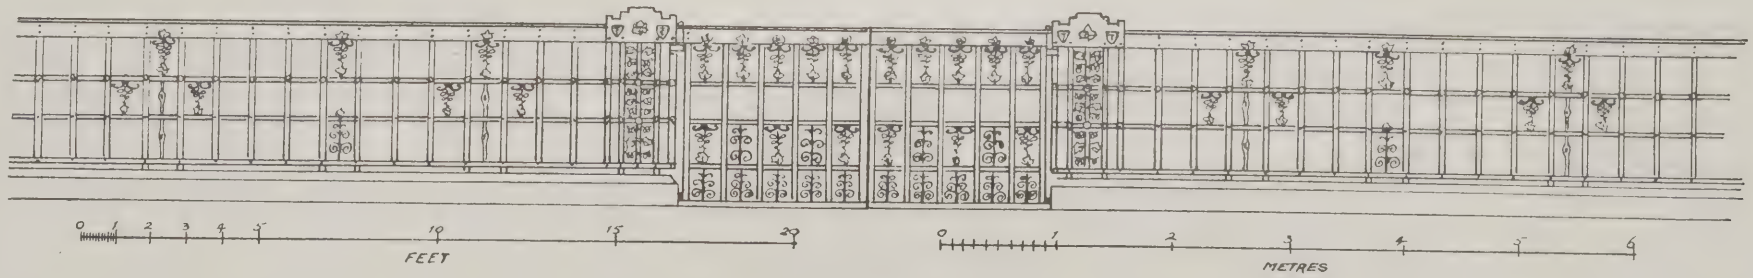
Factor of Safety.



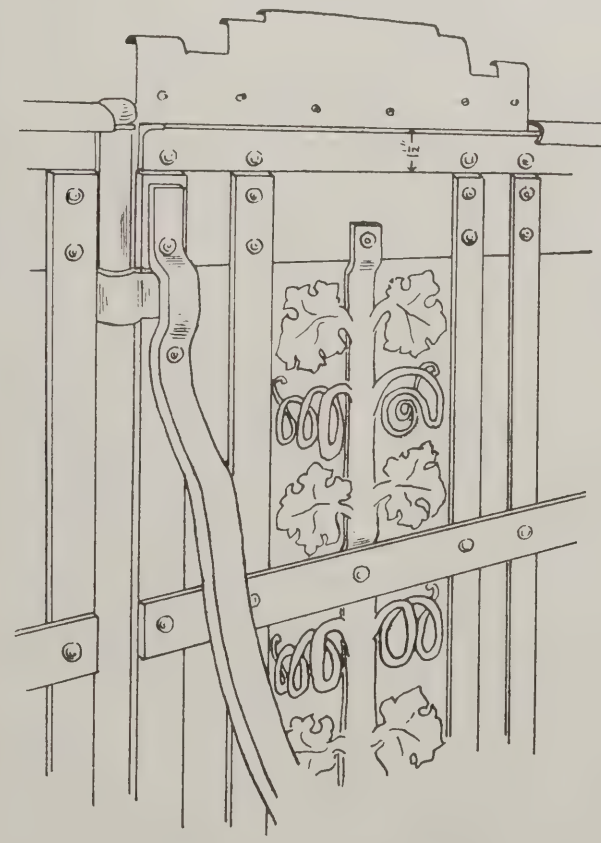
The usual working stresses used with medium steel give a factor of safety in a reinforced concrete beam not greatly in excess of two for live and dead load. A factor of safety of three, if high carbon steel is used, can be obtained at a less cost than a factor of safety of two, with medium steel. While it is true that the variation in the elastic limit is high, carbon steel covers a wider range than with medium steel, the statement made implies discount of this variation, as it is true even if the assumed elastic limit of high carbon steel is placed at the minimum value, while the assumed elastic limit of medium steel is placed on the average value.

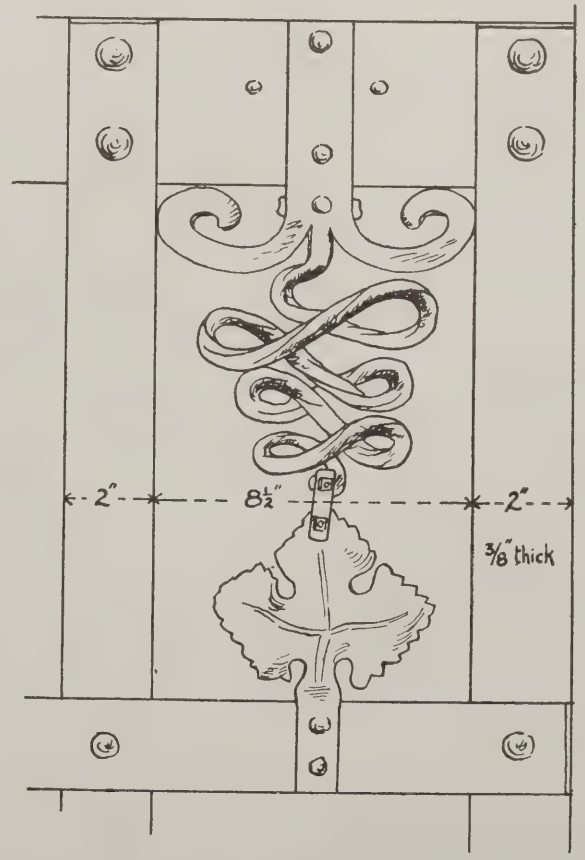
Hair Cracks.

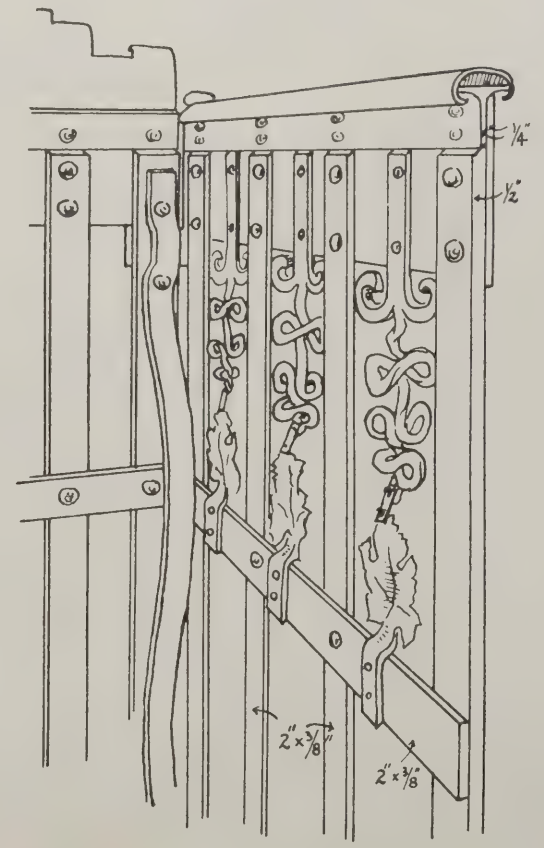
After the speaker had concluded his talk, there was an informal discussion on the part of the members. Mr. Young inquired if the speaker regarded the formation of hair cracks due to the higher working stresses he proposed for his high carbon steel, as affecting the reliability of the structure owing to the possibility of the steel rusting out.



Mr. Noble answered by explaining that these hair cracks are so minute that they had never yet been seen, even by the use of a magnifying glass. The tests which discovered them also showed that they are extremely irregular in their shape. The elements causing rust are air, moisture, and carbon dioxide gas, all of which must be present at the same time. The carbon dioxide, together with the water, forms a very weak acid, which attacks the steel. In beams, the steel is at least two inches away from the surface of the concrete. The concrete is always impregnated with an excess of free lime, which is liberated during the setting up of the cement. This lime is frequently visible on the surface of concrete construction and continues to effloresce for an indefinite period after the concrete is set up. It is reasonable to suppose that this tendency of the free lime to work to the surface extends along the interior surface of the minute hair cracks as well as along the external surface of the construction. The speaker claimed that it is practically impossible for the weak carbonic acid to work into the hair cracks in such quantities as to neutralise the ever-renewing supply of free lime and reach the steel. He pointed out that even should this be the case, the steel will be found to be coated with a protective covering resulting from the chemical action of the cement on the steel surface.

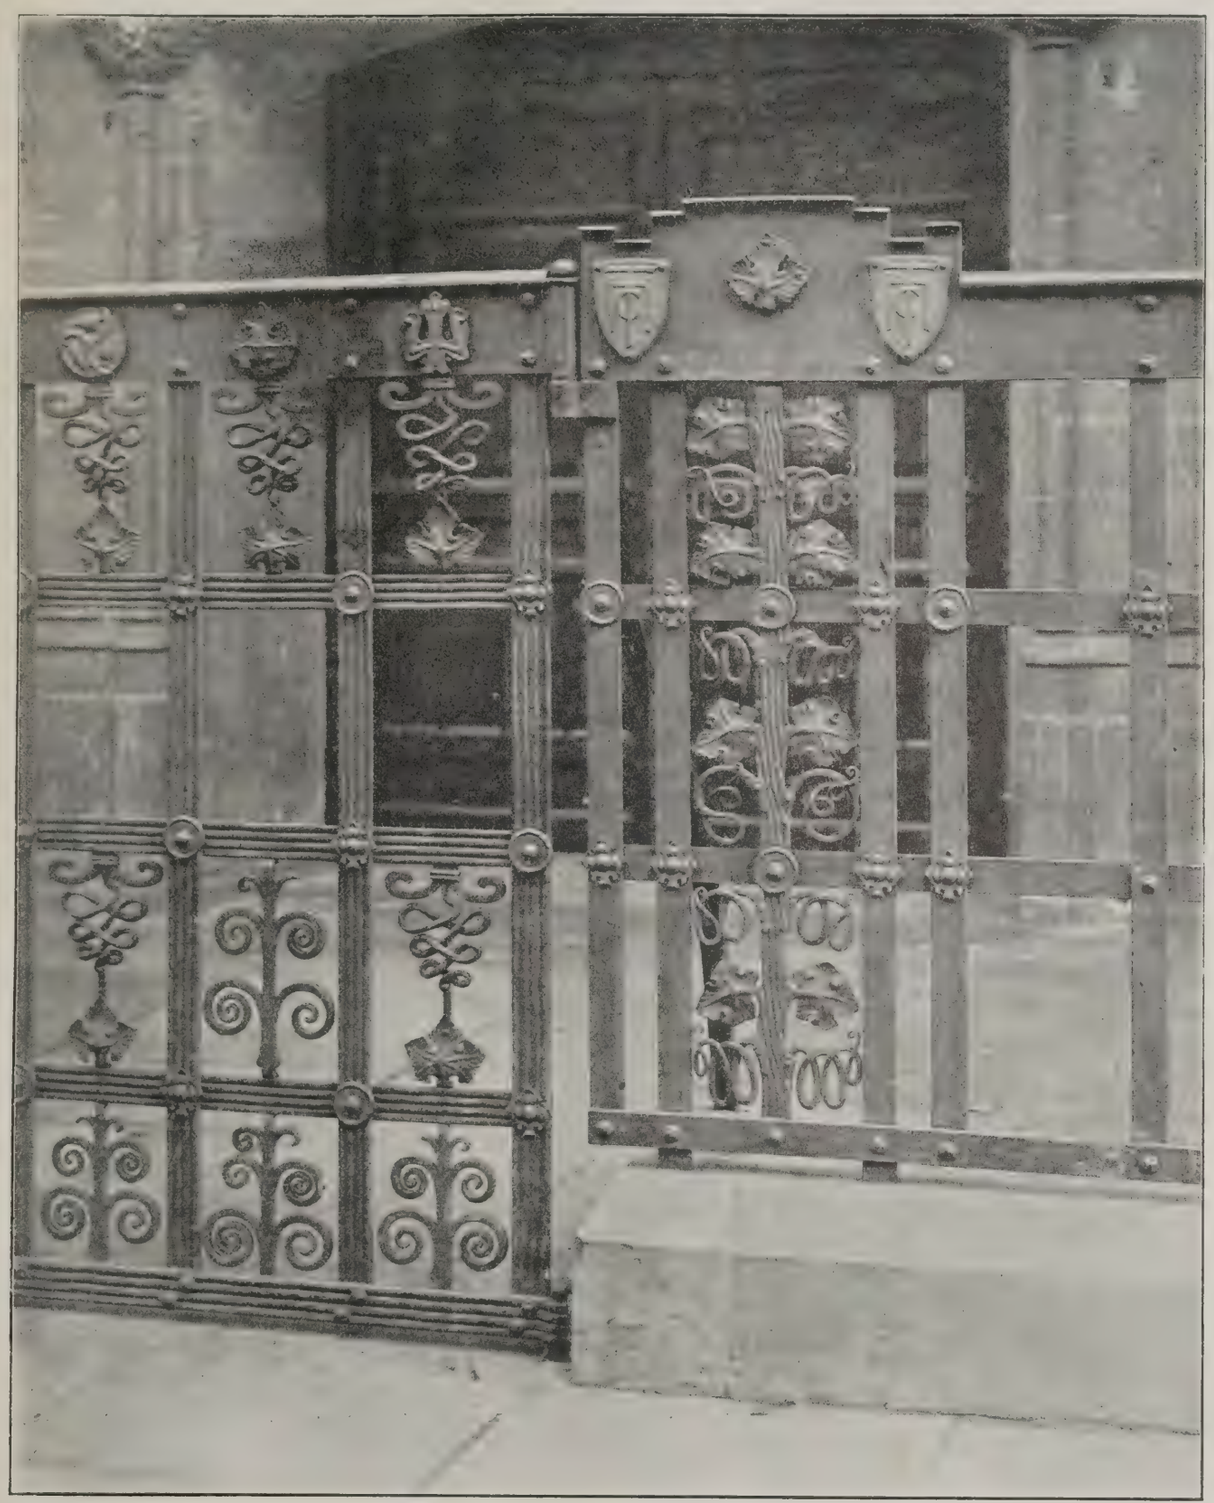






This house is one designed for the new garden suburb of Parklangley, Beckenham, Kent. The design is in modern Georgian style. Plan, views of other houses and plan and view of the shopping centre have already been published in "The Architects' and Builders' Journal."

HOUSE AT PARKLANGLEY, BECKENHAM, KENT. REGINALD C. FRY, ARCHITECT.



The manner in which the railing is built up from flat bars is clearly shown by this drawing. The vine ornament, it will be seen, is fixed from the back, the eaves being attached to the scroll by small nuts and bolts. The railing is about 4 ft. high, supported at the back by stays at intervals of 9 ft.

DETAILS OF GATES AND RAILING, HOLY TRINITY CHURCH. SLOANE STREET, CHELSEA. (THE LATE J. D. SEDDING ARCHITECT). By H. WILSON.

Holy Trinity is one of the finest works of the late John D. Sedding. Many famous artists and craftsmen—Burne-Jones, Morris, Armstead, Thornycroft, and Whall—contributed to the decoration of the interior. The beautiful metalwork, both interior and exterior, was the work of Mr. H. Wilson. These exterior railings are built up entirely of iron, wrought in the flat, and ingeniously put together. The enrichments, following a vine motive, are also wrought in iron, and gilded to give the necessary relief.

DETAIL OF GATE AND RAILING, HOLY TRINITY CHURCH, SLOANE STREET, CHELSEA (THE LATE J. D. SEDDING, ARCHITECT). BY H. WILSON.

OF THE
UNIVERSITY OF ILLINOIS

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

The L.G.B. and Reinforced Concrete.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In the concrete and steel section of the Journal for April 16th, attention is called to the rule of the Local Government Board allowing only 10 years for the repayment of loans for the erection of concrete buildings, and it is suggested that Mr. John Burns should take evidence as to its suitability and durability with regard to many buildings that have been erected of that material a sufficient length of time to afford conclusive evidence on those points.

The Enclosure Commissioners refused to advance a large sum of money on loan for concrete buildings on a landed estate in 1868, but eventually agreed to refer the matter to Mr. George Godwin, at that time Editor of the "Builder," whose opinion resulted in the refusal being withdrawn by the Commissioners, and advances made for the full term allowed. Since that time, I believe, advances for the erection of concrete buildings have always been sanctioned. The buildings referred to, although erected over 40 years since, have, I understand, so far as the concrete is concerned, cost nothing for repairs or renewals, and are practically in as good condition now as when erected.

When concrete first came into use in modern times for walls, floors, etc., many failures took place through want of experience and the extravagant statements made by patentees and other interested parties as to its capabilities and cheapness.

Possibly Mr. Burns has these in mind, but they should not stand in the way of a full inquiry being made and evidence obtained as to the advantages and value of concrete at the present time for the many purposes the Local Government Board have to deal with.

THOMAS POTTER.

Licentiate R.I.B.A.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—With reference to the letter from A.R.I.B.A. on the above subject, may I say that I cordially agree with every word of your correspondent. The practical result of this alleged reform is to place upon a level with, and at the expense of, associates those unqualified and unprofessional competitors who for many years past have been the most unscrupulous poachers.

As your correspondent rightly says, the general public cannot, even if they would, discriminate between A.R.I.B.A. and L.R.I.B.A.

Do the members of the Institute really believe that the best means of closing the profession is by opening the door to all comers? The remedy for such a Gilbertian situation lies in the hands, to a very large extent, of the associates themselves.

I, for my part, have refused, and in future intend to refuse, to nominate persons who desire to become Licentiates, because from my own knowledge they are those who, having had the opportunity to take the examinations of the Institute, have been too incompetent to succeed.

I sincerely trust that this policy is being adopted by every associate who has the welfare of his profession at heart.

ASSOCIATE.

"Percentages off Quantities."

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In your issue for April 27th, under "Enquiries Answered," there is a reply to E. H. D. with reference to percentages off quantities, which does not agree with what I believe to be the correct method of dealing with the matter.

The correct way (which I think is most generally followed) is to deduct the total net value of provisions in the quantities from the total before the percentage is deducted, and then to find the correct percentage which the amount deducted by the contractors bears to the total value of work less the provisions. Thus, if the contractor deducts 10 per cent. (£500) from a total of £5,000, in which is included net provisions to the value of £2,000, he, in fact, deducts £500 from £3,000, which is equal to 16⅔ per cent.

It is not competent for any contractor to reduce provisional sums by deducting a percentage, as these are expressly provided to be expended in any way the architect may direct, and deducted in whole or part if not used; but, of course, the percentage will come off any profit he may add to these net sums.

Yours truly,
W. W. D.

NOTES ON COMPETITIONS.

New Elementary School, Bloxwich.

The result of this competition has been announced. The first premium has been awarded to Mr. G. Thomas, of Handsworth, and the second to Messrs. Ewen Harper and Brother, Birmingham.

Walton and Fazakerley Branch Library.

Mr. W. E. Willink, the assessor in the above competition for the above Carnegie Branch Library at Liverpool, selected three designs by local competing architects for a final selection of the Libraries Committee, the three being by Messrs. Briggs, Wolstenholme, and Thornely, Mr. R. Wynn Owen, and Mr. T. Taliesin Rees. The committee selected the design of the first-named.

New Premises for the Leeds Industrial Co-operative Society.

Mr. F. E. L. Harris, A.R.I.B.A., of Manchester (architect to the Co-operative Wholesale Society, Ltd.), the assessor appointed in the above competition for new premises in Albion Street, Leeds, has delivered his award as follows:—

1st premium (£100), Messrs. Bradshaw and Gass, Bolton.

2nd premium (£50), Messrs. Latrobe and Weston, Bristol.

3rd premium (£25), Messrs. Thomas Newby and Son, Manchester.

LIST OF COMPETITIONS OPEN.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

JUNE 20, YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Competitors to state terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars from Mr. T. Watkins, surveyor to the Council Ystradgynlais.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

THE QUANTITY SURVEYORS' DINNER.

The annual dinner of the Quantity Surveyors' Association was held on Tuesday, the 3rd inst., at Connaught Rooms, Great Queen Street, W.C.

Mr. G. A. Dutfield (Mayor of Stepney) proposed the toast "The Quantity Surveyors' Association," and said he was delighted to make the acquaintance of the quantity surveyors, but he could not speak from the professional point of view. He understood that the majority of buildings depended as largely upon their ability as upon that of the architect and the builder. He was pleased to know that the quantity surveyors were getting into more intimate touch with the municipal authorities than had hitherto been the case. Stepney was certainly indebted to their President (Mr. Chidgey) for his services upon the Council.

Mr. H. T. A. Chidgey responded, and said although the Quantity Surveyors' Association had been but six years in existence its weight was being largely felt. They had endeavoured to include in their ranks only those men of real ability and experience. The Association had, during the course of the year, formulated a system of uniformity of measurement which would unquestionably be of immense value to the profession. Profitable negotiations had also been conducted with the builders and with the R.I.B.A., and with several municipal authorities. Mr. Chidgey dwelt at some length upon the question of specialist work in buildings, and upon the matter of professional tendering, which he deplored. The Association, he concluded, had undoubtedly justified its existence.

Mr. S. A. Stanger, F.S.I., proposed the toast "The Architects," and spoke eloquently of the impressive appearance of London when approached by the railways from the south. The very fine effects obtained were due to British architects. The speaker, continuing, paid a eulogistic tribute to the Architectural Association and its curriculum; and, referring to the R.I.B.A., hoped that this latter body would never get out of sympathy with the profession it represented. The quantity surveyors were always ready to render service to the architects, that they might be able to concentrate upon the higher aspects of their art. Mr. George Hubbard responded, and observed that architects fully realised they were incompetent to carry out a work without the assistance of the quantity surveyor. The speaker then referred to the lately-constituted Licentiate R.I.B.A., and mentioned that Mr. Ernest George intended his son to qualify as much. The halfpenny tax upon undeveloped land, he continued, although it had not been generally realised, actually depreciated the value of land by one-sixteenth.

Mr. W. R. Hood, F.S.I., in proposing the toast "The Contractors," said the gathering was thoroughly representative. The functions of the builder and the quantity surveyor were essentially practical; and having alluded to the Quantity Surveyors' Association examinations, which were now held in places so distantly situated as Newcastle and South Africa, commended the L.C.C. upon their action in permitting the quantities for the new County Hall to be taken by percentage.

Mr. F. Higgs responded, and complained of the name contractor being applied to the builder. It was a regrettable necessity that they had to contract, but it seemed to lower the dignity of the builder to refer to him in this way.

ENQUIRIES ANSWERED.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

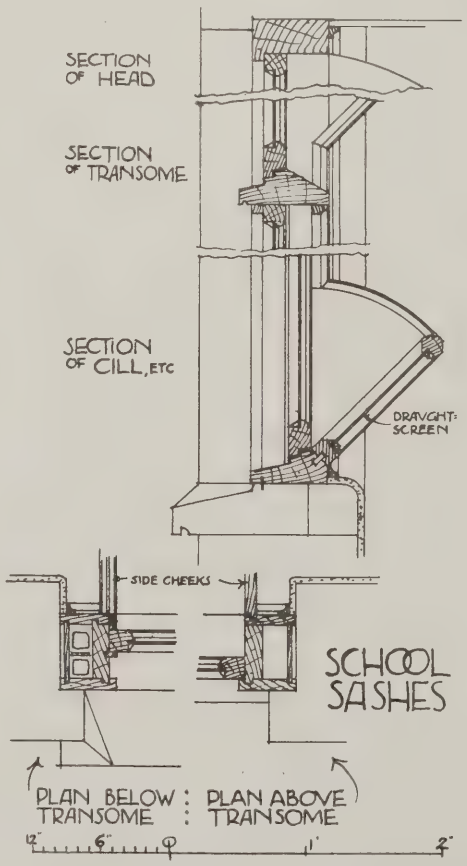
Card Index Systems, etc.

C. L. writes: "Would some correspondent who has had experience recommend a system of book-keeping for a small practice in architecture, or give the title of a suitable publication thereon? I should be grateful for full information upon the card index systems, or should be pleased to know of some publication that gives the required information. I propose to use it for indexing notes or points connected with architectural practice, and also for cataloguing trade circulars, price lists, etc."

[Will the enquirer kindly forward his name and address to the Editor?]

Right of Drainage.

T. S. (Ilkeston) writes: "Could you give me any information as to the right of drainage, as shown on the enclosed plan [not reproduced]? In the first instance the whole of the estate was purchased about four years ago by A. Afterwards A sold the portion coloured brown to B, and later sold residence and garden coloured red and blue to D, and D afterwards sold the part coloured blue to C, and converted the residence into two houses, occupying one himself and letting the other. Has D a right of drainage into the existing cesspit, as shown on B's land, the drain crossing C's land, and also has D a right to overflow from cesspit passing over B and A's land? I am informed the drainage has been as the plan shows for fifteen years. Nothing has been mentioned in the agreements of conveyance of land from A to B, A to D, or D to C, with reference to the drainage, and I understand B is going to ask for an acknowledgement for sewer to cesspit on his land, also A will shortly raise objection to the overflow crossing his land, as he is about to develop it for building. Can A and B get their claim?"



—It has been decided that where an owner of two or more adjoining houses sells one of them, the purchaser of such house is, without any express reservation or grant, entitled to the benefit of all drains from his house; and is, on the other hand, subject to all the drains necessary for the enjoyment of the adjoining house. Such necessity is to be considered with reference to the time of the conveyance, as matters then stood, without alteration and without reference to whether any other outlet could be made for the drainage (*Pyer* v. *Carter*, I.H. and N., 916). The origin of this very just rule appears to be that an easement of drain or sewer is, in reality, an easement of necessity. In these circumstances it would seem that B is not entitled to ask for an acknowledgement for sewer to cesspit in the manner alleged. Nor can A object to the overflow crossing his land on the authority above cited. The only further point is: Was D entitled to increase the use of the sewer as against B, by turning what was one house into two? That may have a distinct bearing on the matter. Before any acknowledgement is given, however, a solicitor should be consulted. B.

House Heating by Hot Water; Sash and Casement Window.

"Constant Reader" (Dudley) writes: "Please inform me (1) how to calculate the length of piping, radiators, etc., required in the heating of schools and houses, and say, also, the method usually employed; (2) kindly illustrate the details of a sash and casement window as frequently used in new schools, the sashes being at the bottom and the casements at the top."

—(1) We recommend our correspondent to read the special articles on heating and on ventilation in "Specification"; these will enable him to grasp the subject fully. For his present need, a good rule is to allow 1 square yard of outer surface of pipes and radiators to each 36 cubic yards of air space in the room, and one square yard of pipe or radiator to each six square yards of glass in windows. When the main pipes go plumb up the walls to the rooms, these allowances can be increased to 38 cubic yards and 6½ square yards; but when the main pipes are chiefly horizontal, the allowances should be 33 cubic yards and 5 square yards. When selecting a boiler, it is necessary to assess its power on the weight of iron and of water in the pipes, in addition to the amount of outside surface of the pipes. When selecting a radiator, pass a piece of string round one of its columns, tubes, or pipes, as its maker may term them; this length multiplied by the height will give you the nett heating surface of each pipe. Ingenior.

—(2) Our correspondent presumably requires a section of sash windows with hopper light above the transome and a glazed draught-screen at the cill.

ILLUSTRATING REPLY TO "CONSTANT READER," DUDLEY.

The draught-screen at the cill allows the bottom sash to be raised for ventilation without incurring down-draught. The light above the transome is hung at the bottom to fall inward between solid cheeks. Ventilation without down-draught is thus possible at three points—at the cill, at the meeting rail (both by raising the bottom sash), and from the hopper light. G.

Hammerbeam Roof Truss,

"Constant Reader" (Matlock) writes: "Please say if the roof as shown [sketch not reproduced] would be strong enough for a 34ft. span. If not, please state the scantlings required."

—The scantlings provided are rather small for a truss of 34ft. span, but they may be sufficient if the building is in a fairly sheltered position. The designing of the joints is almost of more importance than the scantling of the members, and the very rough sketch that is submitted conveys no idea as to the capability of the correspondent in this respect. Henry Adams.

Book on Paint and Colour Mixing.

H. H. W. (Tunbridge Wells) writes: "Please refer me to a book dealing with the mixing of paint, and instructing what staining it is necessary to put into white lead paint to obtain a stone colour, for instance."

—"Paint and Colour Mixing," by A. S. Jennings, published by Mr. B. T. Batsford, 94, High Holborn, W.C., at 5s., would supply our correspondent with all the information he requires. B.

Book on Stresses and Strains for R.I.B.A. Intermediate Examination.

"Strains" (Falkirk) writes: "Please advise me as to the best book to study for 'Stresses, strains, and strength of materials,' as required by the intermediate examination of the R.I.B.A. Is Middleton's 'Stresses and Thrusts' a good one, or is volume 4 on steel construction in the same author's book on 'Modern Buildings' better?"

—Middleton's "Stresses and Thrusts" is a concise textbook of the elementary principles of theoretical construction, but is not alone sufficient to enable an average student to undertake subject V. of the R.I.B.A. Intermediate. In addition, it would certainly be well for querist to become familiar with the R.I.B.A. Report on Brickwork Tests (6s.), and on Reinforced Concrete (1s.), or with textbooks giving a digest of the conclusions therein given. Books on structural ironwork, shoring, and underpinning, and strength of materials are also necessary. The list of books given in the current R.I.B.A. Calendar should be consulted. G.

Textbooks for P.A.S.I. Examination.

"Survey" (London, N.W.) writes: "I am about to read for the P.A.S.I. examination. Please advise me as to textbooks to cover the subjects in the building sub-division, as follows:—(1) Surveying, (2) levelling, (3) trigonometry, (4) quantities, (5) house drainage and plumbers' work, (6) mensuration, (7) dilapidations. I am taking 'constructive and working drawings as my typical subject. I have had the ordinary architectural training. Please indicate also whether the books recommended cover more ground of the subjects in question than the examination demands."

—The following is a list of textbooks which we recommend our correspondent to read:—"Practical Surveying," G. W. Usill (Crosby Lockwood), 7s. 6d.; "Trigonometry" (any elementary textbook); "Mathematical Tables," J. Pryde (Chambers), 4s. 6d.; "Quantity Surveying," Leaning (Spon), 25s.; or "Quantities and Quantity Taking," Davis (Whittaker and Co.), 3s. 6d.; "Building Construction" (elementary and advanced), Mitchell (Batsford), 3s. 6d.; "Mensuration," Baker (Weales Series) (Crosby Lockwood), 1s. 6d.; "Dilapidations," Macer (Estates Gazette), 5s. There is, of course, a certain amount of matter in any book that need not be studied for the purposes of the examination in question; but it is impossible to go fully into the matter here. We would advise our correspondent to seek the assistance of one of the recognised coaches, as the examination is one of extreme difficultly to pass without such help. P. B. P.

Hot Water Supply to Two Bath-rooms.

H. A. R. (BAKEWELL) writes: "Can you help me with the enclosed sketch (not reproduced)? The part in black was from the kitchen boiler with a return as shown. It was later extended, as shown in red, the bend being taken out. The lower cylinder thumps and boils, but the upper cylinder scarcely gets warm. I have been advised to have the new cylinder connections altered, and A returned into flow, and not into return as at present. I give rough plan of new bath-room [not reproduced]."

—The proper way to connect the two reservoirs of hot water and to draw off hot water from them is to connect the top outlet of the lower reservoir to the lowest but one opening in the upper reservoir, and the lowest

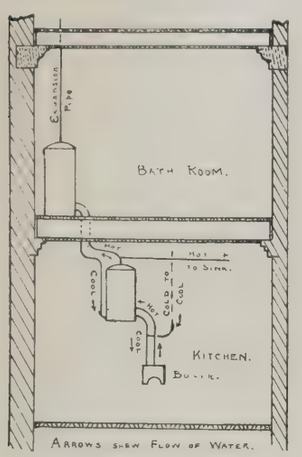


Fig. 1.

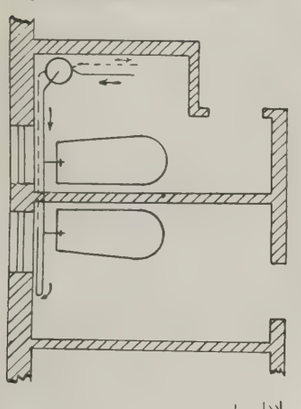

Fig. 2.

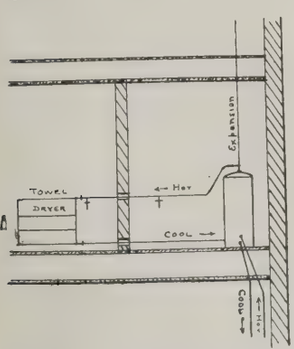

Fig. 3.

opening in the upper reservoir to the lower part of the lower reservoir, and to draw all hot water from the top of the upper reservoir. This sketch shows the arrangement. To get the best results in your case needs a different arrangement of the same principle. This arrangement gives a continuous flow of water through the towel drier, and a quicker supply of hot water to the sink, unless the hot water to the sink be drawn direct from the kitchen cylinder, as it should be. The air vent at the bath taps is not needed. If both dryer and reservoir be in one room, it will be too hot, and the other bath-room too cold. INGENIOR.

Lime Required for Mortar.

H. E. I. (LEEDS) writes: "In a building containing approximately 58,000 bricks, what would be a reasonable amount—in loads—of unslacked lime required to make mortar in proportion of 3 to 1? The mortar is mixed on site by hand, with sand got out of the adjoining land, so there is no means of checking the amount of sand delivered. I am suspicious the contractor is not putting sufficient lime into it. All above base is common brick work. I therefore want to know what number of loads of lime should be necessary."

—About 14 cubic yards of stone lime or 20 cubic yards chalk lime will be needed, on the ordinary basis of one cubic yard of stone lime to each rod of standard brickwork. A. B. S.

Lighting of Small Towns and Villages.

D. L. H. (ABERDOVEY) writes "Please answer the following questions: (1) What is the best and cheapest method of lighting a small village of, say, 1,000 inhabitants, the gas utilised to be such as can be used for cooking purposes? (2) What is the best method of lighting chapels with, say, 15 to 35 lights? (3) Is what is known as 'oil-gas' suitable for lighting small villages?"

—The answer to (1) depends very largely on the local conditions. As a rule it would not be possible to manufacture cheaply gas or electricity for so small a village as having only 1,000 inhabitants. But if there happens to be also a local demand for power purposes during the day-time it is conceivable that both might be profitably used. In the case of electricity this is specially true since the success of an electric supply company depends largely on its securing a steady load both during the day and the evening. If, in addition, the district is a condensed one, so that no large outlay for mains is necessary, the prospects of the successful use of electricity are also rendered more favourable. In this connection it is interesting to note that the advent of small candle-power metallic filament lamps has materially influenced the situation and a new concern, the Rural Electricity Supply Co. has already been formed to deal with the lighting of small communities. Only under very exceptional conditions it will be possible to use electricity cheaply, also for heating and cooking purposes.

The system of "petrol-air gas," in which a mixture of about 98½ per cent. of air and 1½ per cent. petrol is led through the pipes, has been used for lighting parks, and can be applied to small villages effectually. The plant in this case is automatic, and requires less attention than electric or gas installations. It would be an easy matter to arrange a number of properly located substations, from which the gas could be distributed to the consumer. This system answers best when constantly in use. Acetylene gas has been used for village lighting in France and other countries, but great care must be taken in the installation to avoid the possibility of escaping gas which has an objectionable smell. Neither of these systems mentioned has been largely used for cooking and heating purposes, although it is hoped that they will be adapted for this purpose in the future. It is difficult to decide without knowing the local circumstances, whether acetylene or petrol-air gas would be preferable. It may be pointed out, however, that quite apart from a general system of supply, a number of different kinds of portable and self-contained lamps, yielding a much more powerful light than the old oil lamps and candles, are now available. Recently incandescent lamps burning paraffin vapour with a mantle such as those of the Blanchard type, alcohol and other incandescent lamps burning the lighter varieties of petroleum have been introduced. These can be quite portable and enable a much more powerful light to be secured than when the oil is burnt through the wick. Lights of a more powerful kind have also been utilised for outdoor lighting, for example by travelling showmen, while in Russia towns in the petroleum districts have also been lighted by individual incandescent oil-lamps of this kind.

(2) Both electric lighting and gas lighting can be applied successfully to the lighting of chapels. Light for light with gas at 2s. 6d. per 1,000 cubic feet, and electricity at 6d. per unit, gas is usually the cheaper.

If, as assumed in question (1), the chapel is located in a small village where gas or electricity is not available, petrol-air gas and acetylene will be found serviceable. One advantage of the use of acetylene gas is that it can also be purchased in solution in small cylinders. All that the consumer has to do is to attach as per instructions given by the manufacturers such a cylinder containing the acetylene compressed to his main and, when the acetylene is used up, the vessel can be replaced and the empty cylinder sent away to be refilled.

(3) As explained in reply to question (1), oil-gas, or as it is more generally termed petrol-air gas, can be applied to the lighting of small villages. G. L.

Failure of Church Roof Truss.

"TRUSTEE" (LYTHAM) writes: "Please express an opinion on the design and stability of the roof truss as shown on the enclosed sketch (not reproduced). The truss is constructed of pitchpine, and has exerted considerable thrust since its erection some five or 6 years ago, the upright members marked X being 3 to 4 inches out of plumb, and most of the joints have opened, particularly those at A. The eaves gutter is also being pushed off the wall in places, and the wall itself has given somewhat, having large cracks in many places, chiefly in the arches of the windows. The purlins 11×3 spruce, which are *not* placed square off the pitch, have sagged inwards, and several of the bolts to the iron straps have been omitted. The walls are 9in. common brick, 2in. cavity, 4½in. common brick, and 6in. stone parpoint facing—total thickness, 21½in. The cavity is closed where the buttresses occur, and built solid with the buttress. Please suggest the best method of putting the roof in a satisfactory state of repair."

—This is not strictly a hammerbeam truss, but a braced collar-beam truss. It is not well designed for a span of 40ft., and the buttresses are insufficient with such light walls. It is difficult to decide what is best to be done without a personal inspection, but apparently a staging will have to be built up and each truss raised by jacks to allow it to return to its original shape, while the buttresses are strengthened with 12in. more projection in the upper part and 18in. more in the lower part. Two ⅝in. rods with strap ends 1½in. by ⅜in. welded on should be bolted on the sides of the 10in. by 6in. pieces with three ½in. bolts in each, and be supported on the centre line of the church by a ⅝in. suspension rod. If these rods are very strongly objected to in this position, they may be raised to the level of the first purlins. HENRY ADAMS.

Architectural Employment at Messina.

J. W. C. (GATESHEAD) writes: "Please supply information in regard to the possibility of getting work in the architectural draughting line at Messina, Italy. I have heard that there is going to be a considerable amount of building done there, the intention being, I believe, to re-build the new town some distance from where the old city stood. I have recently returned from San Francisco, having been there since the earthquake of 1906. During this time I have had considerable experience in earthquake-proof buildings and the application of reinforced concrete and steel 'frame' to buildings."

—It is somewhat difficult to give any detailed information upon this subject, the intentions of the authorities not yet being fully determined. In August last the proposal was that the city should be rebuilt on the same situation, but the planning as to streets, etc., would be altered to a considerable extent. It is also doubtful if any detailed work is yet in preparation for house building. What opportunities an Englishman would

have in dealing with such matters is again problematical. If English architects or builders obtain any work in Messina, there is no doubt such qualifications as possessed by our correspondent would be extremely useful; but this would resolve itself into obtaining an appointment here even if the services were utilised in Sicily. We would suggest that a close watch be kept upon developments in the near future, and then perhaps a well-placed advertisement would bring into view the desired opening. Mr. Baylis Heynes is the British Consul in Messina, and a reply paid request for information would undoubtedly receive immediate attention.

A. G. H.

Hot Water Supply.

F. O. J. (HOLCOMBE) writes: "A hot-water system is fitted up as shown on sketch [not reproduced] with 1in. flow and return to cylinder from boiler. The supplies to bath, etc., are taken from top of the cylinder in ¾in. pipe. The cold supply enters the cylinder (which contains 30 gallons) as shown. The size of the boiler is 10ins. by 10ins. by 6ins., with flue under, the supply cistern being in roof. The fault of the system is that boiling water cannot be obtained, after having had a good fire for about four hours. I should like to know the cause for not heating. Ought there to be a return pipe from where bath, etc., supplies are taken?"

—Your installation has three little faults and one big one, which is that the amount of fire next the boiler is too small for the amount of water to be heated. The boiler contains at most one-third of a cubic foot of water, the hot water reservoir and pipes nearly 5 cubic feet, the heat-receiving surface of the boiler is about 1½ square feet, and the cubic amount of coal burning may be three-fifths of a cubic foot. If the boiler were 3ins. deep and planned with one flue under as now, much hotter water could be had in the same time. The minor faults are the right-angle elbows at the bends of the pipes and their being 1in. bore, and the cylinder being in the kitchen. Removing the cylinder to the bathroom, making the pipes 1¼in. bore, and the bends to the largest curve possible will give a quicker flow of water between boiler and reservoir. But it would be best to place a new boiler, cylindrical in shape, say, 2ft. high and 7in. or 8in. diameter inside, in the cellar or scullery; and if the chimney draught be proper much of the kitchen refuse can be burnt after a fire has been made with coke or the cinders from the kitchen and other fires. Your suggestion to lead a new pipe from the scullery to the boiler is good, as the complete circulation which this obtains will enable hot water to be drawn at once from the taps, without waiting till the cooled stagnant water has run out. This pipe should be a size smaller than the main outflow from the boiler, as when a tap is opened water flows to it from both ways of the pipe, but most quickly as a rule from the larger one. This returning pipe should enter the boiler half-way up the side. One way of improving the power of the present boiler is to lead its hot-water discharge pipe up the chimney-flue. The hole through which it comes out can be made smoke-tight by asbestos cord or slag-wool, and covered by an iron dish. Bends to a radius of four times the bore of the pipe will absorb the expansion. A cast-iron hot-water heating pipe, 2in. bore, will last as long as the boiler, and a 6ft. length will be enough. Your present 1in. pipe in the chimney will be a great aid to the boiler. This method may, however, cost more in fixing than a new boiler and its connections. INGENIOR.

Building Blocks Containing Silicate of Soda.

A. O. (BARNSLEY) writes: "I wish to know the name of a firm (if any) that manufactures partition blocks, building blocks, or tubes having silicate of soda as a binding principle or matrix. I also wish to know the method of manufacture adopted."

—So many firms have endeavoured to make building blocks and partitions with silicate of soda as a matrix that you would be ill-advised to start this on your own account without special advice, as their manufacture requires much skill and very careful selection of the bulking material. There are no books on the subject, and no articles of sufficient detail to be of any service to you. Modern partitions are best made of a special clay mixture and fired, or of some form of concrete or of plaster. S.

Varnish Making.

"CHELT" (EDGBASTON) writes: "What are the processes in the making of varnish? In boiling are the kettles of oil run on wheels over the fire, or is the fire portable? How is the oil prevented from taking fire? Where is the flue for taking off the hydrogen fumes from oil?"

—The kettles in which oil varnishes are made are portable, and exactly fit circular holes provided in the furnace, which is beneath the ground. Conical caps fit over them when in position, and these carry off the fumes which are now usually condensed by special apparatus. You can obtain the fullest particulars of varnish making by reference to Volume II. of "The Manufacture of Varnishes," by J. G. McIntosh, price 7s. 6d., published by Scott Greenwood and Son, 8, Broadway, Ludgate Hill, E.C. A.S.J.

Hammerbeam Roof Truss.

"CRAFTSMAN" (PLYMOUTH) writes: "I shall be glad to have an opinion as to the stability of the roof truss illustrated by enclosed tracing [not reproduced]."

—The design submitted has been slightly modified and the scantlings of timbers increased. Of course, in so small a scale there are many details not shown, but they do not involve anything exceptional. No constructional work should have bolts less than ⅝in. diameter, and generally ¾in. would be necessary. HENRY ADAMS.

Safe Loads of Roof Truss.

"PERPLEXED" (BRIDPORT) writes: "What would be the correct calculations of the safe loads of each member of the truss on enclosed drawing [not reproduced] for a roof covered with 18 B.W.G. corrugated sheeting? Are the members, stanchions, joists, and channels of sufficient dimensions?"

—The exact calculation of the stresses for a simple shed roof on stanchions involves much time and the consideration of many points in order to ensure safety, and the absence of such preliminary work has caused failure in several cases that have come under the writer's notice. The scantlings given on correspondent's tracing will be sufficient if the building is in a sheltered situation, but if exposed to high winds the whole arrangement should be reconsidered.

HENRY ADAMS.

Falling Off of Roughcast.

"ARCHITECT'S ASSISTANT" (OLDHAM) writes: "I have experienced some trouble in roughcasting a new cottage of mine at a seaside village. The work was carried out in August last in very good weather; but the end of December large patches of damp made their appearance and have since been spreading pretty rapidly, and about a fortnight ago a large piece of the "roughcast" fell off after a frosty night. The sand used was from a bank about a mile and a half from the sea, and the pebbles were seashore pebbles, the lime being from Buxton. I am not quite sure whether the plasterer has worked according to specification; if he had done so I hardly think this would have happened. Would you suggest taking it all off and remake it, or patch it up where it appears defective?"

—It is difficult to give a definite opinion as to the cause of the failure of the rough-cast without seeing it, as so many possibilities exist. It is also necessary to know how much of the material falls off, i.e., is it only the final coat or is the first coat also affected? For this purpose a very careful examination is necessary. It is not impossible that the materials chosen are unsuitable—this would be shown by examination—but it is more likely that the workmanship is poor. Under the circumstances your best plan is to have the work examined by a competent specialist and to accept his opinion and suggestions. He will say whether it would be better to patch or to remake. S.

Pugging and Dry Rot.

D. R. (SCARBOROUGH) writes: "A speculative builder is erecting a house on a ten years' lease for a client of mine. The first-floor joists have to be pugged with coke-breeze. The joists are wood. I find they are inferior 5th Swedish white wood. Will they be liable to succumb to dry rot in a short while? Will either ventilation or some solution covering the joists prevent this? If so, what?"

—Pugging—particularly that in which coke-breeze is used—seems, unfortunately, to be very favourable to the development of dry-rot. All the wood surfaces that come into contact with the pugging should be first painted with methylated spirits containing corrosive sublimate in solution in the proportion of 6ozs. to 1 gallon. Through ventilation, evaporating all dampness, is essential.

Dry Rot.

A. J. writes:—"Can a builder or an architect be held liable if dry rot breaks out in a building which has been recently erected?"

—A building owner is entitled to expect that the builder shall use proper materials, and that they shall be properly put in. He is entitled to rely on the skill and judgment of the builder and the architect. Now there are certain defects which result from faulty construction, and dry rot is one of them. It is caused either by the use of green wood or by insufficient ventilation—the latter being the most usual cause of trouble. The builder may be held responsible if he fails to carry out the instructions of the architect with regard to ventilation. Such instructions are generally given through the medium of plans. Suppose, for instance, the plans provided for air bricks, and the builder failed to put them in, with the result that dry rot broke out under the floor. The builder could be sued for negligence. In that case, also, the architect might be held guilty of negligence in not properly supervising the work.

There have been several cases in point. In a case reported in Fraser's Scotch Reports (1899), 1 F. 1211, an architect was held liable for dry rot which broke out owing to his negligent supervision. In another case (reported in the "Building News," 1907, December 13, p. 838), both builder and architect were held liable, and a similar result was arrived at in a case which is reported in the "Times," October 15, 1909.

Before moving in the matter all the documents should be submitted to a solicitor.

B.

Architect's Charge for Plans.

J. S. H. (WIGAN) writes: "Please state the amount I ought to charge fairly for:—Two complete sketch plans with elevations; one ditto with sections; 1 cloth tracing of last sent to local council; one cloth tracing for the builder; also measuring site, and interviewing adjoining owners for position of brook and rights of light, etc? I might say the owner and builder will erect the house between themselves, so that my services are ended with builder's working drawing. The house will not cost, I should think, more than £200."

—Our correspondent can fairly charge an amount equivalent to 2½ per cent. on the estimated cost in respect of his first two items which will amount to £5. The two cloth tracings of so simple a subject are probably not worth more than one guinea, and payment in respect of measuring site and negotiating with adjoining owner would be proportionate to time spent and result achieved. Probably a total charge of seven guineas would be a fair one. G.

SOCIETIES' REPORTS.

Leeds and Yorkshire Architectural Society.

On Wednesday evening, April 13th, the annual and first general meeting of session 1910-11 was held, Mr. Sydney D. Kitson, M.A., F.R.I.B.A., the new president, taking the chair. The report read by Mr. R. W. Thorp, A.R.I.B.A., hon. secretary, and the balance-sheet, presented by Mr. R. Fielding Farrar, A.R.I.B.A., hon. treasurer, both showed the Society's affairs to be in an eminently satisfactory state; the total membership of the Society was 167, against 165 last year. During the past session a Town Planning Committee had been formed, with the object of locally influencing the working of the Housing and Town Planning Act; while under the auspices of the Society the School of Architecture in connection with the School of Art was proving of advantage to associates in preparing them in the subjects required for the R.I.B.A. examinations.

Aberdeen Architectural Association.

The annual business meeting and "At Home" in connection with the Aberdeen Architectural Association were held in Kennaway's Rooms. The business meeting was first held, Mr. James B. Nicol, the president, in the chair.

The treasurer (Mr. James Blake) submitted the annual financial statement, which showed that the membership of the society stood at 88, and the balance at its credit £2 7s. 3d. Mr. Arthur Clyne was reappointed hon. president, and Mr. Nicol president. The vice-president (Mr. R. Connon Garden), the hon. secretary (Mr. R. W. Gibbon), and the hon. treasurer (Mr. James Blake) were also reappointed. The new committee was appointed as follows:—Messrs. Henry F. David, George Beith, Sydney H. Brown, J. Murray Easton, George G. Irvine, and Andrew McD. Cruickshanks. A vote of thanks was accorded to the retiring members.

Mr. Nicol submitted the report of the committee for the past year. That evening they completed their fifth year as an association, and the record had been one of steady and uninterrupted progress. Last general meeting they had to record the number of members at 76. This year they had to note a still further increase of 12, which, on considering the small amount of work in the various architectural offices in town, was, he thought, very satisfactory, and should incite them to still further efforts for promoting the work of the association. The work of the year, as outlined in the syllabus, had been closely adhered to. As they would recollect, it comprised six lectures, two meetings for discussion, and one meeting for the exhibition of sketches and designs. Two of the lectures were held under the joint auspices of the Aberdeen Society of Architects and the Aberdeen Architectural Association, and at both of the lectures the attendances were very good indeed. The joint lectures had proved themselves to be a great success, and thanks were again expressed to the Aberdeen Society of Architects for the assistance they had so generously given them for the past three years. Their only regret was that there was not a larger representation of the senior members of the profession at these joint lectures. The other lectures in the course were very useful and were largely attended and much appreciated by the members. An exhibition of designs was held on March 5th, when the designs submitted showed considerable originality. Two excursions were held early in the summer, the first to Crathes Castle, and the second to Harthill Castle, Oyne. He thought they might fairly congratulate themselves on the success of their year's work. The quality of the papers read had been excellent, and their sincere thanks were due to all those who had taken the trouble to prepare and read to them the papers at the various meetings, and to those who had joined in the discussions. The sub-committee appointed for the purpose had now issued a sketch book which was on sale, and the sincere thanks of the associations were due to Mr. Irvine for the great interest and care he had shown in its preparation. Another matter which from time to time had been in their minds was the question of a closer connection between the Aberdeen Society of Architects and themselves. This year, in the report of the Aberdeen Society of Architects, there appeared a paragraph bearing directly on the question, and the hope was there expressed that the two societies might see it to be for their mutual advantage to consider whether a more intimate connection could be established between them. He was confident that if the matter was approached in a broadminded spirit by both parties arrangements could be arrived at which would ultimately be of advantage to both bodies, and which should be of great advantage to those they were all trying to help—the architectural students of Aberdeen.

Mr. George G. Irvine made a few remarks as to the sketch book of the association, which he said was one of the finest productions north of Edinburgh or Glasgow.

Manchester Society of Architects.

At the annual general meeting the officers, council, and committees, for the ensuing year were elected. Mr. P. S. Worthington, M.A., F.R.I.B.A., was re-elected as president, for a second year; Messrs. Edgar Wood, A.R.I.B.A., and John Brooke, F.R.I.B.A., vice-presidents; and Mr. Isaac Taylor, F.R.I.B.A., hon. secretary.

The Junior Institution of Engineers.

A numerously attended excursion of this Institution took place recently to Southampton for the purpose of visiting the new 16-acre dock works, which are being carried out for the London and South Western Railway Company by Messrs. Topham, Jones and Railton; and the T.S.S. "Teutonic" of the White Star line. On arrival the party was met by the engineer, Mr. T. E. Wentworth Shields, and Mr. R. H. Taylor representing the contractors. After being shown over the works by these gentlemen, and members of their respective staffs, the visitors were entertained to luncheon at the South Western Hotel, by the kindness of the contractors. Opportunity was afterwards given to go through Messrs. Harland and Wolff's shops, of which many availed themselves. Mr. P. E. Curry, manager of the Ocean Steam Navigation Company, received the members on board the "Teutonic," and special arrangements were made for conducting the party over the vessel, the engine room, etc., being included, Mr. H. S. Boumphrey, superintending engineer, being present. Afternoon tea was served in the saloon at the conclusion, by invitation of the White Star Line, after which there was a short trip round the Dock Estate by steamer kindly provided by the Isle of White and South of England R.M.S. Packet and Towing Company, the party landing at the Royal Pier in time to join the 6.12 p.m. express from Southampton West for London. The acknowledgments of the Institution for all that had been done to render the occasion so interesting and enjoyable were expressed by the vice-chairman, Mr. J. Wylie Nisbet.

Gloucestershire Architectural Association.

Mr. L. Richardson, of Cheltenham, gave a lecture entitled "The Building Stones of Gloucestershire," treating the subject from the architectural point of view, and mentioning the chief stones of the county, together with some of their merits and defects. The lecture, which proved a most interesting and instructive one, was illustrated by an exceedingly fine collection of lantern views, and at the conclusion Mr. Waller expressed the thanks of the members to the lecturer.

The A.A. Play.

It was stated at the Architectural Association dinner last Thursday evening that the A.A. Play had ended with a slight deficit, but that Mr. J. H. Leigh, the lessee of the Royal Court Theatre, had generously given the use of that house for a further performance in November next, when it was hoped that the deficit would be made up and a balance in hand secured.

LEGAL MATTERS.

Public Lavatories and Private Interests.

In the Court of Appeal, before the Master of the Rolls, Lord Justice Buckley, and Lord Justice Kennedy, the appeal in the case of the Stourcliffe Estates Company (Limited), v. Bournemouth Corporation, which was heard last week, illustrates a principle which admits of many possible applications to matters in which builders are interested.

This was an appeal from a decision of Mr. Justice Parker's, in an action brought by a landowning company, to restrain the Corporation of the Borough of Bournemouth from continuing to erect certain lavatories, and for an order on the corporation to pull down and remove the lavatories so far as they had been built. The main contention of the corporation was that the lavatories complained of were not within the terms of a covenant subject to which the land had been acquired. The corporation had covenanted with the company "to preserve and keep the land to be devoted to pleasure ground purposes as an open space for the enjoyment of the public in such manner and form as the corporation shall think best in the interests of the public, subject to no building or erections of any kind being put thereupon except such structures as summer-houses, a band-stand, or shelters, not exceeding 12ft. in height, for the accommodation and convenience of the public, and subject also to no gravel being dug upon or removed from the said piece of land so to be devoted for the purpose of a public garden or pleasure ground, except for the purpose of making such garden or pleasure ground." In the trial of the action, Mr. Justice Parker had come to the conclusion that a public lavatory, urinal, or convenience of that kind, was not included with the shelters and other things mentioned in the covenant. Such an erection as the corporation was putting up would be contrary to the covenant. The corporation was endeavouring to comply with a public requirement, and evidently regarded the erection as a sanitary matter, but there was a breach of the covenant. Unless a corporation could enter into such a covenant, however, the price of land required for the benefit of the public might often be greatly enhanced. Landowners were often willing that there should be open spaces, the sites of which they were willing to dispose of for the benefit of the rest of their properties, but they would be unwilling to convey lands to public bodies if the parting with them to such bodies involved the danger of the lands sold becoming the sites of some structures which were not desired in the vicinity of the portion of the property retained. His Lordship therefore granted an injunction as asked. The corporation appealed.

Mr. Alexander Grant, K.C., and Mr. J. G. Wood appeared for the appellants; and Mr. Mark Romer, K.C., and Mr. MacSwinney for the respondents, the plaintiff company. The Court dismissed the appeal. The Master of the Rolls, in the course of his judgment, said he could not imagine any doubt as to the true meaning of the word "shelter," and particularly as used with reference to place at the seaside. It was a well-known structure, plainly different from what was known as a lavatory, and the attempt to make out that the erection of the structure contemplated by the corporation was a thing of the same kind with the shelters and other things mentioned in the covenant entirely failed; it was an impossible contention. As a fact, when plans were first considered, the plans were for lavatories, and the tenders were for lavatories, and the subsequent alterations of these plans by adding to them some kind of shelters was merely done with a view to try and comply with the terms of the covenant, and would not bear investigation, and Mr. Justice Parker's conclusion on this part of the case that there had been a breach of the covenant by the corporation was in his Lordship's opinion perfectly correct. The Lords' Justices concurred in the dismissal of the appeal.

INTERIOR OF AN INSURANCE COMPANY'S STRONG ROOM FITTED WITH RONEO STEEL FITTINGS.

TRADE AND CRAFT.

Steel Office Fittings.

It is only by the adoption of incombustible interior fittings that the absolute fireproofness so much desired can be obtained, and goods manufactured by Roneo, Ltd., certainly meet this requirement. Their steel counters, desks, letter files, etc., etc., are finished in handsome, well-baked durable enamels in art colours, so as to produce an artistic and harmonious interior. Such fixtures, besides ensuring an effective protection against fire, obtain a great increase in capacity as against wooden fittings for the same space. Steel fittings have the further advantage that they are impervious to the inroads of vermin. They are easily cleaned, and therefore sanitary; and the drawers are never affected by changing climatic conditions. Partitions, Desks, Letter Files and other fittings in actual use may be seen in the showrooms of Roneo, Ltd., 26, Holborn Viaduct, E.C.

The firm issue a booklet illustrating their fire-resisting furniture and fixtures, in which it is pointed out that banks and insurance offices now use steel fixtures almost exclusively for new strong rooms, and it is obvious that so excellent an example is likely to be extensively followed. To the advantages of compactness and cleanliness, already mentioned, are added those which accrue from the convenience of building the fixtures in sections. Re-arrangement, extension, or reduction are thus rendered easy and convenient. Among the ingenious devices illustrated in the booklet is the arrangement for the storage of heavy books. Ledgers, etc., that are constantly handled soon wear shabby by being pushed or dragged in or out of their shelves; but on the firm's steel roller shelf every part revolves that the book strikes. Consequently, there is no abrasive friction, and a large economy is effected in the saving of bindings that are frequently very costly. But the great advantage that is common to all the objects listed—combination cabinets, document files, card index cabinets, steel roll-top desks, office tables and draughting tables—is that, in the terse phrase of the firm's advertisement, "they won't burn."

THE SMOKE ABATEMENT SOCIETY.

The annual general meeting of this Society was held on May 3rd inst., at the Royal United Service Institution, Sir William Richmond, R.A., presiding. In moving the adoption of the report, the chairman said that the society had made rapid progress during its ten years of existence. The L.C.C. was alert and the Borough Councils were beginning to view the smoke nuisance as an unnecessary evil, and in consequence of this change of opinion, fogs caused through smoke were becoming rare. The Colonies, and many parts of the United Kingdom, were awakening to the necessity of coping with the smoke evil. The L.C.C. were trying to get the word "black" deleted from the smoke clauses of the Public Health Act of 1891, because some magistrates had held that "they could not convict of a nuisance unless they were satisfied that in a literal and technical sense black smoke was emitted." Coal-smoke contained acids which destroyed stone, spoiled marble, injured metal, ate into fabrics and painted surfaces; for in every smut, however small, there was strong sulphuric acid. The Society appealed for help to make this a brighter, healthier and cleaner London. The Very Rev. the Dean of Westminster, who moved a resolution supporting the Society's efforts, referred to the harmful effect of coal smoke upon life and property, and observed that almost every kind of stone used in the Abbey was showing signs of deterioration, due in the opinion of the best authorities to the process of burning coal. Experiments had been made on various stones, with almost every preparation, resulting in little or no success. He was sorry to say the Baryta treatment, which they had adopted at considerable expense, and carried out with considerable pains, had proved a failure, though it had succeeded at Chichester. All interested in the Abbey ought to recognise that the efforts of the Society should be supported.

Dr. Des. Vœux (hon. treasurer) said that in the City of Bradford the Society had been able by aid of the Corporation to do much to mitigate the smoke evil and its disastrous results in that important manufacturing centre.

Dr. Rideal observed that a change from coal to gas fires would mean a diminution of 90 per cent. of the smoke nuisance.

Dr. Owen urged the necessity for an official research department, which could fix the minimum of smoke allowed to be emitted from factory chimneys and a standard of smoke measurement.

Sir William Richmond, R.A. was re-elected president for the ensuing year, and the meeting concluded with the customary votes of thanks.

COMING EVENTS.

Wednesday, May 11.
ROYAL SOCIETY OF ARTS.—Mr. Sydney Perks on The Guildhall: the recent discoveries and restoration.

Thursday, May 12.
R.I.B.A.—Science Committee meets.

Friday, May 13.

Friday, May 27.
ROYAL SANITARY INSTITUTE.—Provincial Sessional Meeting at Town Hall, Hereford.

THE SURVEYORS' INSTITUTION.—Country Meeting at Liverpool.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 13. **WOOD GREEN (London, N.).**—Erection of two houses in Clifton Road. Plans and specifications can be seen at the office of Vigers and Co., 4, Fredericks Place, Old Jewry, E.C., to whom tenders must belivered. (See announcement in advertisement columns.)

May 14. **COLLYWESTON (Northamptonshire).**—Erection of a new public elementary school. Send names to the architects, J. B. Corby and Son, of Stamford, on or before May 14. Plans and specifications may be seen at the office of the architects, and quantities for the work will be ready early in June.

May 16. **CARDENDEN (Scotland).**—Brickwork, joiner, plaster, slater, plumber, and gas-fitting for three cottages to be built at Bowhill, Cardenden. Apply to David Burt, Station Road, Cardenden.

May 16. **BARRY (Cardiff).**—Alterations, additions, and drainage works at Tredwgan Farm, for Mrs. Williams, of Miskin Manor. Plans and specification may be seen at the offices of Arthur LL. Thomas and Gomer S. Morgan, Architects and Surveyors, Church Street Chambers, Pontypridd, to whom tenders must be delivered.

May 16. **BRIDGNORTH.**—Restoration and improvement at the North Gate, for the Corporation. Drawings and specifications can be seen at the Borough Surveyor's Office, where further information can be obtained. Tenders to be sent to J. H. Cooksey, Town Clerk, Bridgnorth.

May 17. **DURHAM.**—Alterations and improvements at East Hedley Hope, Springwell, Lanehead, South Church and Etherley infants' Council schools, for the C.C. Sole tenders are required. Plans, specifications, and general conditions of contract may be seen at the office of F. E. Coates, Shire Hall, Durham. Tenders to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

May 17. **BRIDGEND.**—Erection of a new boardroom and offices at the workhouse, for the Guardians. Plans, etc., may be seen, and all particulars obtained at the office of P. J. Thomas, architect, Bridgend. Tenders to be sent to R. Harmar Cox, Clerk, Union Offices, Bridgend.

May 17. **STORNOWAY.**—Erection of a spire on the U.F. English Church. Plans are to be seen with Alexr. Macdonald, architect, Municipal Buildings, Stornoway, from whom schedules of quantities may be obtained. Tenders to be lodged with Neil M'Callum, merchant, Cromwell Street, Stornoway.

May 17. **IRVINESTOWN (Ireland).**—Erection of 40 single cottages for labourers, and fencing 40 plots to same, for the R.D.C. Plans, specifications, and tender forms for the work can be obtained from the Clerk on payment of 5s., and tenders are to be lodged in his office at the Board Room, Irvinestown.

May 17. **WHITLEY BAY (Northumberland).**—Designs, etc., provision and erection of a shelter seat in an open space on the Promenade, Whitley Bay, for the U.D.C. Further particulars may be obtained on application to A. J. Rousell, A.M.I.C.E., surveyor, Council Offices, Whitley Bay. Tenders to be delivered to Augustus Whitehorn, clerk, 60, Saville Street, North Shields.

May 17. **HARTLEBURY.**—Provision of all materials for, and the erection of new schools, in accordance with the drawings and specification prepared by the Architect to the Governors, S. S. Reay, F.R.I.B.A., 4, Unity Street, College Green, Bristol. Drawings and specification may be seen at the offices of the Architect. Quantities may be obtained on deposit of £2 2s. Tenders to be delivered at the office of C. Hugh Watson, Solicitor, Stourport, Clerk to the Governors.

May 17. **GRANGEGORMAN (Dublin).**—Erection of hay shed and lean-to cattle shed, in corrugated iron, at the farmyard at Portrane Branch Asylum, Donabate, Co. Dublin, for the Joint Committee of the Richmond District Asylum, in accordance with plans and specifications prepared by S. J. M'Clure, and which may be inspected at the office of W. J. Murphy, chief clerk, Grangegorman, Dublin. Contractors are requested to put in alternative tenders, setting out in detail the amount of the work that will be done in Ireland, and value of same, as preference will be given to Irish manufacture. A bond for the fulfilment of contract will be prepared by the solicitor to the Asylum, William Dillon, 12, St. Andrew Street. Tenders to be left with the Chief Clerk.

May 17. **DUBLIN.**—Erection of the third section of the Bride's Alley Area Artisans' Dwellings scheme, for the Improvements Committee, in accordance with the plans, specifications, and conditions of contract prepared by the City Architect, which may be inspected daily (except on Saturdays) at his office, Municipal Buildings, Cork Hill, Dublin. Copies of bills of quantities and forms of tender may be obtained at the office of the City Treasurer, Municipal Buildings, Cork Hill, Dublin, on deposit of £2. Tenders must be accompanied by the priced bills of quantities (priced in ink), and must also contain the names of two solvent securities willing to be bound severally with the contractor in a sum of £1,000 each for the fulfilment of contract. Rate of wages, etc., clause to be observed. Tenders, addressed to the Chairman, Improvements Committee, to be lodged at the Improvements Committee Office, City Hall, Dublin.

May 18. **PENGARNISIOG (Anglesey).**—Erection of a Council school, at Pengarnisiog, Ty Croes, Anglesey, for the Education Committee. Plans and specifications may be inspected at the office of Jos. Owen, F.R.I.B.A., County Architect, Menai Bridge. Tenders to be delivered to R. H. Williams, Secretary of Education, Education Offices, Llangefni.

May 18. **CARDIGAN.**—Erection and completion of a new bungalow cottage, Gwbert Road, Cardigan, for T. Gwilym James, St. Peter's House, Hereford. Plans, specification, and conditions of contract can be seen at the office of J. Teifion J. Williams, architect, Napier Street, Cardigan, where also all information and form of tender can be obtained. Tenders are to be sent to Mr. James.

May 18. **PETWORTH.**—Erection of a new post office for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Petworth. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

May 18. **LEEDS.**—Demolition of the existing bridge and the construction and erection of a temporary timber bridge, together with other accommodation works, and the masons', bricklayers', excavators' and ironfounders' works in connection with the construction and erection of a new 50ft. wide bridge, in three spans, across the River Aire at Kirkstall, Leeds, for the Corporation. Drawings may be seen, and a copy of specification, conditions of contract, and bill of quantities obtained at the office of W. T. Lancashire, city engineer, Municipal Buildings, Leeds, on deposit of £5 5s. Tenders must be received at the Town Clerk's Office.

May 19. **COLCAR.**—Erection of additions to Heath House mill, for T. W. Thorpe, Ltd. Plans may be seen, and quantities obtained, at offices of Lunn and Kaye, architects and surveyors, Milnsbridge and Huddersfield.

May 19. **MERTHYR TYDFIL.**—Re-building of Glantaff Factory and the erection of two cottages in Plymouth Street, for D. Mansell and Sons. Plans and specifications may be seen either at the above factory or at the office of Thomas Roderick, architect, Clifton Street, Aberdare. Tenders must be sent to D. Mansell and Sons, Glantaff Factory, Merthyr Tydfil.

May 19. **THORNBURY (Yorks.).**—Erection of a store in Woodhall Avenue, Thornbury (various works; painter's excepted), for the City of Bradford Co-operative Society, Ltd. Plans can be seen and quantities obtained at the office of William Rycroft, architect, Bank Buildings, Manchester Road, Bradford. Tenders to be sent to the Society's office only, 65, Sunbridge Road, Bradford. Contractors will be required to comply with the Society's resolution with respect to fair wages.

May 19. **GLASGOW.**—Erection of a telephone exchange at Cubie Street, Bridgeton, Glasgow, for the Commissioners of H.M. Works and Public Buildings. Tenders are required for the whole work and not for separate trades. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Clerk of Works, H.M. Office of Works, Head Post Office (Hanover Street Entrance), Glasgow. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

May 20. **WATH-UPON-DEARNE (Yorks.).**—Erection of Park Road Council school: new infants' department (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders to be sent to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

May 20. **BARNOLDSWICK (Yorks.).**—Erection of new infants' school, Gisburn Road, for West Riding Education Committee (builder, joiner, slater, plumber, plasterer, painter, whole or separate tenders). Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to the Clerk of the County Council.

May 20. **CHELMSFORD.**—Execution of the following works in their Cattle Market, for the T.C.:—1, construction of a roof over Redd and Slipper's stand; 2, construction of a roof over Offin and Rumsey's auction ring; 3, erection of a small horse shed of corrugated iron; 4, fixing new manger in, and repairing, existing horse shed. The specification and plans may be inspected, and form of tender and full particulars obtained, at the Borough Surveyor's Office, 16, London Road. Tenders must be delivered at the office of W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

May 21. **HIRST.**—Erection of twelve semi-detached houses in Woodborn Road, for the Ashington Industrial Co-operative Society, Ltd. Plans, etc., can be seen, and quantities obtained at the office of Osborne Blyth, architect, Ashington.

May 21. **ABERCANAID (Wales).**—Erection of a new church. Drawings and specification can be seen at the office of T. Edmund Rees, architect and surveyor, Merthyr Tydfil. Tenders to be sent to the Rev. Peter Williams, The Vicarage, Troedyrhiw.

May 21. **DOWLAIS (Wales).**—Taking down two old cottages and erecting three cottages, for the Foresters' Society. Plans and specification can be seen at the office of T. Edmund Rees, architect and surveyor, Merthyr Tydfil. Tenders to be sent to the Architect.

May 21. **CARDIFF.**—Stripping and re-slating, etc., roofs at 62, Charles Street, for the Guardians, according to specification, a copy of which, together with the form of tender, may be obtained from Arthur J. Harris, Clerk, Union Offices, Queen's Chambers, Cardiff, to whom tenders must be sent.

May 21. **PORT-CHESTER (Hants).**—Erection of two semi-detached small holdings dwelling houses. Plans, specification, and conditions of contract (no quantities), may be seen, and other information obtained, at the office of W. J. Taylor, County Surveyor The Castle, Winchester, on and after May 17. Tenders, on form to be obtained from the County Surveyor, are to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

May 23. **CARDIFF.**—(See "Engineering.")

May 24. **PENIEL (Welshpool).**—Alterations to Peniel Congregational Chapel, near Llanfair, Welshpool. Plan and specification and further information may be obtained on written application to R. W. Davies, M.S.A., Architect and Surveyor, Severn Street, Welshpool, to whom tenders are to be delivered.

May 24. **LISCARD (Cheshire).**—Erection of new public library, Earlston Park, Liscard, in accordance with drawings prepared by MacColl and Tonge, Architects, of Bolton and Southport, for the Libraries Committee of the Wallasey U.D.C. Copies of bills of quantities and general conditions, with form of tender, may be obtained on application, on or before May 11, from J. Brierley Preston, Surveyor, Central Buildings, 41, North John Street, Liverpool, on deposit of £1 1s. The drawings may be seen at the Librarian's Office (which adjoins the site), Earlston Hall, Earlston Road, Liscard, Cheshire. The contract will be required to enter into a bond, with approved sureties, for the due performance of the contract. Tenders are to be addressed to H. W. Cook, Clerk and Solicitor, Public Offices, Egremont, Cheshire.

(*Continued on page xiv*)

May 24. **WEDNESBURY.**—Erection of Holyhead Road Council school, for the Education Committee of the Borough. Plans of the proposed buildings may be inspected, and bills of quantities obtained, not later than May 10, at the office of the Architect, C. W. D. Joynson, Springhead, Wednesbury, on a deposit of £2 2s. Tenders to be sent to E. Foster Knowles, Secretary to the Education Committee, Education Offices, Wednesbury.

May 25. **LONDON, E.C.**—(See "Sanitary Engineering.")

May 25. **MONEA (Ireland).**—Erection of the new Devenish school, Monea, according to drawings and specification to be seen at the office of Thomas Elliott, 37, Darling Street, Enniskillen, to whom tenders must be sent.

May 25. **CROYDON.**—Erection of two isolation pavilions and additions to Administrative Block, etc., at the Borough Hospital, Waddon, for the Croydon Corporation. Plans and specifications can be seen, and bills of quantities and form of tender obtained, at the office of the Borough Engineer, Town Hall, Croydon, upon deposit of £1 1s. Tenders to be sent to F. C. Lloyd, Town Clerk, Town Hall, Croydon, at which office the conditions of contract can be seen.

May 28. **WELSHPOOL.**—Erection of a Drill Hall at the Armoury, Welshpool, for the Montgomeryshire Territorial Force Association. Plans and specification may be inspected and further information obtained on written application to R. W. Davies, M.S.A., Architect and Surveyor, Severn Street, Welshpool, to whom tenders are to be delivered.

May 30. **CHELMSFORD.**—Alterations and additions to King Edward VI. Grammar School. The drawings and specifications may be seen on application to the architects, Charles and W. H. Pertwee, Chelmsford. A deposit of £5 is required. Quantities will not be supplied. Tenders to be delivered to William Stunt, solicitor, Clerk to the Governors, 71, Duke Street, Chelmsford.

June 17. **WARWICKSHIRE.**—Alteration of the premises at the Aston Lower Grounds to fit the same for the requirements of the Territorial Units who will be there located, for the Warwickshire Territorial Force Association. Bills of quantities, form of tender, etc., may be obtained from the architects, James and Lister Lea and Sons, 19, Cannon Street, Birmingham, on deposit of £3 3s. The plans and conditions of contract may be seen and all further particulars obtained at the architect's offices. The contractor shall pay rates of wages and observe hours of labour not less favourable than those commonly recognised by employers and trades societies in the building and allied trades in the Birmingham district. Further, the conditions of employment generally accepted in the Birmingham district in the trade concerned shall be taken into account in considering how far the terms of the fair wages clauses are being observed. The contractor shall be prohibited from transferring or assigning to any person or persons whatever any portion of his contract without the written permission of the Association. The contractor shall be responsible for the observance of the fair wages clause by the sub-contractor. Tenders should be delivered at the offices of the Association, 46, High Street, Warwick.

ENGINEERING.

May 16. **CONINGSBY (Horncastle).**—Removal of the present wooden bridge, known as the Wath Bridge, over the River Bain at Coningsby, and the constructing, in its place, of a steel girder bridge, for the Horncastle R.D.C. Specifications and plans can be seen at the Council Offices, and any further particulars desired will be furnished on application to Henry White, Surveyor, Tumby Woodside, Mareham-le-Fen, Boston. Tenders to be delivered to J. E. Chatterton, Clerk, Council Offices, Horncastle.

May 17. **MANCHESTER.**—Construction of a subway in Derby Street, Cheetham. Apply to the City Surveyor's Office, Town Hall, Manchester Deposit of £1 1s. required.

May 21. **ELY, CARDIFF.**—Providing and fixing boiler and connections at the probationary wards, Headquarters Homes, for the Cardiff Guardians. Specification by S. W. Allen, Consulting Engineer, a copy of which, together with form of tender, may be obtained from Arthur J. Harris, Clerk, Union Offices, Queen's Chambers, Cardiff.

May 23. **CARDIFF.**—Construction and maintenance of a skew bridge, consisting of two spans of 41ft. 6ins. each, by 50ft. wide, over the River Ely, in lieu of the existing masonry bridge, which is to be removed; and for the execution of certain road works, in connection therewith. The new bridge is to be constructed with masonry abutments, centre pier, and wing walls, and is to have a steel and concrete superstructure and iron parapet railings. Contract drawings and deed of contract may be inspected, and forms of tender, specification, and bill of quantities obtained at the City Engineer's office, upon deposit with the City Treasurer of £3. Tenders are to be delivered at the office of the Town Clerk of Cardiff, in the City Hall.

June 1. **SOUTHAMPTON.**—Reconstruction of a portion of the town quay, Southampton (contract No. 4), such tender being based upon proposals to be submitted by the persons tendering, and the particulars supplied by the Harbour Board. Specification, conditions, and copies of the general drawings may be obtained upon application to E. Cooper Poole, A.M.Inst.C.E., Engineer and Surveyor to the Board, at the Board's offices, from 10 a.m. to 12 noon, upon deposit of £5. Tenders must be delivered to Harbour Board Offices, Town Quay, Southampton.

SANITARY ENGINEERING.

May 17. **HALIFAX.**—Sewerage works at Northowram, for the Halifax Corporation:— (1) Construction of about 1,430 yards of 15in. main outfall sewer (Mytholme to Godley), 509 yards of 9in. sewer in Staups Lane, and 185 yards of 12in. sewer in Stump Cross; (2) supply of 15in. and 9in. cast-iron pipes to Hipperholme station. Plans and specifications may be seen and forms of tender obtained on application to James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax, upon deposit of £10 contract No. 1, and £5 contract No. 2. Tenders must be sent to Herbert Ashling, Town Clerk. The persons whose tenders are accepted will be required to observe the fair contracts clause adopted by the Corporation.

May 18. **BIGGLESWADE.**—Construction of about 7¼ miles of stoneware pipe sewers, varying in size from 15in. to 6in., together with manholes, lampholes, ejector chambers, and other works; also for the laying of about 1¼ miles of cast-iron and steel rising and compressed air mains, from 10in. to 2½in. diameter, for the U.D.C. Plans and specifications may be seen, and bills of quantities and schedule of prices obtained, at the offices of the Engineer, J. T. Eayrs, M.Inst.C.E., 30, Corporation Street, Birmingham, April 25 to April 30, and also at the office of the Surveyor to the Council, Market Place, Biggleswade, from May 2 to May 7, on deposit of £3 3s. Tenders to be delivered at the office of Henry Chaundler, Clerk to the Council, Council Offices, Biggleswade, Beds. It is hoped that only substantial contractors with extensive experience in similar works will apply.

May 23. **WALTON-UPON-THAMES.**—Construction of the following lengths of sewers, together with manholes, etc., for the U.D.C.:—113 yards lineal 9in. cast-iron pipe sewer, 537 yards lineal 7in. cast-iron pipe sewer, and 323 yards lineal 7in. stoneware pipe sewer. Drawings and specification may be seen and forms of tender obtained on application to R. Wilds, surveyor, Council Offices, Walton-on-Thames. Tenders must be delivered to Percy H. Webb, Council Offices, Walton-on-Thames.

May 23. **SOUTHAMPTON.**—Supply, erection, and setting to work, etc., (1) pneumatic sewage ejector, with cast-iron chamber, near Millbrook Station; (2) pneumatic sewage ejector in existing chamber at Rochester Street, for the Corporation. Plans, specifications and conditions may be inspected and forms of tender obtained at the Borough Engineer's Office on production of the Borough Treasurer's receipt for a deposit of £1 1s. for each contract. Tenders must be delivered at the Town Clerk's Office, Municipal Offices, Southampton.

May 25. **LONDON.**—Reconstruction of the convenience in Byward Street, E.C., for the Streets Committee of the Corporation, in accordance with the terms and conditions contained in specifications, which may be obtained at the office of the Engineer on deposit of £2 2s. Persons tendering must give the names and addresses of at least two substantial sureties, who will be required to enter a bond for the due performance of the contract. Tenders must be addressed to the Town Clerk, Public Heath Department, Guildhall, E.C., and delivered at the office of the Hallkeeper in the Guildhall.

May 28. **WIGSTON MAGNA (Leicester).**—Construction of sewage works:—Contract No. 1, sewers, pumping station, and outfall works; the construction of about 1¾ miles of concrete, brick, and stoneware pipe sewers, varying from 6ft. by 4ft. to 9in. diameter, the laying and jointing of about ¼ of a mile of 13in. cast-iron pumping main, the construction of a pumping station, tanks, two continuous filters, distribution, and other works. Contract No. 2, cast-iron pipes: the supply and delivery of about 190 tons of coated cast-iron pipes and specials, varying in diameter from 18in. to 4in. Contract No. 3, sewage ironwork: the supply, delivery, and fixing of two rotary sewage distributors, 7oft. in diameter, floating arm, screen with power rake, and the supply and delivery of about 130 various sluice valves, air valves, and penstocks. Drawings may be seen at the offices of the engineers, Everard, Son and Pick, 6, Millstone Lane, Leicester, from whom conditions, specification, quantities, and form of tender may be obtained on deposit of £2 2s. for each contract. Tenders upon the form supplied to be sent to A. H. Burgess, Clerk, 2, Wycliffe Street, Leicester.

May 30. **WAKEFIELD.**—Alterations and additions to existing precipitation tanks, etc., the construction of about three acres of percolating filters, containing approximately 31,000 cubic yards of filtering material, effluent settlement tanks, liming and ferric sulphate houses, offices, mess-room, culverts, carriers, drains, and other appurtenant works at Calder Vale, for the Corporation. The contract drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of the engineer, J. P. Wakefield, A.M.I.C.E., city surveyor, Town Hall, Wakefield, on deposit of £5 5s. (Bank of England Note). Tenders must be delivered to W. W. Greenhalgh, Town Clerk.

June 20. **YSTRADGYNLAIS.**—Schemes and estimated cost for sewering the Parish of Ystradgynlais Lower, for the R.D.C., who will pay a sum of £20 for the scheme which they consider most suitable, and the decision of the Council must be accepted as final. Competitors to state their terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars of the area to be drained and any other information may be obtained from T. Watkins, Surveyor to the Council, Ystradgynlais. Schemes to be sent in to D. L. Moses Evans, Clerk to the Council, Commercial Street, Ystalyfera.

IRON AND STEEL.

May 16. **CONINGSBY (Horncastle).**—(See Engineering.")

May 17. **GRANGEGORMAN (Dublin).**—(See "Buildings.")

May 17. **LINCOLN.**—Supply of 2,260 tons approximately 21in. pipes and special castings, for the Corporation. Specification and form of tender may be obtained and drawings seen at the office of the Engineer, Neil McK. Barron, Waterworks Engineer, Lincoln. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the office of W. T. Page, Town Clerk, Guildhall, Lincoln.

May 20. **CHELMSFORD.**—(See "Buildings.")

May 23. **CARDIFF.**—(See "Engineering.")

May 30. **DARLINGTON.**—Corrugated iron roofs to tar macadam sheds, for the Corporation. For all particulars apply to George Winter, Borough Surveyor, Town Hall, Darlington.

PAINTING.

May 17. **ALDERSHOT.**—Painting and decorating the whole of the interior of the municipal buildings and fire station premises, Grosvenor Road, Aldershot, for the U.D.C. Specifications can be seen and further particulars obtained upon application at the office of Fred C. Uren, surveyor to the Council. Tenders to be sent to W. E. Foster, clerk, Municipal Buildings, Aldershot.

May 17. **LONDON, S.E. and S.W.**—Cleaning and painting at the Lambeth parish school, Elder Road, West Norwood, S.E., and No. 220, Brixton Road, S.W., for the Lambeth Guardians. Tenders must be sent to James L. Goldspink, Clerk to the Guardians, Guardians' Offices and Board Room, Brook Street, Kennington Road, S.E., or placed in a box provided for their reception in the office of the Clerk to the Guardians, by May 17, and will be opened at the Board Room at noon on the following day, when all persons tendering, or their authorised agents, must be in attendance. Forms of tender may be obtained at the office of the Clerk. Specifications will be supplied on personal application on deposit of £2.

May 19. **STIFFORD (Essex).**—Distempering and painting works, at the Children's Home, at Stifford, near Grays, Essex, for the Guardians of Stepney Union. Specification, forms of tender, etc., can be obtained on application at the office of T. G. Stacey, Clerk, Guardians' Offices, Barnes Street, Stepney, E., to whom tenders must be sent.

May 24. **GRIMSBY.**—Painting and cleaning the schools as under:—(1) Holme Bill, exterior, senior boys', junior boys', girls' and infants' departments; also cookery and handicrafts centres, and caretakers' house. (2) Harold Street, interior, senior, junior and infants' departments; also cookery, laundry, and handicraft centres. (3) Edward Street, exterior, senior boys', junior boys', senior girls', junior girls' and infants' departments, for the Borough Education Authority. Specifications and full particulars may be obtained at the Education Offices. Tenders, giving the price of each school, must be addressed to Douglas Chandler, Clerk to the Education Authority, Education Offices, Grimsby.

May 25. **HANDSWORTH.**—Painting and cleaning of the public elementary schools during the summer holidays, 1910, for the Education Committee. Apply to J. F. Ingram, Education Offices, Soho Hill, Handsworth, Staffs, for specifications and conditions of tender.

ROADS AND CARTAGE.

May 16. **SEVENOAKS.**—Supply of 1,075 yds. of cleaň local stone, unbroken, for the U.D.C. Specification may be obtained of Mr. Samuel Towlson, A.M.Inst.C.E., Surveyor to the Council, Argyle Road, Sevenoaks.

LATE CONTRACTS.

BUILDING.

May 13. **OAKWORTH.**—Erection of two houses. Drawings may be seen and bills of quantities obtained at the office of Moore and Crabtree, architects, York Chambers, Keighley, on May 13.

May 16. **ST. ANDREWS.**—Repair of the boundary wall at the St. Andrews Links. Copy of specification and schedule of measurement can be obtained on application from Wm. Watson, Burgh Surveyor, St. Andrews, to whom tenders must be sent.

May 16. **BOLTON.**—Adaptation of 9 and 11, Crown Street, Bolton, for the purpose of a Labour Exchange, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Bolton. Forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., to which address tenders must be sent addressed to the Secretary.

May 17. **ABBEYLEIX (Ireland).**—Erection of 29 labourers' cottages and fencing plots under the 10th improvement scheme, for the R.D.C. Forms of tender, plans, specifications, and other particulars can be had on application a tthe office of James Finnegan, Clerk to Council, Clerk's Office, Workhouse, to whom tenders must be sent.

May 18. **FRIZINGHALL.**—Erection of house at Frizinghall (all trades separately, except painters'). For quantities, etc., apply, Horace E. Priestley, M.S.A., Architect and Surveyor, 4, Bertram Road, Manningham, Bradford.

May 19. **BARNSLEY.**—Erection of two semi-detached villas, West View. Plans may be seen and quantities obtained on application to W. T. Turner, architect, etc., Market Hill, Barnsley, to whom tenders must be sent.

May 19. **LEEDS.**—Extending the Jewish baths at the junction of Albert Grove and Leeds Terrace, off North Street, for the Corporation. Plans and specifications may be seen, and bills of quantities, together with general conditions of contract and forms of tender, obtained at the offices of the architect, J. Lane Fox, Britannia Buildings, Oxford Place. Tenders must be delivered at the Town Clerk's Office, Town Hall, Leeds.

May 25. **QUEEN'S COUNTY (Ireland).**—Erection of a building and other alterations, at the Infirmary, for the Committee of Management. Plans and specifications to be had at infirmary.

May 25. **ALLERTON.**—Building new Mistal, Lee Side Farm, Allerton. Application for quantities to be sent in before May 14. Plans will be on view at the offices of Jackson and Fox, Architects, 7, Rawson Street, Halifax, to whom tenders must be sent, and at the farm, from May 18.

May 25. **WEST DERBY.**—Erection and completion of a new hospital at Alder Hey, West Derby, for the Guardians. A set of quantities can be obtained from Harris P. Cleaver, Union Clerk, Brougham Terrace, West Derby Road, Liverpool, on deposit of £5 5s. Specifications and drawings to be seen at the office of the architect, C. H. Lancaster, Brougham Terrace, West Derby Road, Liverpool. The contractor whose tender is accepted will be required to enter into an agreement, under seal, with security as named in specification and quantities, for the due fulfilment of the contract. The acceptance of any tender is subject to the approval of the Local Government Board, whose disapproval of the scheme would cancel any contract the Guardians may have provisionally entered into, and the contractor or contractors would have no claim for compensation. Tenders must be delivered to the Union Clerk.

No date. **BELPER (Derby).**—(See "Engineering.")

No date. **STUBLEY (Dronfield).**—Alterations to the Talbot Arms, Stubley, Dronfield. Send names to W. H. Wagstaff, C.E., Architect and Surveyor, Chesterfield.

No date. **BRADFORD.**—Erection of a new hall, and alterations to Prospect Wesleyan Chapel, Bradford. Send names to W. J. Morley and Sons, Architects, 269, Swan Arcade, Bradford, when quantities will be forwarded.

No date. **PUDSEY.**—Alterations and extensions at the Town Hall, for the Corporation. Send names and addresses to the architects, Jowett Kendall and Sons, Architects, South Parade, Pudsey, and bills of quantities will be sent in due course.

ENGINEERING.

No date. **BELPER (Derby).**—Carrying out of a water supply scheme for the parishes of Denby, Kilburn, Horsley, Horsley Woodhouse, and Smalley, for the Belper R.D.C. 1, supply and laying of about 20 miles of 3in. to 8in. mains and the necessary fittings; 2, building of a covered-in brick reservoir of 100,000 gallons capacity. Bills of quantities will shortly be ready, and intending contractors are to send in application to John B. Mason, Engineer, Duffield, near Derby, with a deposit of £1 1s. for each contract. Contractors will be required to give security for the due execution of the contract by bond of two approved parties.

SANITARY ENGINEERING.

May 18. **ROCHDALE.**—Construction of about 350 lin. yards of 24in. diameter earthenware pipe sewer, 148 lin. yards of 3ft. by 4ft. 6in. brick sewer, 183 lin. yards of 2ft. 6in. by 3ft. 9in. brick sewer, and 69 lin. yards of 3ft. diameter brick sewer, with all manholes, lampholes, storm-water overflow, etc., in connection therewith, situate between Castleton Gales and Collinge Street, near the Crest Mill, Castleton, for the Paving, etc., Committee of the Corporation. Plans may be seen and copies of the specification, quantities, and form of tender obtained on deposit of £1 1s., at the office of S. S. Platt, M.Inst.C.E., Borough Surveyor, Town Hall, Rochdale. Tenders to be delivered at the office of Wm. Hy. Hickson, Town Clerk, Town Hall, Rochdale.

PAINTING.

No date. **LEEDS.**—Painting, etc., of the interior of St. Clement's Church, Chapeltown Road, (painters in the City of Leeds only). Specifications may be inspected at the Vicarage, adjoining the Church, and tenders should be sent, addressed to the Vicar and Churchwardens. The lowest or any tender will not necessarily be accepted.

ROADS AND CARTAGE.

May 16. **HITCHIN.**—Supply and delivery of 2,100 tons of 2in., 1½in., and 1¼in. broken granite (more or less) in such quantities as may be from time to time ordered by their Surveyor, for the U.D.C. Tenders at per ton delivered at the Great Northern and Midland Railway stations respectively, with samples of granite of the sizes specified, to be left at the Council offices, Town Hall, Hitchin. No forms of tender will be issued.

May 16. **SHIREMOOR (Northumberland).**—Supply of whinstone, slag, kerbstone, 6 by 3 setts and refined tar, and for team labour in connection with the repair of roads in the district to March 31, 1911, for the Earsdon U.D.C. Full particulars and form of tender can be obtained from J. R. MacMillen, surveyor, Council Offices, Shiremoor, between 9 and 10 a.m. Tenders to be sent to C. E. Hall, Clerk, Council Offices, Shiremoor.

May 16. **EARSDON.**—Supply of whinstone, slag, kerbstone, 6 x 3 setts and refined tar, and for team labour in connection with the repair of roads in the district to March 31, 1911, for the U.D.C. Full particulars and form of tender can be obtained from J. R. MacMillen, Surveyor, Council Offices, Shiremoor, between the hours of 9 and 10 a.m. Tenders to be sent to C. E. Hall, Clerk, Council Offices, Shiremoor.

May 16. **HAM.**—Materials for the U.D.C.:—1, 400 yards (more or less) of Guernsey or Quenast granite, broken to pass through a 2in. ring, delivered alongside at Petersham Dock; 2, 200 yards (more or less) of broken brown Kent flints, delivered alongside at Petersham Dock; 3, unloading and cartage of granite and flints from Petersham Dock to any part of the district of the Council as required (at per cube yard); 4, hire of horse, cart, and man (per day of 9 hours), for ashes, gravel and rubbish, and horse and man for the Council's water van and horse broom. Further particulars may be obtained on application to R. W. Hindhaugh, the Council's Surveyor, at the Council Offices, Lock Road, Ham, to whom tenders must be delivered.

May 18. **MONMOUTHSHIRE.**—Supply of materials or for hauling broken and unbroken stone for the repair of the main roads within the county for the year ending March 31, 1911, for the C.C. Particulars and schedules may be obtained on application at the County Council Offices, Newport. Tenders to be sent to William Tanner, County Surveyor, County Council Offices, Newport, Mon.

May 18. **ALRESFORD.**—Grading, draining, and tar-paving the playgrounds at the new Alresford Council School. Plan and conditions of contract may be seen, and specification and other information obtained at the office of W. J. Taylor, County Surveyor, The Castle, Winchester. The plan and conditions of contract can also be seen at the school. A deposit of 10s. 6d. will be required for a copy of the specification and form of tender. Deposits must be made by cheque, payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

May 23. **PORTSMOUTH.**—Laying compressed asphalte pavement in Queen Street, Portsea, and part of King's Road, Southsea, and maintaining the same in thorough repair for two years, from completion, for the T.C. Specification, form of tender, and schedule of prices, may be obtained on application to G. Hammond Etherton, Town Clerk, The Town Hall, Portsmouth, on deposit of £2 2s. Tenders must be sent to the Town Clerk.

May 23. **STREATHAM.**—Making-up and paving of that part of Becmead Avenue, Streatham, for the Wandsworth B.C. The specification and drawings may be seen, and forms of tender obtained, of the Borough Engineer, at the office of the New Streets Department, No. 56, East Hill, Wandsworth, S.W., upon deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Persons tendering must in the case of all workmen employed by them pay wages at not less and observe hours of labour not greater than the rates and hours recognised by the associations of employers and employees and in practice obtained in the district where the work is to be executed. If required, the contractor must provide two sureties for the due execution of the contract.

May 25. **RUNCORN.**—Supply of macadam for the R.D.C. Forms will be supplied on application to Geo. F. Ashton, Clerk to the Council, 71, High Street, Runcorn.

May 26. **ASHFORD.**—Supply of 1,320 cubic yards (more or less) of 2in. gauge broken granite, for the U.D.C., as per form of tender, to be obtained from Wm. Terrill, Surveyor, 5, North Street, Ashford, Kent, to whom tenders (with samples) must be sent.

May 30. **CAMBERWELL.**—Kerbing and York paving the footways in Peckham Rye West Side (from Barry Road to Nigel Road); also for roadway paving (patent or otherwise) to specification as submitted by contractors, for the B.C. Full particulars and form of tender can be obtained from Wm. Oxtoby, Borough Engineer, Town Hall, Camberwell, S.E. Contractors are invited to state the roadway paving they are prepared to lay and their conditions as to maintenance for a term of years. Tenders to be delivered to the Town Hall, Camberwell, S.E., addressed to the Works Committee.

May 24. **STROUD.**—Supply of Clee Hill stone, Tytherington stone, and Chepstow stone, for the twelve months ending March 31, 1911, for the U.D.C. Tenders should be sent to E. Northam Witchell, Clerk. Samples of the stone to be supplied should be sent to the Council Offices, Town Hall, Stroud, for inspection.

MISCELLANEOUS.

May 18. **BRAY (Maidenhead).**—Work to be done at the Bray cemetery, for the Parish Council. Tenders must be sent to 5, St. Luke's Road, Maidenhead, where specification of work required may be seen.

May 28. **LONDON, N.**—The following during year ending June 30, 1911, for the Finchley U.D.C. (1) heavy castings; (5), gravel, hoggin, and flints; (6) broken granite; (6a) hardcore; (6b) crushed shingle; (9a) lias lime and Portland cement; (9b) Buxton and grey lime; (10) stoneware pipes and goods—(a) London make, (b) country make; (11) removal of dust and house refuse (for the whole district or separate wards); (12) slab footway paving and tarpaving; (13a) cartage of materials to and from railway stations; (13b) general cartage, including horsing water vans, brooms, scrapers, etc. Forms of tender, conditions, and full particulars may be had on application at the offices. Tenders must be addressed to E. H. Lister, Clerk, Council Offices, Church End, Finchley, N.

Containing about 200 pages of text and 200 illustration together with a detached Ready Reckoner (of celluloid) for the Designing and Checking of Slabs and Beams
Crown8vo, cloth, Price 7/6 net (postage 4d.)

REINFORCED CONCRETE

THEORY AND PRACTICE.

By FREDERICK RINGS, M.S.A.
Architect and Consulting Engineer.

The Author has had wide experience in designing and supervising Reinforced Concrete work, and his book, which embodies the most approved modern practice,

CONTAINS ALL THE FORMULÆ AND DATA NECESSARY IN DESIGNING AND CHECKING REINFORCED CONCRETE STRUCTURES.

The recommendations of the R.I.B.A. are adopted in the work; and the symbols used are those recently arranged by the Concrete Institute.

The Celluloid Calculator forms a valuable complement to the book, enabling the amount of metal, together with the thickness of slab required for all usual spans, to be mechanically obtained without any calculation whatever.

B. T. BATSFORD,

The Royal Academy Exhibition.

"I KNOW of but one art," said Michelangelo, implying thereby not that he himself had mastered but one form of art, but that all forms of art were manifestations of the same spirit. Architects would do well to remember this more than they do, and not to think of painting and sculpture as alien arts. Invention and composition come into all branches of art, and the study of painting and sculpture should serve to quicken the architect's inspiration in his own art, to which, after all, they are the decorative handmaids. The annual exhibition of our leading artistic society should therefore be matter of interest to us all.

Different Points of View.

The public and the artist no doubt look at painting (in this country, at least) from very different points of view. What the English public like is what may be called the "incident" picture; something that tells a story or illustrates a fact. What the artist looks to is the picture which, whether relating a story or not, shows originality and power of composition, colour, and suggestion; for a painting may suggest a great deal to the imagination without illustrating, or perhaps just because it does not illustrate, any concrete fact. From this point of view there is no doubt that the picture of the year to artists is Mr. Brangwyn's "Wine," though it will not be liked by the general public, who will call it brutal—perhaps not without excuse. But this picture, embodying, as one may say, the genius of drunkenness, shows a power of composition and colour, and a boldness of style, which remind one of Velasquez, if indeed in colour it does not surpass Velasquez. One may wish that the artist's great powers had been expended on a nobler subject, but of the power itself there can be no question. Most other things in the Gallery seem comparatively weak beside it.

Decorative Paintings.

We have this year three large decorative paintings, a kind of painting not nearly so much practised in England as in France, partly because so little encouragement is given to it; and Mr. Abbey's two pictures, in fact, are painted for the United States, and not for England. "The Camp of the American Army at Valley Forge," however, is rather illustrative than decorative; it is satisfactory as an historical mural picture, but hardly arouses much interest. "Penn's Treaty with the Indians," painted, like the other, for the State Capitol of Pennsylvania, is a fine work in a decorative sense; it is a great upright, reaching from floor to ceiling of the Academy rooms, the upper part covered with the foliage of the tree under which the ceremony takes place, with the light sparkling through the leaves. In another room Mr. Gerald Moira has a large picture entitled "London," seen from a columned terrace, the whereabouts of which we do not exactly make out—the architecture is perhaps merely invented for foreground effect; under a great space of sky St. Paul's is seen in the distance. This is a vigorous masculine piece of painting, of a type more often seen at the Salon than at the Academy; its defect is that the sky is too solid and insistent, and seems to press upon and be mixed up with the distant buildings.

Figure Subjects.

Of pictures in which figures are the main subject there are but few of importance. Two of the largest are by rather new men. Mr. Middleton's "The Joy of Life," three nude girls by the edge of the sea, one of them standing and holding up both hands in a kind of rapture, looks fine in the distant view of it from the entrance lobby, but it is hardly more than a study of nude models, with a sea painted in behind them; figures well drawn, but rather hard and poor in colour, and altogether scarcely coming up to its title. "The Top of the Hill," by Mr. Mostyn, three girls in white, apparently also enjoying life, is a striking piece of effect, rather spoiled by the commonplace heads at the top of the white dresses; the mass of white makes an effective foil to Mr. Brangwyn's picture hung below it. Sir L. Alma-Tadema has seldom done anything more beautiful than his picture of this year, "The Voice of Spring," a curved marble seat and balustrade with a seated statue terminating it in the foreground, on the side of which we see the reflected sunlight from the grass sward; two or three figures, a dark-blue sea and a distant coast-line; the whole, painted in every detail with the most conscientious care, makes a lovely vision of an antique day. There are two battle pictures, both good; Mr. Beadle's illustrating the stand of "The Rear-guard," under Crawford, on the retreat to Corunna; and Mr. Caton Woodville's picture of Napoleon before St. Jean d'Acre, shaking hands with the engineer officer who had managed to blow up the "curtain" in front of the gate; one of the best things Mr. Woodville has ever painted, and evidently it is the outcome of much careful study as to details. He has contrived to realise for the spectator, too, what a very youthful conqueror Napoleon was at that time.

Mr. Hemy has hardly equalled some of his earlier Academy pictures, but there is much beauty in his figure of a girl in evening dress, listening to "The Nightingale," at a moonlit doorway; his portrait of a lady, in the same room, is remarkable for the beauty of line and composition of the seated figure. Then there are the various antique subjects by Mrs. Normand (Miss Henrietta Rae), Mr. Waterhouse, and Mr. Harold Speed. The "Apollo and Daphne" of the last-named painter is (in a very different way) like Mr. Brangwyn's picture, a merely suggestive composition of line and colour, rather marred by an uncertainty as to the exact attitude and construction of the Daphne figure, which tails off into obscurity in an odd kind of way. Mrs. Normand's classic subject, "Hylas and the Nymphs," good in colour and drawing, has the defect that, while illustrating an antique legend, there is nothing of the antique feeling about it; it is an imaginative subject treated with a want of imagination, and is as far from being Greek as anything could well be. Mr. Stott's "Good Samaritan," too, is rather a composi-

tion of two figures than an illustration of the subject. Mrs. Laura Knight's two *genre* pictures, "Boys" and "Flying Kites," are works of real ability by an artist who has made a style of her own; her evident object is to combine figures and landscape into one whole, which she succeeds in doing at the cost of leaving the figures a little ragged and neglected in detail; but her pictures are pervaded by a true artistic spirit. "Boys" is a bathing subject on the margin of a port; the striving after unity of effect results in leaving the boys, the boats, and the ground a little too similar in colour, but it is better than the forced detachment of objects in the popular style of painting such subjects. Then there is Mr. Hornel, who is absolutely different from every other painter, and regards figures and foliage as merely affording the basis for a scheme of colour and effect invented by himself. "The Earth's Awakening" is one of the best of his peculiar compositions. The only portions of the picture showing natural colour are the faces of the children, which he always paints admirably; the rest is a scheme of colour and texture belonging only to the world of Mr. Hornel. However, it is very clever and very interesting, only we confess we should like to see snowdrops looking a little more like Nature's flowers and less like artificial imitations. And we must not forget, either, Mr. Stanhope Forbes's picture "The Pier-head." The figure of the girl in the foreground is one of the best pieces of design and character in the Gallery.

Portraiture.

In spite of some very bad portraits, and some well-painted portraits of very uninteresting people, the Academy is strong in portraiture, and it may be noted that one of the best and most characteristic portraits is that of an eminent architect, Mr. Collcutt, by Mr. Cope, who now takes rank as one of our best portrait-painters. This is the class of portrait which aims at being simply a likeness, without any special effort at pictorial effect; which is, after all, the primary object of portraiture. The class of portrait in which pictorial effect is the primary object, and the portrait is merely, as it were, thrown in as part of the composition, is illustrated to the full in Mr. Sims's exceedingly clever picture, which includes the portrait of Mrs. Hayes Sadler, a charming figure in a gay costume, forming the centre of a riot of colour and light and shadow, Chinese lanterns, and other accessories. This is one of the cleverest pictures of the year, but it is hardly the way in which most people would desire their friends' portraits to be painted; the accessories are too disturbing, and the personality of the sitter forms only an element in the general effect. Mr. J. J. Shannon, who makes his portraits the vehicle of superb colour effects, nevertheless keeps them completely to their proper character as portraits. He has never been better than this year. Among his works, the full-length portrait of Mrs. Frederick Montagu, supported in the composition by a pedestal and statue, recalls the old style of some of the Reynolds and Gainsborough portraits, with a difference; and his seated portrait of the Duchess of Buccleuch, backed by a great mass of crimson curtain, is a work of great dignity. The half-length under the title of "Black and Silver," in the first room, which is his diploma work, is also essentially a portrait, and is a masterly piece of fine colour and broad and facile execution. Among other portraits one of those which will compel attention is Mr. Strang's remarkable "Portrait Group" in Gallery VIII. Mr. Strang is nothing if not forcible; the faces all stand out, hard and precise, as if modelled in relief; the colour assortment is of the boldest—a girl in a puce frock, a man in a green coat; a gold-coloured table-cloth (which assists of course to harmonise the whole), and a jar of crimson flowers. It is not reposeful; it jumps at you, so to speak; but it is certainly effective. Whether the curious similarity in the modelling of all the faces is due to the fact that the figures are all of one family, or whether it is due to a mannerism on the part of the painter, one can only conjecture. Another highly original portrait is Mr. Orpen's small one of Sir Eric Barrington, treated as Mr. Orpen likes to treat portraiture, as a figure seated in the middle of a room, the details of which are painted as carefully as the figure; but the latter is always the dominating object; it is not, like Mr. Sims's, a picture of which a portrait forms part; it is a representation of the sitter amid the ordinary setting of his indoor life, and as such forms an interesting variation from the more usual types of portrait-painting.

Landscapes.

We have no really great landscapes at the Academy, but there are some very good ones, though they are not those which are popular with the public. What the English public like is a landscape that looks "so real," like Mr. Leader's in the first room; whereas the object of landscape-painting is not so much to represent facts of nature as to represent the feeling of a scene as it impressed the artist's mind, and to convey its predominant character, not its mere facts of detail, in which nature is too multifarious for any merely mortal painter to follow her up. Mr. East paints nature in this spirit, though in his two pictures in which trees form a prominent element he seems to be getting into a habit of painting them in rather too flat a matter, giving a silhouette of their outline rather than an impression of mass. His best picture is really the quiet and unobtrusive landscape "Morning Sunshine," in Gallery V.; a composition in level lines, very thoughtfully carried out, but which will not attract the average spectator. Mr. Adrian Stokes's "Dawn in Winter," in the same room, is a beautiful and refined work, very different from the average "snow scene"; the delicacy with which the slight glow of the sunlight on the foreground snow is hinted rather than shown is remarkable. Mr. H. W. B. Davis occupies a kind of middle position between the merely realistic and the poetic landscape painters; he aims at realism, but it is a realism conveyed in a broader manner, and without hardness of effect. In his "Valley of the Liane" the balance between foreground and distance is perfect. What we want in English landscape-painting is a greater breadth and power of design and treatment. Mr. Davis's landscapes look charming in the Academy, but when one of them is exhibited at the Salon, it is surprising how weak it becomes in comparison with the more massive style of the French landscape school. Mr. Aumonier and Mr. Bertram Priestman come nearest to the grand style in landscape; but Mr. Aumonier only exhibits this year a small work in Gallery IX.; and Mr. Priestman's picture, not very well hung, is not one of his best. Mr. John R. Reid, usually known as a sea and coast painter, brings his power of conveying the impression of air and sunlight to a new class of subject with him—an inland glen and trout-stream, "Glen Ashdale, Arran," which ought to have been better hung than it is. But the great landscape of the year, to use a contradiction in terms, is not land but sea—Mr. Hemy's "Mid-Ocean"; a painting of sea merely, without a ship to give incident to it. That is really a picture of the first order.

We may have something to say about the sculpture on another occasion.

The Right Monument to King Edward VII.

A CORRESPONDENT who signs himself "Loyalist," in a letter to the "Times," makes the best suggestion that could possibly be made for a monument to the late King; a suggestion so entirely admirable that we envy him for having been the first to make it. It is that a new façade should be erected to Buckingham Palace to form a monument to the King, and thus to connect the memorial of the two sovereigns in one monumental scheme. The suggestion has more to recommend it even than the writer of the letter seems to have been aware of; it is not only so suitable from the point of view of sentiment and feeling, but it would remedy the one great defect in the memorial road and sculptural monument to Queen Victoria—the fact that it leads up to and is terminated by a poor and commonplace architectural façade, which will form a pitiable anticlimax to it. It is to

be hoped that the idea will not be allowed to drop. And in case it should be carried out, we wish at once to draw attention to one important point which ought to be kept in mind in the design of the new façade. The treatment of the centre of the façade ought in that case to be kept of a rather flat and unobtrusive design, of a continuous and unbroken character, so as to form a background against which the sculptured monument to Queen Victoria would be relieved. It would be a fatal mistake to make a design with an important central feature, immediately and axially in the rear of Mr. Brock's monument; the two would quarrel with each other. What we should like to see, and hope to see, is a new and fine Classic façade to Buckingham Palace, the centre part forming a somewhat unobtrusive background to the Victoria group of sculpture, with the principal architectural emphasis of the façade thrown into the wings, so as to form, as it were, a framework to the central vista and monument. The effect, if it were well done, would be very fine.

The late King's Interest in Housing.

MR. J. E. C. BODLEY states that it was in 1884 that the late King, who was then Prince of Wales, joined the Royal Commission on the Housing of the Working Classes, on which there was no more assiduous or hard-working member. His Majesty attended with great regularity the biweekly meetings, and examined witnesses in a manner that showed remarkable grasp of the subject, while his criticisms when the draft report was under consideration were always pertinent. The late Mr. Beck, the agent at Sandringham, was called as a witness, and testified as to what had been done for the labourers on that estate; and, Mr. Bodley adds, "not content with letting us hear his agent, his Royal Highness, on several occasions, invited some of us to Sandringham to see for ourselves how the housing problem had been anticipated on the Royal domain." Moreover, his late Majesty adventured into the East End, when, resolved to see for himself how the poor of London lived, he disguised himself in a strange ulster and a slouch hat so well as completely to deceive a familiar vestryman who acted unknowingly as guide to the Heir to the Throne. Mr. William Thompson, Chairman of the National Housing Association, also testifies to the keenness of the late King's interest in housing subjects. In opening the Municipal and Health Exhibition at the Royal Agricultural Hall, Mr. Thompson said: "King Edward was not only one of the greatest monarchs that ever lived, but was one of the foremost sanitarians in this or in any other country. The work on which we are engaged is one that always elicited his late Majesty's keenest sympathy from the time that he was a member of the Royal Commission on the Housing of the Working Classes. His Majesty's concern for the health of his people was demonstrated by the keen interest he took in municipal institutions and in the establishment of the Hospital Fund." Mr. W. Steadman, speaking at the Browning Settlement, added the further testimony that, as a former member of the London County Council, he knew that King Edward took a great interest in the housing of the people of this country. Such testimony is valuable as placing on record what many of us, it is true, knew perfectly well—that, as with his august father, so with King Edward, the social welfare of the people was a deep-seated desire.

The Work at Winchester Cathedral.

IT is now more than five years since the work of renewing the foundations of Winchester Cathedral was begun. As the work proceeded it was found that if the cathedral was to be saved—and its loss would be nothing short of a national calamity—it would have to be entirely underpinned. Before this work can be completed it will be necessary to raise the sum of £12,000. A recent visitor, writing in the "Morning Post," says that Bishop Walkelin, when, in the eleventh century, he laid the foundations, had no firmer support for them than a peat marsh, under which is a subterranean lake or river, with, at the bottom of all, a bed of gravel. In places oak piles were inserted as supports, but generally the builders simply heaped flints on the peat, and laid their foundations thereupon. De Lucy, who, at the beginning of the thirteenth century, added the east end, placed beech trunks on the peat marsh, and laid his foundations on these. Hence it is not surprising to be told that, in about seven hundred years, the building has sunk fifteen inches; indeed, it seems marvellous that the sinking and the consequent damage have been confined within the limits of preservation. It would seem as if the cathedral had been within an ace of utter destruction. The south wall of the south transept is nearly five feet out of plumb, while the arches of the retrochoir have become flattened where they have not been positively inverted! The work of underpinning has been attended with unusual difficulty. At the base of each buttress three shafts or "drifts" have been dug, and a diver has gone down them and cleared away the waterlogged flints, the peat, and the beech trunks. Then he has laid, on the cleared gravel bed, bags of concrete. Finally the water has been pumped out, and new foundations of concrete, finished off with brick round the base of the buttress, have been built up. The east end and the north transept now rest securely on concrete foundations, so that the impression that the cathedral gives as seen from the hills, "not so much of grace or beauty as of massive solidity, peace, dignity, and silent strength," is, as regards the attributes here enumerated first and last, falsified by the foundation facts. We trust that the sum required for putting the entire building on a firm basis will be speedily forthcoming. The ruin of any part of it would be not only a national calamity, but a disgrace, and should be averted at all costs.

Manchester's Indecision.

MANCHESTER is for the moment suffering from what the essayist Foster, in his "Decision of Character," regards as one of the most deplorable states of the human mind. It is halting between two opinions. It has the site of the old Infirmary available, and does not know whether to erect on it an Exchange or an Art Gallery. So far as can be gathered, the objection to the Art Gallery is æsthetic, and the objection to the Exchange is utilitarian, so that the rivals are indeed at cross purposes. Those who are in favour of the Exchange contend that such a building would be more appropriate for a purely commercial city like Manchester (and we all know that fitness or propriety is an æsthetic consideration); and those who oppose it advance the very practical objection that the site is not large enough for an Exchange; and they might also argue that an infusion of Art is a splendid stimulus to Commerce, if Manchester did not already know this quite well. For has it not, in its Corporation Art Gallery, its Royal Museum and Art Galleries in Peel Park, its Whitworth Institute, its Art Museum at Ancoats, and its School of Art, shown a liberal appreciation of the claims of Art? To cite this fine record is by no means to imply that enough has been done in this direction; rather we would adduce it for encouragement and precedent. As a matter of personal preference we could wish a handsome victory for the Art Gallery; although a fine Exchange building would afford some fortunate architect an even rarer opportunity for austere and dignified design. A lurking dread that the rival parties may chance to effect a compromise, and agree upon a combination Exchange and Art Gallery, is wholly unwarranted by anything that has ever been done in Manchester, and is probably traceable to a dim remembrance of atrocities of the kind that have been perpetrated elsewhere. We have but little fear as to the result of the contest. Manchester, we feel sure, is, as Mr. Gilbert Chesterton might say, too intensely utilitarian to prefer the Exchange to the Art Gallery; the resolution of this seeming paradox being that practical wisdom certainly includes a due appreciation of the value of art in practical affairs, as well as recognition of the important part that the imagination, and all its healthier emanations, must always play, even in business affairs; to say nothing of its emollient mitigation of the commercial crudities that tend to harden the heart and soul.

ARCHITECTS OF THE DAY.

XII.—MESSRS. CARRÈRE AND HASTINGS, OF NEW YORK.

[*Messrs. Carrère and Hastings are one of the principal firms of architects in the United States of America. Though to English readers the slightly older firm of McKim, Mead, and White is perhaps better known, Messrs. Carrère and Hastings enjoy a reputation second to none in their own country. Several illustrations of their work in the new Capitol Group at Washington were published in our Edition de Luxe last year.*]

The auspices under which Messrs. Carrère and Hastings began their career, taking the factors of education and social conditions, were almost the same as those of McKim, Mead, and White. Hunt had already exerted his personal influence on behalf of architects, but had not done much by his work to elevate Architecture. Wotan, in the person of Richardson, was building Walhallas in every city, which reflected very accurately the public taste of the time. McKim, Mead, and White had emanated from the office of the latter, and, though trained previously in Paris, their work, at first, displayed traces of Richardson's influence, and, later, of Hunt's.

Two or three years after the formation of the firm of McKim, Mead, and White, and at the time when their work first began to show a leaning to the refined styles of the Renaissance, among the factors in the production of these designs were two of their leading draughtsmen, who were each in charge of important work. These draughtsmen were John M. Carrère and Thomas Hastings. In the year 1885 these two entered into a partnership and began to look about for "something to do."

The Beginning of the Practice.

"Something to do" turned up in the form of a request for a "pretty picture" of the outside of a hotel which Mr. Henry Flagler was about to build at St. Augustine, Florida, the idea being that some local builder was to do the "practical work" of making the plans and details, and that the young architects were to make elevations "to fit." When the builder began to set out the work he began to discover "mistakes" in the architect's drawings (the customary attack of the American country builder upon the young architect); but instead of leading to their summary dismissal it brought Mr. Carrère to St. Augustine, and after proving the accuracy of the drawings he and his partner Hastings were commissioned as architects to design and supervise the Hotel Ponce de Léon. This led to other work, and at St. Augustine they remained for a period of three years, designing and supervising the erection of the Ponce de Léon, the Alcazar, the Methodist and the Presbyterian churches. This work was completed before the inception of the Columbian Exposition of Chicago, and was notably in advance of anything which had been produced in America up to that time. Then came "studies for" a crematory, a Necropolis for Brooklyn (which was not necessary!), and a few other ideal studies and sketches for proposed or executed work, including a design for a fine country house—perched upon a hill—for Mr. C. H. Tenney, at Methuen, Massachusetts. The great competition for the Cathedral of St. John the Divine, in New York, produced more than one masterpiece—including a wonderful Romanesque design by Harvey Ellis. The assessor, Professor Wm. R. Ware, placed first the Renaissance design by Carrère and Hastings. This assured for them a permanent leading position among the architects of the United States—a position which they have maintained ever since, with not more than three or four rivals at any time.

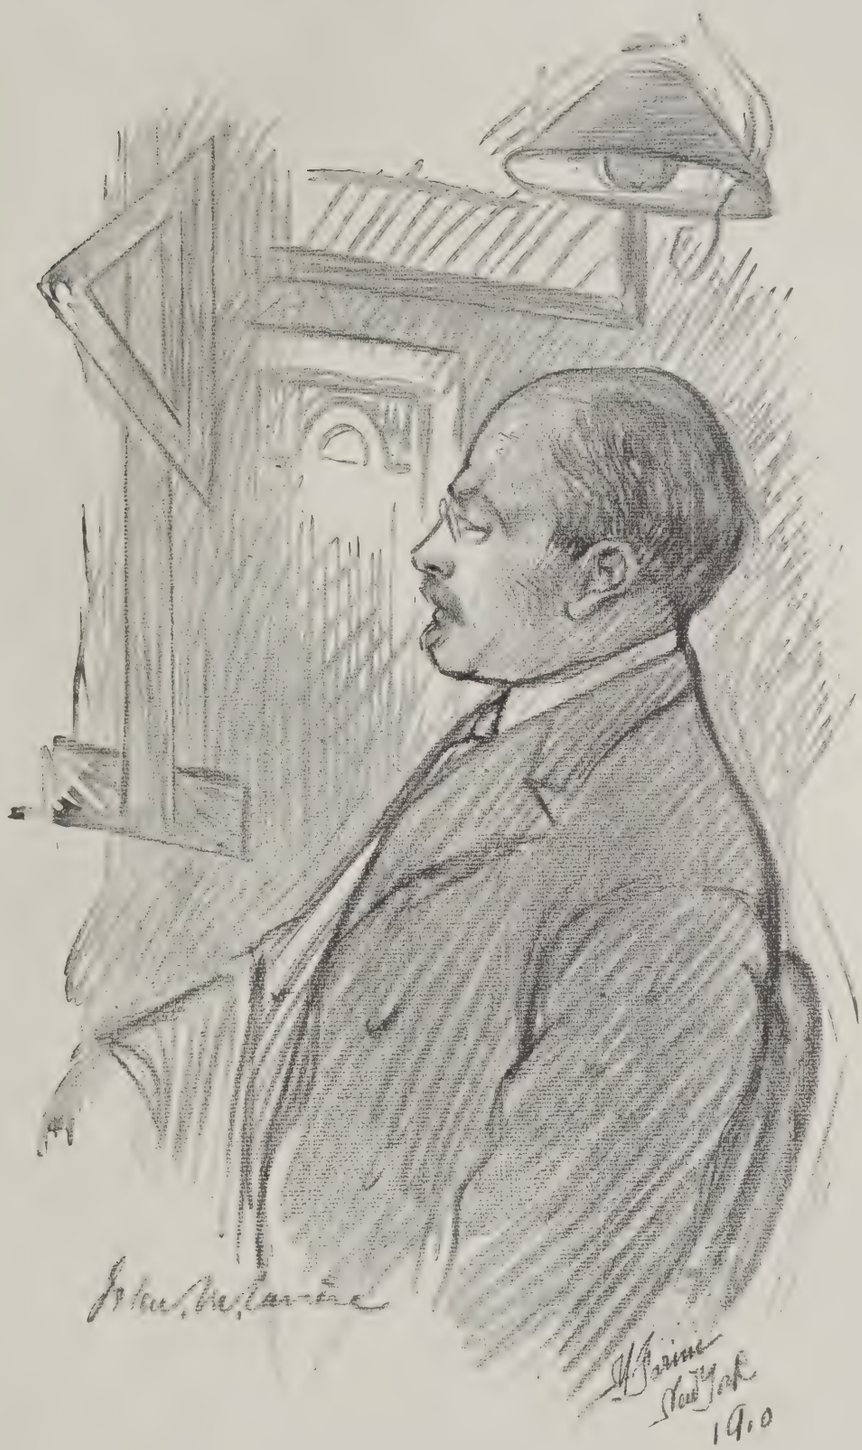
The magnificent design for the cathedral was, however, too far ahead of the times; the building committee was not yet advanced beyond the taste for the work of the school of Richardson, and another design was selected by the committee for execution.

Perhaps the critics did not recognise, as these architects did themselves, that good work could only succeed if the public was educated up to higher standards of taste; and that architects must be taught the ethics of their profession—more especially the ethics of architectural competitions. Upon this task Mr. Carrère began with an energy that drew the attention of the architects, draughtsmen, and students throughout the country; and for nearly twenty years this educational work has been carried on by him with a strenuous zeal. Throughout he has had the steadfast support of his partner, Hastings.

Their Theory of Architectural Art.

Both members of the firm having been trained at the Ecole des Beaux-Arts, where they spent several years, their sympathies have always been with the broad and comprehensive lines laid down at the French school. In their relation to public affairs connected with art they have been enthusiastic exponents of the methods of the Ecole des Beaux-Arts and all that it stands for, and they have contributed largely toward the remodelling of the American educational system in the principal universities on parallel lines with those of the French School.

Their work, which has been executed in every part of the United States and Canada, has been designed on the theory that American architecture needed traditions, and that it should go back, as its point of departure, to the last consistent and really successful period of the Renaissance, the eighteenth century, for its inspiration and its lessons, holding that the development of architecture follows a natural course of development or evolution parallel with the commercial, political, social, and ecclesiastical development in history, and while not disregarding the influence of the periods succeeding the eighteenth century, their theory has been to take up the thread of the evolution where it was broken and to endeavour to carry it on, and in this their work has been consistent and they have always been loyal and faithful to their theories.



The House and Senate Office Buildings, as an illustration of this theory of Messrs. Carrère and Hastings, were inspired directly from Perrault's Colonnade of the Louvre and Gabriel's buildings on the Place de la Concorde, which to them represent the most complete and successful expression of the monumental architectural work of the eighteenth century in France. But however clear the source of inspiration, and however frankly acknowledged, there is no suggestion of slavish copying of the older work, no mere transforming or disguising of a model, but the scholarly study of a new and fresh design which embodies the best characteristics of the French works, but rejects their weaknesses. This is true progress, for it is progress from the best precedents that have come down to us.

As to the individual members of the firm, as it is always interesting to know how far an American *is* an *American*, especially if the name is not of English origin, some account of the personal history of each may not be without value to this article.

Mr. John M. Carrère.

The name Carrère has been for at least four generations American. The great grandfather of Mr. John M. Carrère, having emigrated from France and become an American citizen, married a Miss Walsh, who was closely related to the United States Ambassador to France under President Buchanan. His grandfather, who was American born, married a Miss Buchanan, and his father married a Miss Maxwell.

Mr. Carrère was born in Rio Janeiro, Brazil, in the year 1858, but according to the American and Brazilian laws he is an American by birth. He was educated in the schools of Brazil and Switzerland, and at the Ecole des Beaux-Arts became an "élève de Première Classe." His professors were, first, Victor Ruprich Robert, then Charles Laisne, a member of the Institute of France, and upon his retirement from the direction of the atelier, Léon Ginain, Membre de l'Institut de France. Upon returning to the United States after the com-

pletion of his studies he entered the offices of Messrs. McKim, Mead, and White, where he remained in charge of important work for three years.

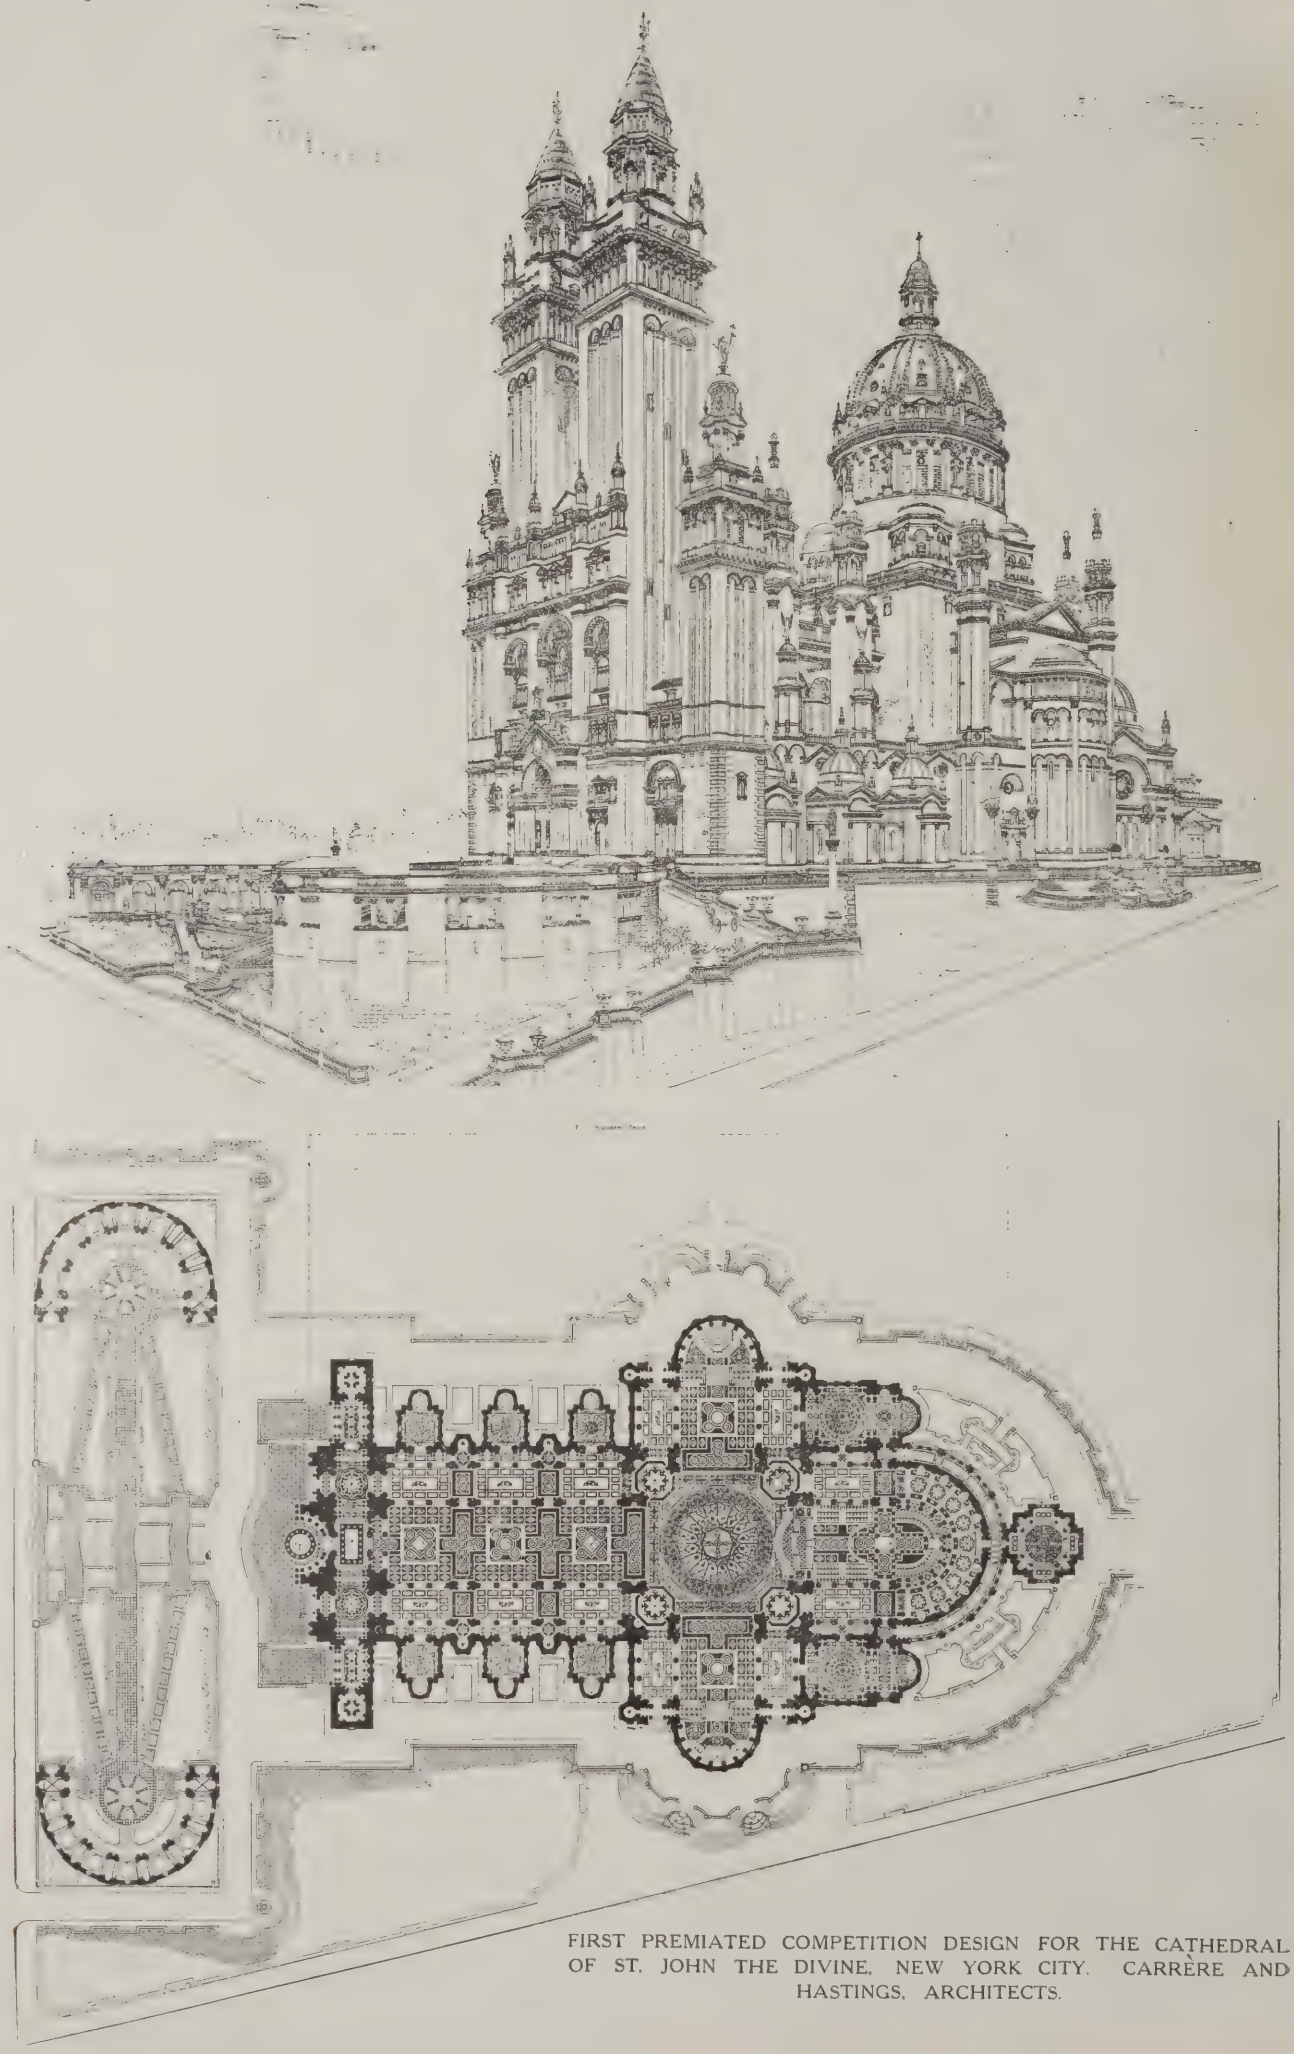
Besides the work which the firm has done jointly, each member has worked individually along special lines for the benefit of the art and profession of architecture. As already indicated in this article, Mr. Carrère has devoted many years to teaching ethics, and to educating the younger men in the profession in the art of design. It was at the instance of Mr. Carrère and the late Richard Morris Hunt, jointly, that M. Masqueray founded his atelier in New York, out of the success of which has grown the whole modern system of instruction in architecture in the United States. Whether Masqueray's atelier would have continued or have ceased after a few years' experiment—just as Hunt's did nearly a half-century earlier—had it not been for the formation of the Society of Beaux-Arts Architects, is a question which does not admit of much doubt.

The only means of keeping students at work after the first few encounters with the necessary drudgery in connection with architectural drawings is to inaugurate the spirit of emulation and competition. The Society of Beaux-Arts Architects was founded in 1894 at the suggestion of Mr. Carrère, and several ateliers were formed to work under the auspices of that society. Mr. Carrère was made the first Chairman of the Committee on Education, and he outlined the course in architectural design which has revolutionised the system formerly prevailing in the American colleges. At the present time practically all of the universities including an architectural course take part in the competitions held by this society, and the recompenses given count so many points in the advancement of the student in his course. The fundamental principle which Mr. Carrère introduced into the American system of architectural education is, that *design* is the first essential to architecture—that whatever other training a student may receive he is wholly unfit to practise architecture unless thoroughly trained in design. Mr. Carrère was for two terms

RESIDENCE OF F. H. GOODYEAR, BUFFALO, N.Y.
CARRÈRE AND HASTINGS, ARCHITECTS.

President of the Society of Beaux-Arts Architects, composed of pupils of the Ecole des Beaux Arts residing in the United States.

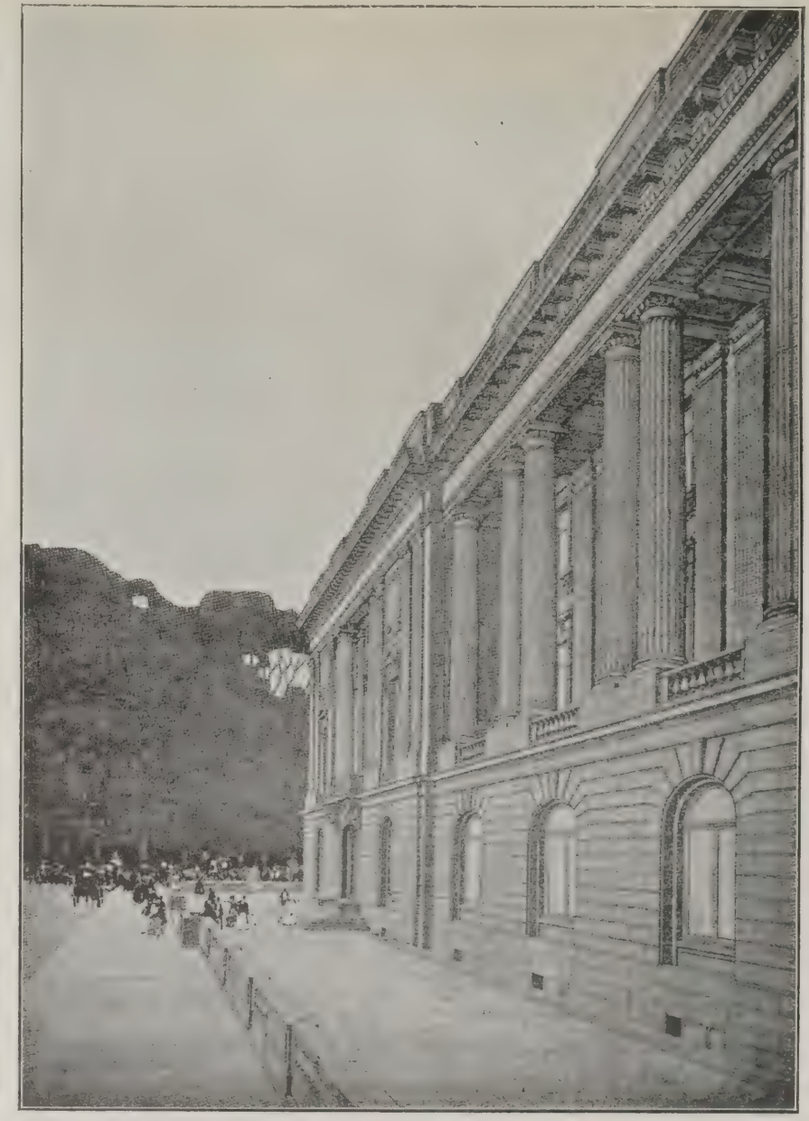
The very important work of establishing the Art Commission of the City of New York was entirely Mr. Carrère's idea, and was put through by himself and his friends, notwithstanding the pessimistic views of the art interests at large.



When the American Institute of Architects, under the leadership of Mr. Burnham, was warring for a revision of the method of designing public buildings—that is to say, for the placing of the work in the hands of the leading practising architects, under the supervision of the Government architect, instead of having it designed by him—there came a time when the architects had so clearly made their case against the Government that it could no longer ignore their protests and claims. Carlisle, who was Secretary of the Treasury, seemed to have no desire to make improvements in his department, and so far as the attacks of the President of the American Institute of Architects were concerned, he made them a personal matter between himself and Mr. Burnham. Finding

YALE MEMORIAL DINING HALL, YALE UNIVERSITY, NEW HAVEN, CONN. CARRÈRE AND HASTINGS, ARCHITECTS.

that he was losing in the fight, and that he had but one more card to play, he cast about him and sought for a way out of the difficulty. It was upon Mr. Carrère that his eye fell. Carrère was the youngest and most vigorous of the hornets about his ears; he was the whip of the party; it was he who kept an agent at Washington to keep track of, and to push, bills which interested the architects. It was he who advanced money to pay various expenses; and it was he who—worst of all—sent out the telegrams which brought those accursed "architect fellows" (to use the Secretary's own words) to Washington from time to time, and just in time to spoil some of his best plans. It was Carrère who was responsible for the occasional and objectionable intrusion of Post, Mead, and Burnham upon his tapis in the Treasury Department, and, to use the choice expression employed at the time by a Western New York Irish-American Congressman, "Carlisle hates Burnham worse than the devil hates holy water." He listened to a suggestion which came from the architects themselves; he offered the position of Supervising Architect of the Treasury Department to Mr. Carrère! That, surely, would settle the matter to everybody's satisfaction.



The writer recalls some of the discussions which took place among the architects in a town where he was working at the time. One of the prominent architects of that town came to the office of another and asked if the latter had heard that Carrère had been offered the position of Supervising Architect, to which the reply was made that it hardly seemed credible, but, if true, it would give him a wonderful opportunity to make a great reputation, and the temptation to accept must be very severe. And the observation was added, "Carrère has been preaching the higher code of ethics; we have

now the opportunity to learn whether he can practise them." Shortly afterwards the architect who had passed this remark entered the office one morning with a newspaper in his hand and announced: "Well, I see that Carrère has made good." Mr. Carrère declined the appointment, not only upon grounds of loyalty to the cause of his confrères, but because he was satisfied that with the large volume of work being done by the Government, it was impossible for any one architect to cope with it, and that, with whatever valuable assistance he might be afforded in the way of young designers, positions in the Government office could never attract the best talent. The only way for the Government to obtain suitable experienced professional and artistic talent was to employ the leading practising architects. This was the substance of his reply in declining the appointment, and it convinced the public officers of the earnestness of his and the other architects' purpose.

President Cleveland and his Cabinet went out of office shortly afterwards, but under President McKinley and his Secretary, Seymour Gage, the present order of things was established. All large Government buildings are now given out to private architects, who are usually selected by competition.

Mr. Carrère has succeeded very largely through his personal efforts in establishing a proper code of ethics for the New York Chapter of the American Institute of Architects, which was the basis of the code adopted by the Institute at its last Convention. He is also the originator of the code of competitions of the Chapter which the Institute at the last Convention voted to enforce for the entire country, with this difference: That it shall be unprofessional for any member of the Institute to *enter* a competition until the programme has been submitted and approved.

Mr. Carrère was Chief Architect of the Pan-American Exposition, and Chairman of the Board of Architects in charge of the grounds and landscape features of the Exposition. Besides this, he has personally held the following appointments and commissions:—

Under appointment by the State of Ohio he now holds office as a member of the Group Plan Commission, having charge of the remodelling of a large section of the City of Cleveland, with a view to establishing the grouping of all the public monuments and buildings with proper surroundings and parks. The work is still in process and well advanced.

He is a member of a similar commission to revise the plan of the City of Baltimore, Maryland, and to design a civic centre, the grouping of its public buildings and a system of avenues and parkways connecting the various points of interest of the city. Preliminary reports have been made and approved.

Member of a similar commission to report on a comprehensive plan for the City of Grand Rapids, Michigan. Preliminary reports have been made and approved.

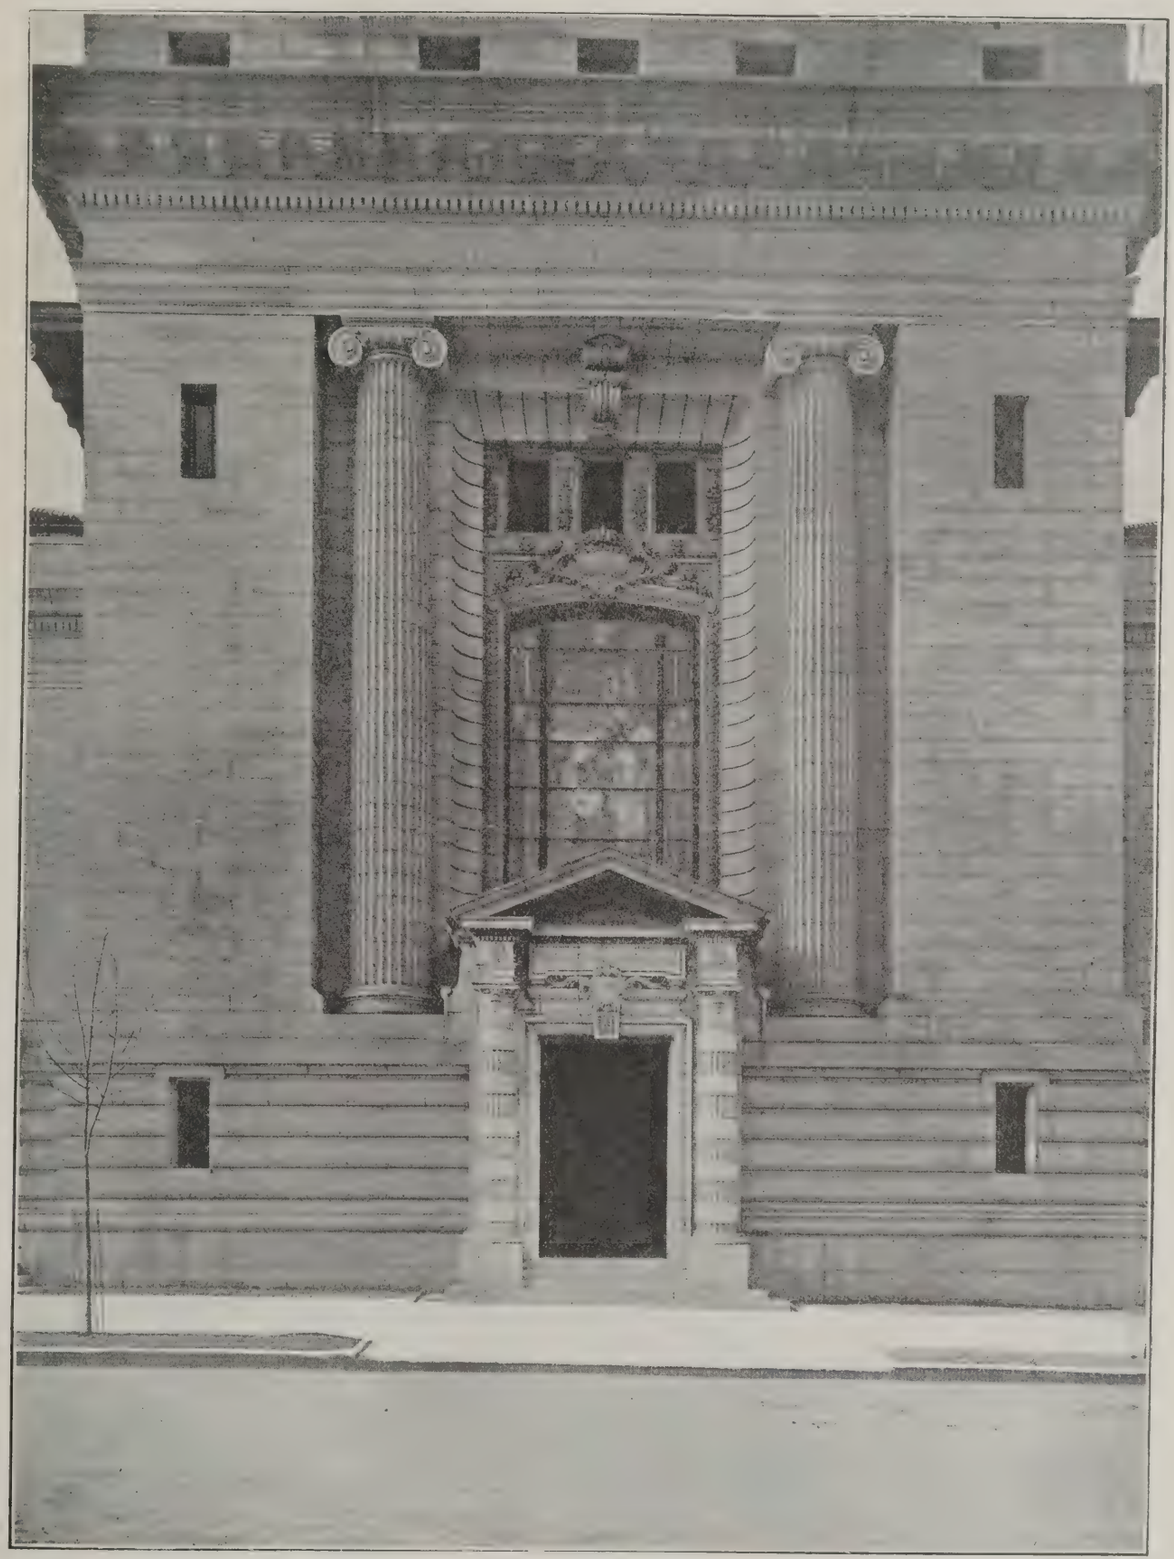
Appointed by the City of Hartford in association with Mr. Hastings to advise and report concerning the development of the plan of that city. The report is now under preparation.

Appointed in association with Mr. Hastings to make an extensive report for the entire remodelling of Atlantic City. The report has been presented and approved, and the work is in process of execution.

Was consulting architect in charge of the design of the Senate Office Buildings or annexe to the United States Capitol in Washington, D.C.

Appointed with Mr. Hastings by Joint Committee of the United States Senate and House of Representatives to prepare a report on the extension of the United States Capitol.

President for two terms of the New York Chapter of the American Institute of Architects. Was several times a Director and a member of the Executive Committee, and is serving at present in that capacity. Several times a Director of the American Institute of Architects, and is serving at the present time in that capacity.



One of the founders and trustees of the Fine Arts Federation, comprising as its constituent societies the thirteen leading arts societies of the City of New York. The founder of the Art Commission of the City of New York. One of the founders of the "Prix Américain." which is a prize offered at the Ecole des Beaux-Arts. It is open only to French students. An associate member of the National Academy of Design. Member of the National Institute of Arts and Letters; member of the Century Club of New York; Director of the American Academy in Rome (Villa Mirafiori).

Mr. Thomas Hastings.

Mr. Thomas Hastings was born in 1860 in the City of New York, of American parents. His grandfather was distinguished as a musical composer. His father, the Rev. Dr. Thomas S. Hastings, an eminent Presbyterian divine, was for

many years the minister of the principal Presbyterian Church in New York, and President of the Union Theological Presbyterian Seminary. His mother was a Miss De Groot, an American of Dutch and French origin.

Mr. Hastings was educated in New York City. At the Ecole des Beaux-Arts he became an "élève de Première Classe" under the professorship of Jules André. Upon his return to the United States he entered the office of Messrs. McKim, Mead, and White, where he remained for two and one-half years, when he entered into partnership with Mr. Carrère. Mr. Hastings has held the following appointments and commissions;—

One of the founders of the Society of Beaux-Arts Architects, and for several terms a director. He was for two years President of the Architectural League of New York, and several times a director.

He is a member, and was several times a director of the American Institute of Architects, and also of the New York Chapter of the American Institute of Architects. He is also an associate member of the National Academy of Design; a member of the American Academy of Arts and Letters; a member of the National Institute of Arts and Letters.

For several years was architect of the Department of Parks of the City of New York. Consulting architect of the Department of Bridges of the City of New York. Consulting architect in charge of the design of the House Office Building or annex to the United States Capitol in Washington, D.C. Professor of architecture in charge of one of the ateliers at Columbia University in the City of New York.

Appointed by the City of Hartford in association with Mr. Carrère to advise and report concerning the development of the plan of that city.

Appointed in association with Mr. Carrère to make an extensive report for the entire remodelling of Atlantic City. The report has been presented and approved, and the work in is process of execution.

One of the founders of the "Prix Américain."

In collaboration with Mr. Carrère appointed architect of the Lafayette Monument pedestal in the Place du Carrousel, Louvre, in Paris.

Appointed with Mr. Carrère by the Joint Committee of the United States Senate and House of Representatives to prepare a report on the extension of the United States Capitol.

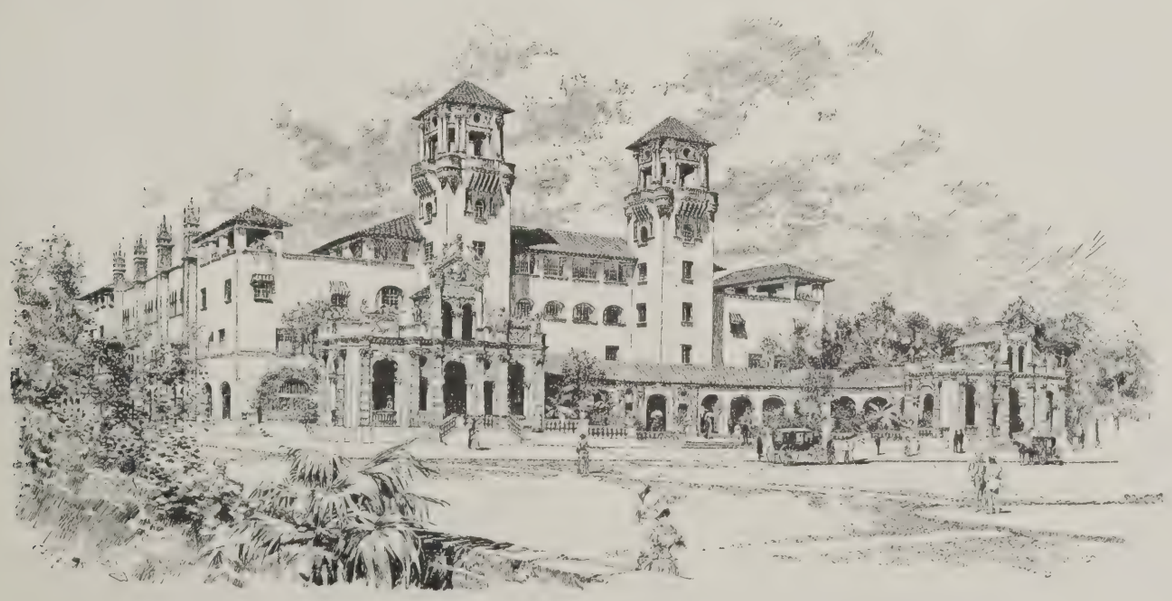
Established one of the first free ateliers for the teaching of architecture on the lines of the Ecole des Beaux-Arts, helping to establish the foundation of the present successful educational work of the Society of Beaux-Arts Architects.

Second chairman of the committee on education of the Society of Beaux-Arts Architects and continued the work started by Mr. Carrère.

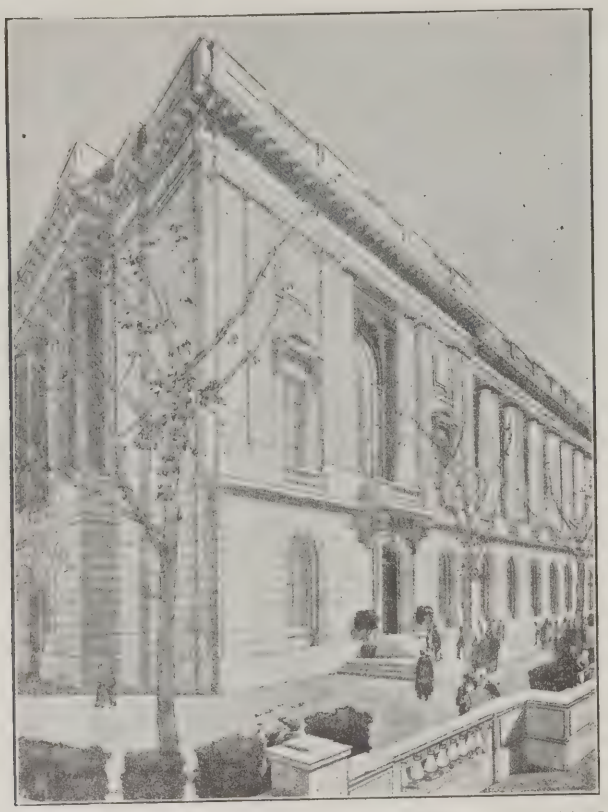
Member of the Century Club for New York.

One of the founders, and for several terms a director, of the American Academy in Rome (Villa Mirafiori), and is serving at the present time in that capacity.

Received the decoration of Chevalier of the Legion of Honour from the French Government in recognition of his services as the official architect of the Lafayette Pedestal in the Place du Carrousel, Louvre, in Paris, which was designed in collaboration with Mr. Carrère.



OFFICE OF THE CARNEGIE INSTITUTION, WASHINGTON, D.C. CARRÈRE AND HASTINGS, ARCHITECTS.



Similarity of Ideals.

It will be seen from the above notes that each of the partners has had practically the same training and experience, that the ideal of each is classical, that the special form of expression of that ideal is through a development of the forms of the advanced Renaissance styles, and that each has a preference for the work of the same period. It is therefore assuming equal natural artistic instincts, that they should think alike and work alike, and that it is impossible to dissociate the works of one from those of the other. All is collaborative, with perhaps the exception of the two annexes to the United States Capitol, for which each designed a building separately, and produced two buildings one of which was the counterpart of the other, proving that they could not do their work without consulting each other and arriving at exactly the same conclusions—except in trifling details. Even in the task of educating the public and the younger men both have pulled together. Only in matters in which exceptional force and individual energy has been required has one appeared alone, and for such emergencies Mr. Carrère has always come to the fore.

Mr. Hastings has worked along the more quiet and gentle path of direct personal instruction. Mr. Carrère has led the strenuous life so dear to and so parallel with—in its way—that of the Ex-President Roosevelt. It has been stormy,

THE ALCAZAR, ST. AUGUSTINE, FLORIDA. CARRÈRE AND HASTINGS, ARCHITECTS.

CORNER OF THE SENATE OFFICE BUILDING, WASHINGTON.
JOHN M. CARRÈRE, ARCHITECT.

trying, fraught with difficulties and jealousies in his way, which have always been overcome—usually by excellent diplomacy—but, when occasion has arisen, with an active force that has impressed upon the memories of friend and foe that this is indeed a strong man. If, and it may be said so, Mr. Hastings was the greatest rival of the late Stanford White in brilliancy of imagination and subtlety of thought in the refining of delicate design, so too may it be said that Mr. Carrère has been for many years the chief rival of the late Charles Follen McKim as the leader in matters of art and its relation to the social fabric of civilisation in America. It is to the position among architects—among artists—held by McKim, Mead, and White that (since the passing away of McKim and White) Carrère and Hastings succeed. So close has been the personal friendship existing between the members of both firms, and so closely allied their aspirations and hopes, that the rivalry was always of the friendliest and most sportsmanlike character. To all intents and purposes they have been members of one family of artists.

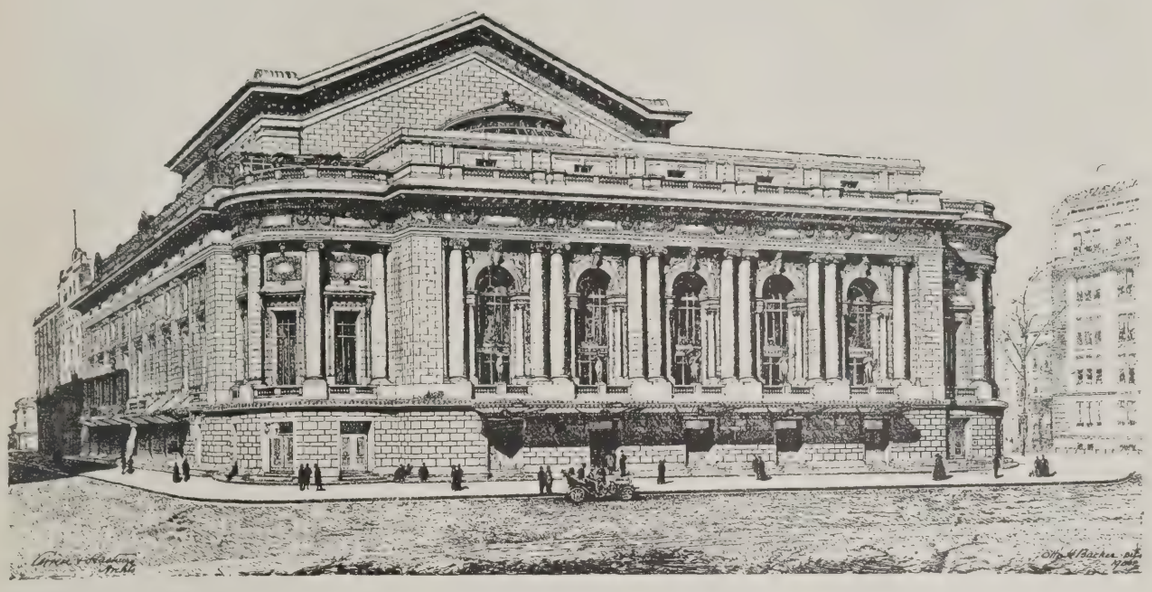
Principal Works.

The earliest examples of their work have been indicated—the group of buildings, hotels, churches, etc., at St. Augustine; and their first notable success in a great competition—the design placed first for the St. John the Divine's Cathedral at New York. Among other work which followed, and, because of its scholarly excellence and the remarkable strength of the plans, attracted the attention of other architects, were their successful competitive designs for the City Hall at Paterson, New Jersey; New York Public Library and National Academy of Design; and their competitive design (which all but won), the New York Custom House, which so far as the architecture of the building was concerned was better than the design selected. Considered purely as architecture, this design was in many respects the greatest composition that has been produced by any American architect. More recently their success in the keen competition for the New Theatre has again drawn attention to the exceptional strength of their design. and the originality of the whole conception. It is, however, impossible in this space to more than briefly catalogue the more notable of their very long list of works.

The following is an incomplete list of the other important or characteristic works of the firm completed at this time:—

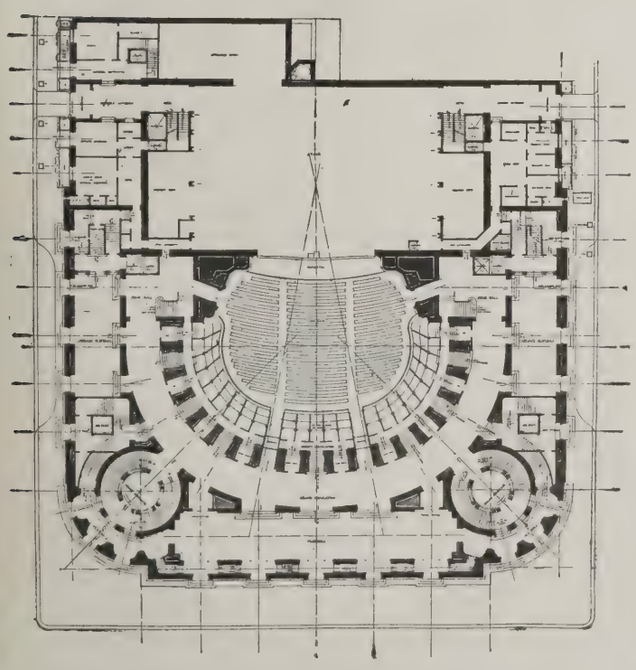
PUBLIC AND EDUCATIONAL BUILDINGS:—New York Public Library, New York City; Annexes to the U.S. Capitol, Senate Office Building, Washington, D.C., House, Office Building, Washington, D.C.; Borough Hall, Borough of Richmond, N.Y.; Ferry Terminal, Borough of Richmond, N.Y.; Paterson City Hall, Paterson, N.J.; Administration Building for the Carnegie Institution, Washington, D.C.; City Hall, Portland, Maine; fourteen Carnegie Branch Libraries in New York City. Manhattan Bridge and Approaches, City of New York; New Theatre, New York City; Woolsey Hall, and the Memorial Dining Hall at Yale University, New Haven, Conn; Rockefeller Hall and Goldwin Smith Hall at Cornell University, Ithica, N.Y.; Science Hall at Hamilton College, Clinton, N.Y.; McKinley Monument, Buffalo, N.Y.; Pedestal of Lafayette Monument, Paris, France.

CHURCHES:—Methodist Church and Parsonage, St. Augustine, Florida; Presbyterian Memorial Church, St. Augustine, Florida; Central Congregational Church, Providence, Rhode Island; Christian Science Church, New York.



OFFICE BUILDINGS:—Mail and Express, New York City; Pierce Building, New York City; Blair Building, New York City; Royal Bank of Toronto, Canada; Traders Bank in Toronto, Canada; Pan American Exposition, Buffalo, N.Y.; St. John's Park for the City of New York; Hamilton Fish Park for the City of New York.

COUNTRY ESTATES:—E. C. Benedict, Greenwich, Conn; C. Ledyard Blair, Peapack, N.J.; E. H. Harriman, Arden, N.Y.; Murray Guggenheim, Elberon, N.J.; Otto H. Kahn, Morristown, N.J.; Whitehall for Henry M. Flagler, Palm Beach, Fla; Giraud Foster, Lenox, Mass; Mrs. Richard Gambrill, Newport, R.I.; Walter Jennings, Cold Spring Harbor, L.I.; Colonel Oliver H. Payne, Esopus, N.Y.



CITY RESIDENCES:—Mrs. Richard Townsend, Washington, D.C.; Mrs. Ralph Ellis, Washington, D.C.; Honorable Elihu Root, New York City; Honorable George L. Rives, New York City; Doctor C. A. Herter, New York City; Charles F. Hoffman, New York City; Burrah Hoffman, New York City; Richard M. Hoe, New York City; Doctor E. K. Dunham, New York City; John H. Hammond, New York City; Frank H. Goodyear, Buffalo, N.Y.

NOTES AND NEWS.

The "Unenterprising" (?) British Builder.

It is suggested that because certain works on French soil are being carried out by French contractors, Englishmen are not sufficiently enterprising. The proposition loses much of its daring, however, when the explanation is added that the land and the houses concerned in it are the property of Englishmen. At Le Touquet, a correspondent of the "Financial News" took note of several fine houses being built for Englishmen by French contractors; while "a big hotel in the forest," which must have cost from £60,000 to £70,000, and is, it is understood, financed by a combination of English and French capital, is being built by contractors from Paris. Moreover, while all the land in Le Touquet was acquired by an English syndicate. some six or seven years ago, and its very extensive development has been "necessitated" by very extensive English advertising, in only a few instances has any of the work been done by Englishmen. The writer made enquiries as to the names of the English architects who designed the few buildings erected by English people at Le Touquet, and found that they included Mr. T. E. Collcutt, Mr. W. D. Caröe, and Mr. A. Blomfield Jackson. No doubt there are others, and the capitalists have probably found it easier to engage British architects than to employ British contractors, materials, and labour. While, therefore it is perhaps, as our contemporary remarks, "a pity that some of our English firms do not try to secure some of the business at Le Touquet and Paris-Plage, instead of leaving the field almost entirely to French builders," we can hardly agree that it is merely "want of enterprise" that has kept Englishmen out. There are, it may be assumed, more practical obstacles than the fear of injuring the *entente cordiale*, and even more material difficulties than that of distance from headquarters. The British builder who thinks twice and thrice before venturing to tender for the erection of a small villa in Le Touquet is not to be accused of want of enterprise.

A Fourteenth Century Palace Restored.

Florence now affords the opportunity of seeing a fourteenth century palazzo in what, unless the restorers have erred, is virtually its original condition. This is the Davanzati Palace, in the Via Porta Rossa, a narrow street in the centre of the city, running parallel to the Arno, and extending from the lower end of the Tornabuoni to the Mercato Nuovo. The palazzo was built early in the fourtenth century by the wealthy Davizzi family, who, sinking to poverty, sold it in 1578 to Bernardo Davanzati, a man of wealth and a translator of Tacitus. In 1830, the last representative of this family, Carlo di Giuseppe, threw himself from a high window in this palace, which even before then had begun to lose all its character. "It underwent," says a "Times" correspondent, "the fate of most of the great Florentine houses. It was broken up into a score of tenements. The frescoed walls were plastered over, the fine wooden ceilings were covered with innumerable coats of whitewash, and joists, beams, and windows fell into a state of ruinous decay." In 1904, Signor Elie Volpi, an art expert and dealer, bought the palace, and he is said to have spent 42,000 lire on the restoration, including more than 50,000 lire for steel girders and beams, which, happily invisible, have made the building solid and strong. The old ceilings, fireplaces, and fresco decorations are now "just as they must have appeared to the Davizzi," many of the old decorations having been revealed in excellent condition when the plaster was removed. "The adornments of the frescoed rooms are for the most part simply decorative—diamond-shaped red panels, enclosing *stemme* or heraldic beasts; but there is a good St. Christopher on the first landing, and in the best bedroom, the *camera di sposa*, a deep frieze has been laid bare containing a whole painted story in some twenty scenes"—apparently a variant of the Romeo and Juliet theme. At the fifth floor there is a fine sixteenth-century loggia, "commanding a glorious view of Florence, and Signor Volpi has supplied many pieces of appropriate unrestored furniture associated with the earlier period.

Puddletown Church, Dorset.

Mr. Thackeray Turner, the secretary of the Society for the Protection of Ancient Buildings, has addressed a letter to the Bishop of Salisbury, in the course of which he says:—"The case for restoration seems a singularly weak one. To say that this church would gain in beauty by a modern patch would be preposterous, and we believe no one has ventured this plea. The ground of utility is equally lacking, for we learn that the church is larger than the parish needs. . . A very loose-thinking sentimentality has widened the circle of approval. There are two appeals to sentiment. First, the chancel once was longer and should therefore be rebuilt as it was before. Those who reason thus do not stop to consider that we do not know what the older chancel was like, and that if we did we could not raise from the dead the Middle Ages or bring to birth from a corpse a living work of art. The other appeal to sentiment depends on a belief that stones from the church were used in a house in the parish. It is proposed to kill two birds with one shot—to destroy a chancel built in 1576 and a house of about the same date in order to recover some stones which have lost their vital significance as architecture. Further, it is intended to move the pulpit so as to expose the rood stair doorway; but the former existence of rood screens is now so familiar that it is quite unnecessary, and the proposed new sounding board would lessen the feeling of genuineness which is part of the charm of the place. For the proposal to lengthen the north aisle there seems no excuse, and it certainly involves the pulling down of an old wall, and another disturbance of the peaceful beauty of the church. Some repairs are no doubt needed, but if these were carried out under an architect who could be on the spot the whole time the building need lose little of its charm." It will be understood that our reproduction of these extracts from Mr. Thackeray Turner's letter does not necessarily imply that we are in sympathy with all that it contains; but as we have already given a statement of the case for restoration, it is only fair to afford the other side a hearing.

Public Health Exhibition.

The second Municipal and Public Health Exhibition, which was held at the Royal Agricultural Hall last week, showed what is being accomplished by the municipalities in the direction of improving public health and comfort. Every department of municipal work was represented. The visitor could see the latest triumphs of sanitary engineering, and the part that electricity plays in the home, the newest devices affecting gas and water supply. A striking feature of the exhibition was the alleyway devoted to the display of road and paving materials. Ten different kinds of roads were laid down. They were constructed with the knowledge that the motor-car is increasing in popularity, for it is claimed that each is dustless. In the centre of the hall an attempt to deal with the housing problem, especially in the country districts, took the form of a model municipal cottage, which combined cheapness with comfort. It comprised a large living-room and scullery-bathroom on the ground floor, and three bedrooms on the first floor, and, it is stated, can be built anywhere at a cost of £175. During the exhibition conferences and lectures of special interest to the delegates from the local authorities were held in the afternoons, while in the evenings popular lectures for the instruction of the public in matters affecting local government were given.

St. George's Chapel, Windsor.

The first step towards getting St. George's Chapel ready for the solemn ceremonies of the 20th inst. consisted in clearing all the benches out of the nave. A large number of workmen were engaged during the day in this work, under the direction of Mr. A. Y. Nutt, clerk of works at Windsor Castle. As soon as that was completed, carpenters were set to work erecting a staging in the nave for the accommodation of the

privileged spectators who will attend the funeral ceremony. This structure will rise at an easy slope from near the western end of the choir, and will accommodate about seven hundred persons. It will be draped in dark purple, tied with silver-white bands. The choir and Garter Stalls will be draped in fabric of a similar mourning tint, and from the west door to the altar steps a similar floor cloth will be laid down. The staging will rise on either side of the central passage up the nave, the passage being, of course, kept clear for the conveyance of the coffin to the bier. The Royal mourners, foreign Sovereigns, and their representatives will be seated in the choir, where the Knights of the Garter will occupy their stalls. Others entitled to be present will have seats reserved for them on the structure now being erected in the nave. These arrangements are practically the same as those observed at the funeral of Queen Victoria. It has now been definitely decided that the mortal remains of his late Majesty shall rest in the Royal vault beneath the Albert Memorial Chapel, and not in the vault in St. George's Chapel. The Albert Memorial Chapel vault was prepared by George III. to serve for generations as a resting-place for the Royal line of England. When King George set about completing the repairs to the Wolsey Chapel, as the Albert Memorial Chapel was then called, he found that the foundations of the building went down to the solid chalk, and he conceived the idea of underpinning the walls and excavating a Royal vault. It is in this vault, says a "Times" special correspondent, that George III. was laid, and here nearly all his descendants have since been buried. The Royal vault was formerly a very dark and gloomy apartment, with long stone tables, upon which the coffins rested. During the later years of Queen Victoria's reign, and in the first few years of that of King Edward, a series of alterations was made. Round the walls three tiers of wide stone benches were erected for the reception of the Royal coffins. These benches were divided into compartments, each large enough for a single coffin, and their fronts were enclosed by a handsome grille of artistic hammered ironwork. The masonry-filled entrance has been replaced by an open stone screen, and the vault and passages fitted with an electric-light installation. The last interment which took place in the Albert Memorial Chapel was that of the late Duke of Teck, who was buried on Jan. 27, 1900.

An Art Palace for London: "An Alluring Dream."

Mr. Walter Crane, having been asked by the editor of the "Daily News" for his opinion on what he (Mr. Crane) describes as "this alluring dream of Sir Hubert von Herkomer's of an Art Palace for London" (to which reference was made in our columns last week), says that he thinks it magnificent, and he declares that if there existed any real enthusiasm for art, or for the adequate housing of art among our people, such a dream would be realised to-morrow. Munich already contains several such palaces, giving impartially equal opportunities both to the old and the new schools to appeal to the public; while in London the centre of the wealthiest Empire of the world, we get poorer and poorer in the matter of public art galleries. Paris has its Grand Palais! Why not London? Sir Hubert's scheme for giving ample opportunities and exhibition space to societies of artists now practically homeless, and, Mr. Crane presumes, chances to unattached artists to place their works before the public, shows a large and generous spirit, although he naturally clears the main stage for his own body, the Royal Academy, which, alone among our Royal societies of artists, enjoys already a splendid mansion rent free. A visitor to the Royal Academy Exhibition, Mr. Crane observes, would hardly realise that any form of art other than painting in oil was of much account. We want a Grand Palais in which all the arts and crafts of design could be shown in their proper relation on a truly national scale and in a truly national spirit. Sir Hubert's words, "individual brilliancy is plentiful, yet collectively we are allowing art to sink into the gutter, instead of making it the glory, and, in a sense, the religion of life," are admirable, and exactly express the present position of art. Hyde Park would no doubt be a splendid site, but one would be a little reluctant to further encroach on London's greensward—unless the present site of the police barracks could be utilised. Where there's a will there's a way, and Sir Hubert Herkomer (Mr. Crane declares) has done good service in appealing to our sense of the importance of art in its bearing on life and as the highest means of national expression.

Dr. Johnson's Statue in the Strand.

Hidden by its white covering, the statue of Dr. Johnson in the churchyard of St. Clement Danes will for the present continue to be an object of unsatisfied curiosity to passers-by, the unveiling by Princess Louise, Duchess of Argyll, which was to have taken place last Saturday, having, of course, been postponed owing to the King's death. The statue, as we have already stated, is the work of Mr. Percy Fitzgerald, who has presented it to the rector, the Rev. J. J. H. S. Pennington. It represents Johnson facing Fleet Street, and his familiar haunts, with a book in his hand, and the avidity of his literary research suggested by others strewn at his feet. The statue is 6ft. high, and stands on a pedestal of similar measurement, so that placed as it is, at the east end of the churchyard, it forms a bold and conspicuous memorial of the genius of the locality. Those who have seen it pronounce it to be a very characteristic presentment of Dr. Johnson. On the pedestal there are medallions recalling incidents of his life. The position is the more appropriate since Dr. Johnson was a regular worshipper in the church, where his pew above the pulpit is still shown at a small charge to defray the balance of cost of the stained glass window to his memory unveiled by Princess Henry of Battenberg last year. The date of the unveiling ceremony remains uncertain.

The site is perhaps the most appropriate that could be found for a statue of Dr. Johnson. One has always felt that Bacon's rather ridiculous effigy of him in St. Paul's is somewhat out of place, taking him rather further east than he was wont to venture, except when bent on business visits to the booksellers. When out for pleasure or worship, he usually went west.

CARNEGIE INSTITUTION, WASHINGTON, D.C. CARRÈRE AND HASTINGS, ARCHITECTS.

D

NEWS IN BRIEF.

Mr. George Macfarlane, who is a prominent member of the National Federation of Building Trades Employers of Great Britain and Ireland, has been appointed by the Chancellor of the Duchy of Lancaster to the Commission of the Peace for Manchester.

* * *

Mr. John Belcher, R.A., is the architect for the new premises of Messrs. Whiteley, in Queen's Road, W.

* * *

Mr. Nandy Hoskins, in winding up his course of lectures on sanitary science and engineering at the Borough Polytechnic Institute, delivered a lime-light lecture giving a résumé on the subjects dealt with during the session. At the conclusion of the lecture, Mr. Percy Hawkins, on behalf of the students, presented Mr. Hoskins with a silver-mounted umbrella, and referred in eulogistic terms to the great service rendered by the lectures to the students, who had benefited by the clear and concise way in which Mr. Hoskins had brought the matters before them. He had often gone out of his way in furnishing material for their instruction, and had taken the greatest care that each student should receive more than a superficial knowledge of the subjects dealt with.

* * *

Mr. R. Frank Atkinson, F.R.I.B.A., of 8, Sackville Street, W., has been appointed by the Midland Railway Company architect for the proposed works to the Adelphi Hotel, at Liverpool.

* * *

Messrs. Patman and Fotheringham, Ltd., of 100 and 102, Theobald's Road, W.C., have obtained the contract for the erection of the Labour Home in Marylebone Road for the Church Army, under Mr. G. A. Lansdown, architect.

* * *

At a meeting of the Ipswich District National Association of Operative Plasterers, the following resolution was passed: "That this meeting urges the necessity of the Government reintroducing the Shops No. 2 Bill at the earliest possible moment with the following amendments: 1, Universal 60 hours' week (inclusive of meal-times); 2, weekly half-holiday at 1 p.m.; 3, Adequate meal-times." A copy of this resolution has been sent to the Prime Minister, the Home Secretary, and the local Members of Parliament. Much seems to turn on the definition of "adequate meal-times."

* * *

A conference of members of the Appeal and Assessment Committee of the Metropolitan Water Board with representatives of the London County Council and of the Rating Authorities of London was held last week at the offices of the Metropolitan Asylums Board, when the Chairman of that Board, Mr. E. B. Barnard, who presided, explained that the object was to see if means could not be devised for avoiding litigation between the rating authorities and the Board in connection with the forthcoming quinquennial assessment, and consequent waste of the money of the ratepayers. The Water Board, having nothing to conceal, was ready to throw the cards upon the table—a huge sum had to be paid by the Board in rates, but it was thought the expense might be avoided in the matter of the division of the money. Mr. C. G. Musgrave, the Chairman of the Appeal and Assessment Committee, moved that with a view to avoiding litigation and the expenditure of public money it was expedient that the valuation of the Water Board's undertaking, as a whole, should be made by an independent valuer, "acting on behalf of the Metropolitan Assessment Committees and the Water Board." As the result of an amendment, however, the words quoted were struck out, and Mr. Musgrave said that in those circumstances he could not advise his Committee to incur the expense involved unless the rating authorities would agree to accept the figures arrived at.

The Coventry Martyrs' Memorial, which is being executed by Messrs. George Maile and Son, is an old style Celtic cross which, with the steps, reaches a height of 20ft. It will be executed in silver grey Cornish granite, with the laurel wreath and arms of Coventry in solid gun-metal. The inscription will mention the following: "In 1510, Joan Ward. On April 4th, 1519, Mistress Landsdail (or Smith); Thomas Landsdail, hosier; Master Hawkins, skinner; Master Wrigsham, glover; Master Hochett, shoemaker; Master Bond, shoemaker. In January, 1521, Robert Selkeb (or Silksby). On February 8th, 1555, Laurence Saunders. On September 20th, 1555, Robert Glover and Cornelius Bongey."

* * *

The Ecclesiastical Commissioners have consented to accept the new Lady Chapel of the cathedral now in course of erection at Liverpool in lieu of the present cathedral. As soon as the Lady Chapel is completed, the services proper to the cathedral church will in future be carried on there. Meanwhile, the arrangements for the dedication on St. Peter's Day are being matured. In the building of Liverpool Cathedral a sum of £53,000 has already been expended on the main fabric—inclusive of the site and foundations—and £40,000 on the Lady Chapel, or £93,000 in all. A further sum of nearly £100,000 is in hand, but another £50,000 will be required to complete even the first portion of the scheme.

* * *

The "Little Theatre," which is being built for Miss Gertrude Kingston on the site of the old bank buildings of Messrs. Coutts and Co., will seat about 400 persons, and is now rapidly nearing completion. Mr. A. B. Hayward, the architect, has stated to an interviewer that it has long been Miss Gertrude Kingston's desire to have a miniature theatre in London in the style of those in Berlin and Munich. One of the features is that the six boxes, with the Royal box in the centre, all face the stage, and are at the back of the stalls. There will be no pit or gallery, only stalls and boxes. The stage will be the same breadth as that of the St James's Theatre, but not of equal depth.

* * *

The erection of twenty-four churches or mission buildings in Plymouth, Devonport, and Portsmouth, in which dockyard towns there has been, owing to "the exigencies of public policy," a rapid increase of population—to the extent, it is estimated, of some 80,000 inhabitants—is advocated in a letter which has been addressed to the Press by the Bishops of Winchester, Exeter, and Southampton, and is also signed by other influential Churchmen. The joint appeal is for £100,000. The organising secretary of the appeal is the Rev. Stanley P. Scott, Church House, Dean's Yard, Westminster.

A special report on dangerous or injurious processes in the smelting of materials containing lead, and in the manufacture of red and orange lead and flaked litharge, has been issued in the form of a Parliamentary White Paper. The author of the report, Dr. Collis Browne, states that it is the result of an inquiry made into the various industries in which furnaces are used for the extraction of metals from materials containing lead, or in the preparation of oxides of lead. The industries concerned are the smelting of ores containing lead, which includes the extraction of lead, silver, or zinc in the form of spelter, from such ores, and the production of red and orange lead and of flaked litharge. The result of the inquiry is that further precautions, beyond those of the special rules, are needed in lead smelting, and that regulations are required for zinc spelter manufacture; for the manufacture of red and orange lead very little beyond the requirements of the present special rules seems necessary, but they should be extended to the manufacture of flaked litharge. It is estimated that the regulations recommended will apply to thirty-four lead smelting factories, eight spelter works, seventeen factories where red and orange lead are manufactured, and to eight factories where flaked litharge is manufactured.

* * *

The Mayor of Southwark unveiled last week two handsome mosaic panels commemorating Chaucer's connection with Southwark, which adorn the external walls of the Library, past whose site the Canterbury Pilgrims passed on their way out of Southwark from the Tabard Inn close by. The ceremony was informal in character, his Worship addressing a few words on the need for art to brighten London's streets.

* * *

An appeal is to be made for funds for the repair of Southwark Cathedral, which is perhaps better known still as St. Saviour's, Southwark, although its earlier name of St. Mary Overie is almost forgotten. About £7,000 is needed.

* * *

The City Corporation has decided to spend £20,000 on new public slaughter-houses at Islington Cattle Market. The idea is to meet not only present requirements but increased demands which will be made in the near future, as private slaughter-houses in the northern districts of the Metropolis have been abolished.

* * *

Mr. F. W. Speaight writes: "One already notices on all sides that black is being very extensively used for the decoration of buildings in connection with the death of the late King. Before further money is spent on material, may I be pardoned in pointing out that purple, not black, is the correct colour, and that on January 29th, 1901, at the time of Queen Victoria's death, an official statement to this effect was published by order of the late King."

* * *

Rochdale Town Council, after consideration of a "£17,000 scheme" for extension of the town hall, has decided to spend only £2,000 on the work The common sense of the matter was pithily expressed by Alderman Ashworth, who said he would not spend £2,000 in patching up, a thing they had been doing for years. Let them tackle the job in a proper way—the hall was patched up enough." What is

worse, it is alleged that the clerks are actually suffering in health for want of proper accommodation.

* * *

Announcement is made of the appointment to the Local Government Board of chief engineer and of architect, under the new arrangements. Mr. J. Walker Smith, Burgh Engineer, Edinburgh, has been appointed chief engineer, and Mr. John Walker, assistant to Mr. Dick Peddie, architect, Edinburgh, has been appointed to the position of architect. Mr. Smith, who has occupied the post of Burgh Engineer for less than two years, is the author of a book upon the construction of dustless roads, and has had a very successful career. He studied the elements of his profession with the Borough Engineer of Willesden, with whom he acted for three years as assistant. For four years he was chief assistant to the Borough Engineer of Burton-on-Trent, after which he was appointed Borough Engineer of Barrow-in-Furness. After occupying that position for eight years he went to Edinburgh. Mr. Walker Smith is a member of the Institution of Civil Engineers, of which institution he is medallist and prizeman; he is a Fellow of the Surveyors' Institution, a member of the Institution of Mechanical Engineers, and a member of the Council of the Association of Municipal and County Engineers. Mr. Walker, who will now take up the duties of architect to the Local Government Board, is joint author of a publication recently issued on the architecture of the Grand and Petit Trianon at Versailles.

During ploughing operations in a field near the village of Bratton, Westbury, Wiltshire, the plough struck what proved to be the cover of a leaden coffin. The coffin has been examined by Mr. B. H. Carrington, the Curator of the Wilts Archæological Museum, who states that the coffin without doubt belongs to the period of the Roman occupation. The place where it was found is about a mile from the site of a large Romano-British village. The coffin is 6ft. 8in in length, its width varies from 1ft. 6in. to 1ft. 4in., and its depth is 7in. Large iron nails 4½in. long indicate that when interred it had a wooden outer covering, but that has perished, as have the bones interred, except the leg bones, the pelvis, and the lower jaw; there is no trace of the skull. Two pieces of lead form the bottom of the coffin, but the cover is one piece. It was only about 12in. below the surface of the ground, which is on the slope of the hill, and has been continuously cultivated for some time.

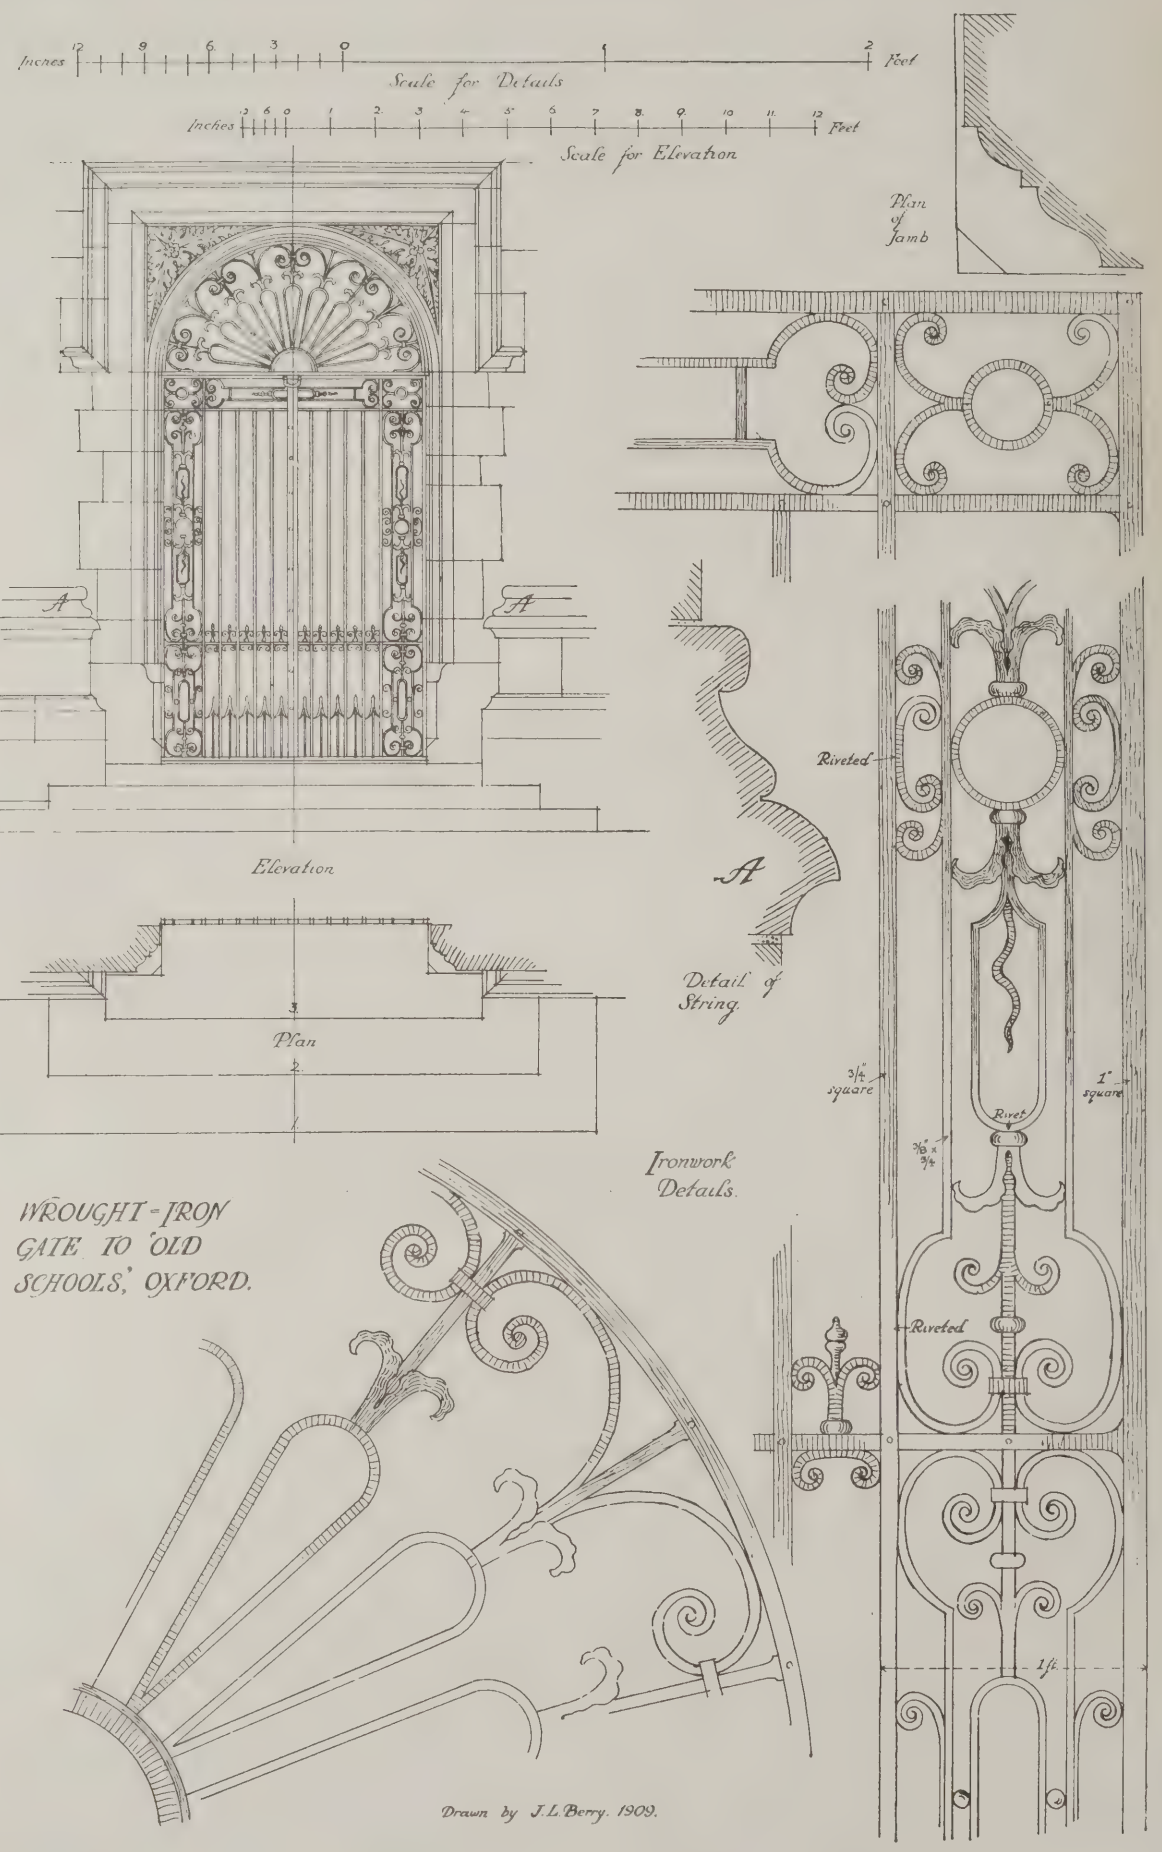
* * *

The Toronto "Contract Record," issued recently, gives a most interesting review of building operations in Canada for the first three months of the year. The figures are especially instructive regarding the great increase of building in Western Canada. Winnipeg stands third on the list for the three months, Vancouver and Toronto leading by £60,000 and £20,000 respectively. Winnipeg during the month of March gained an advantage over the other two cities, having permits to the value of almost £400,000 more than Vancouver and £200,000 more than Toronto. For the first quarter of the year Winnipeg has an average increase in building over last year of 183 per cent. The most prominent feature of the table is the progress which Western towns and cities are making.

CURRENT PHASES OF CONTRACT LAW.*

Very opportunely, considering the agitation that is afoot with regard to several questions that are at issue between contractors and those who employ them, Mr. Alfred A. Hudson, of the Inner Temple, Barrister-at-Law, President of the Tribunal of Appeal under the London Building Acts, has issued, as a supplement to the third edition of his "Law of Building, Engineering, and Shipbuilding Contracts," a thin volume dealing with three cases which have an important bearing on the rights and liabilities of contractors and employers, as well as on the duties and obligations of engineers and architects.

In the case of Patman and Fotheringham, Ltd., v. Pilditch, which was tried in the High Court of Justice (King's Bench Division) in May, 1904, before Mr. Justice Channell, without a jury, the question of lump-sum contracts was raised. The subject of the action was a block of flats in Bloomsbury, and the work was to be done for a lump sum "according to the plans, invitations to tender, specification, and bills of quantities." The item in dispute was a sum of £1,669 19s. 10d. in respect of alleged errors in the quantities. Defendant denied the errors, and pleaded that, even assuming them to exist, he was not liable on that account. Plaintiff's counsel contended that the quantities defined the amount of work to be included in the contract price, and that anything beyond must be paid for. Defendant's counsel contended that "whatever is necessary to complete the works must be done for the contract price quoted."



Mr. Justice Channell took the view that, in given circumstances, "the quantities provide the amount of the work; and if in the course of doing the work the contractor is directed to exceed that amount of work for the purpose of making it accord with what it is desired to have in regard to the building, I think that then that is an extra, subject, of course, to the further things in the contract as to the mode in which it is to be done, and so on." His view was, he further explained, that "the whole of the quantities are introduced into this contract as part of the description of the contract work, and that therefore if he [the contractor] is required, in order to complete the work, to do more work than is in the quantities, he is entitled to have that as extra." "But," he was careful to add, "I should have to deal specifically with the cases of things that everybody must understand are to be done, but which happen to be omitted in the quantities." His final utterance was: "Upon the construction of the contract I decide that the bills of quantities are part of the description of the contract work, and that the whole of the documents must be construed together upon that footing." The upshot of the decision was that the plaintiffs were paid, over and above the contract sum of £12,338, for all work that they did beyond what was stated or understated in the bills of quantities. There was no appeal.

In the case of William Kennedy, Ltd., v. The Mayor, Aldermen, and Burgesses of the Borough of Barrow-in-Furness, which was heard in the Court of Appeal on July 14th, 1909, the work concerned was the construction of a masonry concrete dam. The judge in chambers had, on the application of the Corporation, stayed the action of the contractors (who were suing the Corporation for work done, etc.) on the ground that a clause in the contract provided for submission to arbitration. A clause in the contract stated that "The certificate of the engineer shall have the force and effect of an award, and may be made a rule of His Majesty's High Court of Justice, or any Division therefore, at the instance of any party thereto." In the Appeal Court, Lord Justice Vaughan Williams held that there was no arbitration clause whatever in the contract, and therefore no ground for staying the action, and he conveyed, rather than expressed, his general objection to arbitrators who are also, in a sense, parties to the contract. Lord Justice Buckley pointed out that, in the terms of the contract, "the engineer is to control the work, and the work is to be done to his satisfaction. In doing those acts he is representing the Corporation for whom the work is to be done." His lordship thought that the words "the engineer shall be the exclusive judge," meant nothing beyond the execution of work; did not mean that he is an arbitrator, or acting in a judicial capacity at all. It may perhaps be fairly inferred from these remarks that the objection to contractual referees was then gradually taking form in the judicial mind.

As in the foregoing case, the appeal of Robert W. Blackwell and Co., Ltd., v. The Mayor, Aldermen, and Burgesses of the Borough of Derby (July 29th, 1909) was from an order of the judge in chambers ordering the action to be stayed under a clause in the contract providing for submission to arbitration The clause made the engineer the arbitrator in disputed matters. Lord Justice Fletcher Moulton expressed the opinion that "where the nature of the dispute arising from facts which were subsequent to the contract is such that we are of opinion that the tribunal is not likely to be able impartially to deal with the dispute, it is open to us, and it would usually be the duty of the Court, to refuse to enforce the arbitration clause. . . . Corporations are, in my opinion, often too fond of putting officers of theirs in the position of engineers under a contract, and they forget that, as they are performing other duties to the Corporation, there may arise a conflict between their duties in these other offices, and their duties as engineers under the contract, which may give rise to unfair treatment to the contractor by reason of the zeal with which the officers perform their other duties." Lord Justice Buckley, speaking on the general question, remarked that "the worst possible reference on the question of unreasonable conduct is the person who is accused of being unreasonable. How could you expect him to say, if a person of any character at all, that the acts which he did were unreasonable acts?" That is, of course, just the attitude which builders take on the question of contractual referees; and, like his lordship, they, in putting forward this view, are always very careful—and justly so—to disclaim any merely personal reflection. The objection is not to the person but to the position.

In the book under notice, the cases at which we have glanced, and from which we have ventured to glean a few sentences, are set forth succinctly but adequately; and the notes upon them are admirably clear and concise. We commend it to the attention of all who are interested in the exceedingly important problems upon which it sheds so illuminating a light.

*Supplement to the Third Edition of the Law of Building, Engineering, and Ship Building Contracts. By Alfred A. Hudson (of the Inner Temple, Barrister-at Law), President of the Tribunal of Appeal under the London Building Acts; Author of "The Law of Compensation," and Joint Author of "The Law of Light and Air." London: Sweet and Maxwell, Ltd., 3, Chancery Lane, Law Publishers. 1910. Price 3s. 6d. net.

WROUGHT-IRON GATE TO QUADRANGLE, OLD SCHOOLS, OXFORD.
MEASURED AND DRAWN BY J. L. BERRY.

There are two of these gates, similar to one another, on each side of the quadrangle. The ironwork, of eighteenth-century date, is notable for its simplicity, the side panels being especially good in design. The carved stone spandrels are the original work, but the hood mould and the other stonework around are modern, having been restored about twenty-five years ago (we believe under the direction of Mr. T. G. Jackson, R.A.).

TOWN-PLANNING TOPICS.

Aesthetic Impotence.

At a recent meeting of Wigan Borough Council, Councillor Dickinson referred to an item on the minutes as to plans and sections of a certain shop. He understood that this was a corrugated building, and thought it was quite time the Council took some action in regard to putting up corrugated buildings. He thought it was wrong that people should be allowed to put up corrugated buildings in main thoroughfares, and he was rather surprised that plans for such buildings were passed by the committee. Alderman Ashton said the committee endeavoured to stop the erection of this corrugated iron building, and refused to pass the plans at the first meeting, but the plans came back, and as they complied with the by-laws the committee had no option but to pass them. There was no doubt about it that it was against the best interests of the town that corrugated iron premises should be erected in the main thoroughfares, because they were not only eyesores but they were detrimental to other business premises in the vicinity, which were heavily rated, while such corrugated iron premises could be put up at a smaller cost and might do just as much business as the buildings that had cost five or six times as much.

An Exhibition at Berlin.

A very interesting exhibition has just been opened in Berlin; unique, too, of its kind, as nothing like it has been attempted in any other country. It is, as described by the Berlin correspondent of the "Observer," an assemblage of all that can direct the makers of cities in the laying-out, building, and organisation of an ideal place of residence for populations, large or small. Plans, pictures, photographs, and models of parks, streets, and houses are to be seen, and not alone of the Greater Berlin of the future, which is even now engaging municipal attention in the German capital, but of cities like London, New York, Paris, Boston, and Chicago. It is recognised in Germany that a great, and perhaps the chief, glory of the nineteenth century is the public awakening, which occurred during its last quarter, to the so-called "social question," and particularly that part of it which is concerned with the organisation of towns with a view to dwelling, to transport, and to the exploitation of the town's natural surroundings for keeping strong and healthy its inhabitants of every class down to the poorest. The city fathers of Berlin are enthusiastic on the subject, and are powerfully encouraged by the Kaiser in their efforts to prepare for the health and happiness of future generations, as well as to secure the same, so far as money and technical skill can do it, for the present one. Situated, as their city is, in the middle of Europe, and with a steadily growing influx and passage of merchandise and traffic, they offer prizes for the most promising plans and most practical suggestions with a view to realisation later. They are satisfied that their system of communications is on a sound basis, and that the same may be said of their water supply. They are now principally concerned about the dwelling question and the utilisation of the woods and park-lands and water surfaces round the city. In respect of the first they look with envious eyes towards Vienna and Boston, while to Chicago they turn for ideas regarding public gardens and playgrounds. The exhibition is being held in the large annexe at the Zoological Gardens.

Liverpool Housing Committee.

At a meeting of the Liverpool Housing Committee, held in the Municipal Offices, Dale Street, Mr. G. Kyffin-Taylor in the chair, considerable time was spent in dealing with matters which arose owing to the operation of the Housing and Town Planning Act, 1909. The new statute confers on the committee the power to make closing orders, formerly made by the magistrates, in respect of property proved to be insanitary. The committee thus exercise judicial functions. Before coming to any conclusion in regard to property of the class indicated, they hear the evidence of the medical officer of health and the owners or agents of the premises in question. At the meeting under notice they had a number of cases before them in which closing orders were asked for. After the medical officer, on behalf of the Corporation, and the owners or agents of the property, had given evidence, they made a number of closing orders and postponed several applications. A report, prepared by the Town Clerk, was submitted as to the new Act. The document clearly set forth the powers of the Housing Committee in dealing with insanitary property and workmen's dwellings, whether under the statute law of local Acts. The committee ordered the report to be printed for distribution amongst the members of the City Council. Amongst other business which came before the committee was a joint report of the surveyor and medical officer of health in relation to proposed building schemes in the Pit Street district of St. Peter's Ward. It was moved by Mr. Thomas Shaw, and seconded by Mr. B. W. Ellis: "That the surveyor prepare plans with a view to a building scheme, and that the Town Clerk advise as to the proper procedure to be adopted." It was urged by some members in the discussion that such a proposal would not be following out the past policy of the committee, which has been chiefly to confine itself to the removal of insanitary property and to the rehousing of the dispossessed, whereas the property concerned in the proposed scheme was principally composed of sanitary premises. Upon being put to the meeting, the motion was defeated. Ultimately it was decided that the matter be postponed *sine die*.

Conference of Municipal Engineers.

At the general meeting of the Incorporated Association of Municipal and County Engineers, held at the Royal Agricultural Hall last Wednesday, in connection with the Municipal and Health Exhibition, Mr. R. H. Haynes, the author of a printed paper, introduced the question of town planning, his view being that the Local Government Board intended to leave the subject in a great measure to the discretion of local authorities, and that municipal engineers must take a leading part in the work, though they would need the professional assistance of architects and others. Mr. C. J. Jenkins dwelt on the importance of conferring with landowners in carrying out the provisions of the Town Planning Act. Much might be done by moral suasion in convincing owners that co-operation with the local authority was to their own advantage. Traffic and the position of the main roads must always govern town planning. Mr. T. H. Mawson considered the artistic aspect of the subject, remarking that there was always a tangible something that a city said. Glasgow expressed commerce, but no one could enter Edinburgh without feeling that he was on classic ground. Unless the civic spirit were expressed, municipal planning must be a failure. In this country there seemed to be a dislike of orderly arrangement. Buildings were not staged with a regard to effect one with another, and here we were far behind the Continent. Mr R. H. Campbell thought that there were greater possibilities of carrying out a consistent scheme in the provinces than in large towns with crowded districts. The limitation of the number of houses to the acre would be most useful, but how it would be enforced could not be known until the issue of the regulations which they were awaiting. Mr. S. D. Adshead congratulated municipal engineers on the great opportunity conferred on them by the Act. They were the right men for the work, but he hoped they would not rush into it without realising the enormous responsibility cast upon them. Mr. E. Nesbit Blair, the chairman, said that while the artistic side of town planning was of great importance, municipal engineers would be required to do a great deal of practical work which would be hidden underground, such as the laying of the main lines of drainage. This should be fundamental to any scheme. Grass verges for footways, the position of railway stations, and the establishment of a civic or architectural centre were among the matters discussed in relation to the subject.

Gardenless Cottages.

Mr. H. R. Aldridge, secretary to the National Housing and Town Planning Council, has addressed the conference of the West Riding District Council on the possibilities of District Council administraton in regard to practical town planning. While, he said, we had been spending large sums of money in making crooked places straight, in widening roads, and giving greater traffic facilities; while we were painfully and at great public cost undoing the evil that past generations had done, we were at the same time permitting slums and overcrowded areas to be created. The old model by-laws permitted about 40 houses to the acre. The result had been that even in country districts surrounded with fields there were long rows of gardenless cottages and gardenless back yards. Unless they could give human creatures room to breathe and room to live, they did not get the best results from human life. If they could make the home magnet of sufficient strength to fight magnets of less value outside, they would do much more than they knew to build up a better home life in England. Discussing the details of the Act, Mr. Aldridge suggested that a reasonable figure for density of population was 20 houses to the acre, not counting roads. He urged all District Councils to study the Act and understand what powers should be given them. Each Council should appoint a Town Planning Committee to go thoroughly into the matter. Public taste was growing very rapidly in this matter, and it would pay to develop districts on the right lines. When the Act began to operate it would give to localities a much greater pride and interest in themselves and their surroundings. Once we got better methods of town planning, England would lead the world in regard to housing reform. No finer piece of municipal service could be done than that of preparing a plan, modest in its aim, fair in its judgment, and in which they could take a pride. They would then have taken the first step in the making of a more beautiful town or village. Experience in Germany showed that the cost of a "general idea plan" would be about 6s. 8d. per hectare ($2\frac{3}{4}$ acres).

IS CINDER CONCRETE FIRE-RESISTING?

Is Cinder Concrete Fireproof? An account of the behaviour of a cinder concrete wall of a floor testing building used by Professor Ira H. Woolson (U.S.A.) will be welcomed as being a very practical contribution to the controversy that has arisen as to whether or not what he calls "cinder concrete" is a satisfactory fire-resisting material.

The outside dimensions of the testing house are 18ft. by 22ft., the height being 12ft. It is supplied with six suitable chimneys at the top and draft openings through the walls at the bottom. A fire-grate covering the whole inside area of the building is placed about 3ft. above the ground. A pair of doorways are provided through which the fire is fed with cord-wood fuel. This much of the building is permanent construction. The floor to be tested forms the temporary roof of the structure. After each test is finished the floor is removed, and the building is then ready for the installation of some other type of floor construction. A load of 150 lbs. of pig iron per square foot is in place on the floor, and the kindling distributed ready for lighting. The walls of the building are 1ft. thick, and are made of cinder concrete reinforced with rods and expanded metal. The chimneys are similarly reinforced, but are only 4in. in thickness.

The Composition of the Concrete. The concrete was a 1-2-5 mixture of Portland cement, bank sand, and ordinary unsifted hard coal boiler cinders. Care was taken to have the aggregates thoroughly mixed before water was added. Sufficient water was used to cause it to float the surface of the concrete when well tamped. The cinders were in no way superior to the common run of such material, and were used just as delivered. Owing to a scarcity of cinders at the time the building was erected, it became necessary to collect them from several different manufacturing plants, and a considerable portion of them was considered quite inferior in quality, owing to a high percentage of unburned coal and fine ashes which they contained. They were used because of the difficulty of obtaining anything better at that time. These details are mentioned because they are supposed by some to have an important bearing upon the fire-resisting qualities of the concrete.

The Fire Tests. The building was erected two years ago, and has been subjected to five fire tests of four hours each (20 hours in all), at an average temperature of 1,700 degrees Fah. During at least half of that time the temperature varied from 1,800 to 1,900 deg. Fah. These higher temperatures are always necessary to effect the low heat during the early part of a test. An average of 1,700 degrees for the whole test is thus secured. At the end of each 4-hour test a 1⅛in. stream of water at 60lbs. nozzle pressure is played back and forth over the ceiling for 10 minutes, while the ceiling and the walls are still red-hot. The nozzle is held close up to the doorway openings, and the water striking the ceiling under such pressure sprays off against the side walls with considerable force. Continued repetition of this treatment constitutes a most severe punishment of the walls—far more trying than any fire ordeal they would have to withstand in ordinary building construction, because it is extremely doubtful if any such building would contain enough inflammable material in any one room to maintain an average temperature of 1,700 deg. Fah. for more than two or three hours, with no possibility of a repetition.

Ordeal Survived. In spite of this very severe treatment the walls of this test chamber are practically as good to-day as they were when new, with the exception of the rear wall, which has been scored by the water to a depth of ½in. to 1in. for two or three feet near the top. This wall has suffered most from water because it gets the direct stream a portion of the time at each test, and always receives the deflected stream for the full ten minutes of application (at the end of the 4-hour fire test). The 4in. chimneys which carry off all the products of combustion from the fire chamber are as smooth on the inside to-day as when first made. So far as can be seen, the structure is good for an indefinite number of further tests. The only repairs necessary will be an occasional plastering of the portion of the wall surface washed away.

The Inference. A duplicate of this building sustained seven 4-hour tests at 1,700 degrees Fah. before circumstances necesitated its removal. At that time the walls were as good as those above described. This and other similar experiences have convinced the professor that we have no better fire-resisting material than properly made cinder concrete. He is also positive that any ordinary hard-coal boiler cinders will make good concrete if correctly proportioned and mixed. Contrary to general belief, he is firmly of the opinion that within reasonable limits the percentage of coal and the amount of fine material that such cinders carry have very little, if any, effect upon their fire-resisting qualities. He believes that sifting and washing the cinders as was proposed in the revised code would be a useless expense, and injurious to the cinders as aggregate for concrete. The pieces of coal that came next the surface of these walls have burned to an ash, but remain in place and act as an excellent non-conductor of heat. It is a remarkable fact that plenty of particles of pure coal can be found in these walls less than two inches beneath the surface, which has withstood an average temperature of 1,700 degrees Fahr. for 20 hours. He does not wish to be understood as an advocate of cinder concrete for all types of construction, for it has its limitations, but when it is properly made he knows of no better fire-resisting material.

OBITER DICTA.

The Feuing System In England a man who wants a site on which to build a house usually buys it and pays its full price to the proprietor. . . In Scotland, however, a site can be acquired without paying the price by simply taking it on feu, subject to the payment of an annual feu-duty—which is really interest on the unpaid price. In fact, the landowner (called in Scotland the "superior") practically lends the price of the ground to the feuar at a rate of interest fixed for all time. He can never increase the amount of the feu-duty, nor can he ever force the feuar to pay up the capital value of the ground. If he wants the money he can only get it by selling his right to draw the feu-duty. This feuing system enables the feuar in Scotland to borrow easily a large part of the money required for the purpose of building houses, the lender knowing that the prior burden of feu-duty is definite and unchangeable. The feuar may sell his property at any time, without consulting the superior; and, if it increases in value, the feuar gains the profit, but the superior gets no increase of feu-duty. Obviously, the Scottish system enormously encourages and facilitates the development of building, as compared with the English system, and its most direct advantage to Scotland has been to permit of large expenditure in providing housing accommodation for a rapidly increasing industrial and commercial population.—*Robert Gray in the "Glasgow Herald."*

The Svastika. How many people, in whose eyes they are familiar objects, know the meaning of the Egg and Tongue pattern, or of that ancient symbol of mystery the Svastika? We see them, or their derivatives, daily surrounding us in the most commonplace conditions, but for the majority they have lost their significance, except as the scarce-noticed basis of some flourishing system of bloated curves and sprawling strokes that may serve as modern house or restaurant decoration.—"*Morning Post.*"

[The Svastika, as our readers will not have failed to notice, has been adopted in forming the border round the title of this journal on the first "leader" page. According to the Rev. Dr. Cobb, of the Church of St. Ethelburga the Virgin, Bishopsgate Within, E.C., "the Svastika is one of the most ancient symbols in the world. From the Vedas we learn that it was sacred to Agni, the god of fire. Like the cross with Christians, it is marked on the foreheads of young Buddhists. Dr. Schliemann found it at Troy in strata dated B.C. 2500. It is on the dress of Diogenes the digger in the catacombs at Rome. It is found on the surcingle of the figure of Bishop Edington, in Winchester Cathedral, and on the gigging-strap of the oldest monumental brass in England, that of Sir John d'Abernon, at Stoke d'Abernon, in Surrey. It is a solar emblem. The arms of the Isle of Man are an allied form of it."]

The Skyscraper and the Aristotelian Precept. The early tall buildings were a series of architectural experiments. It seemed as though the sudden enablement of a greater height than had before been feasible had driven out of the minds of the designers the fact that these new and portentous structures were as amenable to architectural laws as the older and more commonplace; that, in particular, the Aristotelian law as completely applied to them, and that every artistic building must have a beginning, a middle, and an end. A confusion of variety came in before the steel frame came in to aggravate the altitude the elevator had made possible, and the transitional buildings, if one may call them so, between the old maximum of five storeys and the new of a maximum number yet undetermined, were really Babelish, almost Bedlamite, in the variety of the theories upon which their designers proceeded. At last came the consensus upon which every designer of skyscrapers acts to-day. The analogy of the column was accepted, of a base of a storey or a group of storeys, a shaft of a number of storeys almost or quite identical in treatment, and a crowning capital which might again be a group of storeys.—*Montgomery Schuyler, in the "Architectural Record" for May*

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

The Strength of Steel Beams.

SIR,—Will you pardon me for pointing out a printer's error in the above article on page 396 of the issue No. 795. The top line of the left column should read

$$\frac{BD^3}{12} \text{ not } \frac{BD^2}{12}$$

W. LEICESTER.

Percentages off Quantities.

SIR,—I am glad to see the reply by "A.G.W.," in your issue of April 27th, has attracted the attention of "W.W.D." in your issue of this week.

Although the method of dealing with this question by "W.W.D." is perhaps more correct, it seems to me to amount to much the same thing as taking 10 per cent. off the whole account.

I almost invariably have friction with contractors in treating this question. Their one idea seems to be 10 per cent. off additions and 10 per cent. off omissions, which, as far as I see, practically wipes out whatever percentage they take off their original estimate to secure a contract job.

It strikes me contractors, in estimating for contracts in these days of low prices, are more inclined to adopt this method, but this is obviously not doing justice to clients, who are quite innocent parties.

Unless a surveyor is extremely careful in dealing with this subject, there is no easier way of arriving at arbitration or a law suit.

Personally, no contractor will in future secure a contract under my supervision who adopts this method of estimating, unless he first produces a clean bill which totals the amount of the tender.

E. H. D.

London, S.W.

Licentiate R.I.B.A.

SIR,—The letters which two anonymous Associates of the R.I.B.A. have addressed to you on the above subject seem to call for a protest from some other members of the Institute who dissociate themselves entirely from the spirit of pettiness which appears to animate the letters already published.

It would, indeed, be disastrous to the object which the majority of Institute members has in view, should these letters be taken as indicative of the general attitude of Associate members towards those gentlemen who are desirous of joining the Licentiate class. Such a drastic change in the by-laws was not arrived at without ample opportunity being given to every member of the Institute to voice his opinion, and the fact that the majority of members were in favour of the proposed class of Licentiates should, surely, silence the objections of every loyal member, albeit he may not be in sympathy with the change which has now become an accomplished fact.

This is not the time for cleavage, but unity within the walls; the time for cavilling is past; it now becomes all members—Fellows or Associates—to join together in welcoming those Licentiates whose presence at Conduit Street will doubtless strengthen and expedite the Registration Bill which is so earnestly desired.

Yours faithfully,

H. SETON-MORRIS, A.R.I.B.A.

SIR,—The three letters on this subject in your last three issues are of great interest, and I am sure that the question asked by "Ad Rem," in the second of these letters, is clearly answered by the spirit shown by the two Associates R.I.B.A. who are your first and third correspondents.

May I, however, point out to these Associates that Licentiates will not be able to describe themselves as "L.R.I.B.A." or even "Lic. R.I.B.A.," but only as "Licentiate R.I.B.A.," as provided in the new charter.

Assuming that the R.I.B.A. will be able to get Parliamentary approval of some scheme for legalising the standing of its members, your correspondent "Ad Rem" proves, I think, the absurdity of the age limit, and the great injustice this measure would be to many able and rising members of the profession, as it may be taken as fundamental that age is not necessarily a test of merit in architectural ability.

The R.I.B.A. is preparing a Bill, and this is not the time to criticise its action beyond this one point, but it is worthy of notice that the R.I.B.A. will have to apply for yet another revision of its charter before it will be able to admit any architects who remain outside after the expiry of the one year allowed for the admission of Licentiates. Your Associate correspondent of this week refers to the admission of Licentiates thus: "The practical result of this alleged reform is to place upon a level with, and at the expense of, Associates, those unqualified and unprofessional competitors who for many years past have been the most unscrupulous poachers." This is hardly a welcome to the candidates, and somewhat uncomplimentary to the Selection Committee of the Institute and to the members of the profession outside the Institute, and the letter as a whole (to me at least) demonstrates that the qualifications necessary for Associateship R.I.B.A. do not include any knowledge of, or natural aptitude for, the liberal arts and sciences which lie outside the mere utilitarian knowledge required for the practice of architecture as a business. I trust that a greater width of view will characterise the Bill of the Institute, and that any measure of registration to be brought forward will be advanced in a spirit which will put the Profession on a sound, reasonable, and logical basis, and free from the anomalies of the medical profession.

I am not a member of the R.I.B.A., and shall, I trust, not be until the Institute justifies its high position by carrying through some measure of Protection or Registration, which in my opinion shall be for the well-being of the whole profession and every existing bona-fide member of it.

May I, in the meantime, assure "Ad Rem" that although he is ineligible under the age limit for Licentiateship R.I.B.A., his interests will be looked after in the event of any proposal vital to the interests of the profession being made by any institute or society? I enclose my card.

Yours faithfully,

H. G. T.

London, E.C.

SIR,—I entirely agree with the statements of "Ad Rem" in his letter [see "A.B.J." April 27]. It is rather hard that the architect or principal draughtsman, who has been at the study of architecture for, say, 10 or 12 years, and has carried out many important works, and is 28 years of age, should be debarred because he happens to be two years younger than the man who is 30 years of age, and who has one or two second-rate works to his credit, and who can, because he is 30, submit a few drawings for approval. I am sure there are many promising architects between the age of 28 and 30 who are in a like position, and I hope they will take the matter up.

ASSOCIATE OF LOCAL INSTITUTE.

MAGAZINES & REVIEWS.

Art Serials.

The "Art Journal" commences with an article on "Gruyères," by Sir Martin Conway, illustrated by Mr. A. R. Quinton, who makes a charming composition of the white tower of St. Theodore, cutting through the lines of the hill behind. "Summer Visitors," with illustrations by Miss Callis, is a paper on the treatment of birds in art. Among the illustrations are reproductions of two of Méryon's etchings of Paris, "Notre Dame" (a very well-known one) and "La Pompe, Notre Dame," an old building by the bridge, erected on a mass of timber construction rising from wooden staging at the water-level; a very curious relic of old Paris, and a very favourable subject for the art of etching.

The "Burlington Magazine" has an article by Mr. Cecinsky on "The Educational Aspect of Irish Chippendale," from which title one expected something like a critical estimate of Chippendale furniture, but it is merely a kind of collector's article on the question of authenticity of certain specimens or types. This is, of course, interesting to collectors, but it would seem to us of more importance to point out that the four examples figured, whether "genuine" or not, are very bad art. Unfortunately, this is a matter little considered from the usual collector's point of view. A thing is genuine Chippendale or genuine something else, or it is not. If it is genuine it has a dealer's and collector's value; whether it is good design or not does not seem to be considered.

To the "Antiquary" Mr. Tavenor-Perry contributes one of his interesting and carefully prepared historical articles on an ancient building, this time the Abbey of Pontigny. Mr. Fothergill's article on things "Round and About the Raby Castle Estate" (Durham) is interesting, both in respect of text and sketches.

The "Architectural Record" (New York) gives an article to the work of Messrs. N. le Brun and Sons, who have erected a mighty campanile at New York for the Metropolitan Life Insurance Building—practically a "high building" with offices on many floors, but a great deal better than the average high building in an architectural sense—and a classical cathedral at Philadelphia, the interior of which is not a bad echo of St. Paul's. The description and illustrations of "A Fifth Avenue Mansion" are of considerable interest, as giving a full analysis of what goes to make a first-class city mansion according to the latest American idea. Considering that it is stated to be a condition that "a house of this type should not only be costly but should look so" (a very American ideal!), the exterior is dignified and quiet enough, and recalls the general aspect of a Pall Mall club; the exuberance of treatment is internal rather than external. Mr. J. Gamble Rogers is the architect. Under the title "The Wild Men of Paris," Mr. Gelett Burgess gives a delightful description of the absurdities of "Salon des Indépendants" at Paris. The illustrations of some of the works exhibited are almost beyond belief in their grotesqueness.

English Magazines.

In the "Edinburgh Review," "Art and Practice" is a thoughtful article on the

relation between current art and current thought or speech about art. There is some sound criticism in it, especially as regards some of the vagaries of the ultra modern artist, who "endeavours to draw like a child and to colour like a spectroscope. . . . It is noticeable that as often as not he does not endeavour to eliminate his unsuccessful attempts. He leaves his misfires upon his paper in order to accentuate the successful effort when it has come, and, by displaying the process, to make clear the result to which the process has led." The same issue contains a long article on "Minoan Crete," intended as a general review of the whole subject at the tenth year after the discovery of Knossos; such a summary is very useful and well-timed; but the artistic and architectural importance of Knossos is very much exaggerated. It gave us an unexpected knowledge of an art and a civilisation older than that of Periclean Greece, and has affected our historic conceptions as to Greek art; but to compare the finding of the Minoan relics with the discovery of the Parthenon sculptures, as an artistic "find," is an absurd exaggeration. Minoan art is barbarous in comparison with that.

The "Quarterly Review" contains an article of great interest to students of architectural history, by that intrepid traveller, Miss Lowthian Bell, under the title "A Palace in the Syrian Desert." A great part of the article is what might be called light reading, description of incidents by the way, etc.; but the remains of the Palace of Kheidar, a building which may have been Sassanian, but was probably later and of Sassanian tradition, are carefully described and illustrated by photographs. The subject was treated some months ago by Miss Bell in an admirable lecture at the Hellenic Society.

The "Nineteenth Century" contains an article by Mr. W. Scott Durrant, "New Art to Social Reform," which is a somewhat out-of-date laudation of Ruskin as an art critic, who ended as a reformer and a preacher of a new political economy, or what he thought such. Everyone who has studied Ruskin's ideas on political economy should know that they have been long condemned as absurd; nor even as an art critic is he a person now to be taken seriously as a guide in regard to architecture and painting. His real merit consisted in the fact that he cared for these things, and by dint of his eloquence induced others to care for them; but it is no use attempting at this time of day to resuscitate him as a critic in the true sense of criticism, which means sound judgment. His enthusiasm was splendid, but erratic, and there is hardly a direct statement about art in his pages which is not open to question.

The American Magazines.

In the "Century" Mr. Hichens continues his articles on Palestine and its neighbourhood, the present number taking us "from Nazareth to Jerusalem." Mr. Guérin's illustrations, some of them printed in colour, furnish the architectural interest of the article. It is rather an unexpected incident to find, in a view in Samaria, a row of classical columns along the side of a narrow lane. The capitals are gone, but the fillet of the necking is in evidence—the trace of the hand of Rome in the Holy Land. Needless to say that Mr. Hichens's descriptions are full of picturesqueness and local colour. The Paris floods are commemorated by a number of very effective sketches by Mr. Castaigne, which give a vivid idea of some of the streets in Paris under water.

"Scribner" contains a noteworthy article on "City Building in Germany," by Mr. Frederic C. Howe. He speaks strongly in regard to the great energy and activity which has been shown in city improvement in Germany during the last twenty years, and especially as to what he calls "The bigness of vision, boldness of execution, and far-sighted outlook on the future," which characterises the German city work. "A large area is undertaken at once. The city is not made to conform to the grade of the district; the district is made to conform to the grade of the city. I have seen great areas of from one-half to a mile square, in which a fill was required of from eight to fifteen feet. Tracks are made from the neighbouring railway to make the fill, and the streets are constructed high in the air." Perhaps, in regard to this kind of energy, there is another point to be considered—whether it altogether makes for beauty in a city to destroy its natural undulation of ground, unless to avoid an inconveniently steep gradient. Otherwise, it would seem to us that the beauty of a city is better promoted by making the most of the suggestion given by natural incidents of site, than by wiping them out. The number contains an illustrated article on America's most eminent miniature painter, Edward Greene Malbone, born at Newport in 1777. The reproductions from his miniatures show that he was an admirable artist in his line.

COMPETITIONS.

Watford Grammar School Competition.

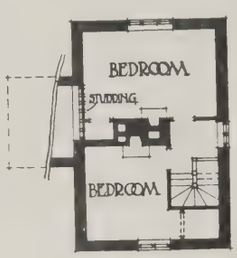
Mr. Ernest Newton, the assessor appointed in the above limited competition, has awarded the first place to the design of Messrs. Russell and Cooper; the second to that of Messrs. Spalding and Myers, and the third to that of Mr. C. P. Ayres.

Extensions to the Swansea Hospital.

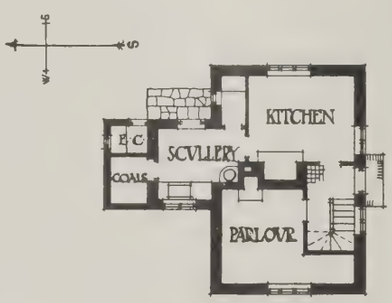
At a meeting of the Board of Management of the Swansea General Hospital, held on May 6th, the plans for extensions to cost between £20,000 and £25,000, prepared by Mr. Glendinning Moxham, F.R.I.B.A., were unanimously approved.

LIST OF COMPETITIONS OPEN.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue March 16th.



JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.



JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

JUNE 20, YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Competitors to state terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars from Mr. T. Watkins, surveyor to the Council Ystradgynlais.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

NEW LODGE, BEECHLAW, PUTTENHAM, SURREY.
FORSYTH AND MAULE, ARCHITECTS.

This lodge has recently been built on the Hog's Back, just above the village of Puttenham. The materials used are Bargate hammer-dressed stone, hand-made roofing tiles, oak frames, casements and leaded lights.

NEW BUILDINGS.

PROPOSED.

Hawarden.—It has been decided that a memorial to the late Canon Drew shall take the form of completing the work in connection with the schools of the parish by attending to buildings at Hawarden which may necessitate the erection of new schools. The estimated cost of the work is £3,000.

Keighley.—For some years the question of additional accommodation at Keighley Institute has been talked of, and at last the Education Committee have provisionally sanctioned a scheme which is estimated to cost between £6,000 and £7,000.

Reading.—The town clerk has received from the Local Government Board the draft of the Provisional Order of the scheme for the extension of the municipal borough. The draft order will have to be returned to the Local Government Board within fourteen days, and will then be laid before Parliament. The scheme includes the incorporation of Caversham, and the construction of a new bridge at an estimated cost of £25,000 or £30,000. It also proposes to bring a portion of the parish of Tilehurst within the borough boundaries.

Sheffield.—A scheme is on foot to erect a new Presbyterian Church in the Pitsmoor district, on a site at the corner of Abbeyfield Road and Scott Road. A spire 100ft. in height is proposed to be built, and the estimated cost of the whole block of buildings, inclusive of manse, etc., is about £5,500. Mr. H. L. Paterson, A.R.I.B.A., of Sheffield, being the architect. It is intended to make a start at once with that portion of the scheme which comprises church hall, class-rooms, and vestries, leaving the church proper until such time as the trustees can see their way to complete the scheme.

IN PROGRESS AND COMPLETED.

Birmingham.—The Bishop of Birmingham has consecrated the new church dedicated to St. Benedict at Bordesley, which will seat about a thousand persons, and with the site has cost about £9,000, of which £3,000 remain to be found. Built from the designs of Mr. G. Salway Nicol, of Messrs. Nicol and Nicol, architects, the church occupies an excellent position in the Hobmoor Road. In style it suggests the Romanesque order, and is constructed chiefly of brick.

Boston.—The foundation stones of the new Wesleyan Chapel, in place of the one destroyed by fire last June, have been laid. The style of the new building is Renaissance, and seating accommodation will be provided for 1,100 people, Messrs. Gordon and Gunton, London, being the architects. The entire scheme of the restoration of the school and re-building of the chapel and organ will cost upwards of £13,000.

Chorley.—The Highways and Buildings Committee of the Town Council has approved the following plans:—Bakehouse off Gillibrand Street; motor house, greenhouse, etc., to Kirby House, Gillibrand Walks; pantries to Nos. 15 and 17, Paradise Street; House in Queen's Road; stable at 186, Eaves Lane.

Dorchester.—The Earl of Shaftesbury has laid the foundation stone of St. Mary's Church, which is in course of erection from the designs of Mr. C. E. Ponting, F.S.A., of Marlborough, at a cost, exclusive of the tower, of £10,000. The church, when completed, will accommodate 745 worshippers.

Edinburgh.—The erection of a new Roman Catholic School in Restalrig, on a site at the rear of St. Ninians Presbytery, has been commenced, and will cost about £1,000, Mr. Archibald Macpherson being the architect.

Edinburgh.—A new First Church of Christ Scientist is about to be erected at Inverleith Terrace. The church will be of stone, and the architecture of a simple character. It will have a gallery, and will accommodate 630 people. Underneath there will be a hall to hold 180, and on the same level there will be accommodation for libraries, reading-rooms, and school-rooms. A large tower will be placed at the entrance end with two flanking staircase turrets. Mr. Ramsay Traquair is the architect.

Edinburgh.—The Dean of Guild Court has approved the following plans:—10 flatted villas at Mayfield Road and M'Dowall Road; excavations and foundations for a villa at Succoth Avenue; alterations and additions at Castle Mills, Fountain Bridge.

Eton.—The Rural Council has approved the following plans:—New house, Stoke Corner, Stoke Poges Lane; alterations and additions to Dipping Well, Farnham Road; new house, Bulstrode Way, Gerrards Cross; alterations to Vine Cottage, Farnham Common; new bungalow, Bell Weir, Wraysbury, as a temporary building; new house, Orche Hill Avenue, Gerrards Cross; alterations at the Brickmakers' Arms, Burnham; two villas in Willoughby Road, Langley Marish; new house, Sidwell, Fulmer Waye, Gerrards Cross; additions to the Firs, Stoke Poges; new stables and motor garage, Foxborough Lodge, Bath Road, Langley Marish; two pairs semi-detached cottages, Swallow Road, Iver; new house, Stoke Poges Lane.

Glasgow.—The following plans have been approved by the Dean of Guild Court:—Alterations and additions to buildings in Commerce Street; double villa in Mannering Road, near Shawlands Station; eleven tenements of four-storey dwelling houses in Allison, Hollybrook, and Bankhall Streets; four tenements of dwelling houses four storeys in height at Onslow Drive, Cumbernauld Road, and Ingleby Drive; tenements of dwelling houses in Allen Street and Woddrop Street.

Hampstead.—The church of St. Jude-on-the-Hill, of which the foundation stones were recently laid, is to be erected on a site on the highest part of the Hampstead Garden Suburb, given by the Hampstead Garden Suburb Trust (Limited), and is to be built in the Renaissance style from the designs of Mr. E. L. Lutyens, F.R.I.B.A., at a cost of £12,304.

Horley (Huddersfield).—The foundation stones of the new Congregational Church, which is in course of erection at a total cost of about £4,500, have been laid. The building to be faced with stone and is designed in the Decorated style of Gothic architecture, with a spire at one corner, and provides accommodation for 417 worshippers. Messrs. W. J. Morley and Sons, of Bradford, are the architects.

Litherland.—The foundation stone of the Willox Memorial Church has been laid, and the edifice, when completed, will provide seating accommodation for 650 people. The exterior of the building, including the tower, will be faced with the St. Helens "rustic" bricks, with dressings of Ruabon red patent bricks and terra cotta; while the tracery in the window heads will be of Runcorn stone. The interior will be faced with Ruabon red bricks, and the columns and dressings will be of flecked Runcorn stone: while the roof will be constructed with selected pitchpine timber and covered with green slates. Early Decorated is the style of architecture, and the builders are Messrs. W. Thornton and Sons, of Toxeth Park, Liverpool, the architect being Mr. J. Francis Doyle.

Stranraer.—The Dean of Guild Court has approved the plans of the new secondary school, which is to be erected by the School Board on a site in Lewis Street, with accommodation for 260 pupils, at an estimated cost of £9,000.

Tibshelf (Derbyshire).—The Duke of Devonshire has laid the corner-stone of the extension to the Parish Church, which will comprise the building of a new south aisle, an extension of the nave by one bay eastward, and the erection of a new chancel, vestries, and organ chamber, involving an expenditure of £3,000. Messrs. Currey and Thompson, of Derby, are the architects for the extensions, which, when completed, will provide accommodation for 150 more worshippers than formerly.

Herne Bay.—The following plans have been approved by the Urban Council:—House at corner of Grand Drive and Grafton Rise; house on plot 48, Pier Avenue, Central Estate; addition of greenhouse to house in Oxenden Park; reconstructional drainage of Danehurst, Margate Road.

Hockley (Birmingham).—The foundation stone of the new mission church and Sunday schools of St. Simon, has been laid. The buildings, which are to stand on a site adjoining the Ickfield Street Council School, will be of two storeys in the Gothic style, and will comprise a mission room on the first floor, providing accommodation for 300 persons, with school and class rooms below accommodating a similar number of scholars. Mr. W. Hawley Lloyd is the architect, and it is expected that the cost of the buildings will be £3,324.

Ilford.—The Lord Mayor has laid the foundation-stone of the Ilford Emergency Hospital, which will cost about £10,000, and is situate on a site close to Newbury Park Station.

Kilwinning.—The School Board of the parish of Kilwinning have accepted offers for an addition to Fergushill Public School at a probable cost of £600.

London.—Operations have already commenced on certain portions of the Polytechnic Institute, Regent Street, which is to be entirely rebuilt, at an estimated cost of £60,000. The scheme includes the erection of an entire new front to the existing buildings, and will afford increased accommodation, with laboratories and workshops.

Southend-on-Sea.—The Town Council has approved the following plans:—Motor house, The Leas; conservatory and stable, 12, Plas Newydd; alterations to urinals, Golden Lion Hotel, North Street; two houses, Sandown Avenue; bungalow, Branksome Road; w.c.'s, three urinals, and drainage, Western Esplanade; twelve houses, Shaftesbury Avenue; six houses and shops, Leigh Road West; two bungalows, Cliffsea Grove; warehouse, Elmer Place; four houses, McDonald Avenue; three houses, Westborough Road; stable, Leigh Road East; conversion of two houses into one, Pembury Road; alterations, White Lodge, St. Vincent's Road; two houses, Shaftesbury Avenue; one house, Ramuz Drive; urinal, Nelson Hotel, H. W. Line; fourteen houses, Maplin Road; one house, Boston Avenue; three houses, Hainault Avenue; addition, Grosvenor Road; additions, Eastwood Lane, Albany Electric Laundry Company; addition, 5, Palmeria Avenue; addition, 2, Weston Road; one house, Brook Road; two houses, Shaftesbury Avenue; one house, Westcliff Park Drive; bottling store, High Street; house and drill-hall, Northview Drive; eight houses, Electric Avenue and Southview Drive; one house and shop, Station Road; motor garage, Victoria Avenue; one house, Highcliff Drive; two houses and workshop, Whitegate Road; and Welcome Club, Station Road.

Stirling.—The Directors of the Stirling Royal Infirmary have resolved, owing to the £12,000 asked for to make a large extension to the Infirmary building not having come in, to abandon the larger scheme, and to proceed at present with a new wing to cost £4,300. The smaller scheme will fit in with the larger proposal, for which it is hoped the money will yet be obtained.

Swanage.—The Urban Council has approved the following plans:—Alterations to "Cliff Side." Ulwell Road: additions to "Purbeck View"; four cottages, Victoria Avenue; addition to house in Highcliffe Road; addition to house in Durlstone Road; additions to "Wyborne," Ulwell Road; summer-house at "Gables": and shed at back of dairy, near Taunton Road.

Haslingden Grane.—The erection of a hall in Grane Road, which will serve the purposes of church, institute, and Sunday School, and cost over £1,000, is about to be commenced. The new hall will be in the lower part of the parish, where the population has increased.

MODERN METHODS OF BRICKMAKING.

By A. B. SEARLE, Ph.D.

[At the Royal Society of Arts Dr. Searle has recently delivered four Cantor lectures on modern methods of brick-making, of which abstracts are given below. The lecturer, who is one of the foremost authorities in the United Kingdom on these and similar subjects, has contributed numerous notes and articles in recent years to "The Architects' and Builders' Journal."]

First Lecture.

In the earliest times, the lecturer stated, clay was used as a writing material, but later its significance in this direction was diminished, as its value as a building material increased.

In comparison with stone, it had the advantage of greater ease in manipulation, as any carving was made on the plastic material instead of being carved in the hard stone, and this led to marked advantages in many directions. Well-made bricks were also found to be more durable than many kinds of stone used for building purposes, and were generally far cheaper.

Passing to the methods of manufacture in ancient and modern times, the lecturer described the processes adopted in primitive countries, where the mud is pressed into rough moulds, turned out again, and allowed to dry in the sun. The rough bricks thus produced may be either baked in the sunshine or they may be heated in kilns.

The lecturer distinguished between dried, baked, and burned bricks, and added that many modern brickmakers still fail to realise that to obtain the maximum durability a brick must be properly burned, and not just "heated through." Insufficiently heated bricks are porous, soft, and far from durable. Further heating of these bricks makes then dense, hard, and extremely lasting, but the process is accompanied by many risks, as numerous clays lose their shape when heated to more than a bright red heat.

Touching the materials used for the manufacture of bricks, the use of slags, sand, and other special materials was mentioned, but attention was chiefly concentrated on clays, or, as they are preferably termed, "brick earths." The term "clay" is so comprehensive as to be capable of serious misunderstanding, and moreover it does not really include shales, of which many modern bricks are made.

A few hints on the selection of materials for brickmaking were given, but the lecturer warned intending manufacturers from relying too much on their own knowledge, and advised the consultation with experts who possess a special knowledge of this kind of work.

A detailed description of the method of making bricks by hand, as largely used in some districts, was given, particular attention being paid to the production of "London stocks." A slight comparison between hand-made and machine-made bricks, to the advantage of the former, was given, but a fuller consideration of the value of bricks made by machinery was reserved for a subsequent lecture.

Second Lecture.

This lecture dealt chiefly with the methods in use for manufacturing bricks by machinery according to two methods, in both of which a plastic clay paste is used. In the first method, by means of machines of the open pugmill type, the clay is mixed into a paste and forced into moulds. Any surplus clay is cut off and the contents of the moulds are turned out on to boards, the resulting bricks bearing a close resemblance to sand-faced bricks made by hand. This type of machine is more popular in the United States than in this country, though several machines of various designs are in use here, particularly in the South, where suitable clays are more abundant than in the Midlands and North.

The second type of machine described was the "wire-cut" brick machine, in which the clay is mixed with water, in what is practically a huge sausage machine, and is given the shape of a series of bricks side by side by forcing it out through a specially shaped mouthpiece. The band of clay thus produced is then cut into separate bricks by means of wires stretched at a suitable distance from each other on an iron frame.

The lecturer described the various parts of the plant in full detail, showed where many brickmakers are not getting as satisfactory results as they should do, and gave numerous useful hints to those engaged in the purchase or use of such plant.

He pointed out that where the clay is of such a nature as to permit of machines of this type being used, the manufacture of bricks in enormously greater quantities than was possible by hand is made a relatively easy matter, and showed how the material may be crushed into a suitable size or may be cleaned and freed from stones and some other impurities in an almost automatic manner by means of special "clay cleaners"—machines which have only been used during recent years and some of which have not yet been introduced into this country, though employed with great success for some time on the Continent.

The lecture concluded with descriptions of the chief methods of drying bricks made of plastic clay, the relative advantages of the ordinary chamber dryer and the more modern tunnel dryers being explained.

Third Lecture.

The third lecture, which was illustrated by a large number of lantern slides, was devoted chiefly to three methods of brick manufacture—the stiff-plastic process, the semi-dry process, and the dust process. These derive their names from the consistency of the material used, the first-named machines working with a clay paste, the second with a slightly dampened material, and the third with ground material or "dust." The lecturer explained that these terms were by no means ideal, but they had acquired fairly definite meanings in the course of time, and could, consequently, be readily understood without difficulty by those engaged in the manufacture of bricks. In the stiff plastic process of brickmaking, the chief object is to obtain a brick with most of the characteristics of hand-made bricks, or of those of the "wire-cut" type, but without the cost of removing so large a quantity of water in drying as when the material is made into a completely plastic paste. This process may also be used for a variety of materials which develop but little plasticity and may be regarded as the most economical process yet discovered, where the plasticity of the clay is used. The principal machines used were fully described, and their chief differences explained. The semi-dry process (sometimes known as the semi-plastic) consists in the use of a material which is naturally rather damp (or to which a small quantity of water has been added), but in which but little plasticity has been developed. It is much used for certain shales, as at Accrington and Peterborough, where the material is specially suitable for this purpose. The shale is ground to a powder, and is pressed in powerful machines into the shape of bricks, many precautions being necessary before a satisfactory article is produced. As little or no water is used, the drying of the bricks becomes unnecessary, and the cost of mixing into a paste and of drying is entirely avoided. In this way a notable reduction in the cost of production is obtained. The bricks made by this method are very accurate in shape, but are different in many physical characteristics from those made of a more plastic material. The manufacture of bricks from a dry powder was also described at length, though it does not differ materially from the semi-dry method. It is not used to a large extent for clay bricks, but is the method employed for sand-lime bricks and for those made of sand and other non-plastic materials. The relative advantages and disadvantages of the various methods of brickmaking were described and compared.

Fourth and Concluding Lecture.

The lecturer devoted most of this lecture to kilns, and described the various forms of furnace now used for burning bricks and making them resistant to weather.

He pointed out that for really efficient work it is necessary to study accurately the temperature of the kilns at different stages in the burning and urged manufacturers to employ some form of pyrometer and a draught-gauge. The lecturer described several of these instruments, and an appliance for ascertaining the composition of the gases passing to the kiln chimney, and considered that before any proper estimate could be obtained as to the best means of burning bricks, the results of the use of these instruments must be studied.

The clamp kiln—for temporary use—and the up and down draught and Newcastle kilns for small outputs were described and illustrated, and their advantages pointed out. For more economical working, however, the lecturer recommended the erection of a continuous kiln of modern type, as this requires less than half the fuel needed by single kilns.

The disadvantages of the original Hoffmann continuous kiln have been quite overcome, and terra cotta and glazed goods of first-class quality can now be burned in continuous kilns at a fraction of the cost formerly required.

The various methods of drying bricks in the kilns by means of hot air were described and compared, and the advantages of a fan in place of a chimney to produce draught were explained. In this connection the remarkable results obtained by the Buhrer kiln were mentioned—a speed of fire travel ten times as great as in other kilns being readily obtained.

The lecture concluded with a brief reference to the economic side of brickmaking, and urged the necessity of thorough and ample study of the whole subject, if bricks of a satisfactory quality are to be made at a remunerative cost.

[The lectures will shortly be reprinted in book form, and applications for the same should be made to the Secretary of the Royal Society of Arts, Adelphi, W.C.]

SOCIETIES' REPORTS.

R.I.B.A.

The following additional nominations for the annual elections have been made under by-law 33:—

As mbers of Council.—Maurice B. Adams; A. W. Brewill; C. Fitzroy Doll; H. P. Burke Downing; F. R. Farrow; W. J. Hale; A. R. Jemmett; G. E. Neild; Paul Ogden; C. Stanley Peach; Sydney Perks; Professor Beresford Pite; W. Gillbee Scott; Lewis Solomon; Sir A. Brumwell Thomas; Percy B. Tubbs; W. Henry White; W. G. Wilson; William Woodward.

As Associate-Member of Council.—C. E. Hutchinson.

As Member of the Art Standing Committee. Hippolyte J. Blanc.

As Members of the Practice Standing Committee.—G. E. Neild; S. Perkins Pick; Percy B. Tubbs.

As Associate-Member of the Practice Standing Committee.—K. Gammell.

As Associate-Member Science Standing Committee.—Arnold S. Tayler.

Institution of Mechanical Engineers.—An extra general meeting will be held in the Institution House, Storey's Gate, St. James's Park, on Friday evening, 27th May, at 8 o'clock. Professor J. O. Arnold will resume the discussion upon Mr. Shipley N. Brayshaw's paper on "A Research on the Hardening of Carbon and Low-Tungsten Tool-Steels." A paper will be taken, if time permits: "Comparison of the Tensile, Impact-Tensile, and Repeated-Bending Methods of Testing Steel," by Mr. B. Blount, Mr. W. G. Kirkaldy (M.), and Captain H. Riall Sankey, Member of Council.

TRADE AND CRAFT.

The Fire at the London Works of Vulcanite, Ltd.

Messrs. Vulcanite, Ltd., state that it has come to their knowledge that since the fire on the 31st March last one or two roofing contracts have passed them owing to the architect being prejudiced against Vulcanite roofing, in consequence of the fire at their London works. They add that, as a well-constructed wooded roof covered with their patent Vulcanite roofing forms an effective fire-resisting roof, as already proved by actual fires and official tests, they naturally wish to remove any misconception that may have arisen owing to the fire. The fire broke out in a store, and spread through the portion of the works destroyed entirely internally: the failure of the roofs was solely owing to the iron constructional work buckling, causing the structure to give way. A great part of the Vulcanite roofing from the destroyed buildings, found after the fire, had not been damaged at all by fire, and the portion partly consumed was found in places where everything else had perished owing to the fierceness of the fire, which was to a very large extent attributed to the high wind storm blowing at the time. Where there has been any misunderstanding with regard to this, they trust that this notice will remove all possible prejudice.

A Model Municipal Cottage.

We give an illustration below of a cottage specially designed for and erected at the second Municipal and Health Exhibition at the Royal Agricultural Hall last week. It has been erected under the auspices of Mr. James Cornes, the author of "Modern Housing in Town and Country," and Mr James A. King, the owner of Highams Park Estate. The architect is Mr. E. C. P. Monson, F.R.I.B.A., architect to the Sutton Trust, who is developing the Highams Park Estate as a modern village on Garden City principles for Mr. King. The external walls, internal partitions, as well as the ceilings, are fire-resisting and vermin-proof, built of "Mack" fireproof plaster slabs—manufactured solely by J. A. King and Company, 181, Queen Victoria Street, London, E.C. (works at Hayes, Middlesex, Pawcliffe, Yorks, etc. They occupy only one-half of the floor space that an ordinary brick or lath and plaster partition would, thereby reducing the cubical cost of the buildings and saving considerable frontage where several houses are erected. They have been tested by the British Fire Prevention Committee to a temperature of 2,250 deg. Fahr., with the best result on record. The cottages can be built in pairs or in blocks of four, with a back entrance opening in the centre; the design shows the end of a block or one of a pair. The accommodation provides living-room, 14ft. 6in. by 17ft.; scullery-bathroom, 11ft. by 8ft. 3ins.; larder, coalstore, w.c., and several cupboards, and three bedrooms on the first floor, 13ft. by 9ft. 1½ins., 17ft. 6in. by 8ft. 3ins., and 10ft. by 8ft. 1½ins. respectively. The cottage is estimated to cost from £160 to £175 according to position and facilities for building.

THE MODEL MVNICIPAL COTTAGE

E.C.P.MONSON F.R.I.B.A. F.S.I. ARCHITECT

COMING EVENTS.

Thursday, May 19.
R.I.B.A.—Literature Committee meets.
Saturday, May 21.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Broomhall, Fife.
R.I.B.A.—Last day for receiving notices of questions for discussion at meeting on June 6th.
Monday, May 23.
R.I.B.A.—Mr. E. A. Rickards on the Art of the Monument. 8 p.m.
Thursday, May 26.
THE SURVEYORS' INSTITUTION.—Country Meeting at Liverpool.
Friday, May 27.
ROYAL SANITARY INSTITUTE.—Provincial Sessional Meeting at Town Hall, Hereford.
THE SURVEYORS' INSTITUTION.—Country Meeting at Liverpool.
Saturday, May 28.
R.I.B.A.—Last day for receiving voting papers. Election of Council and Committees.
ROYAL SANITARY INSTITUTE.—Provincial Sessional Meeting at Liverpool.
Saturday, June 4.
NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to Sunderland.
Monday, June 6.
R.I.B.A.—General Business Meeting. 8 p.m.
Tuesday, June 7th.
SURVEYORS' INSTITUTION.—Special Certificate Examination commences and continues to the 9th June inclusive.
Thursday, June 9.
R.I.B.A.—Science Committee meets.
Saturday, June 11.
EDINBURGH ARCHITECTURAL ASSOCIATION AND GLASGOW INSTITUTE OF ARCHITECTS.—Joint visit to Colinton.
ARCHITECTURAL ASSOCIATION.—Sports at Bickley.
Monday, June 13.
R.I.B.A.—Preliminary Examination for probationership and Intermediate Examination for studentship commence and continue until Friday, the 17th June.

FEDERATION NEWS.

Bradford.

The annual meeting of the Bradford Local Conciliation Board was held at the Builders' Exchange, Bradford, on Monday, May 2nd, Mr. Taylor, president, occupying the chair. Mr. T. E. Taylor was re-appointed chairman, Mr. F. Firth vice-chairman, and Messrs. J. Davidson and J. H. Hopkinson joint secretaries for the ensuing year. Considerable satisfaction was expressed that during the four years the Board had been established it had not been necessary to call the members together to deal with any trade question or dispute.—J. DAVIDSON, Secretary.

West Hartlepool.

Mr. J. A. Tweddle, who has decided to commence business at Edmonton, Alberta, Canada, has been presented with a gold watch as a parting gift by his friends of the West Hartlepool and Tees-side Associations.

Leeds Conciliation Board.

The annual meeting of the Leeds Conciliation Board was held at the offices of the Leeds Association, 38, Boar Lane, Leeds, on Thursday, May 5th. In the absence of Mr. W. Irwin, chairman, Mr. T. W. Newlove, vice-chairman, presided. Mr. Newlove was appointed chairman, Mr. W. H. Dews vice-chairman, and Messrs. J. Davidson and T. C. Heal, joint secretaries, for the ensuing year.—J. DAVIDSON, Secretary.

National Association of Master Plasterers.

The annual general meeting of this association took place at the Builders' Exchange, Leeds, on Thursday, April 28th, the President, Mr. T. Lindley, presiding. Mr. E. Johnson, of the firm of Messrs. S. Johnson and Son, Mirfield, was elected President; Mr. F. Mountain, Leeds, vice-president; the other offices being retained by the past officials.

Upon the question of the proposed conference of the Confederated Associations of Master Plasterers, Plumbers, and Slaters, to be held in the near future, it was decided that it be an instruction to our delegates to see that such matters as separate tendering, sub-contractors' agreement, and payments of sub-contractors' accounts should be items in the agenda for discussion and passing of resolutions. Opinion was expressed that it would be advisable for the executive Council of the Confederated Associations to have a meeting at an early date, to make final arrangements for the conference

It was decided to hold the next half-yearly general meeting at Nottingham.—GEO. SOALL, Secretary.

Scottish Building Trades Federation.

The half-yearly meeting of the Scottish Building Trades Federation was held in Lamb's Hotel, Reform Street, Dundee, on Friday, April 29th, Mr. Hector MacVinish, Inverness, presiding. It was agreed to record in the minutes an appreciation of the services rendered by the late Mr. David Mekie, and a resolution of sympathy with the members of his family.

Reports on the state of trade recorded general depression, with slight indications of improvement in Edinburgh and Glasgow.

The financial report was submitted by the secretary and approved. It was agreed that each secretary send in to the chief secretary, Mr. Cameron, a full list of the members in their respective associations.

It was reported that the associations in Perth and Dumfries were practically defunct owing to the bad state of trade.

The secretary reported that he had been in correspondence with a firm of builders in Wick with a view to a builders' association being started there.

The secretary urged the advisability of forming a Parliamentary Committee, and the following gentlemen were duly elected to act in that capacity:—Mr. David Wilson, J.P., Mr. John Lownie, and Mr. James Cameron, solicitor and secretary, Edinburgh; Mr. Hector MacVinish, Inverness; Mr. T. C. Stocks and Mr. John Scott, Dundee; and Mr. James Leslie and Mr. James Farquharson, Aberdeen.

A request was made by the Aberdeen Building Trades Federation for a definition of cabinetmaking work as distinguished from joiner work, as it was contended that there had been improper competition of cabinetmakers for work which should properly fall to joiners. It appears that certain cabinetmakers, while competing for joiner work, are able to do it by cabinetmakers, whose wages are lower than those of the joiners. The delegates present from other centres stated what their experience was, and from the information supplied the Aberdeen delegates hope to put matters on a proper footing in their centre.

It was agreed to hold the annual meeting in Edinburgh on September 9th.—JAMES CAMERON, Secretary.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 19—June 6. **SHOTLEY BRIDGE (Gateshead).** — Four cottages for children at Shotley Bridge. Send names on or before May 19. Quantities and further information will be forwarded in due course. Plans, etc., may be seen at the offices of the architects, Newcombe and Newcombe, 89, Pilgrim Street, Newcastle-on-Tyne. Tenders to be delivered to George Craighill, Union Clerk, Poor Law Union Offices, Gateshead.

May 21. **ABERCANAID (Wales).**—Erection of a new church. Drawings and specifications can be seen at the office of T. Edmund Rees, architect and surveyor, Merthyr Tydfil. Tenders to be sent to the Rev. Peter Williams, The Vicarage, Troedyrhiw.

May 23. **CARDIFF.**—(See "Engineering.")

May 23. **ST. CLEMENT'S (near Truro).**—Erection and completion of two dwelling houses. Plans specifications, and conditions of contract can be seen by appointment at the office of the architect, A. Ernest Harris, 28, Boscawen Street, Truro. Tenders to be sent to J. Jeffery, The Knoll, Truro.

May 23. **NEWARK.**—Erection of five almshouses, off Hospital Lane, for the Trustees of St. Leonard's Hospital. Plans and specifications can be inspected at the offices of Sheppard and Lockton, architects, Bargate, Newark, and bill of quantities obtained. Tenders to be sent to R. F. B. Hodgkinson, clerk to St. Leonard's Hospital, Newark.

May 24. **PENIEL (Welshpool).**—Alterations to Peniel Congregational Chapel, near Llanfair, Welshpool. Plan and specification and further information may be obtained on written application to R. W. Davies, M.S.A., Architect and Surveyor, Severn Street, Welshpool, to whom tenders are to be delivered.

May 24. **HALIFAX.**—Erection of business premises on the Wards End Estate, Halifax (various works required). Plans and specifications may be inspected and bills of quantities obtained at the offices of Clement Williams and Sons, architects, Post Office Buildings, Commercial Street, Halifax, to whom tenders must be delivered.

May 24. **BRISTOL.**—Reconstruction of the roof of, and alterations to, an engine shed, for the Directors of the G.W.R. Plans and specification may be seen, and forms of tender and bills of quantities obtained, at the office of the Engineer at Bristol Station. Tenders to be sent to G. K. Mills, Secretary, Paddington Station, London.

May 24. **HESSLE.**—Erection of two sanitary conveniences, in brick, with drainage and water supply, in their recreation ground, in Park Avenue, Hessle, for the U.D.C. Plans and specifications may be seen and quantities obtained on application at the Parish Hall, Hessle. Tenders must be delivered to William Coulson, Clerk to the District Council, Parish Hall, Hessle.

May 24. **LISCARD (Cheshire).**—Erection of new public library, Earlston Park, Liscard, in accordance with drawings prepared by MacColl and Tonge, Architects, of Bolton and Southport, for the Libraries Committee of the Wallasey U.D.C. Copies of bills of quantities and general conditions, with form of tender, may be obtained on application, on or before May 11, from J. Brierley Preston, Surveyor, Central Buildings, 41, North John Street, Liverpool, on deposit of £1 1s. The drawings may be seen at the Librarian's Office (which adjoins the site), Earlston Hall, Earlston Road, Liscard, Cheshire. The contractor will be required to enter into a bond, with approved sureties, for the due performance of the contract. Tenders are to be addressed to H. W. Cook, Clerk and Solicitor, Public Offices, Egremont, Cheshire.

May 24. **WEDNESBURY.**—Erection of Holyhead Road Council school, for the Education Committee of the Borough. Plans of the proposed buildings may be inspected, and bills of quantities obtained, not later than May 10, at the office of the Architect, C. W. D. Joynson, Springhead, Wednesbury, on a deposit of £2 2s. Tenders to be sent to E. Foster Knowles, Secretary to the Education Committee, Education Offices, Wednesbury.

May 25. **MONEA (Ireland).**—Erection of the new Devenish school, Monea, according to drawings and specification to be seen at the office of Thomas Elliott, 37, Darling Street, Enniskillen, to whom tenders must be sent.

May 25. **LONDON, E.C.**—(See "Sanitary Engineering.")

May 25. **QUEEN'S COUNTY (Ireland).**—Erection of a building and other alterations, at the Infirmary, for the Committee of Management. Plans and specifications to be had at infirmary.

May 25. **LYMINGE (Kent).**—Erection of four cottages at the workhouse, for the Guardians of Elham Union. Plans and specifications can be seen at the office of R. Lonergan, clerk, 29, Bouverie Square, Folkestone. Tenders to be sent to the Clerk.

May 25. **LAVERNOCK (Cardiff).**—Erection of attendant's cottage and valve chamber, for the Cardiff Corporation. Contract drawings and deed of contract may be inspected, and form of tender, specification, and bill of quantities obtained, at the City Engineer's Office, City Hall, Cardiff, upon deposit with the City Treasurer of the sum of £2. Tenders are to be delivered at the office of the Town Clerk, City Hall.

May 25. **LANCASHIRE AND YORKSHIRE RAILWAY.**—Construction of additional opening under Crosby Road, and other works; construction of overhead booking hall, etc., at Waterloo. Plans can be seen, and copies of tender, quantities, and specification in each case obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders to be sent to R. C. Irwin, Secretary, Hunt's Bank, Manchester.

May 25. **CROYDON.**—Erection of two isolation pavilions and additions to Administrative Block, etc., at the Borough Hospital, Waddon, for the Croydon Corporation. Plans and specifications can be seen, and bills of quantities and form of tender obtained, at the office of the Borough Engineer, Town Hall, Croydon, upon deposit of £1 1s. Tenders to be sent to F. C. Lloyd, Town Clerk, Town Hall, Croydon, at which office the conditions of contract can be seen.

May 25. **WEST DERBY.**—Erection and completion of a new hospital at Alder Hey, West Derby, for the Guardians. A set of quantities can be obtained from Harris P. Cleaver, Union Clerk, Brougham Terrace, West Derby Road, Liverpool, on deposit of £5 5s. Specifications and drawings to be seen at the office of the architect, C. H. Lancaster, Brougham Terrace, West Derby Road, Liverpool. The contractor whose tender is accepted will be required to enter into an agreement, under seal, with security as named in specification and quantities, for the due fulfilment of the contract. The acceptance of any tender is subject to the approval of the Local Government Board, whose disapproval of the scheme would cancel any contract the Guardians may have provisionally entered into, and the contractor or contractors would have no claim for compensation. Tenders must be delivered to the Union Clerk.

May 26. **ABERBEEG (Abertillery).**—Erection of a Council school for mixed and infants at Ty'r Graig, Aberbeeg, for the Abertillery Education Committee. Drawings and specifications may be inspected at the office of the architects, Speir and Beavan, Borough Chambers, Wharton Street, Cardiff, and at the Council Offices, Abertillery. Bills of quantities supplied by the architects on deposit of £2 2s. The contract agreement will contain clauses indemnifying the committee against claims for damage caused in carrying out the work, and under the Workmen's Compensation Acts, and a clause binding the contractor to pay union rates of wages. Tenders to be sent to N. J. Llewellyn, secretary, Council Offices, Abertillery.

May 27. **WALTON.**—Erection of Walton new Council school (builder, joiner, slater, plumber, plasterer, painter, whole or separate tenders), for the West Riding Education Committee. Plans may be seen, and specifications, etc., obtained on application to the Education Architect, County Hall, Wakefield. A sum of £1 must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield.

May 28. **ARGOED (Mon.).**—Erection of 24 houses for the Argoed Workmen's Building Club. Plans and specifications may be seen at the office of A. F Webb, architect and surveyor, Blackwood and Tredegar, to whom tenders must be delivered.

May 28. **MERTHYR TYDFIL.**—Alterations to windows and floors of Treharris boys' and infants' schools, for the Education Committee. Particulars can be obtained from the Deputy Surveyor, Town Hall, Merthyr Tydfil. Tenders to be sent to E. Stephens, clerk to the Education Committee.

May 28. **BRADFORD.**—Erection of Sunday schools and assembly-hall, for St. Columba's parish. Plans may be seen and bills of quantities obtained at the offices of T. H. and F. Healey, architects, 42, Tyrrel Street, Bradford, to whom tenders must be sent.

May 28. **WELSHPOOL.**—Erection of a Drill Hall at the Armoury, Welshpool, for the Montgomeryshire Territorial Force Association. Plans and specification may be inspected and further information obtained on written application to R. W. Davies, M.S.A., Architect and Surveyor, Severn Street, Welshpool, to whom tenders are to be delivered.

May 30. **PINXTON.**—Erection of four cottages by the Pinxton Co-operative Society, Limited. Plans and specifications can be had from the architect, John Tomlinson, South Normanton, or the Secretary, Ashville, Pinxton, on the deposit of £1 1s. Tenders to be sent addressed to the Secretary.

May 30. **CHELMSFORD.**—Alterations and additions to King Edward VI. Grammar School. The drawings and specifications may be seen on application to the architects, Charles and W. H. Pertwee, Chelmsford. A deposit of £5 is required. Quantities will not be supplied. Tenders to be delivered to William Stunt, solicitor, Clerk to the Governors, 71, Duke Street, Chelmsford.

May 30. **BARNSLEY.**—Erection and completion of new wards, to accommodate 38 beds, a new block for kitchens and offices connected therewith, new sterilizing and store rooms, new electric lift, and reconstruction of corridors and renovations to central block, at Beckett Hospital. Plans and specifications may be inspected on application to the architects, G. Moxon and Son, Central Chambers, 26, Church Street, Barnsley. Bills of quantities may be obtained on deposit of £3 3s. Tenders to be delivered to R. F. Pawsey, hon. secretary, 8, Regent Street, Barnsley.

May 30—June 15. **DUNSTABLE.**—Erection of a new Council school, for the Bedfordshire C.C. Drawings, specifications, and form of contract may be inspected at the office of Gotch and Saunders, architects, Kettering. Builders desirous of tendering must send their names and addresses to the architects on or before May 30, together with a deposit of £1 1s., when a copy of the bill of quantities and form of tender will be forwarded to them. The contractor will be required to find sureties for the due performance of the contract. The acceptance of a tender will be subject to the approval of the Local Government Board. Tenders must be sent to W. W. Marks, Clerk of the County Council, Shire Hall, Bedford.

May 31. **CROYDON.**—Additions and alterations and general repairs at "Crosslands" and "Lindens," 218 and 220, London Road, for the Guardians. The specification and conditions of contract may be seen, and bills of quantities and form of tender obtained, at the office of Henry Berney, architect, 104, George Street, Croydon, surveyor to the Guardians, upon deposit of £5 5s. The contractor will be required to enter into a contract and bond and give two sureties, to be approved by the Guardians, for the due performance thereof. Tenders are to be addressed to Harry List, Clerk to the Guardians, Union Offices, Mayday Road, Thornton Heath, Surrey.

June 6. **MANCHESTER.**—(See "Miscellaneous.")

June 17. **WARWICKSHIRE.**—Alteration of the premises at the Aston Lower Grounds to fit the same for the requirements of the Territorial Units who will be there located, for the Warwickshire Territorial Force Association. Bills of quantities, form of tender, etc., may be obtained from the architects, James and Lister Lea and Sons, 19, Cannon Street, Birmingham, on deposit of £3 3s. The plans and conditions of contract may be seen and all further particulars obtained at the architect's offices. The contractor shall pay rates of wages and observe hours of labour not less favourable than those commonly recognised by employers and trades societies in the building and allied trades in the Birmingham district. Further, the conditions of employment generally accepted in the Birmingham district in the trade concerned shall be taken into account in considering how far the terms of the fair wages clauses are being observed. The contractor shall be prohibited from transferring or assigning to any person or persons whatever any portion of his contract without the written permission of the Association. The contractor shall be responsible for the observance of the fair wages clause by the sub-contractor. Tenders should be delivered at the offices of the Association, 46, High Street, Warwick.

(*Continued on next page*)

ENGINEERING.

May 23. **CARDIFF.**—Construction and maintenance of a skew bridge, consisting of two spans of 41ft. 6ins. each, by 50ft. wide, over the River Ely, in lieu of the existing masonry bridge, which is to be removed; and for the execution of certain road works, in connection therewith. The new bridge is to be constructed with masonry abutments, centre pier, and wing walls, and is to have a steel and concrete superstructure and iron parapet railings. Contract drawings and deed of contract may be inspected, and forms of tender, specification, and bill of quantities obtained at the City Engineer's office, upon deposit with the City Treasurer of £3. Tenders are to be delivered at the office of the Town Clerk of Cardiff, in the City Hall.

May 24. **KIDDERMINSTER.**—(See "Iron and Steel.")

May 24. **SHANKLIN, I.O.W.**—Chillerton Auxiliary Water Supply (Contract 3 and 4).—Carting, excavating for, and laying of 9,928 yards lineal of 9in. cast-iron supply main from Whiteley Bank along main roads via Godshill, Rookley, and Highwood Lane, and across certain lands, to the high level reservoir at Chillerton; also for the laying of 1,320 yards lineal of 9in. cast-iron rising main from the pumping station at Rome Meadow, Chillerton, to the high road level reservoir; and 885 yards lineal of 4in. cast-iron main in Chillerton Street; and 570 yards lineal of 3in. cast-iron main in Godshill village; and 25 subsidiary supply main systems along route of main, including all bends, connections, and wash-out pipes, and fixing the necessary sluice valves, air valves, and hydrants, etc., required, for the U.D.C. The work to be tendered for in two half-distance contracts, and as apportioned by the specifications. Plans, specifications, and conditions may be seen and forms of tender obtained at the Council Chambers, Shanklin. The successful contractors will be required to enter into formal contracts, and to give bonds with approved sureties for the due performance of the contracts. Tenders for each separate contract to be sent to John Marsh, Clerk to the Council, The Council Chambers, Shanklin, I.O.W.

May 25. **LANCASHIRE AND YORKSHIRE RAILWAY.**—(See "Buildings.")

May 28. **LONDON, N.**—Sinking and equipment of a deep tube well, for the Finchley U.D.C. Conditions, specification, and form of tender may be obtained at the office of the electrical engineer, E. Calvert, Electricity Works, Squire's Lane, Finchley, N., on deposit of £1 1s. Tenders must be sent to E. H. Lister, Clerk, Church End, Finchley, N.

June 1. **SOUTHAMPTON.**—Reconstruction of a portion of the town quay, Southampton (contract No. 4), such tender being based upon proposals to be submitted by the persons tendering, and the particulars supplied by the Harbour Board. Specification, conditions, and copies of the general drawings may be obtained upon application to E. Cooper Poole, A.M.Inst.C.E., Engineer and Surveyor to the Board, at the Board's offices, from 10 a.m. to 12 noon, upon deposit of £5. Tenders must be delivered to Harbour Board Offices, Town Quay, Southampton.

SANITARY ENGINEERING.

May 23. **WALTON-UPON-THAMES.**—Construction of the following lengths of sewers, together with manholes, etc., for the U.D.C.:—113 yards lineal 9in. cast-iron pipe sewer, 537 yards lineal 7in. cast-iron pipe sewer, and 323 yards lineal 7in. stoneware pipe sewer. Drawings and specification may be seen and forms of tender obtained on application to R. Wilds, surveyor, Council Offices, Walton-on-Thames. Tenders must be delivered to Percy H. Webb, Council Offices, Walton-on-Thames.

May 23. **ILFORD.**—Supply and construction of the following sewers, manholes, etc., in:—Blind Lane, Barkingside, about 450 yards 9in. pipes; Hatch Lane, Ilford, about 418 yards 9in. pipes; for the U.D.C. Plans may be seen and specification and form of tender and full particulars obtained, on application to H. Shaw, M.I.C.E., Engineer and Surveyor to the Council, Town Hall, Ilford, on deposit of £2 2s. Tenders must be delivered to Adam Partington, Clerk and Solicitor to the Council, Town Hall, Ilford.

May 23. **SOUTHAMPTON.**—Supply, erection, and setting to work, etc., (1) pneumatic sewage ejector, with cast-iron chamber, near Millbrook Station; (2) pneumatic sewage ejector in existing chamber at Rochester Street, for the Corporation. Plans, specifications and conditions may be inspected and forms of tender obtained at the Borough Engineer's Office on production of the Borough Treasurer's receipt for a deposit of £1 1s. for each contract. Tenders must be delivered at the Town Clerk's Office, Municipal Offices, Southampton.

May 23—June 10. **NEW MILLS (near Stockport).**—Sewerage and sewage disposal works at Birch Vale, for the Hayfield R.D.C., comprising:—1,520 lineal yards of earthenware pipes, 9in. diameter; 150 lineal yards of steel tubes, 9in. diameter, on rubble piers; and 35 lineal yards of cast-iron pipes, 9in. diameter, under railway, with all manholes, lampholes, flush tanks, and ventilators. Also extensions to the existing disposal works, including precipitation and stormwater tanks, percolating filters, and revolving sprinklers (55ft. diameter), dosing tank, carriers, distributors, etc. Plans and specifications may be seen at the offices of the engineers (John Newton, Son and Bayley, civil engineers, 19, Cooper Street, Manchester), and copies of bills of quantities and form of tender may be obtained from them or from J. R. Bowden, clerk, 16, High Street, New Mills, near Stockport, on deposit of £1 1s. Contractors proposing to tender are requested to send their names to the Engineers by May 23. Tenders to be delivered at the Rural Council Offices, 16, High Street, New Mills, by June 10.

May 24. **HESSLE.**—(See "Buildings.").

May 25. **LONDON.**—Reconstruction of the convenience in Byward Street, E.C., for the Streets Committee of the Corporation, in accordance with the terms and conditions contained in specifications, which may be obtained at the office of the Engineer on deposit of £2 2s. Persons tendering must give the names and addresses of at least two substantial sureties, who will be required to enter a bond for the due performance of the contract. Tenders must be addressed to the Town Clerk, Public Heath Department, Guildhall, E.C., and delivered at the office of the Hallkeeper in the Guildhall.

May 27. **PRESTWICK.**—Construction of a 12in. stoneware sewer in Bury New Road, near Hilton Lane, within the district for the U.D.C., subject to general conditions of contract, which can be inspected at the Surveyor's Office, Chester Bank, Prestwick, any morning between the hours of 9 a.m. and 11 a.m., where the plan, specification, and quantities of the proposed works will be open for inspection. Copies of the bills of quantities and any further information that may be required can be obtained from the Surveyor on deposit of 10s. Tenders must be delivered to Lewis A. Orford, Law Clerk to the Council, Council Offices, Prestwick, near Manchester.

May 28. **WIGSTON MAGNA (Leicester).**—Construction of sewage works:—Contract No. 1, sewers, pumping station, and outfall works; the construction of about 1¾ miles of concrete, brick, and stoneware pipe sewers, varying from 6ft. by 4ft. to 9in. diameter, the laying and jointing of about ¼ of a mile of 13in. cast-iron pumping main, the construction of a pumping station, tanks, two continuous filters, distribution, and other works. Contract No. 2, cast-iron pipes: the supply and delivery of about 190 tons of coated cast-iron pipes and specials, varying in diameter from 18in. to 4in. Contract No. 3, sewage ironwork: the supply, delivery, and fixing of two rotary sewage distributors, 7oft. in diameter, floating arm, screen with power rake, and the supply and delivery of about 130 various sluice valves, air valves, and penstocks. Drawings may be seen at the offices of the engineers, Everard, Son and Pick, 6, Millstone Lane, Leicester, from whom conditions, specification, quantities, and form of tender may be obtained on deposit of £2 2s. for each contract. Tenders upon the form supplied to be sent to A. H. Burgess, Clerk, 2, Wycliffe Street, Leicester.

May 30. **OSSETT.**—Tenders for the laying of about 300 yards of 9in. earthenware pipe sewers, the construction of ejector chamber, air compressing station, and other appurtenant works at the Healey sewage disposal works, for the Ossett Corporation. The plans may be seen and specification and bill of quantities obtained at the office of the Borough Engineer, Town Hall, Ossett, on deposit of £1 1s. Tenders to be sent to the Town Clerk, Ossett.

May 30. **WAKEFIELD.**—Alterations and additions to existing precipitation tanks, etc., the construction of about three acres of percolating filters, containing approximately 31,000 cubic yards of filtering material, effluent settlement tanks, liming and ferric sulphate houses, offices, mess-room, culverts, carriers, drains, and other appurtenant works at Calder Vale, for the Corporation. The contract drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of the engineer, J. P. Wakefield, A.M.I.C.E., city surveyor, Town Hall, Wakefield, on deposit of £5 5s. (Bank of England Note). Tenders must be delivered to W. W. Greenhalgh, Town Clerk.

May 31. **SALFORD.**—Sewering, paving, and flagging works, for the Corporation. The plans may be seen and forms of tender with quantities obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders must be delivered to L. C. Evans, Town Clerk, Town Hall, Salford.

May 31. **LONDON, N.W.**—Construction and maintenance for twelve calendar months of 3,215ft. lineal or thereabouts of brick sewers of various dimensions, and 555ft. lineal of pipe sewers, together with manholes, gauging chambers and other works incidental thereto at Stonebridge, in the parish of Willesden, for the Willesden D.C. Quantities and specifications may be obtained upon application to O. Claude Robson, M.I.C.E., engineer, Public Offices, Dyne Road, Kilburn, N.W., and deposit of £5 5s. Tenders to be delivered to Stanley W. Ball, clerk, Public Offices, Dyne Road, Kilburn, N.W.

May 31. **LONDON, S.E.**—Construction of about 1,564ft. of 3ft. 6in. brick and concrete culvert in Hither Green Lane and Verdant Lane, Lewisham, for the Lewisham B.C. Plans and specification may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). Copies of the specification may also be had on payment of 5s., which will not be returned. Tenders must be delivered at the Town Hall, Catford, and placed in the box there provided for the purpose. The works are to be proceeded with immediately on acceptance of tender and execution of contract, and the contractor must employ local labour as far as practicable in carrying out the work. Rate of wages, etc., clause to be observed.

June 20. **YSTRADGYNLAIS.**—Schemes and estimated cost for sewering the Parish of Ystradgynlais Lower, for the R.D.C., who will pay a sum of £20 for the scheme which they consider most suitable, and the decision of the Council must be accepted as final. Competitors to state their terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars of the area to be drained and any other information may be obtained from T. Watkins, Surveyor to the Council, Ystradgynlais. Schemes to be sent in to D. L. Moses Evans, Clerk to the Council, Commercial Street, Ystalyfera.

IRON AND STEEL.

May 23. **CARDIFF.**—(See "Engineering.")

May 23. **LONDON, N.**—Supply and delivery, within one month of the date of the acceptance of the tender, at Lower Edmonton station on the Great Eastern Railway, and, if so required, the fixing in situ of about 500 yards in length of unclimbable iron or steel fencing, for the Edmonton U.D.C. Forms of tender and full particulars may be obtained of G. Eedes Eachus, M.I.C.E., engineer, Town Hall, Edmonton. Tenders to be delivered at the office of Wm. Francis Payne, clerk of the Council, Town Hall, Edmonton. Rate of wages, etc., clause to be observed. The firm whose tender may be accepted will be required to enter into a proper contract, and to provide such sureties as the Council shall direct.

May 24. **MANCHESTER.**—Supply of:—(a) Steel girder tramway rails; (b) granite setts; for the Tramways Committee of the Corporation. Specifications and forms of tender may be obtained on application to J. M. McElroy, General Manager, Corporation Tramways, 55, Piccadilly, Manchester. Applications for specifications for (a) steel girder tramway rails must be accompanied by a deposit of £1 1s. Tenders are to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester.

May 24. **KIDDERMINSTER.**—Laying and jointing of approximately 3,760 yards of 3in., 4in., and 5in. cast-iron pipes, together with the supply and fixing of the requisite special pipes, fittings, and accessories, for the R.D.C. Plan sections and detail drawings may be seen and specification and bills of quantities obtained at the offices of the engineer, William Fiddian, F.S.I., Old Bank Offices, Stourbridge, on deposit of £1 1s. Two sureties will be required for the due performance of the contract. Tenders to be sent to Fredk. Burcher, Clerk to the Rural District Council, Kidderminster.

May 25. **BOLTON.**—Supply of 374 lineal yards of steel rails for a portable tramway, to be delivered at Bromley Cross Station, near Bolton, for the Turton U.D.C. Specification and form of tender may be obtained on application to V. W. Laithwaite, Surveyor to the Council, Bromley Cross, near Bolton. Tenders to be delivered to J. B. Goulburn, Clerk to the Council, Council Offices, Bromley Cross, near Bolton.

May 30. **DARLINGTON.**—Corrugated iron roofs to tar macadam sheds, for the Corporation. For all particulars apply to George Winter, Borough Surveyor, Town Hall, Darlington.

PAINTING.

May 23. **LEEDS.**—Painting work required in various parks and recreation grounds, for the Parks Committee of the Corporation. Specifications may be seen and forms of tender for any or all the contracts obtained at the office of W. T. Lancashire, City Engineer, Municipal Buildings, Leeds. Tenders must be received at the Town Clerk's Office.

May 24. **GRIMSBY.**—Painting and cleaning the schools as under:—(1) Holme Bill, exterior, senior boys', junior boys', girls' and infants' departments; also cookery and handicrafts centres, and caretakers' house. (2) Harold Street, interior, senior, junior and infants' departments; also cookery, laundry, and handicraft centres. (3) Edward Street, exterior, senior boys', junior boys', senior girls', junior girls' and infants' departments, for the Borough Education Authority. Specifications and full particulars may be obtained at the Education Offices. Tenders, giving the price of each school, must be addressed to Douglas Chandler, Clerk to the Education Authority, Education Offices, Grimsby.

May 24. **LONDON, S.W.**—Cleansing, repainting, tar-varnishing, etc., of Chelsea Suspension Bridge, for the L.C.C. Specification, bills of quantities, form of tender, etc., may be obtained on application to the chief engineer of the Council, Maurice Fitzmaurice, C.M.G., County Hall, Spring Gardens, S.W., upon deposit to the cashier of £1. Full particulars of the work and conditions of contract may be obtained at the County Hall before the payment of this fee. Rate of wages, etc., clause to be observed.

THE RUBBER BOOM.

...se, ... in with marri...
...great cul... ...ation may lie at the
this Lambeth ... ...cience.

Yes, your mackintoshes will cost you more. This is not a Free Trade joke; it's a grimly serious consequence of the rubber boom. Waterproofs have already been put up 20 per cent., and everything of which rubber forms a part is rising proportionately. As there are generally sympathetic movements in other directions, we may perhaps expect to see umbrellas also "going up." It is rather rough on us, when other trades are dull and everyone has to economise, that we should have to pay more for our tennis boots, our hot-water bottles, our golf balls, our goloshes, our ink-erasers, our rubber heels, and our elastic stockings. It's a benevolent wind indeed that blow's nobody harm. Aye, there's the rub—in fact, there's the rubber!

May 24. **GREAT WESTERN RAILWAY.**—Cleaning and repainting stations, bridges, etc., for the Directors:—Contract No. 30, stations at Pontypool, Pontllanfraith, Llanhilleth, Newbridge, Blaengwynn, Blaen Rhondda, and Duffryn Rhondda; 31, stations at Bedwyn, Burbage, Bathampton, Box, Corsham, Great Somerford, Hungerford, Kintbury, Marlborough, and Wylye; 32, Locomotive Department Buildings at Chippenham, Bath, Pilning, Bristol, Weston-super-Mare, Marlborough, Frome, Westbury, Warminster, and Salisbury; 33, bridges in Swindon, Chippenham, Bath, Bristol, Cheddar, Hungerford, Trowbridge, Westbury, and Frome districts; 34, bridges in Hereford and Ross districts; 35, portion of roof of Paddington passenger station; 36, bridges in Shrewsbury, Woofferton, and Leominster districts; 37, bridge on the Roath Dock Branch, Cardiff. Specifications may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Newport Station for Contracts Nos. 30 and 37; at Bristol for Contracts Nos. 31 to 33; at Gloucester for Contract No. 34; at No. 7, Eastbourne Terrace, Paddington, W., for Contract No. 35; and at Shrewsbury for Contract No. 36. Tenders must be sent to G. K. Mills, Secretary, Paddington Station, London.

May 25. **HANDSWORTH.**—Painting and cleaning of the public elementary schools during the summer holidays, 1910, for the Education Committee. Apply to J. F. Ingram, Education Offices, Soho Hill, Handsworth, Staffs, for specifications and conditions of tender.

May 25. **LONDON, N.**—Cleaning and painting works and repairs at the Northern (Convalescent) Fever Hospital, Winchmore Hill, N., for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form of tender, must be delivered at the office of the Board.

May 28. **MIDDLESBROUGH.**—Painting, etc., at several of the public elementary schools in the Borough (tenders from persons having business premises in Middlesbrough), for the Education Committee. Specifications may be had on application to J. S. Calvert, secretary, Education Offices, Middlesbrough, to whom tenders are to be forwarded.

May 28. **BERKHAMSTED.**—Painting, etc., at the Workhouse, for the Guardians:—Men's infirmary, inside and outside painting, etc.; workhouse buildings, external painting, etc., in accordance with specification prepared by C. H. and N. A. Row, architects, Berkhamsted, to whom application must be made for copies of such specification and full particulars of the work required. Tenders must be delivered at the office of A. W. Vaisey, clerk, 207, High Street, Berkhamsted.

ROADS AND CARTAGE.

May 23. **WAKEFIELD.**—Supply and delivery of hand-broken granite, or whinstone macadam, machine broken limestone chippings, Elland edge stone setts, flags, and kerb pitch and creosote oil, for the Corporation. Forms of tender may be obtained at the office of the City Surveyor. Tenders must be sent to W. W. Greenhalgh, town clerk.

May 23. **BRIGHTON.**—Supply of dressed granite kerb and channel:—2,000ft. run 6in. by 10in., granite edge kerb; 4,000ft. run 12in. by 6in., granite flat kerb; and 2,000ft. run 12in. by 6in. granite flat channel, for the T.C. Specification and form of tender may be obtained on application at the office of the Borough Surveyor, Town Hall, Brighton. Tenders must be addressed to Hugo Talbot, town clerk, Town Hall, Brighton.

May 23. **PORTSMOUTH.**—Laying compressed asphalte pavement in Queen Street, Portsea, and part of King's Road, Southsea, and maintaining the same in thorough repair for two years, from completion, for the T.C. Specification, form of tender, and schedule of prices, may be obtained on application to G. Hammond Etherton, Town Clerk, The Town Hall, Portsmouth, on deposit of £2 2s. Tenders must be sent to the Town Clerk.

May 23. **LONDON, E.C.**—Paving the carriageways of Gloucester Street (part) and Wynyatt Street with tar slag macadam, and alternatively with any similar material, for the Finsbury B.C. Specifications can be seen and forms of tender obtained at the Borough Surveyor's office, Finsbury Town Hall, Rosebery Avenue, E.C., on deposit of £1 1s. Tenders must be delivered to George Whitehead Preston, town clerk, Finsbury Town Hall, Rosebery Avenue, E.C.

May 23. **STREATHAM.**—Making-up and paving of that part of Becmead Avenue, Streatham, for the Wandsworth B.C. The specification and drawings may be seen, and forms of tender obtained, of the Borough Engineer, at the office of the New Streets Department, No. 56, East Hill, Wandsworth, S.W., upon deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Persons tendering must in the case of all workmen employed by them pay wages at not less and observe hours of labour not greater than the rates and hours recognised by the associations of employers and employees and in practice obtained in the district where the work is to be executed. If required, the contractor must provide two sureties for the due execution of the contract.

May 24. **MANCHESTER.**—(See "Iron and Steel.")

May 24. **LONDON, W.**—Supply of machine-broken road stone and stone chippings, for the Great Western Railway Co. Conditions of contract and forms of tender may be obtained on application to G. K. Mills, secretary, Paddington Station, London, by whom tenders will be received.

May 24. **GATESHEAD.**—Paving the following streets:—Back Keswick Street West, tar macadam; back Laburnum Gardens East, cement; William the Fourth Yard, for the Corporation. Plans and specifications may be seen and quantities obtained at the office of N. P. Pattinson, borough surveyor, Town Hall, Gateshead.

May 24. **MOUNTAIN ASH (Wales).**—Private street works in the following named streets, for the U.D.C.:—(1) Mount Pleasant Terrace, between Victoria Street and Clarence Street; (2) Mount Pleasant Terrace, between Glyngwyn Street and Victoria Street. Plans and specifications may be seen and forms of tender obtained on application to W. G. Thomas, surveyor, Town Hall, Mountain Ash. Contractors will be required to pay their workmen the recognised trades union rates of wages. Tenders to be sent to H. P. Linton, clerk, Town Hall, Mountain Ash.

May 25. **LONDON, E.C.**—Paving works, for the Corporation, agreeably to specifications to be seen at the office of the Engineer to the Corporation, where forms of tender may be obtained:—Carriageways to be paved with asphalte: New London Street. Carriageways to be paved with granite setts: Seacole Lane (Fleet Lane to railway arch), Fleet Lane (Old Bailey to railway arch), Water Lane (Queen Victoria Street to Playhouse Yard) Pindar Street (west side of Railway Approach to City boundary beneath the L. and N.W. railway bridge), Benet's Hill (lower portion). Footways to be paved with asphalte: New London Street; John Street, Minories (south side); New Street, Gravel Lane; Nettleton Court, Nichol Square; Pilgrim Street (east from Broadway and St. Martin's Court to Ludgate Hill), Seacoal Lane (Fleet Lane to Farringdon Street), Fleet Lane (Old Bailey to Farringdon Street), Aldgate High Street (Mansel Street to L. and N.W. Railway Goods Depot), Stoney Lane (south-east side from Houndsditch to Back Gravel Lane), Hanover Court, Houndsditch; Castle Court, Cornhill; London Wall (Blomfield Street to New Broad Street, both sides); John Street, Minories (noth side). Tenders must be addressed Town Clerk, Public Health Department, and delivered at the Office of the Hallkeeper, Guildhall.

STONIFLEX is that something better in roofing material that the discriminating architect and builder desires. It offers best value at lowest price.

'STONIFLEX'

FLAT ROOFING

We guarantee these points—fireproof—weather proof. For your satisfaction we can refer you to actual users. An important point to note is that "Stoniflex" will not crack on settlement. It keeps its new unbroken surface under all conditions.

Let us send you full particulars and prices to-day. You can give your client no better value in roofing than "Stoniflex."

D. ANDERSON & SON, Room 8,
Roach Road, Old Ford,
London, E.

Fulwell Hydrated Lime.

A high-class Lime, slaked by a patent process, and packed in bags. Saves the labour of washing and running the lime, will not blow, leaves no waste, may be stored without deterioration and without bursting the bags.

For mouldings and lathwork can be gauged with a much smaller proportion of plaster than ordinary lime.

Converts lime into a safe, reliable and convenient material with the advantages of a bagged plaster.

Further Particulars and Samples from:—

The Exors. of the Late
Sir HEDWORTH WILIAMSON, Bart.,
Fulwell Lime Works, SUNDERLAND.

JUST A WORD ABOUT WHITEWASH.

No one denies that the old method of preparing whitewash was both insanitary and wasteful. It is now rendered **obsolete.**

"CEELINKOTO"

(Registered)

does away with it.

WHY? Because just mixed with a little clean cold water it forms a **perfect sanitary whitewash** for ceilings and friezes.

When an article of sterling merit has been successfully placed on the market imitations are bound to spring up. Protect your own interests by making sure that you use

"CEELINKOTO"

(REGISTERED)

It is made in White Cream, and Ivory, and is packed in casks weighing about 1½cwt. It is sold by all Builders' Merchants and Colour Houses. If any difficulty is experienced in obtaining

"CEELINKOTO"

the Proprietors will be glad to furnish the name of their nearest local agent.

Sole Manufacturers:

THOMAS JENKINS & CO.

(ESTABLISHED 1848),

ing, for the Finchley United D.C. Sketch specification, giving particulars, may be seen, and form of tender obtained, on application to the Engineer and Surveyor, Council Offices, Church End, Finchley, N. Tenders to be delivered to E. H. Lister, clerk.

May 30. **FARNBOROUGH.**—Supply of:—Broken granite (British), tar-macadam, Portland cement, pennant kerbing, and hire steam roller and scarifier, for the U.D.C. Specifications and form of tender may be obtained from J. E. Hargreaves, surveyor, Town Hall, Farnborough, Hants.

May 30. **LYE AND WOLLESCOTE.**—Street paving and surface water drainage in their district, for the U.D.C. Plans and specifications may be seen and forms of tender obtained at the office of the surveyor to the Council, H. P. F. Weaver, Bank Chambers, Lye. Tenders may be separately addressed to W. Stanley Mobberley, Clerk to the above Council, Bank Chambers, Lye. Approved sureties will be required for the due performance of the work.

May 30. **CAMBERWELL.**—Kerbing and York paving the footways in Peckham Rye West Side (from Barry Road to Nigel Road); also for roadway paving (patent or otherwise) to specification as submitted by contractors, for the B.C. Full particulars and form of tender can be obtained from Wm. Oxtoby, Borough Engineer, Town Hall, Camberwell, S.E. Contractors are invited to state the roadway paving they are prepared to lay and their conditions as to maintenance for a term of years. Tenders to be delivered to the Town Hall, Camberwell, S.E., addressed to the Works Committee.

May 24. **STROUD.**—Supply of Clee Hill stone, Tytherington stone, and Chepstow stone, for the twelve months ending March 31, 1911, for the U.D.C. Tenders should be sent to E. Northam Witchell, Clerk. Samples of the stone to be supplied should be sent to the Council Offices, Town Hall, Stroud, for inspection.

June 25. **LEWES.**—Supply of 600 tons of 2in. broken granite, 150 tons of coarse granite screenings, and 500 tons of broken surface picked flints, for the T.C. Forms of tender and specification may be had and any further information obtained at the Borough Surveyor's Office, Town Hall, Lewes. Tenders must be left at the office of Montague S. Blaker, town clerk, Town Hall, Lewes.

MISCELLANEOUS.

May 24. **ANDOVER.**—Supply of the following, for the T.C.:—Heavy cast-iron coated water pipes, jointing lead, and sundry valves and fittings; 9in. and 6in. Dorset stoneware plain and patent jointed socket pipe and junctions; best quality building bricks, cement, ventilating pipes, macadam, manhole covers, flushing doors, etc.; deal timber and navvy barrows; repairs of wood fencing and repainting of water works engine houses; the overhauling and reseating of pump valves at the waterworks. Each tender is to be in accordance with a specification, which may be seen upon application at the Surveyor's Office, Town Hall, Andover, and is to be accompanied by a cheque for £2 2s. as deposit. Tenders to be sent to T. E. Longman, town clerk, Andover.

May 28. **LONDON, N.**—The following during year ending June 30, 1911, for the Finchley U.D.C. (1) heavy castings; (5), gravel, hoggin, and flints; (6) broken granite; (6a) hardcore; (6b) crushed shingle; (9a) lias lime and Portland cement; (9b) Buxton and grey lime; (10) stoneware pipes and goods—(a) London make, (b) country make; (11) removal of dust and house refuse (for the whole district or separate wards); (12) slab footway paving and tarpaving; (13a) cartage of materials to and from railway stations; (13b) general cartage, including horsing water vans, brooms, scrapers, etc. Forms of tender, conditions, and full particulars may be had on application at the offices. Tenders must be addressed to E. H. Lister, Clerk, Council Offices, Church End, Finchley, N.

May 30. **BRENTWOOD.**—Cleaning and Painting Works at High Wood School, Brentwood, Essex, for the Metropolitan Asylums Board. Contract and specifications prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., Engineer-in-Chief. The conditions of contracts, specifications, and forms of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon deposit of £1. Tenders must be delivered at the office of the Board.

June 6. **MANCHESTER.**—Supplying and fixing tiled dados at the Brookdale Park Municipal School, Newton Heath, and the Moseley Road Municipal School, Fallowfield, Manchester, for the Education Committee, in accordance with the specification, which may be obtained at the offices in Deansgate, Manchester, on a deposit of £1 1s. Tenders and samples of dados must be delivered at the Education Offices. Cheques to be made payable to the Accountant, Education Offices, Deansgate, Manchester.

June 7. **LONDON.**—Construction of a bridge over the waterworks channel of the River Lea for the L.C.C. Drawings, bills of quantities, form of tender, &c., may be obtained on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon deposit with the cashier of the Council of £3. Full particulars of the work and conditions of contract may be obtained at the County Hall before the payment of this fee. The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Full particulars of the Council's Standing Orders on these matters are given in the L.C.C. Gazette.

TO CONTRIBUTORS.

Owing to the very large number of voluntary contributions submitted to the Editor, it has been found desirable to make the following regulations:—

1.—Intending contributors are advised to send a preliminary letter before forwarding articles and illustrations. The non-receipt of a reply within one week is to be taken as a polite negative. MSS. and drawings in all cases should be accompanied by sufficient stamps to cover return postage.

2.—The Editor declines to take any responsibility for the safety or return of contributions submitted, although every care will be taken where these regulations are complied with.

3.—Each MS. and illustration should bear the name and address of the owner or sender.

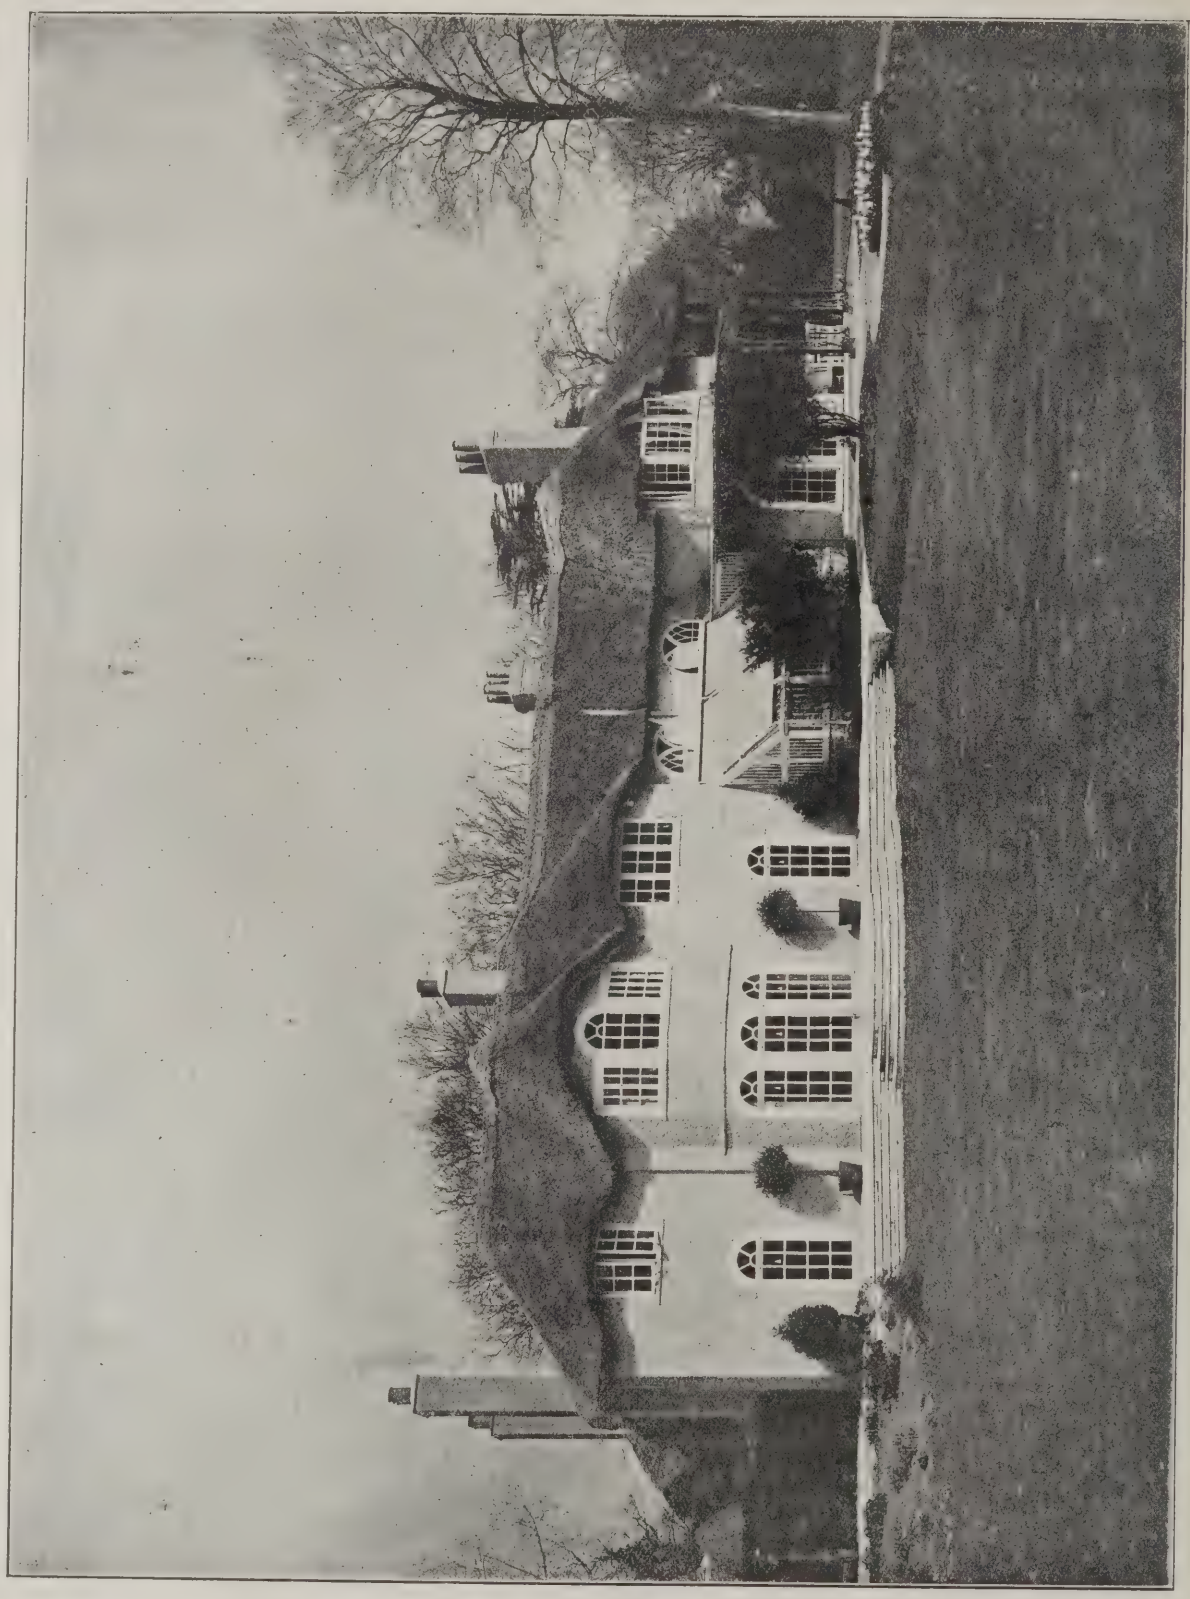
THE ARCHITECTS' & BUILDERS' JOURNAL.



WEDNESDAY,
MAY 25th, 1910.

Volume XXXI. No. 799.

Thin red facing bricks were used for the facings, and the roofs are covered with old tiles and old Horsham "heeling." The woodwork throughout is of oak.

WALSTEAD HOUSE, LINGFIELD, SUSSEX. VIEW FROM THE DRIVE. E. TURNER POWELL, F.R.I.B.A., ARCHITECT.

ADDITIONS TO BLACKBROOK GROVE, FAREHAM. WALTER CAVE, F.R.I.B.A., ARCHITECT.

The additions to this picturesque house consist of a large ball-room, 40ft. long by 20ft. broad, with three bedrooms over. The exterior is finished in cream-white rough-cast, and the roof is thatched to agree with the old building.

THE ARCHITECTS' & BUILDERS' JOURNAL.

MAY 25, 1910. *CAXTON HOUSE, WESTMINSTER.* VOLUME 31. No. 799.

Japanese and English Art.

THE "White City" has been thoroughly cleaned and brightened up for the Japan-British Exhibition, as it is called, and looks as picturesquely attractive as ever. The doubt we imply in regard to the propriety of the title, so far as the Art portion of the Exhibition is concerned, arises from the fact that, while we may conclude that the Japanese section of the Exhibition represents the best that modern Japanese art can produce, the English portion of the show, as far as the pictures are concerned, is but a kind of second-best exhibition of English painting, a sad descent from the splendid show of the Franco-British year. Sculpture, on the whole, is better represented than painting. Nevertheless, there is sufficient material here to afford matter for a contrast between the exceedingly diverse methods and aims of British and Japanese art; methods and aims so different that one has the feeling that both cannot be right; at all events that interesting questions are suggested as to the objects of the art of painting.

European Movement in Japanese Art.

We may mention at once that one rather curious incident in the exhibition is a small room full of pictures by Japanese artists who are obviously aiming at Europeanising their art. There are landscapes here, not of the first order, but fairly good, which might be found in a London picture exhibition, and which differ absolutely from the typical Japanese landscape in which detail, treated more or less conventionally, is everything, and aerial effect and linear perspective are almost unknown; and there is a half-length portrait of a "Young Poetess," by Mr. Ishibashi, of Tokyo, which looks like a not unsuccessful attempt to imitate the style of Mr. Shannon; while the large, crude picture entitled "Soft Breezes," showing some figures on the deck of a ship, seems to be inspired by the French *plein-air* school. There is even a half-length nude, very delicately painted, a kind of thing absolutely at variance with all our usual associations with the art of the Japanese, who, while from all accounts they exhibit a child-like simplicity and innocence in respect of nudity in real life, seem entirely to ignore it in their national style of painting, in which costume is everything. Considering the manner in which the Japanese are Europeanising their dress as well as other institutions, this kind of attempt to Europeanise their art was bound to come sooner or later. How far it is likely to extend one cannot yet predict; whether it is an advantage or not will depend on the view one takes of native Japanese painting as already existing.

Architectural Exhibits.

Architecture is rather largely represented in the Japanese exhibits; and although a European style and European architects have been employed in one or two recent public buildings in Japan, all the architectural exhibits in the Japanese section are racy of the soil, and, with one exception, are all represented by most beautifully executed wooden models, which, as examples of architectural modelling, are a study in themselves. A number of these are arranged in the Central Hall of the Art building, all to the same scale, and all dated. These are very interesting as examples of the native Japanese style of architecture at different dates. Considering the differences of date, however, the difference or the development in style between buildings of one century and another is not very obvious to the English eye. All have the same high roofs with the hips canted up at the angles, and the same heavy bracketed-out eaves. Possibly to the Japanese eye models of English Gothic of different dates would convey the same impression of general similarity. At all events, there seems to have been a very persistent general character in Japanese building from century to century; an illustration of the prevalent conservatism of the East. It is a somewhat barbaric school of architecture, and it is totally destitute of repose or of monumental character; on the other hand, it has the interest of a style of building arising naturally out of the tastes and habits of life of the people, and the nature of the most available material, timber. Besides the models of ancient Japanese buildings there is, in the side galleries, an interesting set of large-scale working drawings of a design for a modern mansion in Japan. The ground-plan is given in considerable detail, showing the grouping of rooms for residence, for business, and for the children. The plan is arranged with four inner courts for light and air, not symmetrically placed; on the contrary, symmetry of plan seems to be studiously avoided, and the very outline of the plan, with one side continually receding in a series of notches, so to speak, is characteristically Japanese. Another incident to be noted in the plan is the provision, in two or three of the rooms, of a recess marked "decorative shelves," i.e., we presume, shelves for the arrangement of decorative objects, without which, apparently, a Japanese living-room would be incomplete. A hint for English architects might be taken from that. M. Iida, of Tokyo, is the architect.

Vagaries of the Corridor.

As Bacon classed some ideas as "Idols of the Cave," so we may class some of the displays on the long bridge connecting the Exhibition with Uxbridge Road Station as "Vagaries of the Corridor." One of these shows, indeed, is worth a better place, and is the most important of the Japanese architectural exhibits, and should not be missed. This is the very large model, filling a bay to itself, of the great shrine of Itsukashima, on a sacred island the scenery of which is painted in on the walls of the partitions as a surrounding background to the shrine and its extensive architectural dependencies. This, which is not in the catalogue of the art exhibits, is a most beautiful piece of work, which has occupied its author, Mr. Takahoshi, for ten years, and has gained him, apparently, the special thanks and encouragement of his Government. With this exception, the approach corridor in question is not of a kind to encourage the judicious visitor, and when proceeding between a series of panoramic views of Japanese scenes with artificial foregrounds in the round, and panoramic

views of English watering-places, one is tempted to adopt the lines from Southey's ballad—

> "For things like this, you know, must be
> At every famous victory"—

or at every popular exhibition. Another most singular fancy is that two or three large passage rooms are painted all round with full-size elevations of the different classes of Japanese railway carriages, while the window spaces of the carriage-elevations are utilised for small paintings (European style) of Japanese scenes—a most unsatisfactory medley. It is a common thing for foreign countries, at an exhibition of this kind, to exhibit specimens of their national railway rolling-stock; it would have been more to the purpose to have sent some of the actual carriages than to make a mural decoration of their effigies. In one of the artificial scenes the visitor may see a full-size representation of the typical Japanese form of timber bridge, a footway curved in an arch formed upon a framed structure of timber, with uprights driven into the river-bed; a form of timber bridge which may be described as at once the most picturesque and the most unscientific ever imagined. Structurally, it is perfectly childish, requiring (even for a small stream) the driving of piles into the bed of the stream, instead of clearing it with a structure requiring no intermediate supports; and yet it is so picturesque that one cannot help admiring it. Further on the London County Council exhibit models of two of their bridges over the Thames, as examples of English bridge building; it would have been more to the purpose had they exhibited Putney Bridge alone, which is a really fine one, without the inferior and tawdry structure which accompanies it.

Japanese Art Galleries.

In the range of galleries round the Central Hall which are devoted to Japanese art we may endeavour to come to a definite opinion in regard to Japanese *versus* European art. The catalogue seems to be very imperfect, but most of the paintings have written titles affixed. There is a large picture of many figures, entitled "A Surprise," apparently a social function disturbed by an alarm of the approach of some enemy. There is plenty of expression of movement and energetic action among a crowd of figures, who are painted in strong colours, but almost as flat as if they were figures cut out of pasteboard, in a scene of which the attempt at perspective effect is of the most naïve description. It is a totally different sort of thing from what we call a picture in England. Is there anything in it of value that European painting does not achieve? On the whole, we think not. There may be said to be the principle of reducing a scene in life to decorative effect; it may be argued that Greek vase-paintings do the same. But the Greek vase-painting is in one plane, and, moreover, it is really intentionally decorative in spacing and arrangement. This Japanese scene is not: it is a jumble of lines and planes, in which the separate figures are flat and without modelling, but the whole scene is designed in the round. On the whole, we conclude that this is a barbaric manner of representing a scene in painting, and that, under the present conditions of intercourse between nations and the increased prevalence of a European standard of culture, such an art is bound to go before long. The Japanese power of representing life in painting seems to stop short with the animal world; it fails in dealing with human life, or, at the best, it can only portray its grotesque side. Take the sculptures in bronze and ivory, mostly on a small scale. Many of these show the greatest cleverness in modelling, and a power of expressing humorous or simple ideals in figures. The small seated figure of "A Village Maid at Lunch," for instance, is a very pleasing bit of rustic character in sculpture, but it never gets further than that. There is nothing of dignity, nothing of beauty of line, in the sculpture. The ivory statuette entitled "A Beautiful Woman," seems to the English eye, in connection with such a title, only like a bad joke.

As soon as it comes to the painting of animals it is quite different. There we realise the remarkable power of the Japanese in painting both character and detail, and in making animals part of a decorative scheme. And, on the whole, this seems to be a more artistic way of treating animals than that of merely making them into pictures, after the manner of Landseer and Mr. Rivière and Mr. Blinks, and other English painters. And the curious thing is that the animals are splendidly drawn, whereas the power of accurate drawing seems to forsake the Japanese artist as soon as he gets to the human figure. It almost seems that while he takes animal painting seriously, he takes man as a joke.

We must say, also, that we think there is a great deal of nonsense talked about Japanese landscape painting. They do not paint landscape, they paint bits of decorative detail culled out of landscape, sometimes very charming as such. But their conventional representations of clouds and water are the art of the nursery. There is a large piece of work in the Exhibition supposed to represent running or foaming water and trees. The representation of water is absurd, and it has not the merit even of being decorative in effect. The admiration for this kind of thing among some English people is a mere affectation, and will come to the end of all artistic affectations. It is when we come to the purely decorative treatment of such things as textiles and lacquer, where no imitation of Nature can be pretended, that Japanese work is at its highest. There we can all concur in admiration. There is a great deal of splendid applied art of this class in the Japanese Galleries which is well worth a visit. In decorative workmanship they are supreme. It is when they come into touch with human nature, and with the scenery of nature in its broad and poetic aspects, that they fail. In regard to these things they are still a nation of children, and look at man and nature from the point of view of children.

The English Art Galleries.

As already intimated, the English Galleries do not represent English painting of to-day at its highest; a good many of the pictures sent there rather give the impression that they are there more for the good of the painter than of the public. There are some well-known works, however, such as Orchardson's "Napoléon at St. Helena," which we are glad to see again. There is (what is of special interest at the moment) Sir L. Alma-Tadema's portrait of the late Professor Aitchison; Mr. Beaumont's fine and thoughtful picture "Silent Music," at the Academy (under some other title) a year or two back; Mr. Sims's "Island Festival"; and Mr. Wetherbee's "Praise of Spring." Among some pictures that are new to us is a very fine landscape, "Breezy Lowlands," by Mr. James L. Henry, and a painting of the Temple of Concord, at Girgenti, by Mr. A. H. Elphinstone. The Retrospective Section is a fine collection, containing a remarkable Turner, a remarkable Lewis, and a remarkable Constable; one of the finest examples we have ever seen of George Morland; and Burne-Jones's "Mirror of Venus" and some of his sketches and studies, which one is always glad to see. Among some patriotic pictures of old date in one of the small galleries, a picture of the "Death of Nelson" is an odd illustration of the careless way in which painters of a century or two back regarded the realities of a scene. The painter has made quite a lofty apartment of the space between decks, in which, in fact, a man could hardly stand upright. We have become more conscientious than that in the present day, at all events.

The room devoted to architectural drawings is well filled with a representative collection mostly of designs which are already known and have been carried out. The Central Hall contains a large collection of modern English sculpture, the best of which, however, is already known from exhibition elsewhere. Mr. W. S. Frith's large model of "The Fountain, Hever Castle," which fills up one end of the gallery, we have not before seen; it is an important composition rather in the French manner, a fountain basin with Cupids on the rim, behind which a balustrade rises in a curve, with two figures of nymphs seated at the top. It is noticeable as a more

important work of sculptural decoration than one generally meets with in England as a private commission; in France such large decorative schemes are common enough.

The Paris Salon.

We may call attention to the fact that on another page in this issue we have given a short account of the principal attractions of this year's Salon, arranged in such a way as to assist visitors in finding any work they wish to see—often no easy matter at the Salon. We desire to encourage those of our readers who are interested in art generally (and all architects ought to be) to visit the Paris Salon more. Most of us are far too insular in our ideas about painting and sculpture.

The Mausoleum Chariot in the British Museum.

The last issue of the Journal of the Hellenic Society contains a long article by Mr. Knowlton Preedy on the question of the correctness of placing the statues of Mausolus and Artemisia in the chariot, as they now stand at the British Museum. Dr. Murray's decision to place them so was a good deal canvassed at the time; but, on the whole, there is more to be said for it than against it. One of the arguments—that the statues are on a larger scale than the horses—we should call incorrect. As Dr. Murray remarked, in reply to one of his critics, few people realise how very large a horse's head is compared with a man's. It seems to be admitted, even by the objectors, that the position in which the figures were found was in favour of their having some connection with the chariot. One of the objections is that the figure of Mausolus leans somewhat, instead of assuming the upright attitude which would be expected in the chariot position; but the leaning does not amount to very much, and might be explained by the position of the arms and hands, if they were not destroyed. In fact, it may be observed, from Mr. Preedy's own illustration, that the two figures lean slightly towards each other, which would be a natural position if they stood in the chariot together. We are inclined to think that Dr. Murray's solution is still the more probable one, and that, at all events, the reasons against it are weak. But Mr. Preedy's paper is an interesting analysis of the subject, and worth reading.

The St. Paul's Bridge.

We regret to see that there is already evidence that the recommendations of the Institute of Architects in regard to St. Paul's Bridge are likely to have no effect, at all events in respect of the line to be taken by the bridge and the road up to it. The Institute recommended, what everyone with any architectural perception ought to see, that the bridge should be built on an axial line leading up to the centre line of the crossing of St. Paul's Cathedral, so as to have the south transept and its portico, and the dome rising above it, centrally at the end of the vista. It is now pretended by the Corporation that this will "destroy the value of the bridge" in the matter of access to it on the north side, and that the proper line should be to carry the line of Aldersgate Street past the east end of St. Paul's, and so southward, and that this line would take the road on the south side up to the junction of Marshalsea Road with Southwark Bridge Road. Marshalsea Road is a small street, and there is no reason why it should be considered. We have laid down the line of road as proposed by the Institute on the map, and find that, taking the bridge and its approaches at right angles with the centre of St. Paul's will just bring it, on the south side, to the most convenient point for its continuance along Southwark Bridge Road. The objection that the crescent road on the south side of St. Paul's Churchyard is too narrow could be met by purchasing property on its south side, and widening it. The Corporation talk of purchasing street property elsewhere to make their line of road; why cannot they purchase it at the right place, just where it will make a great public improvement? It is too bad that we should be faced with another London blunder in laying out, and lose an opportunity for a grand effect, because the authorities concerned have no perception as to the value of architectural effect, and cannot even understand it when it is pointed out to them.

The Newer New York.

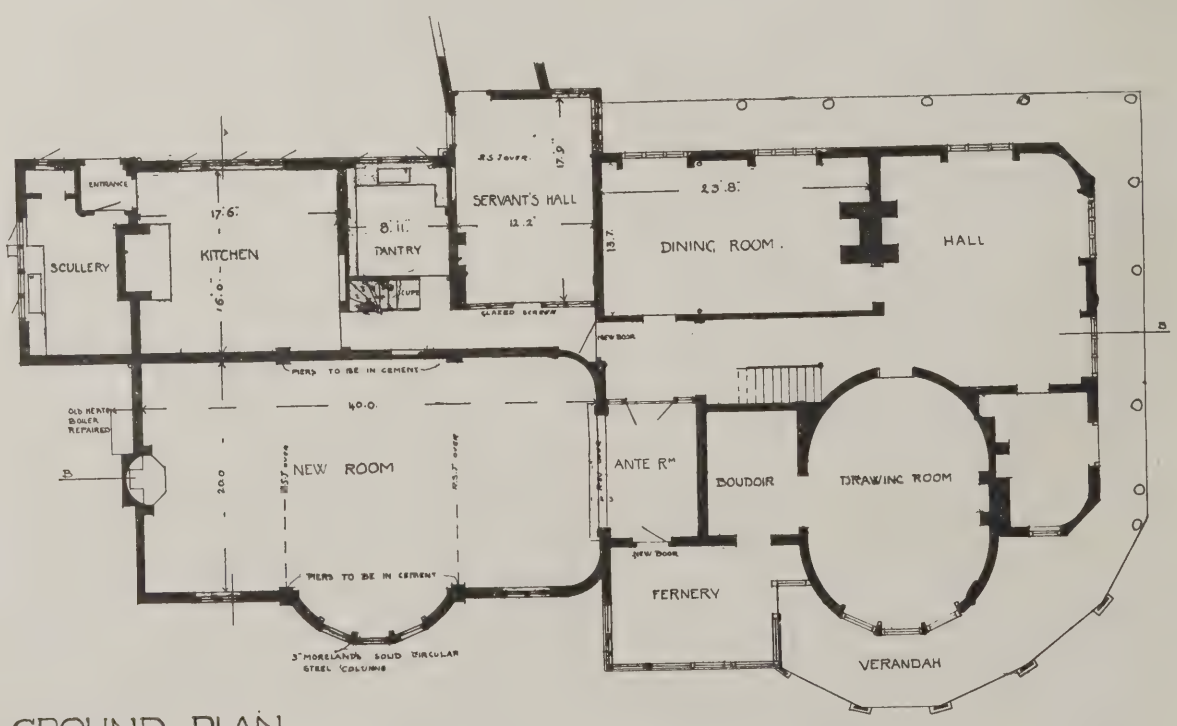
"New York will be a nice town when it is finished." So says the "New York Herald," which ought to know, but which ought not to recall stale jests, even as an introduction to such interesting information as it gives us concerning the changes that have been, are being, or are about to be made in the U.S.A.'s restless capital. The subways brought tremendous influxes of population, and caused swift and unexpected developments. Then, "more bridges were required—more everything." Thirty-fourth and Forty-second Streets, formerly quiet residential quarters, have been added to the busy shopping streets. And now Fifth Avenue, a "staid, respectable old street, where you used to see liveried servants in the doorways of the private mansions, is going to become a Great White Way, to rival Broadway at its gayest point." It is to be "transformed into a boulevard of light." Thousands of powerful street lamps are to make the sidewalks and roadway as light as day, and every store window along the entire distance of nearly two miles will be brilliantly illuminated "by agreement of its merchants." It is anticipated that then thousands of people will throng its sidewalks and promenade up and down after the fashion of Parisians on some of the night boulevards in the French capital. "Seeing Fifth Avenue by night" is to become a recognised pastime. But the avenue "will maintain its dignity." It will not have the ultra-picturesqueness of Broadway; there will be no hideous electric signs advertising whiskeys and petticoats." Apparently the railways will run trips to it. A "double-decked subway" is in contemplation; "the express tracks will be laid in solid rock below the local tunnel, instead of building four tracks on one level." The local railway will follow the undulation of the surface, while the express track will be a straight bore. Then surely the newer New York will be replete with bores of every variety.

The Liability of the Agent.

The old question of the liability of an agent towards a contractor came up again in a county court case heard at Sheffield a few days ago. A builder and contractor sued an engineer for several sums, amounting in all to nearly £60, for work and labour. The defendant denied liability, stating that, as he had in the first instance told the plaintiff, he was acting on behalf of a company. Defendant's counsel, dealing with the point that defendant had sent written acceptance of the contract, argued that in such cases it was the invariable practice for an engineer or architect to transact business in his own name, and that to make such a person liable "would be a very big assumption." For the plaintiff it was argued that by Section 42 of the Companies Acts, 1862, if a person acting on behalf of a company signed an order, and that order did not contain the name of the company, the agent was liable to a fine of £50, and was also personally liable for the goods he had ordered. The judge held that the section quoted did not affect the present case, which merely raised the question of fact. He could find nothing to suggest that plaintiff ever thought of charging defendant up to the time he sent in his bill, which he then sent where he thought he was most likely to get the money. Judgment was given for the defendant. This is the usual termination of such cases. If it were otherwise, the position of intermediaries would be intolerable. The moral for the contractor—who, of course, always has our sympathy when he thus suffers loss upon loss—is that when he is unfortunately compelled to sue for his money, he should take care to bring the right party into court, since it is clear that, in the majority of such cases, the intermediary will not, and cannot, be held liable; and, indeed, it is difficult to see on what principle he should be made to pay for work that is done for the third party, whom he merely represents professionally.

NOTES AND NEWS.

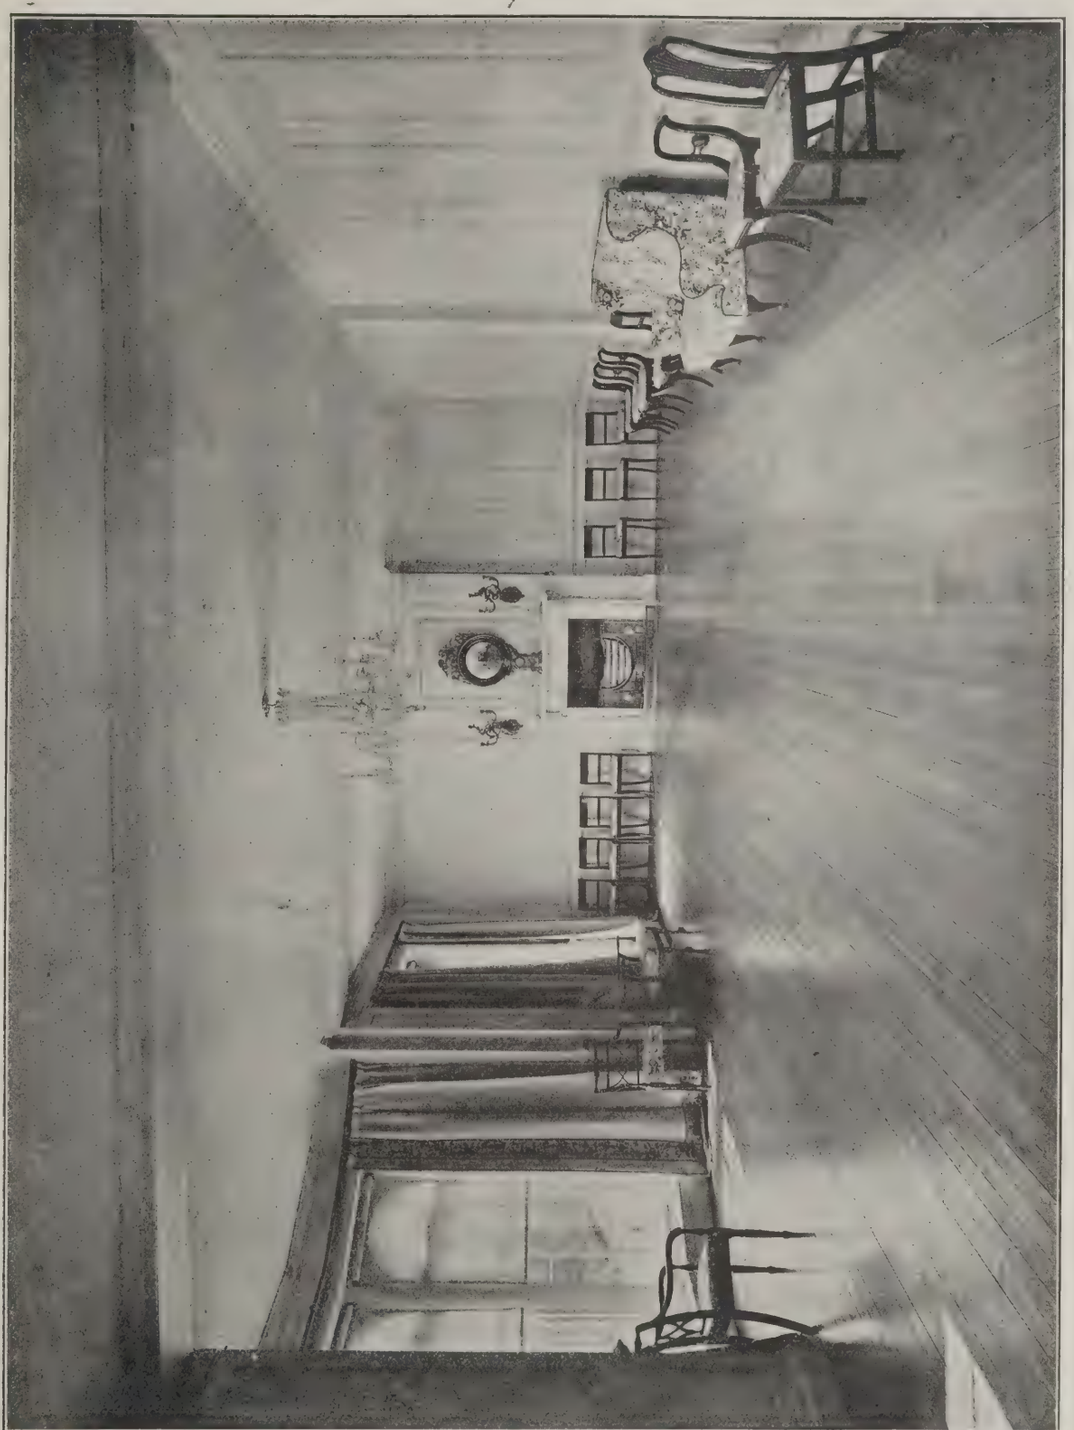
The Late Professor Aitchison.



Professor Aitchison had practically retired from active work in connection with architecture for a good many years back; but the news of his death on Monday week, at the age of 85, gives occasion for some remarks in memory of one who filled rather an exceptional place in the profession. The son of an architect who was engaged on work more generally connected with engineering than architecture—his father was architect to the St. Katherine's Dock Company, and a designer of railway stations on what was then called the London and Birmingham Railway—it would not have seemed that he started with any special leaning towards the artistic side of architecture. And yet George Aitchison was, throughout his life, and from an early period, the friend and companion of artists—painters, sculptors, and architects—more than any other class of men. He made, at an early age, an architectural tour with Burges, one of the least professional of architects, and was the lifelong friend of Leighton, for whom he built the "Arab Hall," which is the architectural work by which many people know him best. Professor Aitchison was a student of colour in architecture, especially in regard to mosaic; but he had carried out engineering work for St. Katherine's Dock Company, and was district surveyor for a London district. With these rather diverse acquirements he combined a very extensive knowledge of architectural history and literature, and a special knowledge of the various forms and editions of Vitruvius. Though his executed work in architecture did not amount to very much, as far as quantity is concerned, his varied knowledge and artistic friendships gave him an important position in the architectural world, and led to his appointment as Professor of Architecture at the Royal Academy, where some of his earlier series of lectures, on Roman architecture especially, were of great value, though it cannot be denied that he continued his lectures to a period when his health did not permit of his doing justice to his subjects. He lived a very quiet life in his house at 130, Harley Street, where his study was a room characteristic of the owner, containing shelves of learned works on architecture, specimens of mosaics and other *disjecta membra* of decoration, and piles of drawings and manuscripts which occupied every chair and table in the room. Sir L. Alma-Tadema's portrait of him at the Institute of Architects (of which he had been one of the Presidents), showing him seated with a book (probably the beloved Vitruvius) in one hand, and the other hand with a finger raised as if arguing a point, is not only a good likeness, but is very characteristic of the man, and of the special place which he occupied among the architects of his day.

The Victoria Memorial at Calcutta.

There seems to be rather an unfortunate fate about the great memorial hall which is to be erected at Calcutta from the designs of Sir William Emerson. The architect has already suffered a good deal of annoyance and misrepresentation in regard to some trouble about the foundations, which seems to have arisen mainly from the neglect of his own advice and directions. Now the news arrives that the lowest tender for the erection of the building, £364,662, is considerably in excess of the intended and prescribed limit of £333,333 (or 50 lakhs of rupees, Indian currency), and the Committee have recommended a number of omissions from the original design in order to bring it within the stipulated cost. We do not hear whether these are omissions of features in the building, or omissions of decorative detail; but in either case this course seems most unsatisfactory and most unfair to the architect, and very unlikely to produce a satisfactory result in any case. One member of the Committee has dissented from this view, maintaining that, as the funds were insufficient, it would be much better to erect a smaller building on a design complete in itself, than to spoil the first design by omissions for the sake of economy; and this view seems to have received a good deal of support from public opinion outside the committee. If the requisite amount of money really cannot be raised, a smaller but complete design would certainly be preferable to erecting the original one in the incomplete manner suggested.



Cambridge Museum of Archæology and Ethnology.

The foundation stone of the Museum of Archæology and Ethnology at Cambridge was laid recently. The new building has been designed by Mr. T. G. Jackson, R.A., to accord with his adjoining buildings, the Squire Law Library, and the Sedgwick Memorial Museum.

GROUND PLAN

ADDITIONS TO BLACKBROOK GROVE, FAREHAM. WALTER CAVE, F.R.I.B.A., ARCHITECT.

The ball-room has an oak floor and a grate and chimney-piece of eighteenth century pattern. The floors are panelled in pine, painted white. The casement doors open on to a new stone-paved terrace.

ADDITION TO BLACKBROOK GROVE, FAREHAM: THE BALL-ROOM. WALTER CAVE, F.R.I.B.A., ARCHITECT.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

A Cottage Hospital, Holkham, Norfolk.

The small cottage hospital illustrated on pages 516 and 517 is being erected by the tenants of the Holkham Estate, in memory of the late Earl of Leicester, K.G. The site adjoining Holkham Park is delightfully situated, and almost ideal for a building of this special character, the subsoil being gravel above chalk, and the ground gradually falling to the south with a road on the northern boundary of the plot. The plan, which is somewhat original in its outline, is in the shape of a "Y," the two wards forming the short arms, while the administrative portion of the building forms the stem, with the main entrance to the north. All the advantages of aspect and cross ventilation are thus gained for the wards, which are 12ft. high, and amply ventilated by the large windows in the end gables, in addition to those at the side of each bed. The verandahs for patients are so planned that whichever direction the wind is, shelter can be obtained. A small duty room is arranged between the wards for supervision, from which there is at the same time command of the main corridor. A "cut off" is formed between the administrative portion of the building and the patients' quarters by the corridor running east and west, with external doors at the ends.

The whole of the ground floor is being laid with patent jointless flooring with core skirtings laid by Messrs. George M. Callender and Co., Ltd. Strict economy, coupled with efficiency, had to be studied in the design and construction of this building, the total cost of which, including fencing, water supply, gas lighting, drives, etc., is under £1,000. The architect for the work is Mr. Leslie T. Moore, A.R.I.B.A., of 3, Raymond Buildings, Gray's Inn, London, W.C., and Mr. James Needs, of Fakenham, is the builder.

LONDON COUNTY HALL FOUNDATION WORKS.

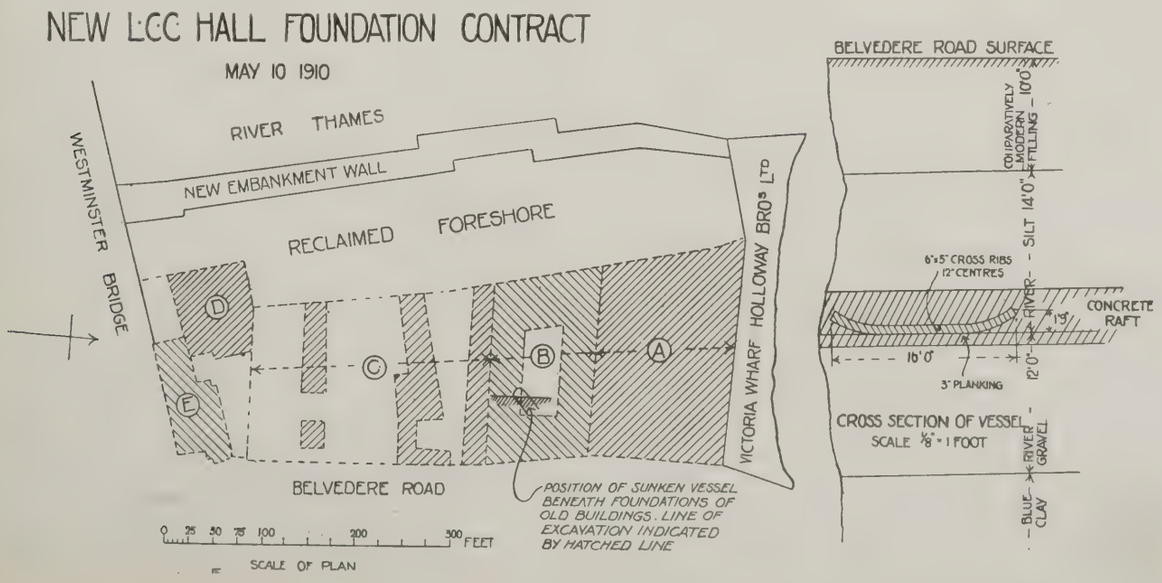
The following memorandum of items noted at a recent visit to the London County Council Hall Foundation Works is contributed by one who has exceptional knowledge of such work, and who has made close observation of the details here described.

The Site.

The L.C.C. acquired the premises between Belvedere Road and the Thames, formerly occupied by (a) Peter Brotherhood's engineering works; (b) Crosse and Blackwell's riverside pickle and jam factory; (c) the Lambeth Borough Council's yards, stables, and premises, which were formerly in the possession of Messrs. Maudslay, the well-known marine engineers; (d) the premises known as Westminster Bridge Wharf; (e) the row of shops abutting on the north side of the eastern approach to the bridge.

Most, if not all, of these premises, stood upon a site known for centuries as Pedlar's Acre, by which name the road itself was commonly known until it was decreed that it should be called Belvedere Road. Legend has it that some 350 years or more ago, a pedlar with his dog appealed for assistance and shelter to the priest in charge of Lambeth Parish Church, and having been kindly treated he demised at his death, in gratitude for this small benefit, some land bordering the river and a little way north of Lambeth Palace and Church. Since that time this land has been the property of the Parish of Lambeth, until its late compulsory acquirement by the L.C.C. for their County Hall site.

In addition to the above-named premises, the Council have acquired, with a view to ultimate extension, the new premises, northwards, at present in the occupation of Messrs. Holloway Bros., Ltd., and beyond them again there are the old L.C.C. Works Department premises, of which the Council are already the freeholders, so that future requirements would seem to be amply provided for.



Besides the land area at present involved, comprising a little more than 2½ acres, the Council have reclaimed foreshore to the extent of nearly two acres more, making over four acres as the area of the land to be covered by the buildings now in contemplation, and the embankment wall, etc.

Excavation.

The whole of the site is being removed to a depth of about 25ft. from the street level in Belvedere Road, and the strata dealt with has turned out to be a top layer of comparatively modern rubbish filling of 10ft., followed by 14ft. of river silt, hardened into a clay of the consistency of cheese, at the bottom of which the river gravel is reached, one foot of which is removed, and upon the level thus reached the concrete raft, 5ft. thick, is to be laid, on the surface of which the nine great blocks comprising the greatest town hall in the world will presently be placed.

Discoveries.

Various small objects of interest have been unearthed, but in no case either so ancient or so numerous as might from the situation have been expected. There, however, has come partly to light a sunken ferry barge of exceeding interest, the date of which has not yet been determined, but which probably belongs to the period of the Roman occupation. The point to which the excavation has at the moment proceeded has cut the vessel obliquely, as indicated upon the plan annexed, and the section has revealed a ship 16ft. width by length at present unascertained, and a depth of 1ft. 9in.,

COTTAGE HOSPITAL, HOLKHAM, NORFOLK. LESLIE T. MOORE, A.R.I.B.A., ARCHITECT

having a flat bottom, roughly represented by an inverted ellipse. It has crossribs 6in. by 5in. at 12in. centres, and an outer covering of 3in. planking, all being of oak, black and nearly perished. It is intended shortly to remove the earth down to the level of the sides, and then, under careful inspection, to clear out the remainder, so as to obtain a perfect view of the vessel before its removal, which unhappily cannot be effected otherwise than by demolition, owing to its state of decay. Some articles of interest also may be discovered among its immediate contents.

Its position in the strata above-named is at the bottom of the river deposit, and resting upon the sandy gravel. From this situation it is quite clear that it must have sunk at a time when the full flow of the river was over this spot, since which time the centre of the channel has changed, or been diverted westwards, with the result that the mud began to silt up over it, which process continuing for ages, the 14ft. of accumulation had accrued by the time that the mud bank foreshore was bequeathed by the pedlar to the Lambeth Parish.

Concrete Raft.

About one half of the material to be removed under the contract has been cleared, and the concrete raft has been begun. The Council requires the mixture to be deposited in 12in. layers, and well rammed. The lowest of these layers is being covered with a damp-proof course of washed sand, and cement $\frac{3}{4}$in. thick, above which the remaining four layers are placed, breaking joint vertically where for any cause the work has to be temporarily stopped off.

Composition of the Concrete.

The concrete is composed of broken brick and old concrete, obtained by the demolition of the old buildings and foundations upon the site, adjusted to contain two-thirds coarse and one-third fine material, with Portland cement from Strood, in the proportions of six of the aggregate to one of cement.

Mixing Machines.

It is being mixed in machines of ingenious and novel construction, invented and patented by the contractors, in conjunction with one of their managers. These machines are triangular in form, having hoppers for aggregate and cement at one end of the base, and from these up one of the sides two elevators operate, one placed over the other, the buckets from which fill themselves as they pass through the hopper bottoms, and are immediately struck off by weighted strikers, ensuring accurate measure. When the lower or aggregate bucket reaches its highest level point the cement elevator bucket immediately overhead overturns its contents upon it, whence at once the contents are discharged down the other side of the triangle, which takes the form of a trough in which are four mixing drums, each having four wings or blades, which pick up the material on its descent, and turn it completely over. The first two drums mix it dry, when it encounters a sponge pipe, the remaining two turning it in a wet state. Thence it emerges at the opposite end of the base as mixed concrete ready for depositing in position.

These machines are so placed that their tops are about at the old ground level, and the hoppers are extended upwards, and into these extended hoppers the aggregate and cement are wheeled and tipped, and the concrete is delivered at the foot into contractors' narrow railway trucks, and run away to its destination.

From the architect's and engineer's point of view, the machines appear to afford two great advantages: (1) The mixing of the concrete in small quantities at a time, ensuring the proper and regular distribution in the mass of cement and aggregate; (2) the impossibility, provided the hoppers are kept filled, of errors and irregularity in the proportions of one to the other. The cement buckets can be altered at pleasure, to suit any desired proportion of cement by increasing or reducing the thickness of the packing pieces which are placed on one side of every bucket for the purpose.

The motive power is derived from an electric motor placed on the platform forming the base of the triangle, whence it is applied by a system of belt and pinion wheels, so that all parts of the machine work at the same pace.

The output of each machine continuously worked may be taken at about 150 yards per day, but its capacity is really only limited by the ability to remove the resulting mixture.

All the excavated material unsuitable for manufacture into aggregate is being trucked and craned to the contractors' own jetties, alongside, where it is deposited into barges and taken down the river to filling up low-lying lands bordering the stream at its lower reaches.

NEWS IN BRIEF.

We have been requested by the Secretary of the Society of Engineers (Incorporated), 17, Victoria Street, S.W., to remind our readers that the last date on which essays in competition for the Status Prize can be received is Tuesday, May 31st, 1910.

* * *

New banking premises are about to be erected at Swansea for the London and Provincial Bank, Ltd., the site being opposite their present offices in Wind Street. Mr. Glendinning Moxham, F.R.I.B.A., Swansea, has been appointed their architect to carry out this work.

* * *

With regard to the recent unsuccessful application of the Society of Architects for an injunction to prevent the unauthorised use of the distinctive initials "M.S.A.," we are officially informed that the Council has decided to appeal against the decision then given.

* * *

In the case of the Hopton Wood Stone Firms, Ltd., v. Gething, which was tried in the Chancery Division of the High Court of Justice, before Mr. Justice Parker, on May 14th, plaintiffs sought an injunction to restrain Messrs. T. T. Gething and S. F. Spencer from registering a company with a name including the words "Hopton" or "Hopton Stone"; and an injunction to restrain defendants from selling their stone as "Hopton Wood Stone," or under any description calculated to induce the belief that the stone was the plaintiff company's stone or the product of the company's quarries. His lordship inclined to the view that to architects, builders, and stone merchants, the expressions "Hopton Wood Stone" or "Hopton Stone" denote the character and quality of the stone without any connotation of the seam from which the stone is obtained. He suggested that confusion might be avoided if the defendants formed their proposed company under a name including the word "New," such as the "New Hopton Stone and Marble Quarrying Company, Ltd." Defendants assented to this suggestion.

* * *

The current issue of the "Journal" of the Royal Society of Arts refers to the connection of the late King with that body. In 1863, when Prince of Wales, in response to an address presented by the Council of the society, he intimated his willingness to accept the office of President, "that he might be better able to promote the great and beneficent objects which his dear father had so much at heart, and in which he was so zealously supported by the society." In October of that year an extraordinary general meeting was held, at which his Royal Highness was elected first a member and then President of the society. For 38 years he continued to hold the office of President, and on his Accession to the Throne in 1901 his Majesty, at the request of the Council, consented to become patron of the society. In 1908 he granted it permission to prefix to its title the term 'Royal." In 1901 the Albert Medal was awarded to King Edward "in recognition of the aid rendered by his Majesty to art, manufactures, and commerce during 38 years' presidency of the Society of Arts by undertaking the direction of important exhibitions in this country and the executive control of British representation at international exhibitions abroad, and also by many other services to the cause of British industry."

As we have already recorded, the First Commissioner of Works recently requested Lieut. Sladen, the Chief Officer of the Metropolitan Fire Brigade, to report upon the arrangements for protecting Hampton Court Palace from fire, and his suggestions for perfecting the appliances received immediate attention. During the last 50 years there have only been two fires of any importance at the Palace, and in both cases they were subdued without any damage having been done to the State apartments. For many years there has been an efficient fire brigade at the Palace, commanded for 34 years by Mr. Moorman and manned entirely by employees in the Palace. The advantage of having a brigade composed of men who know every nook and corner in the labyrinth of buildings is obvious. Neither gas nor oil is now allowed to be used in the residential apartments of the Palace, electric light, carefully insulated, being installed throughout. After receiving the report of Lieutenant Sladen, Mr. Harcourt sent a special letter of thanks to the superintendent of the Palace Brigade for his long and efficient services, and spoke in the highest terms of the work of the brigade. The water mains are kept day and night at such a pressure that from any hydrant a jet of water can be thrown without pumping to the highest part of the building. There is also a fine modern steamer and escape, and every part of the Palace is connected by fire alarms with the brigade station.

M. U. Schoop describes, in the "Comptes Rendus" of the Académie des Sciences, a new process of covering an inferior metal with a layer of a harder or more precious one. His process seems to consist in bombarding the surface with a stream of metal in a state of minute subdivision. He suggests that the process can be applied not only for plating an article but also for taking a cast or electrotype, which can be detached from the model and used as a mould.

* * *

At the meeting of the Society of Antiquaries on April 28th, Mr. W. H. St. John Hope submitted a report of the excavations carried out by Colonel Hawley and himself for the Society on the site of Old Sarum, in 1909. These had been confined to the inner and higher of the two great earthworks that form the monument, and had revealed considerable remains of the Norman castle for which the inner work had probably been thrown up. The

Ground-Floor Plan.

Scale of 10 0 10 20 30 40 50 Feet.

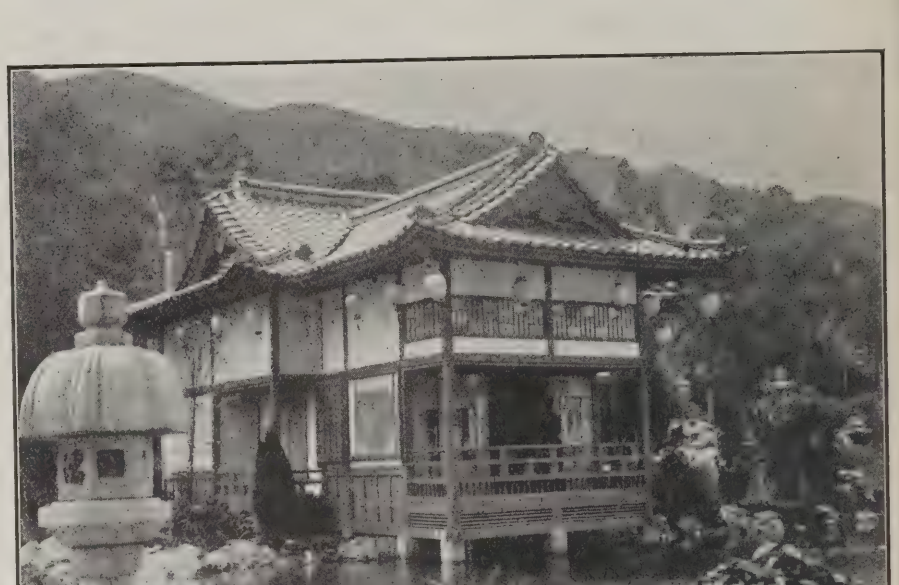
Mr. Cormell Price, who recently died at Rottingdean, was the last survivor of the Oxford set of which William Morris and Burne-Jones were the most prominent members. He was their intimate friend, and in their biographies there are many references to him. He was the "head" of the school at Westward Ho! described by Mr. Kipling in "Stalky and Co."

* * *



The "contagious diseases of metals" have been described by Professor Ernest Cohen in a lecture delivered to the Société de Chimie physique at Paris. Tin, he says, when exposed to a temperature below the freezing point of mercury, shows a kind of eruption of pustules, in which the metal loses its ordinary shining surface, becomes grey, and, on being cut with a saw, either falls to powder or breaks up into a bundle of fibres. The lecturer apparently felt justified in calling this a disease, because he was able to show that it is capable of extension by infection or contagion, the application of a few grains of the above-mentioned powder to the surface of a block of perfectly sound tin bringing about its transformation in a few days. In another transmittable disease of tin, the structure of the metal is changed and becomes crystalline. This disease has a special tendency to attack joints which have been soldered; but it is not peculiar to tin, as it attacks brass and lead as well.

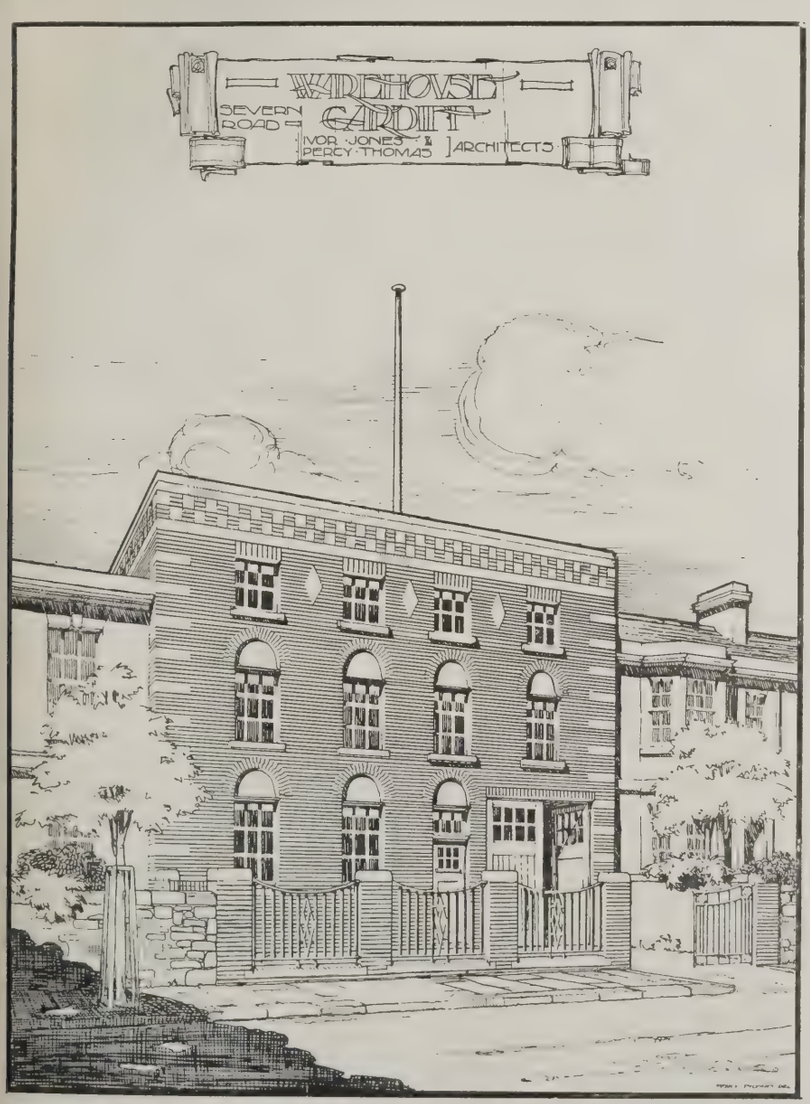
Grave anxiety has been felt in Nottin ham building trade circles, owing to th threatened strike of bricklayers and bric layers' labourers, numbering more th 1,000 men. Notices following upon th agitation for an additional penny p hour terminated on May 14th, when th men contemplated ceasing work; b after several inconclusive conferences, strike has been averted by an agreeme to refer the labourers' case to Board Trade arbitration, the Building Trad National Conciliation Board having be asked to adjudicate upon the demands the bricklayers.

THE PARIS SALON.



The great annual exhibition at the Palais des Beaux-Arts—the most important periodical exhibition of painting and sculpture in the world—is as bewildering as usual in its extent and variety. To those who have not visited the Salon since the erection of the Grand Palais des Beaux-Arts, planned to accommodate both the Old Salon ("Société des Artistes Francais") and the New Salon ("Société Nationale des Beaux-Arts"), some idea of its extent may be conveyed by saying that the Royal Academy Galleries would form but a corner in the Paris range of galleries, and might be cut out of the latter without being much missed. The Art-Palace was designed to accommodate both the Salons in a building which is architecturally a single one externally, but is a dual one internally, not only in the management of the plan, but in the different style of the decorative treatment. The erection of this dual building is rather unfortunate, as it seems to perpetuate in material form a division in the French artistic camp which arose originally merely out of a quarrel as to the justice of the "awards" made by the Old Salon Committee, and which is an injury to Art. There are not pictures enough of a high class to fill both Salons, consequently both are compelled to lower their standard in order to cover their walls. To the style of "Nationale," it may be added, the New Salon has no sort of pretence in fact; it was adopted as a taking title, but the Old Salon is in reality much the more "National" of the two—more representative of French art, especially in sculpture, for the display of which it has the advantage of its great central glass-covered court, where sculpture can be seen with plenty of space round it, and under a practically open-air light. Sculpture at the New Salon is hardly worth considering in comparison, except for those crazy people who think (or pretend to think) that a headless and legless trunk by Rodin is worth more than all the finished works of other French sculptors.

This is not one of the best years of French art, either in painting or sculpture. Three of the finest of the Old Salon men—MM. Henri Martin, Gervais, and Raphael Collin—do not exhibit; the first-named is the painter of various immense decorative pictures in a broad manner of his own invention, and the absence of any such work of his is a distinct loss to the exhibition. For the rest, one may say that visitors unfamiliar with the Salon exhibitions should distrust first impressions. The general tone and style of the paintings, and their immense number, give an impression so different from what we are used to at Burlington House, that it is difficult to get one's critical balance of mind at first. We seem to see an immense number of pictures which are not very interesting, and some which are vulgar; but the fact is that many very fine pictures are almost swamped, at first sight, by mere numbers, and have to be looked for and considered on a second inspection. There are, for instance, very few landscapes which make a strong impression at once; but a more detailed examination will show that there are quite a large number of landscapes which at the Academy would count among the most remarkable works of the year. With the exception of some realistic painters, such as Didier-Pouget and Biva (and their realism is quite beyond anything we are used to in London), French landscape has a tendency to look rather sombre; but it represents nevertheless the most thoughtful and intellectual school of landscape painting of the day, and they have one or two very powerful sea-painters now, M. Moteley especially, who is always worth looking at, and M. Palézieux, who unfortunately does not exhibit this year.

Decorative mural painting, or painting intended to be fixed on walls afterwards, generally plays a great part at the Salon, especially owing to the practice of the Government of giving commissions for such works for the decoration of provincial mairies and museums. There is rather less than usual of decorative painting this year; M. Laurens's "Surrender of Yorktown" is an American and not a French commission. But M. Gorguet's "Entry of Henri IV. into Rennes," to be executed in Gobelins tapestry for the Rennes Parliament House, is a remarkable example of the right way to design for tapestry; a symbolical, not a realistic picture, kept quite flat and all in one plane; and M. La Touche's three pictures for the Ministère de Justice (in the New Salon) show how light and rich colour can be employed for decorative effect. The Government likes

PLAN: NEW WAREHOUSE, SEVERN ROAD, CARDIFF.

The warehouse is planned for a furniture repository, and consists of ground, first, and second floors, with flat roof over, served by staircases and lift. The walls are of stone, faced with Cwmbran pressed bricks, with Victorian stone coping, sills, and dressings. The semicircular window heads are filled in with cement, finished white. The first and second floors are of timber, and the ground floor and flat roof of concrete on steel joists. The whole of the interior and exterior woodwork is treated with green preservative. An attempt has been made in the elevation to get away from the usual type of warehouse building without going to needless expense or using costly detail.

also to encourage the production of large historical pictures of important events; M. Detaille this year exhibits a very large and vigorous painting of a barricade scene during the Revolution of 1830, one of the best things of the kind that we have seen. This kind of picture does not, it is true, represent the highest object of the art of painting; but to make an historic scene live again is one use of the art, and one that is not to be despised.

We have not space, however, for an essay on contemporary French painting; it would be more useful, perhaps, to give a short list of some of the most noteworthy pictures, with the number of the gallery in which they are to be found; for by the inconvenient practice, in French exhibitions, of not hanging pictures in the order of numbering (they are apparently numbered first and then hung without reference to the numbers) it is impossible to know where to look for anything named in the catalogue. If any of our readers are visiting the Salon, the following short list may save them the trouble of looking for works which should not be passed over:—

OLD SALON.

Gallery I.

Steck: "Réunion dans un Parc": decorative picture bought by the State.

Simonnet: "Le Matin au Poudreux": street scene in sunlight.

Audras: "Soir d'Orage au bord de la mare."

Gallery IV.

Joseph Bail: two interiors with figures and accessories, unsurpassable in their kind.

Biva: two small landscapes at Villeneuve-l'Etang, of wonderful realism of detail; a special power with this artist.

Gallery V.

Bohm: "Heures Dorées": beautiful scene of mother and children; bought by the State; a real work of art.

Commerre: fine portrait of a lady: his "Au Soleil" a somewhat uninteresting nude.

Gallery VI.

Bertrand: "Derniers Rayons à Carqueiranne": landscape.

Gallery VII.

Béroud: "Salon Carré du Louvre": one of a series of Louvre interiors by this artist.

Cagniart: "Vallée de la Meuse"; bought by the State.

Chabas: "Sous les branches": water and figures; also a fine portrait of a lady.

Delaistre: "Falaises à Marée basse": a fine coast landscape; also a smaller landscape by the same artist.

Gallery VIII.

Franck Bail (brother of Joseph Bail): "La Fontaine de cuivre rouge" and "Le Potiron"; both splendid in their way.

Gallery IX.

Cabane: "Portrait de Jeune Fille."

Debat-Ponsan: two scenes of landscape and cattle (he generally paints more important subjects).

Humbert: two portraits of ladies, the best of the year. Humbert may be called the Gainsborough of modern France.

Gallery XI.

Detaille: "Rue du Petit-Pont, 29 Juillet, 1830": a large painting of a barricade fight.

Félix: "L'Après-midi d'Eté": nude figure seated under foliage through which the sunlight strikes; bought by the State.

Gallery XII.

Detaille: "Service Funèbre du général Dauvrémont," before the breach in the walls of Constantine (Algeria).

Cabié: "Les Chênes"; a fine landscape.

Gorter: "Paysage d'Hiver"; fine snow scene.

Hubbel: "La Sortie"; really a portrait of a lady in walking dress.

Gallery XIV.

Dupré: "Dans le Campagne."

P. Glaize: Portrait of Dr. Cathelin.

Guillemet: "Les Roches d'Equihen"; fine coast landscape.

Jules Lefebvre: "Le Vestale Condamnée."

Gallery XVI.

J. P. Laurens: "La Reddition de Yorktown"; large decorative painting for the Baltimore Law Courts.

Tapissier: "L'Eté"; decorative figure group.

Gallery XVII.

Gagliardini: "La Saluté, Venice"; architectural picture.

Kawalsky: "Jeunesse"; bright sunlit landscape and figures, in a style peculiar to this painter.

Gallery XXI.

Harpignies: "Un Centenaire"; a great tree in the middle of a landscape; the perfection of style in landscape painting.

Flameng: seated portrait of a lady.

Calvés: "Les Lagunes"; fine broad landscape.

Gallery XXII.

Mdlle. Humbert-Vignot: "Un jour de Grève"; a good example of the type of picture with a moral lesson.

Lenoir: Portrait of a lady.

Gallery XXIII.

Laugée: two small pastorals, landscape and figures, absolutely perfect in style and handling.

Gallery XXV.

G. Fanty-Lescure: "La Femme aux Prunes."

Sabatté: "L'Eglise"; a good architectural interior.

Gallery XXVII.

Moteley: "Une barque à la Côte"; a grand sea picture.

As for the sculpture at the Salon, there is not even the division into galleries to guide one through its mazes. It is, as usual, a wonderful collection of work, in which talent is to be seen everywhere; genius here and there; in which intellectual symbolism and poetic ideals are mingled with absolute (and sometimes very effective) realism and at times with extravagant sensationalism. No one work can be picked out which can be said to dominate the rest as the great production of the year; but there are many fine things. The sculptors whose work is especially to be looked to are Bourlange ("Le Devoir Civique"); Champeil ("L'Été de la Vie"); Convers ("L'Inspiration et l'Harmonie," a group for the Conservatoire National de Musique); Gardet (two great animal groups—State commissions for out-door decoration); Guillaume ("Aux Champs"—two peasants at work); Laoust ("Vers l'Infini," a beautiful female figure); Michel (monument to Jules Ferry); Perron ("Primavères," a group symbolic of Spring); and Terroir ("Vision Antique," two Greek lovers seated at the foot of a Doric colonnade). These are among the best, but there are plenty more that are worth attention.

MODERN BRICK AND TILE WORK.

Chiefly through the attention given to it by certain architects of outstanding ability, considerable interest has been aroused in modern brickwork—both in the actual texture and the detailing of it. The public still regard all brickwork askance, when used for other than purely commercial or utilitarian purposes, and on that account they cannot see any merit for example, in the campanile of Westminster Cathedral, which to them is no more than a glorified chimney stack. But among architects all such ideas have long since vanished, and it is to be hoped that as more and more consideration is given to the careful design of brickwork detail, and its possibilities become better known, the public will rise to a better appreciation of it.

As an example, take carved brickwork. How little of it, comparatively, is employed. Yet it is admirable on a brick building. Ever since our houses were bespattered with stucco—surely, the most baneful architectural disease we have yet suffered—the introduction of carved stone work on all classes of houses has been general. The most ignorant jerry-builder throwing up his brick boxes on the fields of our suburbs, has always had prominent in his mind the necessity for some foliated stone capitals on either side of the entrance doorway, and on the little bay window with its harsh slate roof and Gothic finial. It is not good carving; it is ill-devised, proportionless, coarse, and it sets on the house like fungus on a tree. Perhaps the builder in his ignorance, is the better judge of the taste of his prospective tenants, and as he buys his carved stone trimmings from the mason's yard at so much per dozen, and gets them hewn *in situ* for a lump sum, it seems hopeless to ask for something else. But with the better-class house, intended for people who are supposed to have a fitter sense of things, with at least some appreciation of appropriate work, it is surprising to find so little in the way of carved brickwork, for such work has a peculiar charm on a brick house, and no great expense need be incurred in the execution of it. It seems to grow out of the surface instead of having the appearance of being stuck on.

The design of brickwork detail depending for its effect on the disposition of ordinary bricks, in conjunction, perhaps, with tile work, also offers possibilities. Several well-known English architects of to-day have given proof of this, as, for

DETAIL OF CARVED BRICKWORK ON BAY, 25, VICTORIA STREET, WESTMINSTER. C. J. C. PAWLEY, ARCHITECT.

CHIMNEY TO LODGE IN KEW GARDENS. W. EDEN NESFIELD, ARCHITECT.

example, Mr. R. Weir Schultz, Mr. Troup, Mr. E. S. Prior, and especially Mr. Lutyens, who has done more for the revival of brick building than any other architect. But the revival, of course, was started years ago, and such names as those of Norman Shaw, Philip Webb, Eden Nesfield, and Butterfield at once occur as pioneers; while midway between these and those who are carrying on the work to-day stands the name of Bentley. The accompanying illustrations serve to show what can be done with brickwork when in capable hands.

OBITER DICTA.

The Grace of Grass.

Mown grass of some degree we must have in our forecourts, gardens, squares, parks, urban "open spaces." The time at which our early forefathers—smitten, perhaps, by the green carpeting of some forest glade or smooth slope of the downs—had the thought of replacing the prehistoric midden and fold-yard before the house door by a grass plat is a notable turning-point in our social development. From that rude beginning has descended the smooth green of castle-courts, cloister-garths, college quadrangles, terrace-slopes of great houses, and not less the little flower-bordered patch in the cottage garden, and the grimy herbage, the last survivor of green things, in the crowded yards of the town.—"*Times.*"

* * *

Continuity of Ideals. The ritual of worship, words, ceremonies, and all the beauty of art, are needed to remind men that they are something more than animals, and also that they have a common purpose in worship. There is a cumulative power in such things, arising from the fact that many generations have made use of them to express the nobler aims of men. And so it is with the ritual of national mourning. The mere fact that every one takes part in it makes it more ennobling than the mourning of private loss. . . . It is a symbol of that continuity of ideals which makes a nation, and which is so bravely opposed to the mechanical continuity of things.—"*Times.*"

CONSTRUCTIONAL STEELWORK.

By S. BYLANDER.

[*In this paper, which was read by Mr. S. Bylander before the Society of Architects, the special feature is a general description of the routine of steel-frame construction; bu interspersed there are many practical hints drawn from Mr. Bylander's extensive experience. Mr. Bylander has had under his control the design of all the more important recent steel framed structures in London, including the Ritz Hotel, the "Morning Post" Offices, the Selfridge Stores, the Waldorf Hotel, and, at the present moment, the New Automobile Club, Pall Mall. Some interesting illustrated articles on the steelwork at the Ritz Hotel appeared in our issues for September 28th, November 2nd, and November 30th, 1904, March 1st, 22nd, April 12th, and May 24th, 1905. On the "Morning Post" Offices in our issue of May 23rd, June 20th, July 18th, October 10th, November 7th, and December 5th, 1906, February 27th and March 27th, 1907. On the Waldorf Hotel in our issues for November 7th, December 5th, 1906, February 27th and June 19th, 1907. And on the Selfridge Stores in our issues for March 3rd, March 31th, May 26th, and June 23rd, 1909.*]

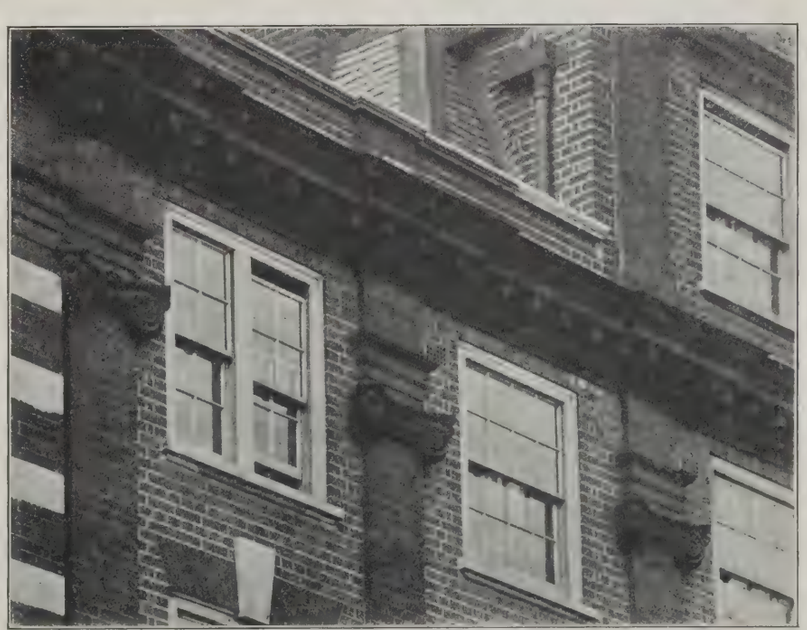
Planning and Designing.

The preparation of the plans for a building where the skeleton consists of steelwork, as compared with a building where the loads are carried on walls or piers, differs considerably.

Steel is becoming a more and more important material in building construction. As the sizes of the buildings are increased and fireproof construction is adopted, steel construction can be used with advantage. Heavy brick walls are substituted with steel stanchions, and rolled steel beams are used instead of wooden joists, thereby saving rentable space, and by the use of fireproof floors the danger of ruinous fire is materially reduced.

It is entirely wrong to prepare the final architectural design independently of the steel construction, and ask a contractor or engineer to design steelwork to suit the lay-out of the different floors. Steel should be employed to its greatest advantage, and not merely as a substitute for brick and stone as is often the case; for instance, where large rooms are required in the lower storeys, while in the upper storeys are placed heavy division walls and brick stacks, and where positions of the columns vary in the different storeys.

The object of the design should be to obtain the best result for the minimum amount of money, and this can only be obtained when each of the different building materials is employed to its greatest advantage.



It is obvious that the steelwork, brickwork, and stonework must be designed simultaneously, in order that no material should be wasted.

The amended London Building Act of 1909 will give guidance to the architect and engineer, and ensure uniformity in specifications and designs, and undoubtedly prove of great advantage to the quality of construction generally.

The advantages promised in the Act of 1909 will, however, not be complete until all buildings are treated on the same basis. At present there are no regulations for buildings constructed in accordance with the old Act, while stresses and loads are definitely specified for steel-framed buildings.

The first consideration the designer has to take into account is the factor of safety in relation to the loads which should be used in the calculations for the different members. Good practice is to use a safe stress for steel equal to one-quarter of the ultimate strength of the material, or seven and one-half tons per sq. in. if the ultimate strength of the material is 30 tons per sq. in. As the elastic limit of medium steel is about 15 tons per sq. in., the actual factor of safety will be two.

The general lay-out of steelwork for a building is primarily dependent upon the size of rooms and type of floor construction; secondly, upon loads to be carried and requirements as to decorations. The spacing of columns should be uniform, if possible, in order to permit repetition of sections and details.

DETAIL OF BRICK CORNICE AND PILASTERS ON FIRE STATION, GREY COAT PLACE, WESTMINSTER. W. E. RILEY, F.R.I.B.A., L.C.C. SUPERINTENDING ARCHITECT

Loads.

The actual live load is not used in the calculations, but the corresponding dead load, which would cause the same stress in the steel as the actual live load. This dead load is usually referred to as "superimposed load," and varies from 70lb. to 120lb. per sq. ft. for apartment houses, hotels, and office buildings, and from 150lb to 400lb. per sq. ft. for warehouses and factories. To the above loads should be added the weight of the floor itself (including steel girders and beams, which is about 100lb. per sq. ft. for an average concrete floor. The dead load of floor must be carefully calculated in each particular case.

Steel may have to be used in buildings where the design will not permit of the use of only brick and stone work on account of large rooms, great loads, architectural features, or planning requirements. It is used by reason of economy where steel is found to be cheaper than other material, or where the floor space saved by using steel columns instead of brick wall or piers will more than compensate for the extra cost of steel compared with the cost of brick.

Steel beams and concrete are substituted for wooden joist floors and roofs in order to obtain a more fireproof construction, often with a considerable increase in the first cost of the building. However, the fireproof building may be more profitable to the owner than the old wooden construction when the reduced insurance premiums, and the increased rigidity and stability, are taken into consideration. No doubt fireproof construction will soon be adopted generally for large towns, and I will, therefore, in this paper only deal with that kind of construction.

In addition to the before-mentioned reasons for using steel in buildings, there are others more or less important according to conditions or circumstances: (1) Rapidity of construction. (2) Possibility of changing the arrangement of rooms after the carcass of the building is completed. (3) Increased stability and rigidity; uniform distribution of loads on foundations to prevent unequal settlement.

Rapidity of construction is generally a question of economy. By speedy completion of the building, interest on the capital is saved. Possibility of changing the arrangement of rooms saves cutting away brick walls and putting in steel girders to suit the client's requirements. Such alterations of rooms may in many cases increase the rateable value of the building. A steel-framed building where steel is properly covered with protective material is, I believe, the most durable fireproof building that can be produced at reasonable cost.

Difference between Brick and Steel Construction.

Let us compare the setting out and construction of a brick building and a steel-frame building. The setting out of a brick building need not be very accurate as to dimensions. The builders can set out the walls and foundations to the architect's plans and elevation drawn correct to scale, but not necessarily dimensioned. The accurate dimensions of the site are often not ascertained before the old building is taken down, and the builder is ready to start work building the walls. A little variation between the dimensions scaled from the drawings and the actual dimensions of the site will not present any great difficulties or cause delay or additional cost. The dimensions can simply be agreed upon between the builder's foreman and the architect's representative on the site. Nor is it necessary to have particulars of details when starting the work, as cutting away of a little brickwork is not accompanied by any great difficulty, should it be found at a later date that some alterations were necessary on account of some of the detail drawings not being ready when the work was commenced.

In the case of a steel structure, however, it is most essential that the drawings are completely worked out beforehand, and all details made. Ventilation, heating, drainage, lighting arrangements, etc., should be set out beforehand, and the general lay-out and steel plans made to suit the different requirements.

Economy.

Economy is the essential thing to aim at, and, generally speaking, steel is being used in buildings because it admits of cheaper construction than other materials, and at the same time ensures a reliable structure. By the use of steel the rental floor-space is increased considerably; it also permits the use of large spans and fewer pillars, thereby enabling the future tenants to arrange the rooms according to their requirements. Buildings can be quickly erected and completed, thus saving interest on capital. In order to obtain true economy, however, it is necessary that the planning and designing, and also the method of carrying out the work, should be systematical, and in accord with the general principles which I will deal with hereunder.

Systematical Progress of Work.

The steelwork plans should be ready several months before work can be started on the site, to allow for the time required for the manufacture of the steelwork at the mills; also it should be borne in mind that the steel can be obtained at a smaller cost if ample time is allowed for the steel contractor.

It is advisable to order the full quantity of each section in one lot, and get the pieces cut to exact lengths at the mills. Considerable waste occurs if the shop has to draw material from stock. To take material from stock should only be permitted when very quick deliveries are absolutely essential. Generally speaking, complete dimensioned shop drawings should be made in the office in preference to having the rivets, connections, and details set out by workmen in the shop.

It is of course necessary that the engineer in charge of making the detail drawings must have a well-trained staff of draughtsmen who are thoroughly familiar

("*Modern Brick and Tile Work.*")

with shop work, as the draughtsmen are called upon to do such work as the template worker would otherwise do according to the old practice. The position of every rivet should be shown on the detail drawings, and nothing should be left to the judgment of the workmen in the shops. More reliance can be placed upon drawings which have been checked than upon setting out in the shop, which setting out is not usually checked. Another advantage of having complete shop drawings is that every piece can be inspected and compared with the detail drawing, and errors in shop work can more easily be detected than if the work is set out in the shop without shop drawings. Every piece can be made complete to the detail drawing, without fitting the different pieces together, and still they must fit perfectly when erected. The essential thing to remember in steel construction is that there should not be any alterations of the steelwork on the site.

Alterations During Construction.

It is a very serious proposition to make alterations to the steel design during the progress of manufacture, and still more during erection. Not only will it cause delay and additional cost, but it will also result in less satisfactory work. If all drawings are properly worked out and completed before the work is started, the liability to alterations is materially reduced.

Manufacture.

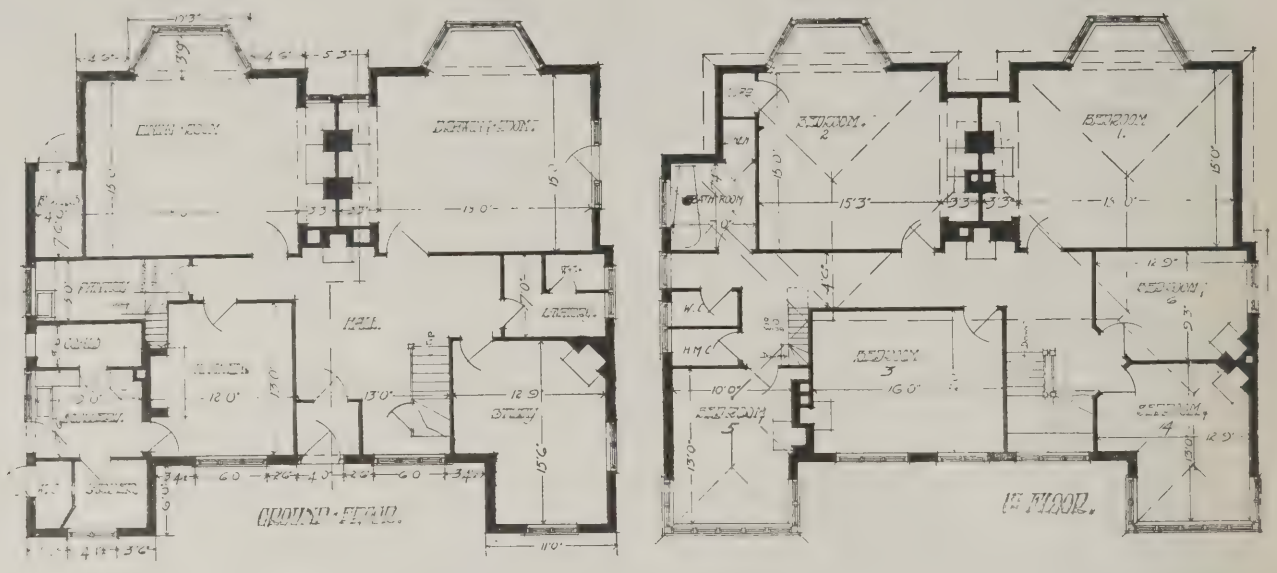
The first thing the contractor has to do is to issue orders for rolling the material. An inspector will be appointed by the architect or engineer to inspect the quality of material at the place of manufacture. The inspector will be at the mills when the material is rolled. He will be present when the chemical and physical tests are made, and make records of the results of the tests, and order additional tests to be made if the material does not run evenly. The inspector will reject and order to be removed such material as fails to meet the requirements of the specification, and he will stamp and approve that which is satisfactory.

Inspector's Approval.

The approved rolled material is stamped with the inspector's mark of approval of quality of metal. Any piece coming from the rolls is stamped with the blow or melt number, and this number is referred to on the test sheet reports. Every piece is also marked with an identification number given on the detail drawings. This number is used for reference when consulting the drawings in the shop or when locating in which place the piece is to be erected on the site. After being rolled and straightened, the material is placed in the stockyard until required in the shop. As a rule, the material cannot be rolled in the order in which it is required in the shop, but in such order as the rolls go in according to the rolling programme for the rolling mill.

Weeks and often months may elapse before the same section is rolled again. It is often, therefore, advisable to roll the beams for the roof at the same time as for the lower floors when same section is used. In the shop, however, the material is usually fabricated in the order in which it is required on the site. The inspector is kept well informed as to the dates of rolling and manufacture, so that he can be present and inspect as required, and as the work proceeds.

Shopwork.



From the stockyard the material is brought to the working shop, where skilled workmen mark the position of the holes, lines of cutting, etc., on the steel pieces direct, with or without template. The number of the shop drawing and number of job are often painted on the piece before it leaves the working shop, in order to assist the checker and inspector. Therefrom the marked material is brought to the drilling shop.

In the case of built-up sections, as, for instance, a column composed of angles and plates, all the angles and plates are not marked and drilled separately, but only a few holes are first drilled; the different plates and angles are then bolted temporarily together, and the whole thickness of metal is drilled through at the same time, thus saving time and assuring greater accuracy and all holes being true. Several drilling machines can be used for one member at the same time. Burrs are removed after the drilling, and the ready-drilled piece is sent to the assembly shop. Some pieces are milled or ground to fit; the different pieces forming one member are temporarily bolted together and sent to the riveting shop.

During assembly the detail drawings are consulted and the dimensions checked. When the pieces are riveted, they are sent to the milling machines if any part has to be machined, such as ends of columns or bearing plates on girders. Before assembling, some surfaces must be painted, as after assembly they are inaccessible. Open holes which are to be filled with rivets in the field are marked by the assembler, so that such holes shall not be filled in by

HOUSE AT PARKLANGLEY, BECKENHAM, KENT: PLANS. REGINALD C. FRY ARCHITECT.

rivets in the shop. Holes in small pieces and brackets are generally punched and rimered after assembling, but main members are drilled. Before the finished steelwork is painted, it is examined by the inspector, and all dimensions are checked. Ends of compression members which are machined must be examined, and it is ascertained if the ends are square to the axis of the member. If all measurements are correct, and the workmanship satisfactory, the inspector stamps the piece with his shop inspection mark.

The material will now receive its shop coat of paint or oil before shipment.

Marking.

Any piece or bundle of pieces must not be shipped unless having the following marks applied: (1) blow or melt number; (2) identification number; (3) mark of mill inspection; (4) mark of shop inspection; (5) shipping mark.

When painting the material before shipment, all marks made in the shop are extinguished (except those above stated). A small circle or triangle with white paint is made around the marks previously indented by stamps. The shipping mark and the identification mark are applied with paint in large and distinct letters or figures. Sometimes pieces for different parts of the building are painted in different colours, or a spot or ring of a distinguishing colour is applied to facilitate selection of the material at erection. If the above-described methods are used, little or no difficulty will arise at erection, and no risk is taken of material arriving at the site incorrect.

The inspector makes remarks on his copy of the shop drawing when approving any piece at the time when his stamp of approval is applied. He has also to see that the material is shipped in the right order as required on the site. After completing inspection for each lot, he makes up a proper list of material. The works do likewise, and the two lists are compared and checked. Several days before a shipment is made, the shipping statement is written out in detail, and instructions are issued for shipment or transport of the material to the site.

As the material passes out of the works, it is weighed, and the inspector records the weight and counts the pieces weighed and sees if they are in agreement with the advice of shipment. The weighing machine should be checked at regular intervals by an independent party to assure that it registers the correct weight. The shipping statement, advice, and invoice are now sent to the contractor as the material is shipped, if the contractor only buys the material, but executes his own erection.

Shipment.

According to requirements, the steel is transported on van, railway car, or barge, or by ship. Considerable damage to the material may occur during transport if proper precautions are not taken against careless handling when loading and unloading, so that small pieces are not bent or crushed by large or heavy pieces placed on top. Delay through mixing up of the different consignments is a source of great inconvenience.

Erection.

The material is usually brought alongside the building on vans, and is hoisted by the erection cranes to a place on the building near to where it is to be erected, or sometimes directly placed in its final place. The different pieces are first temporarily bolted together, and afterwards set to correct level and made plumb, after which all holes are filled with rivets. The steelwork is painted immediately after erection, and if more than one field coat is applied, different colours of paint should be used. Floors and walls are built and fireproofing applied. The erection of the steelwork should be two storeys ahead of the floors. The floors should be put in one storey ahead of the walls, as may be convenient. In cases where walls partly support the floors or girders, the walls must, of course, be built the same time as the steel is erected. In order to prevent accidents to the workmen below, the floors should be put in close to the steel erection, or the floor framing should be boarded over to prevent any tools or material falling on the men below. At the same time, the different trades should be kept separate, so as not to interfere with the rapid progress of the work.

When the carcass is complete, and the roof is on, heating, ventilation, etc., are installed, partitions built, and joinery and finishing completed.

In the carrying out of a large job, it is not always satisfactory to put the responsibility on to different parties for designing, detailing, manufacture, inspection, and erection, as in that case it is not likely that uniformity of system will be followed. In my opinion, one man should be responsible for the systematic carrying out of the work. The engineer responsible should bear in mind that no work is satisfactory unless the following requirements are fulfilled: (1) Economic and safe design; (2) good material and workmanship; (3) correct work as to dimensions; (4) prompt deliveries; (5) proper erection.

It is wrong to suppose that after a good design and specification are made, the responsible engineer's work is done. A good specification is of as little use without inspection as a clever design is without proper shop drawings. The practice of taking a few test pieces from a job and sending them to a testing firm is not reliable. The material should be tested at the mills during the progress of manufacture.

Calculations and Preparation of Plans.

When preparing plans and calculations for a building the work should proceed in the following order:—

(1) The specification drawn up for stresses and loads.

(2) The principal members for the structure to be calculated, and it should be ascertained whether the setting out of the columns and girders is economical and reasonable, and if necessary such modifications made as will improve the construction.

(3) When the architectural plans are completed the engineer will calculate all the loads of floors, walls, etc., make stress sheets for each member, after which a set of plans is made and the required sizes given. The sizes of the steelwork thus obtained are drawn to scale on the architectural plans, and, where necessary, the engineer will modify the sections to suit architectural requirements; after which the architectural plans are practically completed, the shop drawings made, the contract placed with the steelwork contractor.

LEGAL NOTES.

By THE LEGAL EDITOR.

Covenants Relating to Building.

The fact that questions are frequently addressed to "The Architects' and Builders' Journal" in connection with covenants as to building raises the presumption that difficulty sometimes arises in understanding them. A man buys or leases a plot of land which places various restrictions on his powers of building. He reads them through, and in all probability his solicitor explains them somewhat fully; but their real effect does not come home to him until such time as he desires to build. He then finds that he must build a house of a certain value, or with a certain frontage, or "which shall be approved by the vendor (or landlord) or his surveyor." In the result he is unable to build the house which suits him best. Again, if his plot of ground forms part of a large building estate, he may find that he has to observe covenants which enure for the benefit of the purchasers or lessees of other plots. How far are such covenants binding upon him?

It is proposed, in the present article, to deal with these questions in their legal aspect.

It is clear, in the first place, that one who is laying out a building estate must needs be in a position to impose restrictions on those who take the various plots for the mutual benefit of all. That such restrictions are legal is clear from a case heard by Lord Romilly in 1865.* There the plaintiff and the defendant were adjoining owners. The plaintiff sought an injunction to restrain the defendant from erecting a certain building in the rear of his house. Both premises had been part of one estate, and a covenant in the head lease provided (*inter alia*) that houses to be built thereon were to be in accordance with a particular plan. It was held that a covenant against building entered into by a purchaser of land with the vendor, who was also adjoining owner, his heirs, etc., "runs with the land," and may be enforced by a subsequent purchaser of part of such adjoining lands. A person seeking to enforce it must, however, show that substantial damage will be caused by the breach. The principle is well illustrated by a later case,† where there was a general covenant entered into by all the purchasers of plots on a building estate, to the effect that no public-house should be built on any part of the estate. The defendant, in breach of this covenant, erected a public-house. The plaintiff then brought an action to restrain him, and would probably have succeeded had it not been proved that long before he brought the action he knew that the public-house was going to be built and took no steps to prevent it.

The above case may be relied on as an authority for the proposition that acquiescence in a breach of covenant by an adjoining owner may deprive a man of his remedy; but the fact that a lessee does not interfere to prevent a small and limited breach of a restrictive covenant in a building lease does not prevent him for all time from seeking to restrain a wider and more important breach. Acquiescence may be inferred by delay, and the amount of delay which spells acquiescence will naturally depend upon the nature of the breach. For instance, if a neighbouring lessee erects a building which obviously constitutes a breach of covenant, action must be taken at once; while the carrying on of a prohibited business might not be so easily discovered.

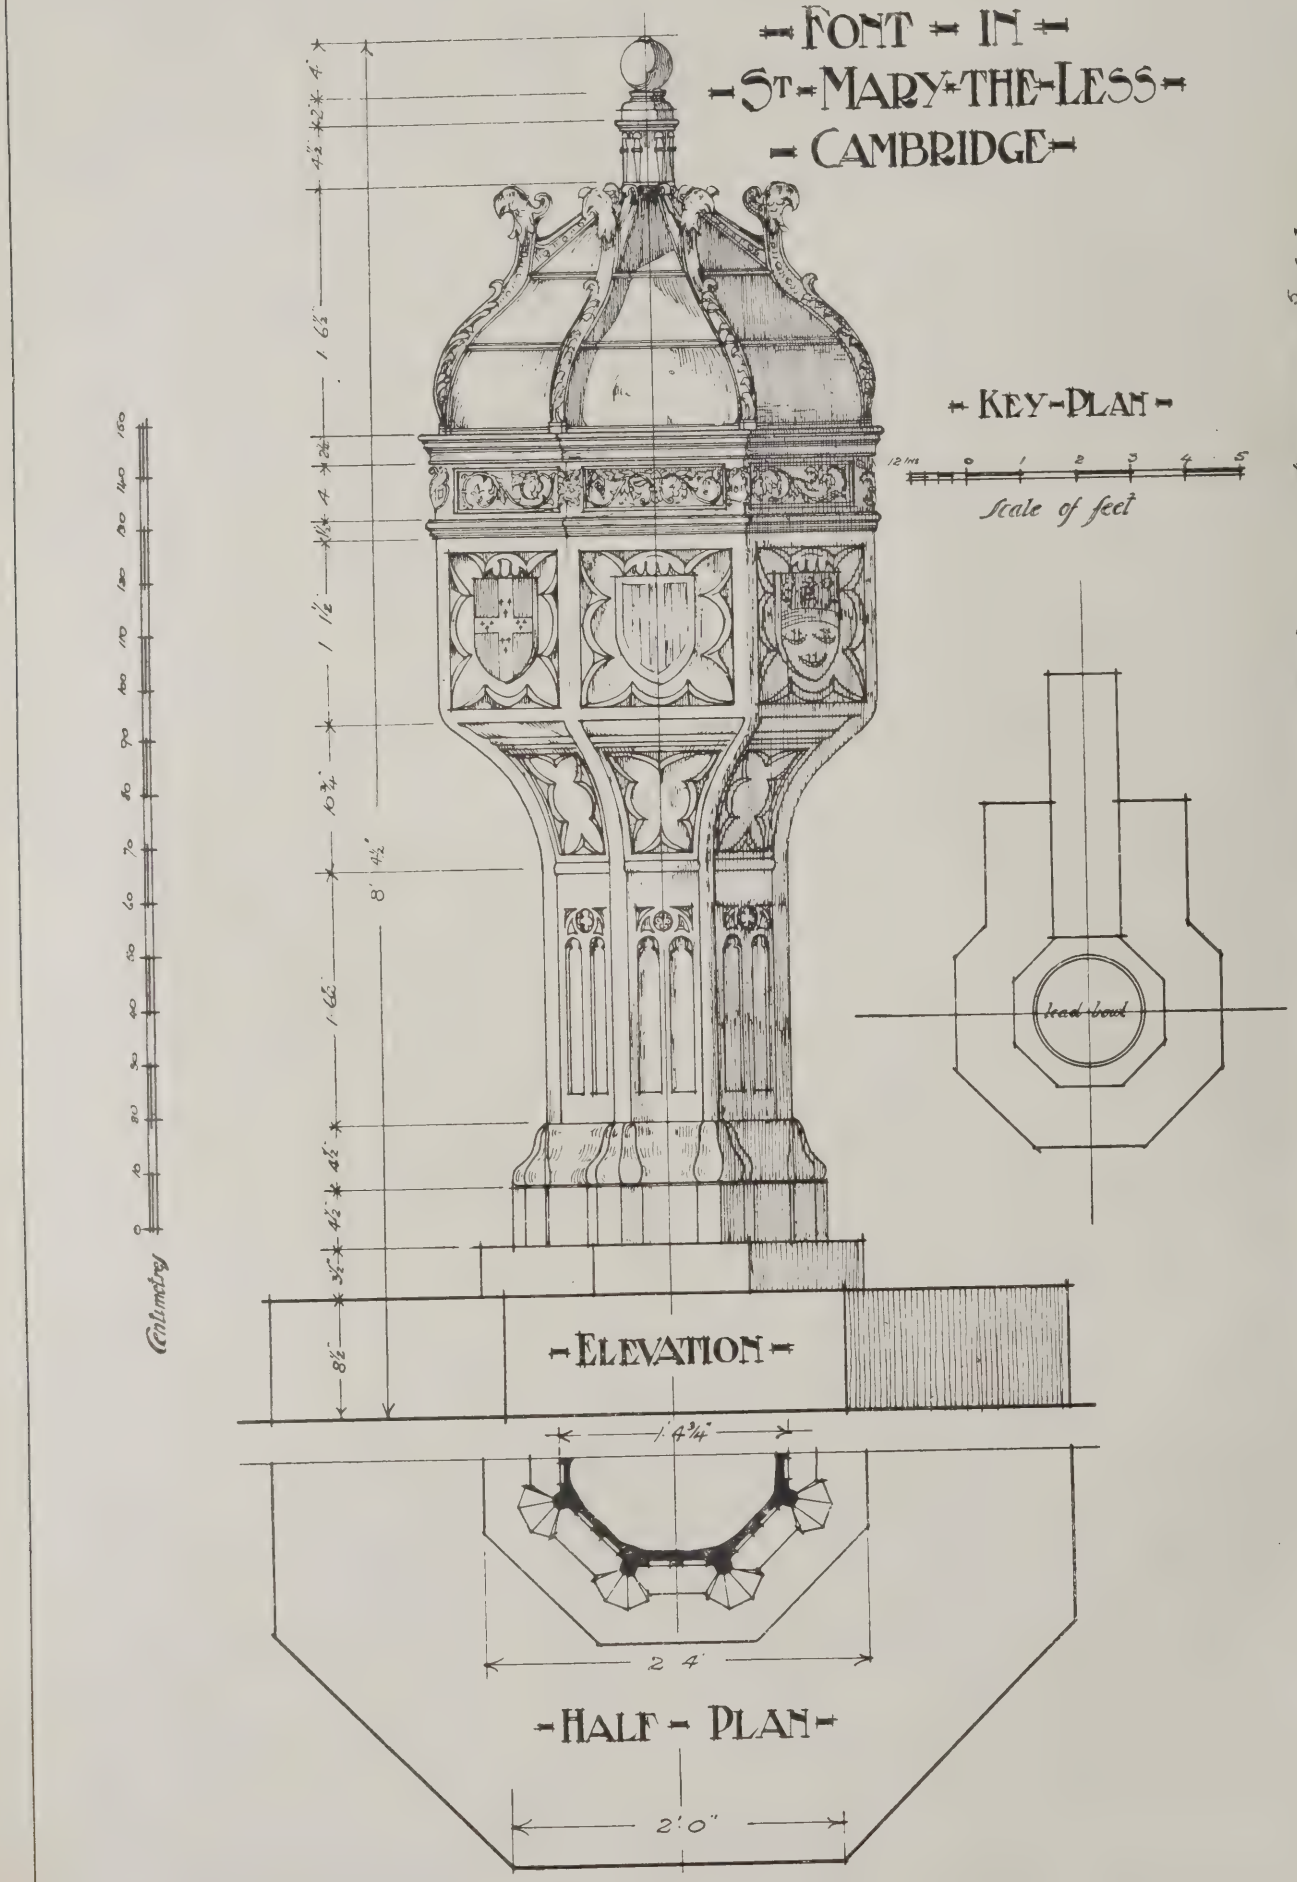
One other fact may be noted in this connection. The vendor or landlord may have waived his rights. Thus, if he omits to enforce a covenant in the case of the holders of some plots, the Court will decline to restrain a similar infringement by other tenants.

No lessee, however, should rely on any such point as this to justify a breach of covenant. If he builds in contravention of a covenant he will certainly run the risk of expensive litigation, and may be ordered by the Court actually to pull down the buildings which he has erected.

*Western v. Macdermott, L.R. 1 Eq. 499.

†Sayers v. Collyer, 28 ch. D. 103.

Mutual Credit and Set-off.



What is "mutual credit and set-off"? This is a question which may seem to the layman difficult to answer; but a proper appreciation of its meaning is of considerable moment in relation to building contracts. As everyone knows, when a man becomes bankrupt, his assets, such as they are, are divided up amongst his creditors *pro rata*. A creditor is generally regarded as lucky if he gets 10s. in the £. Now when a man goes bankrupt the trustee has to collect his assets. All debtors of the debtor have to pay up in full. But suppose that, at the date of his bankruptcy, the debtor owed me £100, while I owed him £100, I might have to pay the trustee £100 and only get £50 out of the bankrupt's estate. This would be clearly unjust. To put a concrete case. Suppose a builder is employed to erect certain houses, and he obtains an advance of £500 from the building owner to enable him to procure materials. The work proceeds, and £500 becomes due on certificates. That £500 would be assets in the bankruptcy; but it would be manifestly hard on the building owner that he should have to pay over the £500 to the trustee and get back £250. To provide against this injustice, the Bankruptcy Act, 1883, provides that where there have been mutual credits, mutual debts, or other mutual dealings between a debtor against whom a receiving order is made and any other person proving or claiming to prove a debt, an account is taken, and the balance of the account only is paid over. It is obvious, however, that the rule must be, and it is in fact, limited by this: that it can only apply if the creditor did not know that bankruptcy was pending when he gave credit to the bankrupt.

This represents an attempt to adapt the eighteenth century exterior to a modern planned house. The building has been specially designed for Parklangley, to occupy a site on the south side of a road running east and west.

HOUSE AT PARKLANGLEY, BECKENHAM, KENT. REGINALD C. FRY, ARCHITECT.

FONT IN ST MARY-THE-LESS CAMBRIDGE

MEASURED AND DRAWN BY FRANK T. DEAR.

This is the most interesting font to be found in Cambridge. It is of stone, formerly touched with colour on the shields. The font itself is obviously of much earlier date than its cover, the latter having the date 1632 carved on one of its angles. The cover we believe has suffered many viciss tudes, having once been buried, but, with certain portions repaired, it now remains in very much its original condition.

CONCRETE AND STEEL SECTION

(MONTHLY.)

In Praise of Concrete. There is one striking feature connected with the war that is being merrily waged around concrete: the unanimity of opinion existing between the opponents and adherents of the material as regards its availability for foundation construction. But let it show its head above ground (said Mr. W. F. Hall, in a paper read before the Franklin Institute) and immediately protests, ranging from mild-mannered objection all the way up the scale to vituperation, make themselves apparent from every quarter into which concrete has made inroads. The bricklayer who scents the decrease of brickwork, the drain-tile and sewer-pipe man who no longer enjoys a monopoly, the brickmaker who contemplates his decreased output, they, and many others, all unite in the cry of "Down with concrete." This is exactly what engineers have been doing with it for centuries with the result that the tourist is enabled to pay homage to structures to-day that, but for their concrete foundations, would long ago have been mere unrecognisable heaps of masonry. The man who first mixed water with stone and sand and tied them together with cement was the original conservator of natural resources. His puddling made it possible to give the house built on the sand the same stability as that founded on the rock. He devised the means of securing for structures immunity from time and the elements. The iron founders have erected statues to Vulcan. It is regrettable that the name of concrete's inventor should have escaped going down the ages. As previously stated, concrete has been used as a foundation material for centuries. Of recent years, refinements of this application have come into use that are worthy of more than passing notice. The concrete bearing pile is supplanting its perishable wooden prototype. The concrete sheet pile is responsible for the construction of bulkheads and other marine structures that will be in existence centuries after their builders have been forgotten. The concrete caisson made possible the building of towering structures on the most treacherous kind of soil There is an increased desire on the part of the Federal, State, and Municipal Government, as well as large corporations and people holding valuable property, to replace temporary construction heretofore used with permanent construction, and there is every evidence that an increasing amount of this class of work will be done each year.

* * *

Importance of Workmanship. The effect of workmanship on the strength of concrete was tested some time ago at the laboratory of the Technologic Branch of the United States Geological Survey, then situated in St. Louis. Three firms doing concrete work in the city were asked to furnish gangs to mix and place concrete for cubes and test beams. The same materials were supplied to all three gangs, and the cubes and beams were tested under the same conditions. The maximum variations between the test results were about 100 per cent., parallel specimens made by the laboratory's workpeople testing to about the same strength as those of the gang securing the maximum results. With a richer mixture the greatest difference in results was about 60 per cent., indicating that an increase in cement tends to cut down discrepancies. The beams were 13ft. long, and were designed to fail in compression, so as to give a truer index as to the strength of the concrete.

* * *

Waterproofing Concrete. According to Prof. Ira L. Baker, when alum and soap are used as waterproofing for concrete, the alum in powdered form may be mixed with the dry cement or the sand, and the soap may be dissolved in the water employed in mixing the concrete; or both the alum and the soap may be dissolved in the water. The former is probably the safer method in practice, since with the latter method the water must be thoroughly stirred while the two are being mixed or the precipitate may form in large masses which it is practically impossible to break up; and, further, the water must be kept stirred to prevent the compound from accumulating on the surface. However, the alum is more easily dissolved than the soap; and hence the alum may be dissolved in, say, one-fifth of the water, and the soap in the remaining four-fifths, and then the two portions may be mixed together. The alum and the soap combine and form a finely divided, flocculent, insoluble, water-repelling compound which fills the pores of the concrete and decreases its permeability. The best proportions are: Alum one part and hard soap two parts, both by weight. Soap varies in its chemical composition, and hence a single proportion cannot be stated which will be chemically exact for all cases. The above proportion is in round numbers the relative combining weights of alum and average hard soap. Any reasonably pure soap will do. It is difficult to dissolve more than about 3 per cent. of hard soap in cold water; and hence this practically limits the amount of alum to 1.5 per cent. and of the soap 3 per cent. These amounts will give a precipitate equal to about 3 per cent. of the weight of the total water. The amount of precipitate formed in the pores of the mortar or concrete will depend upon the amount of water used in the mixing.

* * *

Failure of a Concrete Roof. Part of the reinforced concrete roof of a car barn under construction at Saybrook, Conn., for the Shore Line Electric Railway, having collapsed, the failure is thought to be probably due to the removal of the forms at too early a date, and the weight of a large quantity of roofing material that had been piled on it. The matter is mentioned here for the sake of the lessons it may chance to convey. The building is one storey high, 74ft. wide and 194ft. long. The roof was a reinforced concrete slab carried on beams 8ft. apart on centres, and of somewhat less than 37ft. span. They were placed transversely and carried on wall pilasters and by the columns and girders of a longitudinal centre line of columns. It seems that the foreman, without instructions, directed the removal of the forms, although some of the concrete was not over 10 days old. The settling of the roof was noticed by one of the workmen, who gave the warning, permitting 15 men who were beneath it to escape. Some of these men were on a scaffold beneath the roof. Of the three men who were slightly injured, two were outside the building and were struck by the falling pieces of concrete. That the failure came slowly is evident from the fact that one of the men inside the building had time to warn the foreman who happened to be on another part of the roof. The foreman walked on to that part that was settling and fell with it. The parapet wall, 2 to 3ft. high, was pulled in, and falling on the foreman, caused injuries which proved fatal. The panels came down one after the other, breaking off sharply on the line of the new concrete. The section that failed extended across the width of the building for a distance of about 37ft. at one end. The loss, though not accurately determined, will probably be between 1,000 and 2,000 dollars. The structure was being built by the Sperry Engineering Company, of New Haven, Conn.

* * *

Concrete Mixers. A marked feature in the recent development of concrete mixing machinery is the very general application to mixers of ordinary size of auxiliary apparatus for delivering the charges of raw material, and the occasional application of apparatus for handling the finished concrete. This was made very evident at the Cement Show held recently in Chicago, where the concrete mixers made by a score or more of different manufacturers were on exhibition. A large majority of the mixers of the revolving drum type were equipped with power-operated charging hoppers or buckets. This equipment facilitates the work in two ways: (1) it reduces the amount of wheeling for the materials, and especially wheeling up inclines to reach the charging platform, which is frequently a cause of delay or interruption in the steady progress of the work; (2) it practically increases the capacity of the mixer, since the material for one charge is being got ready while the previous charge is being mixed. As soon as a batch of concrete is delivered, the complete charge for the next batch is dumped into the mixer. This takes but a few seconds, whereas a much longer time will be required if several loads of material for the charge have to be wheeled up and dumped into the mixer. Another matter to which attention was drawn by the machines at the exhibition was the very large number of self-contained units, each having mounted upon its frame the mixer, the motive power, the water tank, and the charging hopper and concreting bucket, with their hoists. Thus one man could control the entire series of operations of charging, mixing, discharging, and delivering the concrete.

THE CONCRETE INSTITUTE.

[At the Royal United Service Institution, the monthly ordinary general meeting of the Concrete Institute was held, Mr. William Dunn, F.R.I.B.A., in the chair. There was a fairly numerous attendance of members and visitors to hear a paper read by Mr. Sidney H. Chambers on the subject of "The Effects of Sewage and Sewage Gases on Portland Cement Concrete."]

The Chairman submitted to the meeting the following candidates for membership: Mr. Henry Alfred Brain, Assoc. M. Inst. C.E. (London), Captain John Gibson Fleming, R.E. (Chatham), Mr. Frederick Herbert, Assoc. Inst. Sanitary Engineers (Pretoria), Mr. Archibald Cecil Hughes (Wokingham), Mr. Segar Owen, F.R.I.B.A. (Warrington), and Mr. Cyril W Rice (Wick, Caithness). These gentlemen were unanimously elected.

THE EFFECTS OF SEWAGE AND SEWAGE GASES ON PORTLAND CEMENT CONCRETE.

The lecturer, Mr. Sidney H. Chambers, engineer and surveyor to the Hampton District Council, in the course of his remarks, said that it might be assumed that the available evidence as to the effects of sewage and sewage gases on Portland cement concrete was either inconclusive or of a more or less negative character. Cases were on record of destructive changes in tanks and sewers, but, nevertheless, the opinion tended to prevail that when the concrete construction was sound no marked disintegration need be anticipated, neither from sewage nor from its emanations. The author's experience, however, did not support this view, and it was to the elaboration of this, the positive side of the question, that he desired to direct attention. During the last five or six years he had had very special opportunities for studying the problem.

The Hampton Installation.

The nature of the sewerage system was water carriage, primarily flowing by gravitation, and, secondarily, raised by plenum pneumatic power. The sewerage was entirely and completely on the separate system. The installation consisted of a screening chamber, two detritus tanks, a hydrolytic tank, and triple contact beds, and an air-purifying filter. The sewage on its arrival at the works was delivered from the rising main into the screening chamber, and after passing through the screen was conveyed by a channel to the detritus tanks. From these tanks the sewage entered the hydrolytic tank, which, together with the detritus tank, was installed in 1903. The disposition of the tank was such that the main bulk of the sewage—80 per cent.—passed through at a comparatively high rate of flow, issuing in four hours as a clarified liquid, whilst the small volume—20 per cent.—containing the deposited matters, was sixteen hours in the tank. After flowing over the weirs of the first portion the liquid entered a channel which led to the second portion of the tank, consisting of four hydrolysing chambers arranged in sequence, and filled with large flint stones. The liquid having taken three hours in its passage through these four chambers, entered the lower channel, which conducted it to the contact beds.

The screening chamber, the tank, and the channels leading to and from the tank, as also the effluent channel of the primary contact beds, were covered in. The entire installation was ventilated by the hydro-mechanical system of sewer ventilation, and the withdrawn gases were purified by being passed through an air filter.

The sewage of Hampton was of a strong domestic character. It had undergone thorough disintegration by the lifting operations, and by the putrefactive changes occurring in the rising main. It was malodorous on its arrival at the screening chamber, where, as it left the rising main, it evolved sulphuretted hydrogen and other bad smelling compounds. The liberation of these gases constituted a nuisance, necessitating the screening chamber, channels, and tank being covered in, and a means being provided for drawing a large volume of air through them before discharging the gases into the atmosphere.

The Concrete Used.

The whole of the tank and channels were constructed of Portland cement concrete. The walls of the tank are 6ft. 6in. in thickness at the base, and 1ft. 6in at the top, and are strengthened by tie-rods; the roof was 6in. in depth and was reinforced by expanded metal, and the channels were covered by 2in. patent paving slabs. The work was executed by departmental labour and the best materials were used.

The concrete was composed of one part of Portland cement properly mixed with clean water and six parts of ballast thoroughly free from loam, clay, mud, or dirt of any kind, and no material was allowed to be used larger than would pass through a 2in. screen.

The patent paving flags were composed of granite chippings, washed and crushed to pass through a ¼in. mesh sieve, and heavy Portland cement. The materials are mixed in the proportion of one part of cement to three parts of granite.

Efflorescence.

Early in 1905, a few months after the hydrolytic tank had been put into use, it was noticed that the roof and walls of the hydrolysing chambers above the liquid level were white or yellowish in appearance. This efflorescence was not crystalline in structure, but was of a chalky subsistence, and resembled distempered work on a damp wall. On examination it was found to be due to a thin covering of sulphur, which could be easily removed by rubbing. Later the face of the walls and the roof in the second part of the tank showed signs of peeling, and the concrete appeared to be disintegrating. A thorough inspection of the installation was thereupon made.

Disintegration.

At the screening chamber nothing appreciable was observed, neither at the highest water-level nor on the underside of the roof. The concrete was sound, and when struck had a good ring. Immediately adjoining this chamber was the main sewage inlet channel, along which the whole of the gases pass to the main air duct leading to the air filter. At this point slots were made in the concrete to receive a dam; the concrete at the back of the grooves was found to have disintegrated, although the sides were perfectly sound.

Further along this channel it was observed that the greatest disintegration had taken place on the walls at the liquid level. Owing to variations in the flow of the sewage, the level of the liquid in the tank and channels rose and fell; thus a certain area of the walls was constantly being immersed in the sewage and then exposed to the air. This area was, consequently, even when not immersed, much wetter than the part of the walls which was always above the level of the liquid. The latter area at this point showed erosion, which, however, had not penetrated so deeply as that at the level of the liquid itself. At the liquid level there was a deep groove in the concrete, and above this the face of the work had bulged out and lost its nature.

The first portion of the tank, *i.e.*, the hydrolytic tank proper, appeared to have suffered a little. The walls and roof had only the slightest sulphur deposit. At the liquid level, which varied less than in the channel, there was a slight erosion. The second part of the tank, *i.e.*, the hydrolysing chambers, was found to have suffered in places to a marked degree. It was observed on breaking through the erosion on the surface that the concrete at the back was moist, soft, and gritty. Also, it was noticed that increased dampness constituted an important factor in the destruction of the concrete, for the lower parts of the vertical faces of the beams supporting the roof were more affected than the upper parts. The lower portions of the vertical walls of the tank also were more eroded than the upper. At the liquid level the concrete had been severely attacked, and a deep groove existed in it.

Analyses of Concrete in Hydrolytic Tank.

Two samples of surface concrete were taken above and below the liquid level, and the following was the result of the analyses:—

	Below Liquid Level. Sound.	Above Liquid Level. Unsound.
Appearance	Grey	White
Texture	Hard	Soft
Ratio cement to sand ..	1 : 2	3 : 3
Sulphate of lime in cement	Trace	66 per cent.

Considerable Deterioration.

The same pronounced effect was to be seen in connection with the concrete blocks, which were grooved to receive sliding boards and project above the liquid level; these blocks had in many instances crumbled away to such an extent as to be almost shapeless. Recently these chambers were emptied, and it was found that the concrete below the liquid level was perfectly sound and in a good state of preservation.

The lower channel conveying the liquid from the tank to the contact beds revealed the same characteristics as were observed in the upper channel, but the portion at the liquid level was very much more markedly affected.

Analyses of the Disintegrated Concrete in the Channels.

Samples taken of the lining of the sides and covering gave the following analyses:

	Ratio. Cement.	Ratio. Sand.	Sulphate of Lime in Cement.
1. Concrete at varying liquid level	1	1	70.26 per cent.
2. Underside of slab forming covering..	5	1	74.61 per cent.

The air duct taking the gases from the effluent channel of the primary beds and communicating with the tank outlet channel was found to have a coating similar in appearance to that observed on the underside of the covering to the channels.

Analysis of Concrete in Air Duct.

Analyses of this coating were made, with the following results:—

	Ratio. Cement.	Ratio. Sand.	Sulphate of Lime in Cement
Underside of slab forming covering of air duct ..	2	1	70.71

Conversion of Sulphate of Lime.

The point to observe in the above analyses was the conversion of the lime in the cement into sulphate of lime, the sulphur being obtained from the sewage flowing through the tank and channels, as well as from the gases expelled from the sewage,

and contained in the air withdrawn from the several parts of the installation.

Suggested Explanation.

Much thought had been given to the explanation of the foregoing observations, and it had been concluded that the effects had arisen from the putridity of the sewage and the oxidation of the putrid products by the air supply. The main erosive effect was at the varying liquid level, and was there dependent upon the amount of sulphuretted hydrogen in solution in the liquid. The gas was comparatively small in amount in the incoming sewage and in the liquid in the hydrolytic tank, and increased as the liquid passed through the hydrolising chambers. The results of this were especially well shown in the two channels; the alternate wet and dry area of the upper channel conveying the sewage from the rising main was less markedly affected, whilst in the lower channel the corresponding area was severely attacked. So with the two parts of the tank; the first part into which the sewage was delivered, and wherein comparatively little putrefaction took place, had not been affected to anything like the extent that the second part or hydrolysing chambers had.

When the level of the liquid fell, it left the concrete which it previously covered wetted with a liquid containing sulphuretted hydrogen in solution. This wet surface was then exposed to the action of the air supply, which oxidised the sulphuretted hydrogen with the production of sulphur and sulphuric acids; these decomposed the concrete, the lime being converted finally into sulphate of lime. What the exact nature of the intermediate compounds was could not be stated, as none of them had been isolated, but it was probable that the active agent was sulphurous acid, as it was known that cement was insoluble in sulphuric acid. When the liquid rose again, the decomposed concrete was washed away either wholly or in part, and a fresh surface was exposed to action when the liquid fell again. It was the continuation of this cycle which led to the formation of the grooves at the varying liquid level.

Concrete above the Liquid Level.

The erosive effects on the concrete above the liquid level were dependent upon the sulphuretted hydrogen evolved from the liquid and mixed with the air supply. Some of this gas was dissolved by the moisture which was present on the walls and roofs, from evaporation and condensation: it was then oxidised by the air, and decomposed the concrete as described above. In this case the decomposed concrete either remained as a coating on the surface, peeled off, or crumbled away.

Effect on Concrete Tubes.

In order to observe the phenomenon on concrete tubes, two 9in. concrete tubes were selected, which were supplied by the makers of the paving slabs previously referred to, and were composed also of similar materials in the same proportion. One of the tubes was coated with Dr. Angus Smith's composition (coal-tar, pitch, linseed oil, and resin). They were placed side by side in the second part of the tank in such a position that they would be subjected to the rise and fall in the level of the liquid. At low level the tubes were not in contact with the liquid, and at high level the liquid rose to half the diameter.

After the tubes had remained in the tank for eight months they were taken out and examined. The coated tube did not appear to have been effected, other than at the highest liquid level, where a thin line could be observed, and when struck it was found hard and had a good sound. It was noticed that there were two areas on this tube without any coating, due no doubt to its having been placed upon two supports to allow it to dry; these areas were soft on the surface and similar to the uncoated tube. With these exceptions the tube appeared to be in as good a condition as when first placed in the tank. On the other hand, the uncoated tube had a distinct line at the highest liquid level, which was found to be soft, and when tapped with a chisel had a dull sound; the interior of the tube which had been immersed appeared soft and had a dull sound when struck; the portion of the tube above the liquid level was unaffected, and when struck had a clear ring.

The author then referred to other cases of disintegration of concrete by sulphur compounds.

Conclusions.

The deductions to be drawn from the investigations were that the gases in solution in sewage, and those expelled from it, arising from its decomposition, do act injuriously upon Portland cement concrete, notwithstanding the fact that the concrete is constituted of sound and good materials, when the following conditions prevail:—(1) A high degree of putrescence of the sewage. (2) A moistened surface, which held or absorbed the putrid gases. (3) The presence of a free air supply. Further, that in the absence of one or other of the above enumerated factors little danger from erosion need be feared

Finally, the author recorded his obligations to Mr. T. Hughes, the manager of the Hampton Sewage Works, and to Mr. J. H. Johnston, the chemist, for their valuable assistance in obtaining the necessary material and data for the paper.

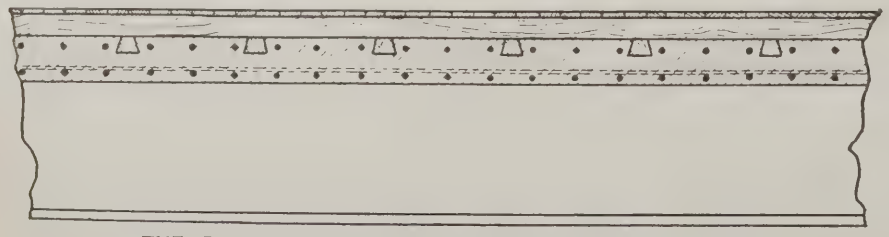
DISCUSSION.

The Chairman said that the lecturer had given them some important information concerning one of the dangers to which their work was exposed. It had already been found that water in the earth might act in such a way as to disintegrate lime concrete and cement concrete. It had been found in France, and sewage pipes in Algiers and Texas, where the brickwork in the one place and pipes in the other were buried in the ground amid alkaline waters. He had received the following two letters: Mr. Arthur E. Collins wrote from Norwich saying that some concrete tanks which he had at Norwich, which were laid down in 1891, of varying diameter, from 42in. to 24in., the total length of which amounted to several miles, showed 12 years since no signs of deterioration. He was also consulted with regard to the failure of a retaining wall of a circular percolating filter constructed by the local authority in a town of East Anglia. He found the mortar to have no appearance of being constructed with cement. It was analysed, and a large quantity of sulphur was found there. He concluded by saying that he was responsible for Mr. Chambers communicating his valuable knowledge to the Concrete Institute. Mr. H. K. G. Bamber also wrote expressing his appreciation of the paper as an extremely valuable one, being a plain record of actual facts rather than the exposition of vague theories. He believed it was a fairly warm temperature and moist atmosphere which was necessary to produce the results stated by the author, *i.e.*, the conversion of sulphuretted hydrogen into sulphuric acid.

Mr. Alfred Roechling, who was called upon by the Chairman to open the discussion, said concrete was very largely used at the present time in sewage disposal works. Engineers could not do without it. He had made a considerable study of these matters especially with regard to the subject of concrete tubes, and he had come to the conclusion that no alarm at all need be felt by anyone who had been using concrete tubes. If they were correctly understood they limited the subject to very foul and very putrid sewage. Concrete tops had been now used for 10 or 14 years. On the Continent they had been used very largely, but he did not think concrete tubes would replace stoneware below 15in. in diameter. It should not be where they had very hot liquids, *i.e.*, over 120 deg. Fahr. Neither should there be steam in the sewer, because it set up internal faults which led to cracking. These were experiences of his, and those who used concrete must bear in mind that under these conditions it was reasonable to avoid it.

Mr. Edwin Ault said that some four years ago he had samples of concrete pipes sent to report upon the cause of corrosion, which appeared to him to strikingly corroborate Mr. Chambers's observations and deductions. The pipes were made with good cement and clean sharp sand, which, on analysis of a new pipe, showed a proportion of 1 to 1½ throughout. The pipes were four inches internal diameter, and had walls rather more than three-quarters of an inch thick. They were of the ordinary spigot and rachet shape, and were of a length of 24 inches in the work. The quality and the make of the pipes might be judged by the fact that under an internal hydraulic test they stood 100ths pressure per inch, when water began to ooze out of the pores of the pipe. The pressure was then slowly increased to 120ths per inch, when the pipe failed by cracking at the spigot end. The pipes, which were made of cement of the tensile strength of 678lbs. per inch, were used for the conveyance of sewage, and the corrosion appeared only on the upper or aerial parts of the pipes, while the invert or lower parts of the pipes, which were covered with sewage, were found to be unaffected. The upper part showed on examination a large excess of sulphur anhydride in the form of calcium sulphate. Curiously, an experiment with fumes of sulphuretted hydrogen directed on the pipe had no corrosive action. This was probably due to the absence of moisture. The portion exposed to the fumes turned black, which was attributed to the action on the ferric oxide contained in the cement. By suspending pieces of pipe in the fumes of sulphurous anhydride the calcium carbonate was changed into calcium sulphite, which, subsequently, on exposure to air, changed into calcium sulphate. The pipes were in use in a tropical city, but their information did not show whether the cement pipes generally were affected, or only those in certain districts. Bearing in mind the greater intensity of the decomposition of organic matter in the tropics and the great humidity of the ordinary atmosphere of this particular city, and also the fact that the sewage flowing through was a domestic one of great strength, and also bearing in mind the later experiences which Mr. Chambers had so lucidly set forth in his paper, he had not the slightest doubt that the corrosion of the pipes he had mentioned was due to the same causes as that which Mr. Chambers had experienced at Hampton.

Mr. D. B. Butler also contributed to the discussion. He had made a few notes which seemed to him to corroborate very much what the author had read so clearly in his paper. About five years ago he had a piece of concrete piping examined which had been down about five years, and its condition was exactly parallel to the case which the author had brought forward. The concrete was corroded. The pipe was one inch thick, and on the top the thickness was reduced to half an inch. The top coating was largely sulphate of lime, and from experiments he made the corrosion was due to sulphuretted hydrogen.



Mr. Arthur C. James (Grays), as a person who had been in charge of sewage works dealing with strong sewage, said that practically the whole of his tanks were formed of concrete. The sewage was from Grays and Tilbury, districts which were very flat, so that the velocity of the sewage was very slow. The average dry-weather flow was under 15 gallons per head per day, so that not only was it very strong, but it was very concentrated. The tanks had cracked.

Mr. J. Kirkaldy said that the presence of sulphuretted hydrogen was due entirely to the presence of vegetable matter; thus it was found most prevalent in the neighbourhood of cookshops—(laughter)—and such districts as Hampton. (Laughter.)

Vote of Thanks. Mr. Wells and Mr. Brooks also spoke, and a hearty vote of thanks to the lecturer concluded the proceedings, Mr. Chambers saying that he would prepare his remarks in reply to the discussion and communicate them at a later date.

LAYING BOARDS ON A CONCRETE FLOORS.

The new yarn mill of the Jules Desurmont Worsted Co., at Woonsocket, U.S.A., presents an interesting type of machine-carrying floor of concrete with wood top, designed by F. W. Dean, mill engineer and architect, of Boston, who planned the whole building. The necessity of providing a wood top of such sort that it would afford a secure attachment for machinery, dictated the special scheme shown in the annexed figure. Planed, dovetailed nailing pieces or sleepers, 2in. by 3in. were accurately placed with centres 18in. apart, and when the concrete was poured about them they were securely locked into the mass of the floor slab. It will be seen, by reference to the figure, that the sleepers were laid parallel to the support course of reinforcing bars in the concrete, and that there were three bars to each space between sleepers. The bases of the latter were a little below the level of the upper course of bars. Machines can be easily and securely attached to this floor by means of lag screws.

THE DEAN WOOD-TOP REINFORCED CONCRETE FLOOR.

CONCRETE NOTES.

Reinforced Concrete for Short Span Bridges. The American Railway and Maintenance of Way Association has issued a very useful bulletin (No. 117), containing the report of the Committee on Iron and Steel Structures. In any bridge (the committee say) the qualities to be desired are: adequate strength, freedom from vibration and excessive deflection, economy in first cost, economy in maintenance, and permanence. The theory of flexure of reinforced concrete is sufficiently well understood to enable safe and economical designs to be made of this material, and experience with reinforced concrete structures carrying dead loads only has been abundant. Experience with such structures carrying heavy live loads and subjected to the shock and vibration of these loads, moving at high speed, has not been so extensive, but reinforced concrete girders can be designed and built in short spans of any strength required, or likely to be required, by railway loads. In the event of overloading or defective construction, reinforced concrete will give quite as much warning of probable failure as other materials.

Advantages Over Steel. One of the chief advantages of reinforced concrete over steel for short spans is that the form lends itself more readily to ballast floor construction, the superiority of which to open decks is evident to every operating officer, not only on account of the absence of wood, which may rot or burn, or exposed steel, which requires protection from brine drippings or other corrosive influences, but also on account of the freedom from vibration and excessive deflection and the reduction of the cost of maintenance to a minimum.

Comparative Economy. A comparative economy of the two styles of construction is a matter which is not easily determined in general terms, depending as it does upon the market price of steel, concrete materials, and labour. The character of the design is also a factor of first importance. Generally speaking, if it is not considered advisable to use ballasted floors in a particular case for that case, the short span of I beams with ordinary floor of wooden ties is the cheaper construction in first cost. If, however, a large number of similar spans are to be built, so that concrete slabs can be constructed in a central and conveniently arranged plant, and if the erected price of steelwork approximates three (3) cents per pound, the difference between concrete slab construction built with ballast floor and steel construction with open wooden floor will be small, and in many cases will be favourable to the concrete. If the designs contemplate the use of I beams embedded in concrete, compared with reinforced concrete girders, economy will be all on the side of the latter. Short spans of reinforced concrete also permit a substantial economy in the design of abutments carrying them.

Reinforced Concrete Recommended. It is the opinion of committee that reinforced concrete flat slabs or girders are not generally advisable for railway loads in spans exceeding 40ft., but, as the great majority of structures carrying tracks over openings in the roadway are of spans less than 40ft., the importance of these small structures is very great, and we believe the use of reinforced concrete for these small spans is desirable.

Embalmed in Reinforced Concrete. Entertaining in life peculiar ideas as to the hereafter and determining not to have his body disturbed in future aeons of time, William Lay, a coal merchant of Honeoye Falls, N.Y., left a unique will, from which the following is an extract: "That a grave be prepared of at least the ordinary size and depth; that the bottom thereof, for a depth of at last six inches below the place prepared for the body be constructed of reinforced concrete; that above said foundation a space be left for the reception of the body, and the said space be large enough so that there will be an opening about six inches on all sides above and around the body; that my body be placed in a winding sheet of suitable material and placed in said grave without box or coffin; that said grave then be filled and the body entirely covered along the sides and above with reinforced concrete, consisting of one part Atlas Portland cement to three parts of clean gravel; that said concrete be brought up to a point about two feet above the level of the ground, and the ends of the solid concrete levelled and the top given an oval form; that the same be furnished with a smooth surface, and upon the same be placed an inscription containing my name, 'William Lay,' the figures '1854,' that being the year of my birth, together with figures indicating the year of my death, and that no other inscription be placed thereon."

An American Concrete Bridge. As the durability of concrete work is occasionally called in question, it may be useful to recall that in the south of France the concrete arch bridge known as the Pont du Gard was erected in the year 56 B.C. The concrete in this was not composed of crushed stone or other small aggregate of the variety now employed in concrete bridge work, but was of the old style, consisting of alternate layers of large and small stones, gravel, etc., and of cementitious materials. Vitruvius describes the materials and methods in use before the Christian era, and other writers, like Alberti in 1845, and Palladio in 1570, accurately described the method which the "ancients" (as they call them) employed, "of using boards laid on edge and filling the space between with cement and all sorts of small and large stones mingled together." It is very improbable that the Pont du Gard would have withstood the rigours of a northern climate, but its actual state of preservation, as well as that of many other specimens of ancient concrete work, proves that if modern work is honestly executed it will many times outlast any reasonable bond period, so that a very small yearly sinking fund per cent. is all that is required for properly designed and erected concrete work.

SPRINKLERS.

Installation Details. Sprinkler installations are erected in accordance with the fire insurance companies' official rules. Lines of horizontal distributing pipes are fixed at intervals of approximately 8ft. to 12ft. along the ceiling of each room, and are connected with larger vertical rising pipes supplied from the public water main, and an elevated tank, or other source of supply, which will keep the water in the pipes under constant pressure. The automatic sprinklers are attached, at intervals of 8ft. to 12ft., to each of the lines of distributing pipes. Should a fire break out in any part of the protected building, the heat at once rises to the ceiling, where the temperature very soon becomes sufficiently high to melt the solder on the link of the sprinkler, which solder fuses at 155 deg. Fah. The elastic valve in it is thus released and the water discharged profusely over the fire. The sprinkler has a clear outlet ½in. in diameter, and a deflector or splash plate, by means of which the stream of water is broken into spray and distributed effectively on the ceiling above and on the floor below each sprinkler. At the pressure of only 5lb. to the square inch, this sprinkler completely protects 100 superficial feet of floor area. It can be fixed above, below, or obliquely to the pipe line, giving an equally good distribution of water in any position. The arrangement of the piping can be adapted to any style of construction and every description of property.

Automatic Alarm. Next to the sprinkler itself is the continuous automatic alarm. This fulfils its purpose by immediately giving warning of the smallest escape of water inside the protected buildings, whether such escape be from a leaky pipe, a broken joint, or the operation of a sprinkler through fire, and to continue that alarm as long as the escape takes place.

Dry Pipe System. In buildings where the water in the pipes is likely to freeze, the dry pipe system is applied. This patent differential air-valve intervenes between the water supplies, which are beyond the reach of the frost, and the sprinkler pipes in the building. Within these pipes air under moderate pressure keeps the valve closed, thus excluding the water. The opening of one or more sprinklers in case of fire lets the air out of the sprinkler pipes, and simultaneously the valve is automatically opened by the water, which fills the pipes and is discharged upon the fire in a profuse shower from each unsealed sprinkler. The Grinnel sprinkler, applied to the protection of buildings throughout, has received official recognition from the fire insurance offices in all the important countries in the world. The 25 to 50 per cent. discounts granted off the premium on buildings equipped with the sprinkler extend, it seems, to all classes of risks, and, therefore, apart altogether from the question of protection and immunity from fire, the sprinkler installation may be fairly reckoned as an excellent investment, the saving in the insurance premiums paying a very satisfactory return upon the outlay. Moreover, property, the insurance of which has been previously very difficult to cover on account of the exceptional hazard involved, is freely accepted by the fire offices after it has been protected by the installation of these sprinklers.

External Protection. Another interesting feature of the system is the water curtain and drencher, designed specially for the external protection of buildings from fire breaking out in surrounding properties.

Concealed or Exposed Pipes ? When an architect comes to consider sprinklers for a new building, he sometimes desires that all the pipes shall be concealed, irrespective of the construction of the building and design of the ceilings. Such a decision is sound enough where the ceilings are of a decorative or heavily moulded type, or where the cross-beams come down below the ceiling to form panels; but in many cases where the ceilings are plain, it is preferable to see the range pipes exposed. In a new building it is always possible to conceal the main feeders, and at the same time expose the smaller distributing pipes. It is unquestionably sounder practice, and therefore more satisfying to the eye, to see where the sprinklers come from, rather than to see the bare heads pricked through a plain ceiling. As a general rule, all piping, no matter for what service, should be easy of access, and therefore exposed. In a drapery establishment where the heads were painted a bright vermilion, the effect was striking, but certainly not an eyesore, as one might have expected.

STRESSES IN ROOF TRUSSES.

By Max am Ende, M.Inst.C.E.

(*Continued from page 510, No. 746.*)

Example II.

Fig. 5 represents a roof truss which, with somewhat different proportions, is also used sometimes as a bridge girder. The number of bars—among them many redundant bars—is so great that the calculation according to Example I. would be too laborious; and as its object is mainly to find the stress in the bottom tie, it would be sufficient to substitute a structure with fewer lattice bars, so that the bottom tie is the only redundant bar. But a still shorter way is to substitute a plate for the lattice web, and to introduce the work from the bending moments upon a piece of the solid beam into the equations. By this method, suggested by the present writer (Engineering, 1883, p. 509), continuous beams and arches can be calculated either alone or when forming part of a system of bars. The beam is divided into a number of pieces and each piece with its properties. its length, λ, sectional area, a, and moment of inertia of section I, are imagined to be located in its centre of gravity, which is used as the fulcrum for the moment acting on it. Besides the work from the moment of a force, the work of the axial stress, and of the shearing force should be taken into account and added to it, but if the depth of the beam is not great compared to the depth of the whole structure, as here, it is sufficient to calculate with the moments only. Apart from this, the accuracy of the results will depend on the number of divisions. In the present example, only to show the method, we divide the whole arch into the 8 pieces marked by the radial ties.

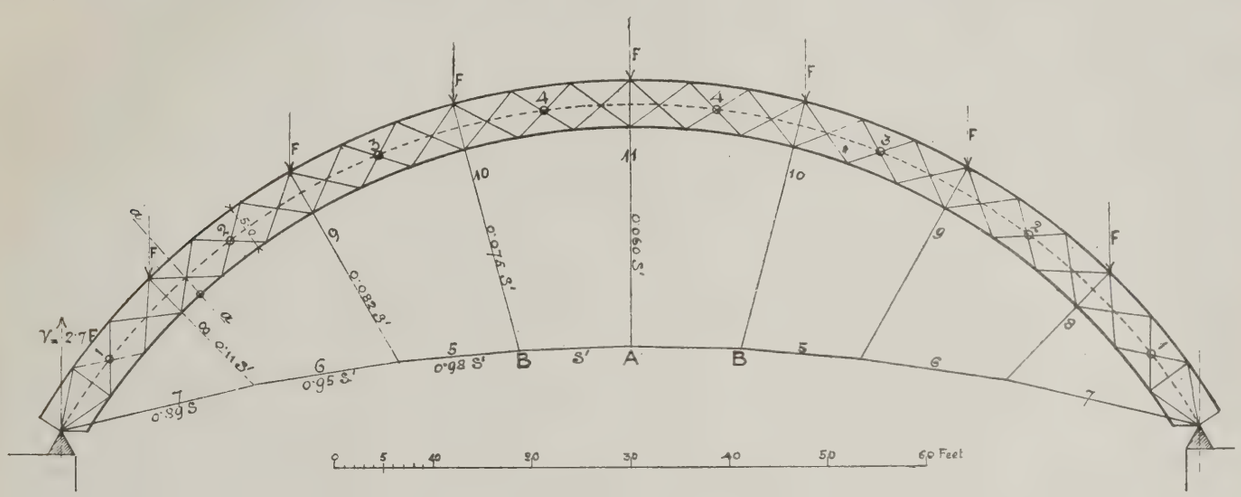


FIG. 5. STRESSES IN ROOF TRUSSES.

Fig. 6 represents the stress diagram of a piece λ acted upon by the moment M. The unit stress at the distance η from the neutral fibre is $\frac{M\eta}{I}$. The elongation at this distance is $\Delta\lambda = \frac{M}{IE}\eta\lambda$. The work on the unit of section at η is $\frac{M\eta}{I}\frac{\Delta\lambda}{2} = \frac{M^2}{2I^2E}\lambda\eta^2$. The work on the lamina $bd\eta$ is $= \frac{M^2}{2I^2E}\lambda\eta^2 d\eta b$ and the work on the whole section is:—

$$\frac{M^2\lambda}{2I^2E}\int_{-e_1}^{+e}\eta$$

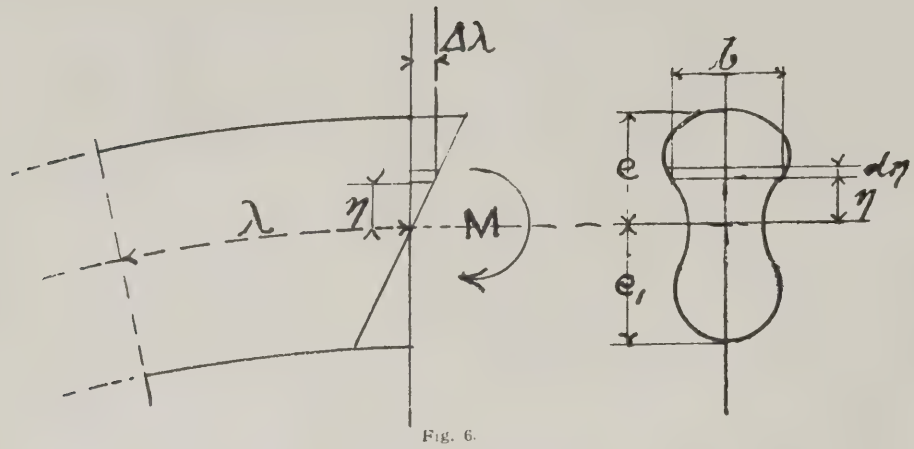

Fig. 6.

The integral is equivalent to I, and therefore we have the double work,

$$2w=\frac{M^2\lambda}{EI}$$

instead of $2w=\frac{S^2}{aE}l$ in the case of a bar.

Naming $\overline{\mu}$ the moment in any part x due to the units of the forces F and μ', μ'', etc., the moments from the units of S', S'', etc., and putting these in (9) in place of σ and σ', as also $m=\frac{\lambda}{EI}$ in place of $m=\frac{l}{aE}$ we get in this case of only one redundant bar:

$S'm'+\Sigma_o^n(\mu')^2 S'm_x+\Sigma_o^n\mu' R_x m_x=0$ .. (9a)

where $R_x=\Sigma_o^r \mu F$. In the same way we get three equations corresponding to (10), if there are three redundant bars.

In the present case the bars 5 to 11, left and right, may be regarded either as belonging to the determinate system, in which they have no stress, or as belonging to the redundant tie, since their stresses, stated in Fig 5, depend only on S' in an elementary way. We can now set up the following table, assuming values for I and a, and regarding moments bending concave upwards as positive:—

TABLE II.

Part No.	λ (ft.)	I (ft.²in.²)	m	R_x	μ^1	$(\mu^1)^2 m_x$	$\mu^1 R_x m_x$
1	17·5	75	0·233	+13·4	− 5·34	+ 6·6	— 16·7
2	17·5	75	0·233	+46·6	−14·25	+ 47·3	—154·7
3	17·5	75	0·233	+51·8	−20·58	+ 98·8	—248·6
4	17·5	75	0·233	+52·6	−24·00	+134·1	—294·0

			$\times\frac{I}{E}$	$\times F$		$\times\frac{I}{E}$	$\times\frac{F}{E}$
				$\Sigma_o^n =$		$\frac{+588\cdot04}{E}$	$\frac{1136\cdot8F}{E}$

$$\frac{3\cdot66}{E}S'+\frac{588\cdot04}{E}S'-\frac{1136\cdot8}{E}F=0;$$

$$S'=1\cdot92F.$$

For the computation of the actual stresses we can now revert to the lattice construction of the rib. For example, in the section a—a, assuming the shearing stress equally apportioned to the two diagonals, the fulcra for the chords will be opposite the intersection of the diagonals, and we have the stress S for the upper chord:

$$+5S+14\cdot0V-5\cdot8F-10(0\cdot95)S'=$$
$$5S+32\cdot0F-18.24F=0.$$

Hence, $S=+2.8F$. For the stresses in the diagonals we resolve the 3 forces into components parallel to the chords, and two equal components in the direction of the diagonals as usual.

Example III.

Fig. 7, consisting of an arched rib ABCDE (solid or braced) and 7 bars, represents a system with 3 redundant bars. As such may be regarded AG, GF, and FE, the removal of which would make the system determinate. Or the continuity of the flanges of the rib at B, C, and D may be cut with the same result. In the latter case a bar of infinitesimal length at each point may be regarded as a redundant bar, so that m', m'' and m''' would be nil. As the depth of the rib is small in proportion to that of the whole structure, the effect of the extensibility of the redundant bar GF upon the stress in it will not be great.

The stress in GF could therefore at once be determined by assuming a hinge at C. Then BG and DF may be regarded as the two redundant bars. Whether their stresses may also be determined simply by assuming hinges in the rib at B and D, so that the structure would be a determinate system, would depend on the degree of accuracy required.

Example IV.

The arch, Fig. 8, fixed at both ends, represents one of the principals of the roof over St. Pancras Station, London. Assuming it for the present to have a solid

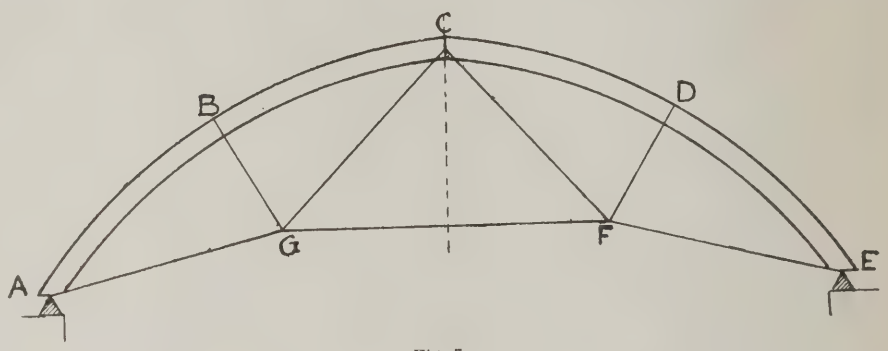

Fig. 7.

web, and dividing it into 20 parts of the length $\lambda=17\cdot5$ft., we have a system with $n=20$ necessary parts, but also with 3 redundant parts. A larger number than 20 would be desirable for greater accuracy. Assuming now the arch to be cut in two, for example, in the middle, there would be the axial pressure S', the shearing stress S'', and the moment of S' *i.e.* S'r, acting on each face of the cut. These are at present unknown, but the moments due to the unit of each, viz., μ', μ'', and μ''' in any section of each half of the structure as a cantilever, can be stated. We regard the forces S', S'', and S'r as stresses in three redundant parts; but the parts have no length, and the lever arm r must be regarded as inflexible, because the two faces are actually in contact. Therefore m', m'' and $m'''=0$. The 10 pieces of each half of the arch are here of equal length and equal section, and the factor m_x, being thus constant, may be omitted. This could, of course, not be done if the work of the axial and shearing stresses were to be taken into account. It would then be necessary to add to each member of the following equations one for each of these stresses; but the effect of these axial and shearing stresses is very small compared to that of the moments. It may be remarked that the moment of S', for example, on point 7, is S' $(18\cdot5+r)$, and that accordingly $\mu'=18\cdot5$ and $\mu''=r$.

Equations (10) will then be as follows.—

$$\left.\begin{aligned} &S'\Sigma(\mu')^2+S''\Sigma\mu'\mu''+S'\Sigma\mu'\mu'''+\Sigma R_x\mu' \\ &\qquad =0 \\ &S''\Sigma\mu'\mu''+S''\Sigma(\mu'')^2+S'\Sigma\mu''\mu'''+\Sigma R_x\mu'' \\ &\qquad =0 \\ &S'\Sigma\mu'\mu'''+S''\Sigma\mu''\mu'''+S'\Sigma(\mu''')^2= \\ &\qquad \Sigma R_x\mu'''=0 \end{aligned}\right\} \quad 10a$$

The following table contains the values necessary to make up the sums of 20 members each in the above equations. Its composition is too simple to need further explanation, and the sums worked out from it are stated in Table III. on p. 535, where b is the distance between two roof principals in feet and w the wind-pressure

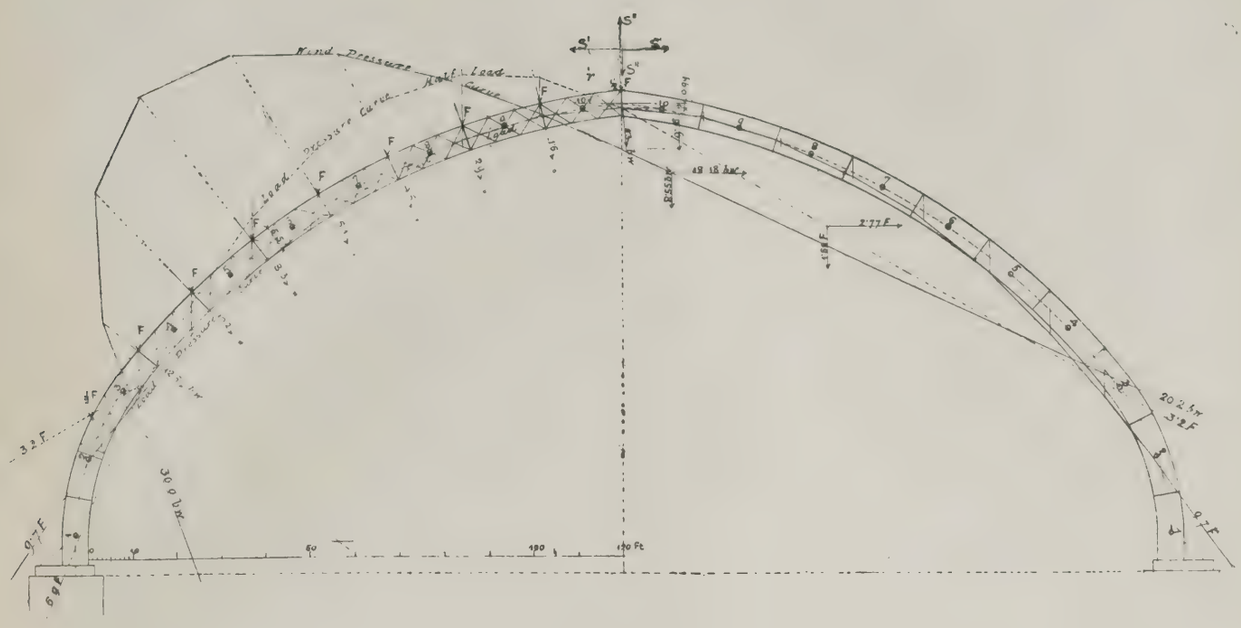

Fig. 8

per square foot. It may be noted that only the radial component of the wind-pressure is effective as usually assumed.

Load : $\Sigma R_x \mu'_x = -136771$; $\Sigma R_x \mu_x'' = -225454$; $\Sigma R_x \mu''' = -2163r$.
Wind : $\Sigma R_x \mu'_x = -770000$; $\Sigma R_x \mu''_x = -1214444$; $\Sigma R_x \mu_x''' = -10796r$.

$\Sigma(\mu'_x)^2 = 50153$; $\Sigma(\mu'')^2 = 141970$; $\Sigma(\mu'''_x)^2 = 20r^2$; $\Sigma \mu'_x \mu_x''' = 786r$; $\Sigma \mu_x' \mu_x'' = \Sigma \mu_x'' \mu_x''' = 0$.

The equations are now as follows :

Load
$$\left\{\begin{aligned} &+50153S' + 786rS' - 136771F = 0 \\ &+141970S'' - 225454F = 0 \\ &+786rS' + 20r^2S' - 2163rF = 0 \end{aligned}\right.$$
$S' = 2{\cdot}77F$; $r = -0{\cdot}99ft.$; $S'' = 1{\cdot}588F$.

Wind
$$\left\{\begin{aligned} &+50153S' + 786rS' - 770000bw = 0 \\ &+141970S'' - 1214444bw = 0 \\ &+786rS' + 20r^2S' - 10796rbw = 0 \end{aligned}\right.$$
$S' = 18{\cdot}18bw$; $r = -9{\cdot}6ft$; $S'' = 8{\cdot}55bw$.

The resultant of S′ and S″ is the reaction of the right-hand abutment, and its amount, direction, and position, given by the above results, is shown in the drawing. The left-hand abutment pressure is found by completing the funicular polygon in the usual way to be 6·9F. If the right hand half of the arch is equally loaded with loads F, there will be another pressure line equal and opposite to that shown, and the resultant of the two will be the pressure line for the full load shown to the right, with an abutment pressure of 9·7F. The wind-pressure line is obtained in a similar way.

TABLE III.

			×F		×b w							

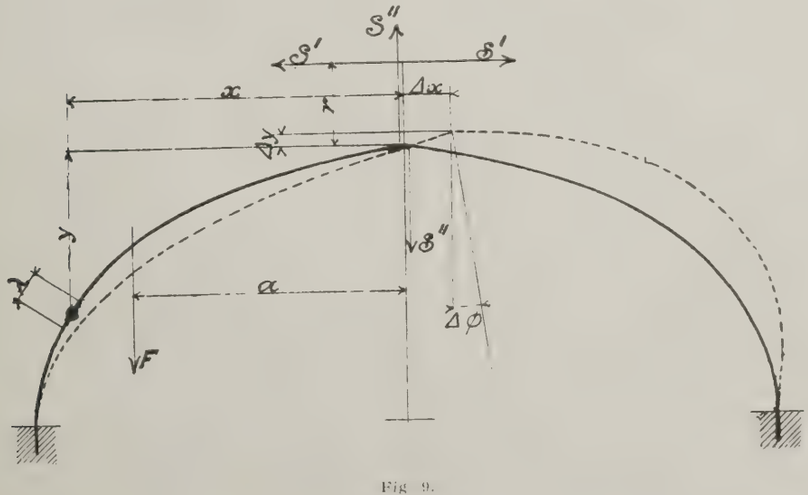

Fig. 9.

The forces acting on the arch are now complete, and we can calculate the stresses in any section in the way illustrated by Fig. 7. We have, for example, the stress in the outer chord at point 6.

From load : $(9{\cdot}7 \cdot 12 - 11 - 24{\cdot}5 - 375 - 23{\cdot}6)F + 5{\cdot}5S = 0$; $S_f = -3{\cdot}6F$.
From wind : $(30 \cdot 48 - 8{\cdot}3 \cdot 8{\cdot}7 - 10{\cdot}2 \cdot 26 - 12{\cdot}5 \cdot 43)bw + 5{\cdot}5S = 0$; $S_w = -103{\cdot}4bw$.

Assuming the weight of ironwork at 19lbs., and of the covering at 9lbs. per square foot, we find with $b = 29'6''$.

$F = 17\frac{1}{2} \times 29\frac{1}{2} \times 28$ lbs. $= 6{\cdot}4$ tons, and assuming $w = 40$lbs. we have $bw = 0{\cdot}523$ ton and

$S_f + S_w = 3{\cdot}6 \cdot 6{\cdot}4 + 103{\cdot}4 \cdot 0{\cdot}523 = 76$ tons compression.

The sectional area of the chord is about 21 square inches wrought iron.

It may be interesting now to recall to mind the older method of calculating the fixed arch from the movements of the section at the crown.

Naming (Fig. 9) the movements of the left face $\Delta\phi$, Δx and Δy and those of the right face $\Delta\phi'$, $\Delta x'$ and $\Delta y'$ we have the three equations : $\Delta\phi = -\Delta\phi'$; $\Delta x = -\Delta x'$ and $\Delta y = \Delta y'$. Each movement, though small, is the sum of movements $d\phi$, dx, dy, due to the deformation of one element λ_x, and we

have $d\phi = \frac{M\lambda}{EI}$; $dx = yd\phi$; $dy = xd\phi$. Then assuming $\frac{\lambda}{EI}$ to be constant, we find:

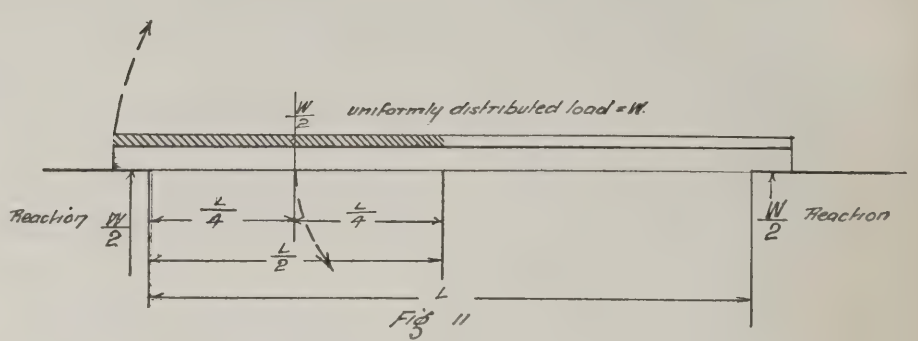
$$\left.\begin{aligned} \Delta\phi + \Delta\phi' = 0 &= \Sigma F(x-a) + \Sigma S'y \\ &\quad + \Sigma S'r + \Sigma S''x \\ y\Delta\phi + y'\Delta\phi' = 0 &= \Sigma F(x-a)y \\ &\quad + \Sigma S'y^2 + \Sigma S'rv + \Sigma S''xy \\ x\Delta\phi - x'\Delta\phi' = 0 &= \Sigma F(x-a)x \\ &\quad + \Sigma S'yr + \Sigma S'rx + \Sigma S''x^2 \end{aligned}\right\} \quad (11)$$

Here F $(x-a)$ is the same as R_x in the previous calculation, y is the same as μ' and x is the same as μ''. Substituting these symbols in (11), and observing that sums where x (*i.e.* μ'') appears only once are nil, we get equations (10*a*) in the order 3, 1, 2. If it were desired to take into account the additional movements $\Delta\psi$, Δ_x and Δy, due to the axial compression, and to the shearing stress, there would be two additional sums for every one in (11), the same as there would be in (10*a*). Different factors m_x for moments, axial stress, and shear would have to be introduced in both calculations. The labour of calculating is equal in both methods, but the advantage of the method based upon the principle of work is that equations (10*a*) or (9) are the same for all kinds of structures composed of solid beams or bars, while equations (11) are only applicable to solid, straight or curved beams, and would be different in each case.

THE STRENGTH OF ROLLED STEEL BEAMS.

By W. LEICESTER.

(Concluded from p. 397, April 27, 1910.)



Referring to Fig. 10,* we have $\frac{w}{2}$ acting at the end of the beam and causing it to have a tendency to rotate "clockwise"—as shown by the dotted line—around any point or fulcrum selected in the axis of the beam This "fulcrum" or "centre of moments" is the point on the beam at which it is desired to find the "bending moment." First, determine the B.M. at the centre under the load. At this point the B.M. will be the greatest, and its intensity is measured by "$\frac{w}{2}$" at the support multiplied by its perpendicular distance, or leverage from that point, which is

$$\frac{w}{2} \times \frac{L}{2} = \frac{wL}{4}$$

$\frac{wL}{4}$ then, is the formula for finding the maximum bending moment in any beam supported at the ends and loaded at the centre with a point load.

Next consider the case of a beam loaded uniformly over its entire length (Fig. 11) In this case, as before, it is obvious that half the load will be carried by the supports, and consequently the reactions will each be $\frac{w}{2}$. Taking moments at the centre of the beam, we have $\frac{w}{2}$ acting with a leverage of $\frac{L}{2}$ causing the beam to rotate clockwise, but there is also a load on the beam causing it to rotate in the opposite direction. This load is of course half the total load shown by the shaded portion in Fig. 11. Its amount is $\frac{w}{2}$ and its leverage is $\frac{L}{4}$. Distributed loads are always considered as acting through their centre of gravity, which is —in the case of even distribution—at the centre of their length. Therefore the leverage of the shaded portion of the load, Fig. 11, is $\frac{L}{4}$. So that we have

* See page 397, issue of April 27, 1910.

$$\frac{w}{2} \times \frac{L}{2} - \left(\frac{w}{2}\right) \times \frac{L}{4} = \frac{wL}{4} - \frac{wL}{8} = \frac{2wL - wL}{8} = \frac{wL}{8}$$

This is the formula for finding the maximum bending moment for beams supported at the ends and uniformly loaded over their entire length.

It has previously been shown that bending moment is equal to moment of resistance of the beam.

But resistance of the beam is equal to the section modulus × ultimate fibre stress, or breaking stress of the metal, and since the working stress is one-fourth of the ultimate stress: the safe resistance therefore is equal to section modulus × working stress, and this for safety is equated with the bending moment so that B.M. = Mod. Sec. × working stress per inch.

The section modulus of a 11in. × 6in. × 42lb. R.S.J. British Standard section is 52.55 sq. inches: find the safe distributed load that it will support over a span of 14ft. under a working stress of 7.5 tons per sq. in.

Bending Moment = *Safe* Moment of Resistance

$$\therefore \quad \frac{wL}{8} = 52.55 \times 7.5$$

$$= \frac{w \times 14 \times 12}{8} = 52.55 \times 7.5$$

$$21 \times w = 394.125$$

$$\therefore \quad w = 394.125 \div 21 = 18.76 \text{ tons.}$$

It is thus seen that to find the safe uniformly distributed load for a beam with ends supported over any span, the formula or rule is,

Section modulus × 8 × working stress per sq. in. on the steel divided by the length in inches.

So that if the working stress is limited to 7 tons per in., the rule will be expressed as follows:—

$$\frac{\text{Sec. mod} \times 8 \times 7}{\text{Length in inches}}$$

And for a centre load the rule is:—

$$\frac{\text{Sec. mod} \times 4 \times 7}{\text{Length in inches}}$$

Examples of Calculating.

Before passing to the consideration of other than distributed and centre loads, it will be better if the foregoing rules are supplemented with a few examples.

Find what centre load can be applied to a 16in. × 6in. × 62lbs. R.S.J. British Standard section, when the span is 18ft. and the working stress on the metal is limited to 7 tons per inch.

The modulus section is 90.71 sq. inches.

(*a*) Then $\frac{90.71 \times 4 \times 7}{18 \times 12} = 11.38$ tons.

(b) What distributed load can safely be applied to a 12in. × 6in. × 54lbs. R.S.J. B.S. section.

Span 16ft.. Unit stress 7.5 tons per inch. The section modulus is 62.58 sq. ins.

$$\frac{62.58 \times 8 \times 7.5}{16 \times 12} = 19.55 \text{ tons.}$$

In practice it is often necessary to select a section suitable for some arbitrary condition. For instance: Determine the section of a R.S.J. suitable for a span of 14 ft. and a distributed uniform load of 30 cwt. per lin. foot.

$$\text{Max. Bending Moment} = \frac{wL}{8}$$

$$= \frac{21 \times 14}{8} = 36.75 \text{ foot tons.}$$

This must be reduced to *inch* tons by multiplying by 12 = 441 inch tons.

But bending moment equals resistance, therefore "resistance of beam" = 441 inch tons; but this "resistance" is made up of the "modulus section" multiplied by the working stress.

Therefore, if the "bending moment" in inch tons is divided by the working stress, the result will be the "modulus section," which it is necessary that the selected beam should possess.

$$441 \div 7.5 = 58.8 \text{ square inches.}$$

Now since we are confined to the sections turned out by the rolling mills, and which are given on the "beam sheets," we must select a beam from the list, which approaches nearest the conditions demanded.

Deflection.

In making this selection there is another very important condition to be provided for, that is, "deflection." The beam should not deflect more than $\frac{1}{360}$ of its span, and to provide against excessive deflection the depth should not be less than $\frac{1}{20}$ of the span for quiescent loading and $\frac{1}{14}$ for moving loads.

Upon inspecting the column headed "Modulus Section" about x-x; in sq. ins. it is found that the beam whose "modulus section" is nearest to 58.88 without dropping below that figure is a 12in × 6in. × 54lbs. R.S.J., whose mod. sec. is 62.58 sq. ins., and the depth is $\frac{1}{14}$ of the span. That beam would undoubtedly more than fulfil the conditions required, but it does not follow that it is the best choice. There is a 14in. × 6in. × 46lbs., whose section modulus is a little higher. Now here we have a beam which is 8lbs. per foot less in weight: but which has a higher value with regard to its section modulus. From an economical point this beam would be preferable to the former, if the extra depth of 2in. was not objectionable. The weight of these beams should not be lost sight of in selecting. It is by weight that their cost is generally estimated. Carrying this example a little further on the "beam sheet," we notice a 15in. × 5in. × 42lb. R.S.J., whose section modulus is 57.06 sq. inches; provided that the depth is not objectionable, it appears on the face to be a tempting offer, since its weight is only 42lbs. per foot. As a rule, it is not wise to depart from your calculations in that direction. The results or conclusions to which they lead should be considered as the "irreducible minimum," below which it is dangerous to proceed.

Therefore, before giving your verdict on this last beam, investigate under what working stress the steel will exist. The bending moment under which it will exist is 441 inch tons.

Then $441 \div 57.06$ (its Sec. Mod.) will give the unit or working stress, to which the steel will be subjectel.

$441 \div 57.06 = 7.72$ tons per sq inch.

This is not excessive, and under a stationary load it would be quite safe.

ECCENTRICALLY LOADED STANCHIONS.

By W. E. BARKER.

Most formulæ for calculating the strength of stanchions or struts assume that the load acts centrically, and therefore when using one of the generally accepted formula in the case of an eccentrically loaded stanchion, the results obtained will be incorrect.

A common case of eccentric loading occurs when a stanchion is used to support a crane girder in addition to the roof truss—as indicated by the sketch. The crane bracket should in all cases be made fairly deep and no wider than practicable for clearance of crane wheels and frame. A very good type of bracket is shown by the illustration, which is taken from actual workshop practice. It will be noticed that the crane bracket is cut from a piece of I section joist, and by one diagonal cut through a suitable length of joist two brackets can be made.

As regards calculations, the eccentric loading causes a bending stress, the bending moment being the load of the crane that comes directly over the centre of the crane girder where it rests on the bracket, multiplied by the distance from the centre of stanchion to centre of crane girder.

Therefore let

W = Total weight in tons or cwts. of the eccentric load.

D = Distance between neutral axis and load.

E = Distance between neutral axis and outer edge of stanchion.

R = Radius of gyration of section.

The radius of gyration of the various sections of I joists or stanchions can easily be obtained from any of the section books issued by the leading rolling mills.

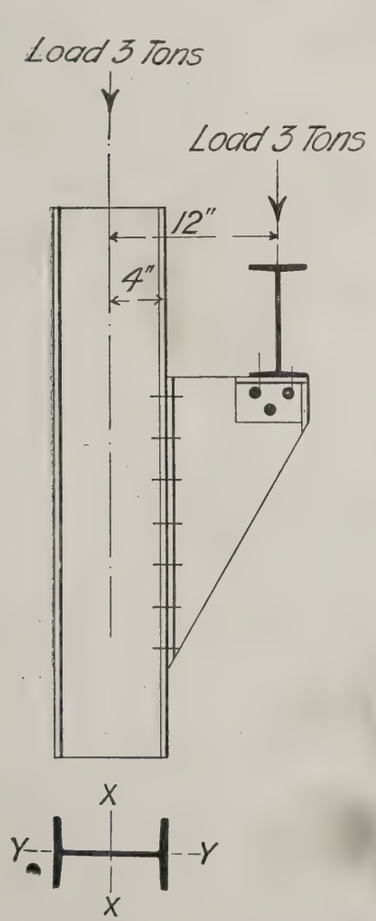


DIAGRAM ILLUSTRATING ECCENTRICALLY LOADED STANCHIONS.

To obtain the equivalent centric load upon the stanchion as a result of the eccentric load, we have

$$W\left(1 + \frac{D.E.}{R^2}\right)$$

Having found the equivalent centric load resulting from the eccentric load, this must be added to the direct centric load due to the weight of the roof truss, etc., and the result will be the total load that the stanchion will have to support.

Let us work out a case from actual practice, the stanchion being 8×5×28lbs. per foot and the length 16ft. from foundation level to underside of shoe of roof truss, having a combined centric load from truss, roof covering and wind pressure of 3 tons and an eccentric load from crane 3 tons.

Therefore $3\left(1 + \frac{12 \times 4}{10.8}\right) = 16$ tons equivalent centric load, and 16 tons×3 tons=19 tons total centric load.

A British standard beam used as a stanchion 8×5×28lbs. per foot has an area of 8.24 sq. ins. and a minimum radius of gyration of 1.11. Therefore to obtain a safe load per square inch divide the length of the stanchion in inches by the radius of gyration which in this case equals 173. From a standard section book we find that, allowing a factor of safety of four, the safe centric load per sq. in. for an 8×5 stanchion 16ft. long with a minimum radius of gyration of 1.11 is 2.32 tons per square in. of section, or a total load of 19 tons.

It must be borne in mind when using this formula that the maximum radius of gyration—axis XX—is used for the term R when the eccentric load comes on the flange, and the minimum radius of gyration—axis YY—when the load is applied to the web of the section.

THE GERMAN BUILDING TRADE TROUBLES.

Some very strong allegations as to the "uncompromising attitude" of the employers, who were said to be actuated by a determination to crush the trade unions, having been made in the English newspapers, we have thought it desirable to obtain an authoritative statement of the case for the employers. The information here given has been gleaned from particulars courteously supplied by officials of the German Building Trades Employers' Federation, and it therefore, of course, represents only the employers' point of view, which, in the circumstances, is exactly what was required.

Addressing the Imperial Administrative Authority, the German Builders' Federation offer the following explanation of what has taken place:—

On April 15th nearly all the building concerns, adherent to the German Building Employers' Federation, dismissed their workmen, belonging to the Social-Democratic Central Associations of Masons and Bricklayers, Joiners, and Labourers, as also those belonging to the Christian Central Association of Building Workermen. The number dismissed amounted at first to about 200,000, and was afterwards substantially increased. The occasion for this severe measure is the refusal by the large workmen's organisations to renew the Tariff Agreement, which expired on March 31st, on a basis which the employers could consider practicable.

The negotiations which have been in progress since November last have shown that, on certain points of principle, differences existed between the parties which could not be bridged over. These could not be overcome by the efforts made, during recent weeks, to bring about an understanding, by Imperial officials, by the Governments of various Federal States, as also by the magistrates of several cities, because the tactics of the workmen's representatives, as on former occasions, consisted in taking exception to proposals of the employers, while conceding nothing, the object obviously being to put off the ultimate decision to a time unfavourable to the employers. The dispute turns not so much upon the rate of wages as upon the fact that the employers demand provisions in the proposed working agreement, which shall serve to maintain the agreement itself, and also to strengthen several regulations therein, hitherto regarded as negligible by the workmen. The workmen's organisations are extremely opposed to these proposals.

After referring the administration to some accompanying documents for details, the employers proceed:—"The German Building Trades Employers' Federation begs that these particulars be sufficiently studied, because it is of first importance to it, that in the Government departments of the Empire it should be known that the employers desire nothing inequitable, but are rather filled with humane and social ideas. Also that, for safety in carrying out building operations, that indispensable authority on the works is required which only these working conditions can secure—conditions which are necessary to the undisturbed further progress of the building industry. No extraordinary insight is needed to see that the employers will gladly extend the hand of peace as soon as the operatives are ready to give their adhesion to the, for the employers, indispensable conditions in the new tariff agreement. That our action is not directed against the workmen's organisation itself follows from the fact that no object is to conclude a new tariff agreement with the strong central organisations of the workers."

The documents referred to give some explanations of the reasons for the demands put forward by the employers; these are, shortly:—That the tariff agreement must be with the central organisations of the workers, and, in addition, must be subscribed to by each of their affiliated branches, because it is essential that one fundamental agreement should rule throughout the Empire, and it is impossible, therefore, to leave it permissible for local associations to set the agreement aside. That to each local association full liberty shall be reserved to bargain as to the local minimum rate of wages, and as to any special methods of remuneration which may be locally in use, but that there is no intention to use this freedom as a means to lower wages. It is explained that under the minimum standard wage the output of workmen has notably declined, and it is contended that it is not equitable that the bad workman should receive the same wage as a good one. It is also contended that the system by which each workman enters into a formal contract of work with his employer shall be admitted as allowable under the tariff agreement. This is because in some places the unions object to these contracts, and fine or expel members who sign them. The employers do not wish to compel every man to sign a contract, but they wish that where a man desires to secure a better wage for better ability he may be able to enter into a special contract without coming under the ban of the association to which he may belong. The employers further urge that where the employers set up, or have set up, Labour Exchanges, these shall not be interfered with by the operatives in any way. It appears that the unions do not like the Bureaux, and prejudice them in the eyes of their members. It seems the unions want to have joint control of the labour exchanges; and then the officials of the exchanges, who are mostly members of the Social-Democratic Organisation, are expected to favour the members of that body at the expense of the rest.

The employers, it seems, resolved three years ago, that they would not allow their branches to concede any shortening of the summer hours below a 10 hours day, or, where the hours in summer are already below that, to shorten them further. The workmen demand the rescission of this resolution as one of the conditions of agreement.

NOTES ON COMPETITIONS.

Competition for Essays on and Designs for Glazed Bricks.

The competition instituted by a committee of glazed brick manufacturers produced several designs of merit, but none displaying such a combination of artistic quality with practical suitability to the material as, in the opinion of Mr. Max Clarke, R.F.I.B.A., the assessor appointed, would justify the award of the first premium to any individual designer. Several of the essays submitted have also been admirable, but in no case did a set of drawings and the essay sent with it attain anything like corresponding excellence. The assessor has awarded prizes as follows:—50 guineas to John Greaves and L. MacDonald Gill, 16, Old Buildings, Lincoln's Inn, W.C.; 50 guineas to Alexander Peacock, Elmswell, Longton Bridge, Preston; 25 guineas to F. Van Baars, 5, Clive Road, Colliers Wood, Surrey; and two guineas to each of the following:—A. Troyte Griffiths, The Priory Gateway, Malvern; J. M. W. Halley and H. A. McQueen, 55, Lincoln's Inn Fields, W.C.; J. Algernon Hallam, 18, St. Mark's Crescent, Regent's Park; W. Henry Jowett, 38, North Road, Highgate, N.; and Leonard W. Tracey, 49, Rann Street, Ladywood, Birmingham. The glazed brick manufacturers intend to circulate from time to time reproductions of the drawings and also selections from the various essays.

LIST OF COMPETITIONS OPEN.

MAY 31. MUNICIPAL OFFICES, KARACHI. Particulars given in our issue March 16th.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

JUNE 20 YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Competitors to state terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

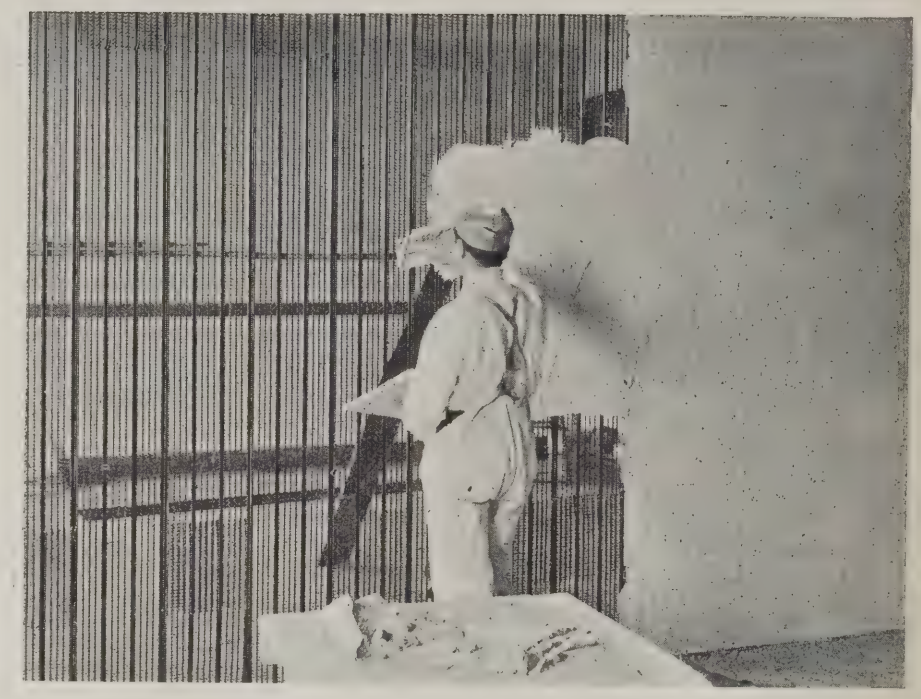
AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

TRADE AND CRAFT.

A New Steel Lathing.

The Trussed Concrete Steel Co., Ltd., of Caxton House, Westminster, who supply the Kahn bar for reinforcing concrete, have just recently put on the market a material which, while it has its uses for reinforcing concrete, is more generally applicable to plastered surfaces.

This material known as "Hy-Rib" consists of a sheet of slitted metal pulled out to open up into mesh work formation, stiffened every now and again by unsevered portions of the sheet bent to form ribs that serve to stiffen it and displace studs. The material derives its name from these rigid "high ribs." It is something to be able to do away with the use of studs for partitions and walls, but the ribs have a further use in



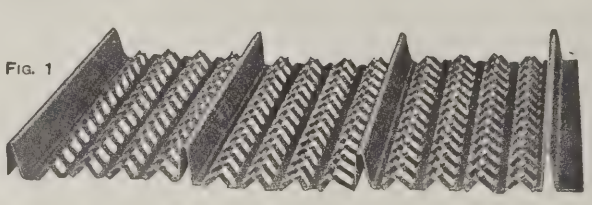


FIG. 1

stiffening the sheet of lathing so that it can be used for reinforcing concrete floors and roofs without centering being required, the material having sufficient strength and rigidity to withstand the weight of wet concrete and the punning of the same thereon. The lathing quality of "Hy-Rib" seems very good, as the surface is straight and true, and the expansion of the metal to form the meshwork is so arranged as to provide a good key with a minimum amount of plaster. As "Hy-Rib" so greatly reduces the cost of building work by doing away with expensive field labour and centering, while also saving time in erection, it is obvious that there must be a very large field for its use. It has been applied already in the United States to the construction of floors, roofs, walls, partitions, ceilings, and floorings of all kinds. One kind of application is interesting, namely, the use of bent sheets of the material for the centering of arched floors, culverts, conduits, sewers, silos, tanks, reservoirs, and tunnels.

"Hy-Rib" is manufactured from the highest grade of open-hearth rolled steel plate, in three guages. The cross-sectional areas of metal per foot of width, including side laps, are as follows:—

U.S. Gauge.	Sq. Ins.
28	.209
26	.251
24	.335

The centre of gravity of the section is 3-10ths in. from the flat side of the sheet.

As centering, the following table gives the safe load in lbs. per sq. ft. for "Hy-Rib" not embedded in concrete:—

U.S. Guage.	Span in Feet.						
	2	2½	3	3½	4	4½	5
28	68	44	30	22	17	13	11
26	87	56	39	29	22	18	15
24	140	90	63	46	35	28	22

Of course, if the material is arched its strength as centering is greatly increased.

When wide spans are necessary, temporary lines of shoring may be arranged at convenient centers.

The use of "Hy-Rib" for reinforced concrete floors is simple. It is laid over the supports with the lath side down, and the concrete poured in from above; the concrete flows through the lath surface only enough to secure a good key or bond to the steel. Plaster is applied directly to the under surface. Sheets are laid side by side and are spliced by just overlapping, so as to interlock the end ribs. There is obvious economy in a material which provides reinforcement and centering all in one. Roofs are constructed in the same way as floors except the loads are lighter and the construction is therefore lighter, slabs as thin as 1¼ins. often being built. This saving in dead weight in a fire-resisting roof is a point of economy: it saves in the direction of lighter roof trusses and supports being needed.

The manner of uses of the material for partitions, walls, and ceilings is obvious No channels, tees, angles, or studs are necessary, thus doing away with the expense and labour of attaching sheets of lath struts.

Curved sheets of "Hy-Rib" are supplied shop bent, varying in radius from 13ins. to 20ft. They have been used for reinforcing concrete sewer and water pipes.

A useful little booklet is published by the Trussed Concrete Steel Co., Ltd.

Berwickshire.—Duns School Board has been considering proposals for the enlargement of the Berwickshire High School, Duns, and it has been resolved to instruct a firm of Glasgow architects to prepare final plans for the extension and specifications in terms of the Scotch Education Department's requirements, with a view to an application for a grant under Section 19 of the Education (Scotland) Act, 1908. The probable estimate of the cost of the extension is £5,530.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 30. **HALIFAX.**—Erection of two shops and appurtenances, situate at Skircoat, Halifax, for the Halifax Industrial Society, Ltd. Plans, etc., may be seen, and bills of quantities obtained at offices of Clement Williams and Sons, architects, Post Office Buildings, Commercial Street, Halifax.

May 30. **PINXTON.**—Erection of four cottages by the Pinxton Co-operative Society, Limited. Plans and specifications can be had from the architect, John Tomlinson, South Normanton, or the Secretary, Ashville, Pinxton, on the deposit of £1 1s. Tenders to be sent addressed to the Secretary.

May 30. **SEATON.**—Erection of a residence at Seaton. Plans and specifications may be seen at the office of Donald and Donald, 14, John Street, Workington, to whom tenders must be sent. Only full tenders will be considered, and the work will be required to be completed within five calendar months of the signing of the contract.

May 30. **CHELMSFORD.**—Alterations and additions to King Edward VI. Grammar School. The drawings and specifications may be seen on application to the architects, Charles and W. H. Pertwee, Chelmsford. A deposit of £5 is required. Quantities will not be supplied. Tenders to be delivered to William Stunt, solicitor, Clerk to the Governors, 71, Duke Street, Chelmsford.

May 30. **RYDE, I.W.**—Alterations and additions to the Artillery Drill-hall, Butler's Road, Ryde, I.W., for the Southampton Territorial Force Association. Plans and specification can be seen at the office of the architect, Percy M. Du Feu, Ventnor from whom copies of same and form of tender can be obtained on deposit of £1 1s. Tenders to be sent to the offices of the Association, 32, Queen's Terrace, Southampton.

May 30. **BARNSLEY.**—Erection and completion of new wards, to accommodate 38 beds, a new block for kitchens and offices connected therewith, new sterilizing and store rooms, new electric lift, and reconstruction of corridors and renovations to central block, at Beckett Hospital. Plans and specifications may be inspected on application to the architects, G. Moxon and Son, Central Chambers, 26, Church Street, Barnsley. Bills of quantities may be obtained on deposit of £3 3s. Tenders to be delivered to R. F. Pawsey, hon. secretary, 8, Regent Street, Barnsley.

May 30—June 8. **TIDWORTH, HANTS (Assaye Barracks).**—Erection of twelve blocks of troops' stables, including drainage, water supply, pavings, etc., at Assaye Barracks, Tidworth, Hants, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Tidworth, on May 25, 26, and 27. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than May 30, and the application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders to be delivered addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

May 30—June 8. **TIDWORTH, HANTS (Mooltan Barracks).**—Erection of twelve blocks of troops' stables, including drainage, water supply, pavings, etc., at Mooltan Barracks, Tidworth, Hants (or other selected site within the barrack area), for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Tidworth, on May 25, 26, 27. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than May 30, and the application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders must be delivered addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

May 30—June 15. **DUNSTABLE.**—Erection of a new Council school, for the Bedfordshire C.C. Drawings, specifications, and form of contract may be inspected at the office of Gotch and Saunders, architects, Kettering. Builders desirous of tendering must send their names and addresses to the architects on or before May 30, together with a deposit of £1 1s., when a copy of the bill of quantities and form of tender will be forwarded to them. The contractor will be required to find sureties for the due performance of the contract. The acceptance of a tender will be subject to the approval of the Local Government Board. Tenders must be sent to W. W. Marks, Clerk of the County Council, Shire Hall, Bedford.

May 31. **BELFAST.**—Erection of a manse at the Woodvale Park Presbyterian church. Plans, etc., may be seen at office of Young and Mackenzie, Scottish Provident Buildings, Belfast.

May 31. **MERTHYR TYDFIL.**—Improvement and extension of Pentrebach school, for the Education Committee. Names in writing to the Deputy Surveyor, Town Hall, with deposit of £2 2s. with the Borough Accountant.

May 31. **BRYCHNI (Wales).**—Construction of a masonry arch bridge over Afon Wen, near Brychni, in the parish of Llangybi, for the Lleyn R.D.C. Plans, specifications, etc., may be seen at the office of the Council's Surveyor, Tynewydd, Chwilog, S.O. Tenders (which must be on a form supplied by the Council's Surveyor) to be delivered at the office of Hugh Pritchard, Clerk to the Council, Pwllheli.

May 31. **CROYDON.**—Additions and alterations and general repairs at "Crosslands" and "Lindens," 218 and 220, London Road, for the Guardians. The specification and conditions of contract may be seen, and bills of quantities and form of tender obtained, at the office of Henry Berney, architect, 104, George Street, Croydon, surveyor to the Guardians, upon deposit of £5 5s. The contractor will be required to enter into a contract and bond and give two sureties, to be approved by the Guardians, for the due performance thereof. Tenders are to be addressed to Harry List, Clerk to the Guardians, Union Offices, Mayday Road, Thornton Heath, Surrey.

June 1. **STENALEES (Cornwall).**—Erection and completion of a new Wesleyan church, according to plans and specifications, which may be seen and particulars obtained at the office of F. C. Jury and Son, Architects and Surveyor, No. 1, Alma Villas, Tregonissey Road, St. Austell. Tenders to be sent to Rev. W. H. Gibbs, Wesley Manse, Bodmin, Cornwall.

June 1. **LONDON, S.E. (Lewisham).**—Building brick graves and vaults, supplying York ledgers, taking down and replacing head stones, etc., which may be required at the Borough cemeteries at Ladywell and Hither Green during the three years from Midsummer, 1910, for the Borough of Lewisham Cemeteries Committee. Specifications, with forms of tender and schedule of prices, may be obtained on application to Edward T. Oxenham, Clerk to the Committee, Lewisham Town Hall, Catford, S.E., to whom tenders should be sent.

June 2. **WOODSTOCK.**—Alterations, repairs, and other work at the Workhouse, for the Guardians. Specifications can be obtained on application at the office of A. G. Higgs, Clerk to the Guardians, Woodstock, to whom tenders must be sent.

June 3. **BRADFORD.**—(See "Sanitary Engineering.)

June 4. **HOLYWELL.**—Erection of a mortuary Chapel at their new public cemetery, for the U.D.C. Plans and specification may be seen at the office of R. Arthur Thomas, District Surveyor, Holywell. Tenders to be sent to the Clerk to the Council, The Town Hall, Holywell.

June 4. **DUBLIN.**—Tenders are invited for (a) general contractors' work; (b) shop fitting; (c) electric installation; (d) decoration of 67, Sackville Street premises. Plans, etc., can be seen in office of Geo. T. Moore, A.R.C.S.I., M.Inst.C.E.I., 1 and 2, Foster Place, Dublin.

June 4. **CASTLEREA.**—Erection of a new residence for the Sisters of Mercy at Castlerea Workhouse, for the Guardians, in accordance with plans, etc., which may be seen at the office of W. A. Byrne and Son, architects, 20, Suffolk Street, Dublin, or at the Boardroom, Workhouse, Castlerea.

June 4. **DEAL.**—Alterations and additions to the Wesleyan day schools, Union Street, Deal. Plans and specifications, prepared by the architect, Ernest W. May, Walmer, can be seen at Lloyd's Agency, opposite Deal Pier, till May 28, on application to John Prior. Tenders to be delivered to the Rev. M. Allen, Blenheim Lodge, Gilford Road, Deal.

June 4. **EDENDERRY (Ireland).**—Repairs of certain labourers' cottages, for the R.D.C., according to specification which can be seen on application to H. R. Waters, C.E., Edenderry, who will supply all necessary information. Tenders must contain the names of two solvent securities, willing to join in a bond with contractor (at his own expense) for the due performance of the contract. Forms of tender can be had on application to T. Humphrey F. Bor, Clerk of the Council, Boardroom, to whom tenders must be sent.

June 6. **MANCHESTER.**—(See "Miscellaneous.")

June 6. **PENGAM (Wales).**—Erection of an infectious diseases hospital, near Pengam, consisting of two pavilions, lodge, laundry, stables, and administrative block, for the Gellygaer U.D.C. Plans and specifications can be seen and bills of quantities and all particulars may be obtained on application to the Council's architect, P. V. Jones, Bank Chambers, Hengoed, on deposit of £2 2s. Tenders to be delivered to Frank T. James, Clerk, Council Offices, Hengoed.

June 7. **CAERAU (Glamorgan).**—Erection of a new goods shed, stable, etc., at Duffryn Sidings, Caerau, Glamorganshire, for the G.W.R. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Newport Station. Tenders to be addressed to G. K. Mills, Secretary, Paddington Station, London.

June 7. **WARWICKSHIRE.**—Alteration of the premises at the Aston Lower Grounds to fit the same for the requirements of the Territorial Units who will be there located, for the Warwickshire Territorial Force Association. Bills of quantities, form of tender, etc., may be obtained from the architects, James and Lister Lea and Sons, 19, Cannon Street, Birmingham, on deposit of £3 3s. The plans and conditions of contract may be seen and all further particulars obtained at the architect's offices. The contractor shall pay rates of wages and observe hours of labour not less favourable than those commonly recognised by employers and trades societies in the building and allied trades in the Birmingham district. Further, the conditions of employment generally accepted in the Birmingham district in the trade concerned shall be taken into account in considering how far the terms of the fair wages clauses are being observed. The contractor shall be prohibited from transferring or assigning to any person or persons whatever any portion of his contract without the written permission of the Association. The contractor shall be responsible for the observance of the fair wages clause by the sub-contractor. Tenders should be delivered at the offices of the Association, 46, High Street, Warwick.

June 8. **GRIMSBY.**—Erection of a new Council school in Strand Street, for the Borough Education Authority. Plans may be seen at the offices of Herbert C. Scaping, architect, Court Chambers, Grimsby. Bills of quantities will be supplied on receipt of a deposit of £2 2s. Tenders to be delivered to Douglas Chandler, Clerk to the Education Authority, Education Offices, Grimsby.

June 8. **LAMPHEY (near Pembroke).**—Erection of a new Council school building, for the Education Committee. Drawings and specifications may be seen on application to the Head Teacher at the present school at Lamphey, and also at the office of the architect, D. E. Thomas, 17, Victoria Place, Haverfordwest. Bills of quantities and forms of tender may be obtained at the architect's office upon deposit of £1 1s. Tenders must be delivered to W. Davies George, Clerk, County Education Offices, 9, Quay Street, Haverfordwest.

June 10. **BRADFIELD AND STAINLAND (Yorks.).**—Whole or separate tenders for the following works:—Bradfield: Stannington New Council school; Swinton: Roman Terrace Council school, alterations and additions; Stainland-with-Old-Lindley: Bowling-green Council school, new woodwork centre (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to the Clerk of the County Council, Wakefield.

June 20. **WATERLOO WITH SEAFORTH.**—Erection of the Crosby Road North Council school, Waterloo, near Liverpool, for the U.D.C. Bills of quantities may be obtained from John I. Thompson, Clerk to the Council, Town Hall, Waterloo, near Liverpool, upon deposit of £1 1s. Drawings and specifications may be seen at the office of Appleyard and Quiggin, architects, 67, Lord Street, Liverpool. Tenders must be delivered to the Clerk to the Council.

ENGINEERING.

May 31. **BRYCHNI (Wales).**—(See "Buildings.")

May 31. **ROTHERHAM.**—Supplying and fixing complete fittings and apparatus for heating and ventilating, and also for laundry and disinfectant apparatus at the proposed smallpox hospital at Kimberworth, near Rotherham. Plans and particulars may be had on application to the Borough Engineer, Town Hall, Rotherham. Detailed plans and specifications must be submitted with the tender, which must be addressed to W. J. Board, town clerk.

June 1. **SOUTHAMPTON.**—Reconstruction of a portion of the town quay, Southampton (contract No. 4), such tender being based upon proposals to be submitted by the persons tendering, and the particulars supplied by the Harbour Board. Specification, conditions, and copies of the general drawings may be obtained upon application to E. Cooper Poole, A.M.Inst.C.E., Engineer and Surveyor to the Board, at the Board's offices, from 10 a.m. to 12 noon, upon deposit of £5. Tenders must be delivered to Harbour Board Offices, Town Quay, Southampton.

June 4. **EDENDERRY.**—Works at well at Edward Connors, Bunsallagh, and water supply to Carmakill National School, according to specifications, which can be seen on application to H. R. Waters, C.E., Edenderry, who will point out the work and give any information necessary. Tenders must contain the names of two solvent securities, willing to join in a bond with contractor (at his own expense) for the due performance of the contract. Forms of tender can be had on application to T. Humphrey F. Bor, Clerk of the Council, to whom tenders must be sent.

June 4. **HARTLAKE (Somerset).**—Taking down and re-building of Hartlake bridge, on the main road between Glastonbury and Wells, for the Somerset C.C. The new bridge will be constructed of reinforced concrete, and is not designed on any particular patented system. The work comprises reinforced concrete piling, beams and slabs, piers and abutments, and three arches of the following spans, 22ft., 11ft., 11ft.; also masonry parapets and wing walls, roadworks, and temporary bridge. Drawings, specifications, and form of contract may be seen by appointment at the County Surveyor's Office, Bath, when a copy of the bill of quantities and form of tender may be obtained on deposit of £3 3s. Tenders to be delivered to H. T. Chapman, County Surveyor, County Surveyor's Office, Queen Square, Bath.

June 7. **LONDON.**—Construction of a bridge over the waterworks channel of the River Lea for the L.C.C. Drawings, bills of quantities, form of tender, &c., may be obtained on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon deposit with the cashier of the Council of £3 Full particulars of the work and conditions of contract may be obtained at the County Hall before the payment of this fee. The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Full particulars of the Council's Standing Orders on these matters are given in the L.C.C. Gazette.

June 14. **STAFFORD.**—Supply and erection of a triple-expansion vertical rotative direct-acting pumping engine and Lancashire boiler, together with all machinery, pipes, valves, and other works in connection therewith, for the Corporation. Conditions of contract, specification, form of tender, and bill of particulars may be obtained from W. Plant, borough and waterworks engineer, Borough Hall, Stafford, on deposit of £5. Tenders to be delivered at the office of Richd. Battle, town clerk, Borough Hall, Stafford, addressed to the Chairman of the Waterworks Committee.

June 16. **PEMBROKE.**—Supply and erection of a weighbridge at the Union Workhouse, including the erection of necessary house, which must be described in the tender, for the Guardians of Pembroke Union. Persons tendering are requested to submit tenders for a machine of 3 tons, 4 tons, 5 tons, and 6 tons capacity, stating the name of maker of machine. Tenders to be sent to J. S. W. Jones, clerk, Union Office, Pembroke.

SANITARY ENGINEERING.

May 23—June 10. **NEW MILLS (near Stockport).**—Sewerage and sewage disposal works at Birch Vale, for the Hayfield R.D.C., comprising:—1,520 lineal yards of earthenware pipes, 9in. diameter; 150 lineal yards of steel tubes, 9in. diameter, on rubble piers; and 35 lineal yards of cast-iron pipes, 9in. diameter, under railway, with all manholes, lampholes, flush tanks, and ventilators. Also extensions to the existing disposal works, including precipitation and stormwater tanks, percolating filters, and revolving sprinklers (55ft. diameter), dosing tank, carriers, distributors, etc. Plans and specifications may be seen at the offices of the engineers (John Newton, Son and Bayley, civil engineers, 19, Cooper Street, Manchester), and copies of bills of quantities and form of tender may be obtained from them or from J. R. Bowden, clerk, 16, High Street, New Mills, near Stockport, on deposit of £1 1s. Contractors proposing to tender are requested to send their names to the Engineers by May 23. Tenders to be delivered at the Rural Council Offices, 16, High Street, New Mills, by June 10.

May 30. **OSSETT.**—Tenders for the laying of about 300 yards of 9in. earthenware pipe sewers, the construction of ejector chamber, air compressing station, and other appurtenant works at the Healey sewage disposal works, for the Ossett Corporation. The plans may be seen and specification and bill of quantities obtained at the office of the Borough Engineer, Town Hall, Ossett, on deposit of £1 1s. Tenders to be sent to the Town Clerk, Ossett.

May 30. **WAKEFIELD.**—Alterations and additions to existing precipitation tanks, etc., the construction of about three acres of percolating filters, containing approximately 31,000 cubic yards of filtering material, effluent settlement tanks, liming and ferric sulphate houses, offices, mess-room, culverts, carriers, drains, and other appurtenant works at Calder Vale, for the Corporation. The contract drawings may be seen, and specification, bill of quantities, and form of tender obtained at the office of the engineer, J. P. Wakefield, A.M.I.C.E., city surveyor, Town Hall, Wakefield, on deposit of £5 5s. (Bank of England Note). Tenders must be delivered to W. W. Greenhalgh, Town Clerk.

May 31. **SALFORD.**—Sewering, paving, and flagging works, for the Corporation. The plans may be seen and forms of tender with quantities obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders must be delivered to L. C. Evans, Town Clerk, Town Hall, Salford.

May 31. **HADLOW (Kent).**—Laying of new drainage and construction of new offices at the Hadlow Council school, for the Kent Education Committee. Specifications and plan, prepared by the architect, Wilfrid H. Robinson, Caxton House, Westminster, can be seen and further information obtained at above address, or at the offices of Wm. Stow, Hadlow, Kent, to whom tenders must be forwarded.

May 31. **LONDON, N.W.**—Construction and maintenance for twelve calendar months of 3,215ft. lineal or thereabouts of brick sewers of various dimensions, and 555ft. lineal of pipe sewers, together with manholes, gauging chambers and other works incidental thereto at Stonebridge, in the parish of Willesden, for the Willesden D.C. Quantities and specifications may be obtained upon application to O. Claude Robson, M.I.C.E., engineer, Public Offices, Dyne Road, Kilburn, N.W., and deposit of £5 5s. Tenders to be delivered to Stanley W. Ball, clerk, Public Offices, Dyne Road, Kilburn, N.W.

May 31. **LONDON, S.E.**—Construction of about 1,564ft. of 3ft. 6in. brick and concrete culvert in Hither Green Lane and Verdant Lane, Lewisham, for the Lewisham B.C. Plans and specification may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). Copies of the specification may also be had on payment of 5s., which will not be returned. Tenders must be delivered at the Town Hall, Catford, and placed in the box there provided for the purpose. The works are to be proceeded with immediately on acceptance of tender and execution of contract, and the contractor must employ local labour as far as practicable in carrying out the work. Rate of wages, etc., clause to be observed.

May 31. **DUBLIN.**—Construction of about 4,350 yards run of pipe sewers and works connected therewith within Old City Area, for the Improvements Committee of the Corporation. Drawings, etc., may be inspected at the office of the City Engineer, City Hall, Dublin, and at the office of the consulting engineer, George Chatterton, M.I.C.E., 6, The Sanctuary, Westminster, London, and a limited number of copies of the key plan of the lines of sewers, the specification, form of tender, estimate of quantities, and schedule of prices may be obtained at the offices on deposit of £5 5s. Crossed cheques only will be received in payment. No copies of the documents will be sent to contractors till they have been inspected by a representative of the firm. Tenders must be addressed to the Chairman of the Improvements Committee, City Hall, Dublin.

June 3. **BRADFORD.**—Erection of the superstructure (masonry, brickwork, and 100 tons steelwork) of the sludge disposal works at Strangford, on the Esholt Estate, for the Bradford Corporation. The area covered is about one acre. Copies of specification, form of tender, and conditions of contract may be obtained and the drawings seen at the office of Joseph Garfield, A.M.I.C.E., Esholt Hall, Shipley (Station, Apperley Bridge, Midland Railway), on deposit of £3 3s. The contract will be let subject to the fair contracts clauses of the Corporation, which may be seen at the Sewage Works Engineer's Office, and which the accepted contractor will be required to sign. Tenders must be sent to Frederick Stevens, town clerk, Bradford.

June 6. **GNOSALL (Salop).**—Laying of about 5,000 yards of 12in., 9in., and 4in. glazed earthenware and cast-iron pipe sewers, the construction of manholes, tanks, filters, engine house, etc., and other appurtenant works in the parish of Gnosall, for the D.C. Drawings may be seen and copies of specification, tender, and bill of quantities, may be obtained at the offices of the engineers, Berrington, Son and Watney, Bank Buildings, Lichfield Street, Wolverhampton, and 28, Victoria Street, Westminster, S.W., on deposit of £5 5s. Tenders must be delivered at the office of H. G. U. Elliott, clerk, Newport, Salop.

June 7. **RIPLEY.**—Construction of sewerage, and sewage disposal works, comprising sewerage, subsidence tanks, percolating filters, and other appurtenant works, for the U.D.C. Plans and specifications may be seen and bills of quantities and forms of tender obtained on application to George W. Bird, Surveyor to the Council, Town Hall, Ripley, Derby. A deposit of £1 1s. will be required. Tenders must be delivered at the office of George Whitcombe, Clerk, Town Hall, Ripley, Derby.

June 9. **DAVYHULME (Manchester).**—Construction of about 1,586 yards of brick sewers and 6,523 yards of pipe sewers, with syphons, flushing chambers, and manholes, in the township of Davyhulme, for the Barton-upon-Irwell R.D.C. Plans, sections, and specifications may be seen and forms of tender and bills of quantities obtained (upon deposit of £3 3s.), at the office of A. H. Mountain, A.M.I.C.E., 16, John Dalton Street, Manchester. Tenders to be addressed to J. W. Whitworth, clerk, Union Offices, Patricroft, Manchester.

June 20. **YSTRADGYNLAIS.**—Schemes and estimated cost for sewering the Parish of Ystradgynlais Lower, for the R.D.C., who will pay a sum of £20 for the scheme which they consider most suitable, and the decision of the Council must be accepted as final. Competitors to state their terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars of the area to be drained and any other information may be obtained from T. Watkins, Surveyor to the Council, Ystradgynlais. Schemes to be sent in to D. L. Moses Evans, Clerk to the Council, Commercial Street, Ystalyfera.

IRON AND STEEL.

May 30. **DARLINGTON.**—Corrugated iron roofs to tar macadam sheds, for the Corporation. For all particulars apply to George Winter, Borough Surveyor, Town Hall, Darlington.

May 31. **EALING.**—Erection of corrugated iron fencing, for the T.C. Specification and schedule of quantities may be seen, and forms of tender may be obtained from Charles Jones, M.Inst.C.E., Borough Engineer, Town Hall, Ealing, W., on deposit of £1. Tenders must be delivered at the office of Geo. E. Brydges, Town Clerk, Town Clerk's Office, Town Hall, Ealing, W.

June 1. **MANCHESTER.**—Supply of 23 tons of 30lb. steel rails, fishplates, etc., and 2,100 creosoted sleepers, for their Carrington and Chat Moss Estates, for the Cleansing Committee of the Corporation. Specifications may be obtained from Robert Williamson, Superintendent of the Cleansing Department, Town Hall, Manchester.

June 11. **MANCHESTER.**—Iron and steel work.—Supply of iron and steel work required for an installation of horizontal retorts at their Rochdale-road Station, for the Gas Committee. General conditions of contract and specification can be obtained on application to F. A. Price, superintendent, Gas Department, Town Hall, on deposit of £3 3s. Drawings may be seen and any other information obtained on application to the engineer, J. G. Newbigging, M.I.C.E., Rochdale Road Station. Tenders (addressed to the Chairman of the Gas Committee) must be delivered at the Gas Offices, Town Hall, Manchester.

PAINTING.

May 30. **CARSHALTON (Surrey).**—Cleaning and painting works at the children's infirmary, Carshalton, Surrey, for the Metropolitan Asylums Board. Conditions of contract, specifications, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon deposit of £1 1s. Tenders must be delivered at the office of the Board.

May 30. **BRENTWOOD.**—Cleaning and Painting Works at High Wood School, Brentwood, Essex, for the Metropolitan Asylums Board. Contract and specifications prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., Engineer-in-Chief. The conditions of contracts, specifications, and forms of tender may be inspected at the office of the Board, Embankment, E.C., and can then be obtained upon deposit of £1. Tenders must be delivered at the office of the Board.

May 30.—**RUSTINGTON.**—Cleaning and painting works at Millfield, Rustington, near Littlehampton, Sussex, for the Metropolitan Asylums Board, in accordance with conditions of contract and specifications prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. The conditions of contract, specifications, and forms of tender may be inspected at the Office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders must be delivered at the Office of the Board.

May 31. **LONDON, W.C.**—Painting works executed at their casual wards, in Little Gray's Inn Lane, W.C., for the Guardians of Holborn Union Specification and conditions of contract may be obtained on application to J. Allan Battersby, clerk, 53, Clerkenwell Road, E.C., to whom tenders must be delivered.

Reinforced Concrete

Leslie's Patent System

FOR

PUBLIC BUILDINGS, FACTORIES, SILOS
FOUNDATIONS, BRIDGES RESERVOIRS,
AQUEDUCTS, SEWERS, PILES, WHARVES.

Leslie's Linked Hanger as assembled in position.

Leslie's Hanger before Link is driven on to provide rigid attachments.

Reinforced Concrete Beam on the Leslie System.

Leslie's Patent System

possesses the following advantages :—

1. Rigid Stirrups.
2. Stirrups any length and varied spacing.
3. Complete truss action in Beams,
4. No loose members.
5. Al members completely framed as Units.
6. Exactitude of disposition.
7. No risk of members being displaced.
8. Elimination of Errors in workmanship
9. Formed from ordinary standard sections of steel.
10. Fire-resistance.
11. Economy of material and labour.

Special Treatise on Reinforced Concrete

will be sent to Architects and Contractors FREE on application.

EFFICIENT CONSTRUCTION GUARANTEED.

LESLIE & COMPANY, Ltd.,

General and Specialist Contractors to Government Departments, Public Authorities, Railway and Dock Companies, etc.

KENSINGTON SQUARE, LONDON, W.

Telephones : 1257 and 1258 KENSINGTON.

May 31. **DURHAM.**—Painting, etc., of the following schools:—Easlington Lane, Eppleton, North Hetton, Newbottle, Paddock Stile, New Penshaw, Hetton-le-Hole (girls' and infants'). Forms of tenders may be obtained from the District Clerk, J. P. Tulip, Saville House, Houghton-le-Spring, to whom tenders must be sent.

May 31. **SUNDERLAND.**—Painting, etc., at Mere Knolls Cemetery, for the Corporation. Specification may be seen, and schedule and form of tender obtained at the Borough Surveyor's Office, Town Hall. Tenders, addressed "To the Chairman of the Cemeteries Committee," must be delivered at the office of Fras. M. Bowey, Town Clerk, Sunderland.

May 31. **LONDON.**—Cleaning, re-painting, etc., work at Albert, Chelsea, and Victoria Embankments; the stairway to Charing Cross Footbridge; Bow and Lambeth Bridges; and the Bridge over the East London Railway at Rotherhithe Tunnel. Drawings may be inspected and specifications, bills of quantities, forms of tender, etc., obtained on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of a deposit of £1. Full particulars of the work and conditions of contract may be obtained at the County Hall before the payment of this fee. The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract or any part thereof wages at rates not less, and to observe hours of labour not greater than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Full particulars of the Council's Standing Orders on these matters are given in the "London County Council Gazette."

June 2. **LONDON, S.E.**—Painting, cleaning, etc., work at their Infirmary, East Dulwich Grove, S.E., for the Guardians of the Southwark Union. Specification, conditions of contract, and form of tender may be obtained at the offices of their architect, A. W. Tribe, 120, Clapham Road, S.W., on deposit of £2 2s. Tenders should be addressed to the Guardians, and delivered at the offices of Sydney Wood, Clerk, Union Offices, Ufford Street, Blackfriars Road, S.E. Fair wages clause.

June 3. **WARRINGTON.**—Painting of the various schools, for the Sites and Buildings Committee. Specifications, etc., may be seen, and forms of tender and all further information obtained, at the office of the Borough Surveyor, Town Hall, where tenders must be delivered. A deposit of 10s. 6d. will be required for specification, and cheques are to be made payable to the Borough Treasurer.

PLUMBING.

May 30. **AMMANFORD.**—Execution of private house connections with water mains as follows:—(a) From main to stop cock; (b) from stop cock to the point where the householders may require the piping and tap, for the U.D.C. The contract to be for the period ending March 31, 1911. For form of tender and further particulars, apply to T. M. Evans, Clerk to the Council, Ammanford, to whom tenders must be sent.

ROADS AND CARTAGE.

May 30. **CLAYTON-LE-MOORS.**—Painting or spraying of about 20,000 super yards of roadway with tar compound, for the U.D.C. Further particulars may be obtained on application to Arthur Dodgeon, A.M.I.C.E., surveyor.

May 30. **ST. NEOT'S.**—Supply of about 400 tons broken granite, 500 tons tarred slag macadam, and 100 tons slag chippings and dust, for the U.D.C. Forms of tender and particulars may be obtained of John Edey, Surveyor, Offices: South Street, St. Neot's, Hunts, to whom tenders, accompanied by samples, are to be delivered.

May 30. **HAYWARDS HEATH (Sussex).**—Road-making and sewering works in Petlands Road and Kents Road, for the U.D.C. Drawings and specification may be seen and copies of the bills of quantities and forms of tender may be obtained at the office of Geo. Plummer, surveyor, South Road. Tenders to be delivered to E. J. Waugh, Clerk to the Council, Boltro Road, Haywards Heath.

May 30. **EPSOM.**—Making up Heatherside Road, Ewell, for the Epsom R.D.C. A plan and specification of the works and form of contract may be seen at the office of the surveyor of Highways, T. E. Ware, Waterloo Road, Epsom, where forms of tender and other particulars may be obtained. Tenders must be received by Arthur R. Cotton, clerk, Waterloo Road, Epsom.

May 30. **LONDON, W.**—Providing and laying creosoted deal blocks on the existing foundations in Earl's Court Road (13,950 square yards approximately); Kensington High Street, from Church Street to King Street (1,414 square yards approximately); Gloucester Road, from Kensington Gate to Elvaston Place, and from Cromwell Road to Harrington Gardens (5,486 square yards approximately); Bayswater Road, from Kensington Palace Gardens to Broad Walk (5,200 square yards approximately); and Fulham Road, from Sydney Street to Arthur Street (2,433 square yards approximately), for the Kensington B.C. Specifications can be seen and further particulars obtained at the office of the Borough Engineer and Surveyor, Town Hall, Kensington. The contractors will be required to enter into a written contract to find two good and sufficient sureties for the performance of contract. Rates of wages, etc., clause to be observed. Tenders must be delivered at the office of Wm. Chambers Leete, Town Clerk, Town Hall, Kensington, W.

May 30. **ELLESMERE PORT AND WHITBY.**—Reconstruction of Whitby Road, Ellesmere Port, for the U.D.C. Plans may be inspected, and specification and form of tender obtained, at the office of the Surveyor, J. M. Hudson, Bank Buildings, Ellesmere Port. Contractors are required to state the time within which they will undertake to complete the work. Tenders to be sent to D. Bunting, Clerk to the Council, Bank Buildings, Ellesmere Port, near Chester.

May 31. **HORBURY (Yorks.).**—Kerbing, flagging, concreting, paving, etc., on the Wakefield and Austerlands main road, at Benton Hill, Horbury, for the U.D.C. The drawings and specifications may be seen, and form of tender, together with schedule of quantities and other particulars, obtained from J. H. Drew, engineer and surveyor, Town Hall, Horbury, on deposit of £1 1s. Tenders must be sent to T. Barker, clerk, Town Hall, Horbury.

May 31. **MIDDLETON.**—Making up of the passages between Chester Street and Dorset Street, and at the back of Essex Street, for the Corporation. Plans may be seen and specifications, quantities and form of tender, which will contain a fair-wages clause, obtained on payment of 10s. 6d., on application to Mr. Welburn, Borough Surveyor, at his office, Town Hall, Middleton, between the hours of 9.30 and 10.30 a.m. Tenders must be delivered at the office of Frederick Entwisle, Town Clerk, Town Hall, Middleton.

June 1. **HERNE BAY.**—Paving, etc., of the following streets:—Carlton Hill, St. Louis Grove, for the U.D.C. Plans, sections, and specifications can be seen and forms of tender obtained from F. W. J. Palmer, surveyor to the Council, Town Hall, Herne Bay. Tenders to be addressed to Joseph Jubb, Clerk, Town Hall, Herne Bay.

June 1. **HOVE.**—Providing and laying wood paving (about 5,012 yards superficial) in Sackville Road, between Blatchington Road and Coleridge Street. Plans, specification, and form of contract may be seen, and particulars, with forms of tender, obtained at the office of the Borough Surveyor (H. H. Scott). Tenders must be addressed to H. Endacott, Town Clerk, Town Hall, Hove.

BUILDING.

May 31. **BRADFORD.**—(See "Painting.")

May 31. **ST. NEOTS (Hunts.).**—Alterations and additions to the St. Neots police station. Plans and specification can be seen at the office of Herbert Leete, County Surveyor, 36, High Stret, Huntingdon, to whom tenders must be sent. The acceptance of any tender will be subject to the sanction of the Local Government Board first being obtained.

May 31. **RAMSEY (Hunts.).**—Erection of new police station at Ramsey. Plans and specification can be seen at the office of Herbert Leete, County Surveyor, 36, High Stret, Huntingdon, and copies of the bills of quantities can be obtained on deposit of £2 2s. Tenders to be delivered at the above address. The acceptance of any tender will be subject to the sanction of the Local Government Board first being obtained.

June 1. **PENZANCE.**—Alterations at the Morrab House Library. Tenders to be delivered at the Surveyor's office, where all particulars may be obtained.—Frank Latham, M.I.C.E.I., Borough Engineer, Public Building, Penzance.

June 1. **GOOLE.**—Erection of two cottages at the Pollington Waterworks, for the U.D.C. Plans and specifications may be seen at the offices of the architect, H. B. Thorp, Carlisle Street, Goole. Tenders to be delivered to Robert Tyson, Clerk to the Council, Council Offices, Goole.

June 1. **CARLISLE.**—Extension of buildings at the Central Electric Lighting Station, situate in James Street, for the Corporation. Drawings, stipulations, and conditions of contract may be inspected, and a copy of the specification, bill of quantities, and form of tender obtained at the office of Henry C. Marks, M.Inst.C.E., City Engineer and Surveyor, 36, Fisher Street, Carlisle, on deposit of 10s. 6d. Tenders to be delivered at the office of the above. The lowest or any tender not necessarily accepted; parties tendering must do so at their own cost.

June 2. **FULHAM.**—1.—Painting and decorating works works to be done at the Infirmary Nurses' Home, and Guardians' Offices, Fulham Palace Road, W., and the Receiving Home for Children, 9, Parsons Green, Fulham, S.W.; and 2.—Relaying certain ward and day-room floors at the Infirmary with composition flooring and certain bath rooms, w.c.'s, etc., with impervious material, for the Guardians. Forms of tender and specification may be obtained by application at the office of E. J. Mott, Clerk to the Guardians, 129, Fulham Palace Road, W., or by forwarding a stamped addressed foolscap envelope. Tenders must be returned to the Clerk.

June 4. **STANWIX (Carlisle).**—Erection of the Miles Macinnes Memorial Hall at Stanwix. Drawings and specifications can be seen at the office of John Slack, Architect, 18, Bank Street, Carlisle, to whom tenders must be sent.

June 10. **BENTHAM, LONGSTAFFES (Yorks.).**—Alterations and additions to Bentham, Longstaffes, and Lower Council schools (builder, joiner, slater, plumber, plasterer, painter, asphalter, whole or separate tenders). Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

June 11. **HOLMES CHAPEL (Cheshire).**—Alterations and additions to the Agricultural College Holmes Chapel, Cheshire. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., county architect, Newgate Street, Chester, and quantities obtained on deposit of £1. Tenders are to be delivered to R. P. Ward, Director of Education, County Education Offices, Chester.

June 11. **GLOUCESTER.**—Erection of a new Council school, at Deacon Street, Gloucester, for 336 boys, for the Education Committee. Plans and specifications may be seen on application to J. Fletcher Trew, M.S.A., County Chambers, Station Road, Gloucester, and quantities will be supplied on deposit of £1 1s. Tenders to be delivered to P. Barrett Cooke, Secretary to the Committee, Berkeley Street, Gloucester.

No date. **ST. BURYAN (Cornwall).**—Repairs to premises, occupied by John Mitchell, Churchtown, St. Buryan. Particulars on application to Manager, St. Loy, St. Buryan.

IRON AND STEEL.

June 1. **HAMMERSMITH.**—Supplying and erecting wrought iron boundary fencing and gates around Wormholt Park, Hammersmith, for the B.C. Forms of tender and specification may be obtained on application to H. Mair, Borough Surveyor, at the Town Hall. Tenders must be delivered to H. Thompson, Town Clerk, Town Hall, Hammersmith, W.

PAINTING.

May 31. **OXFORD.**—Cleaning, painting, etc., at the Radcliffe Infirmary, and County Hospital. Specification can be had on application to G. C. Rynd, Captain, Secretary-Superintendent, to whom tenders must be sent.

May 31. **BRADFORD.**—Tenders for the following works: 1, St. James's Market, erection of store rooms; 2, St. James' Market, limewashing; 3, Rawson Place Market, painting, etc.; 4, Bolton Lane Slaughterhouses, limewashing, for the Corporation. Drawings and general conditions of contract may be seen and bills of quantities and specifications and forms of tender obtained on application to the City Architect, Town Hall, Bradford. Tenders must be delivered to Frederick Stevens, Town Clerk, Town Hall, Bradford. The contracts will be let subject to the fair contracts clauses of the Corporation, which the accepted contractors will be required to sign.

June 2. **FULHAM.**—(See "Buildings.")

June 2. **SALFORD.**—Painting, etc., required at the Union Workhouse, Eccles New Road, Salford, and Farm Superintendent's House, Hope, Pendleton, and other property, for the Guardians. Forms of tender and all particulars may be obtained on application to the Master of the Workhouse. Tenders to be received by F. Townson, Clerk to the Guardians, Union Offices, Eccles New Road, Salford.

ROADS AND CARTAGE.

June 1. **OUNDLE.**—Supply of granite and slag to be delivered free of charge at the Oundle Station of the London and North-Western Railway, between July 1 and November 30, 1910 (both dates inclusive), for the U.D.C., at such times and in such quantities as the Surveyor may from time to time require. Forms of tender may be obtained on application to Robert Knight, Clerk to the said Council, New Street, Oundle, to whom tenders must be sent.

June 1. **LITTLEHAMPTON.**—Coating with approved tar composition and granite chippings the surfaces of Arundel Road, Terminus Road, Arun Bridge way and approaches, High Street, and part of Beach Road, in all about 13,500 super yards, for the U.D.C. Specification of work can be seen and form of tender obtained on application to the surveyor, H. Howard, F.S.I., Town Offices, Littlehampton. Tenders to be sent to the Chairman of the Council, Town Offices.

[We regret that owing to pressure on our space, we are obliged to hold over our list of tenders till next week.]

for
ARCHITECTS, ENGINEERS & CONTRACTORS

Containing about 200 pages of text and 200 illustration together with a detached Ready Reckoner (of celluloid) for the Designing and Checking of Slabs and Beams
Crown8vo, cloth, Price 7/6 net (postage 4d.)

REINFORCED CONCRETE

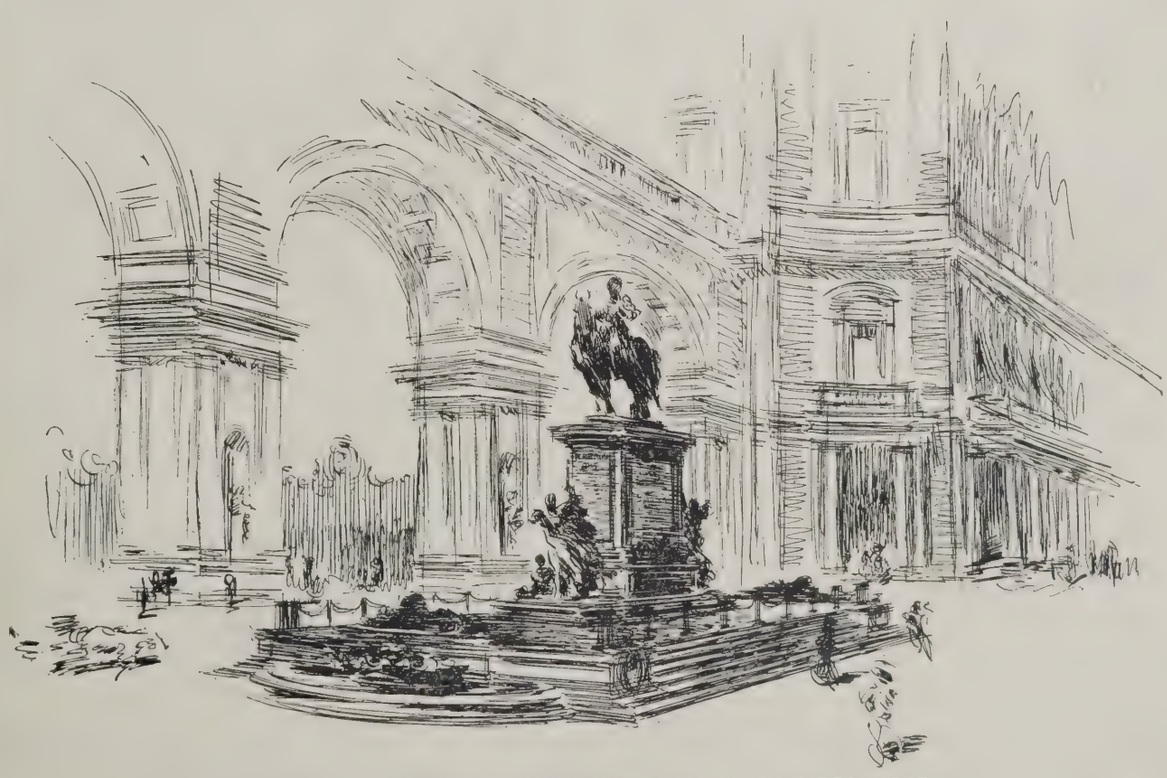
THEORY AND PRACTICE.

By FREDERICK RINGS, M.S.A.
Architect and Consulting Engineer.

The Author has had wide experience in designing and supervising Reinforced Concrete work, and his book, which embodies the most approved modern practice,

CONTAINS ALL THE FORMULÆ AND DATA NECESSARY IN DESIGNING AND CHECKING REINFORCED CONCRETE STRUCTURES.

The recommendations of the R.I.B.A. are adopted in the work; and the symbols used are those recently arranged by the Concrete Institute.



The Celluloid Calculator forms a valuable complement to the book, enabling the amount of metal, together with the thickness of slab required for all usual spans, to be mechanically obtained without any calculation whatever.

Builders' Grievances.

EVIDENCE from time to time turns up as to complaints which the building trade make in regard to the treatment which they either do actually receive, or which they think they are liable to receive, at the hands of architects and building-owners, under certain circumstances, in connection with the carrying out of buildings. Some of these are very real grievances, injustices which ought not to be countenanced at any time; some of them, we are inclined to think, are to some extent imaginary, in the sense at all events that they are possible rather than probable. It may clear the ground a little if we consider some of the points that have come under our notice from time to time, not solely from the point of view of either architect, builder, or building-owner, but with the endeavour to represent impartially the claims of each.

Difficulty of Finding Good Workmen.

The first subject on our notes is not a grievance against any person or persons, but against things in general. It is said that there is an increasing difficulty in finding skilled workmen, and that builders are anxious as to the means of maintaining an adequate supply of such workmen, who have become more and more scarce with the decline of the apprenticeship system. And truly, on this head, it is difficult to find any consoling words, or to offer any suggestions. Technical schools, it is said, do not meet the requirements. There are not enough of them in this country at present, in any case, to supply the demand as far as numbers are concerned; but the experience of employers seems to be that the lads who come out of such institutions as the London County Council training schools for instance, however their instruction may have fitted them to work out the problems set them in the schools, have not the faculty for turning their hands to actual building work. It would be of interest to know whether this is the same in Germany, where technical schools are more numerous, larger, and possibly better equipped than in England. But we doubt if the best technical school will really make a workman, though it may give him a better general understanding of principles of construction than he would otherwise have. The only real remedy seems to lie in an endeavour to revive the apprenticeship system—an endeavour which, on general grounds, would evidently receive the sympathy and might count on the support of many people, outside of the actual building trade, who are anxious for the well-being of the country and for the adequate practical instruction of boys of the artisan class. And it is probable that the scarcity of skilled workmen arises to a great extent from the foolish idea that there is something derogatory in working with the hands; that to be a "clerk" and write at a desk is a move up in the world; whereas really the work of a skilled joiner or mason is much more interesting than that of an ordinary clerk, and requires more ability. If these persons could be persuaded of the real dignity and worth of skilled labour, and its value to the community, they might perhaps develop a greater wish to excel in it. At present it seems to be regarded as a degrading form of occupation, to rise above which should be their ambition.

By-laws.

The Federated builders claim that it would be advantageous to call them into consultation when by-laws are being revised, and that for want of this by-laws are passed which are inconvenient and oppressive, as well as unpractical. We should be in favour of such societies being asked if they had any suggestions or criticisms to make, mainly in fairness to themselves, since they would be the persons at whom a new set of by-laws would be mostly aimed. But for that very reason they must remember that they are interested parties whom the new legislation would chiefly affect, and they could hardly expect, therefore, that their judgment could have the same weight as that of persons who were acting solely in the general public interest. Apart from this, the idea is a reasonable one, and we should support it.

Tenders.

It is said that when the lowest tender is not accepted, builders find it difficult to rid themselves of a suspicion that the tenders have been invited with the object of checking the figures of some favoured firm for whom the job was originally intended. That we should regard as one of the wrongs which are "possible, but not probable." There is such a thing as being too suspicious. Corporate bodies are often very stupid, but we do not think they are in general deliberately dishonest; and if they wanted to check the figures of a favoured contractor they could do it by a less clumsy and unprincipled method than setting a number of other contractors to work at a sham competition. And provided that it has been clearly advertised that "the lowest tender will not necessarily be accepted," there are occasions when it is wiser not to accept the lowest tender, i.e., when it is so low that it is obvious that the tenderer could not honestly make a profit out of the work. Such a situation is not likely to lead to results satisfactory to anyone concerned. With the complaint that too short a time is often allowed for the satisfactory preparation of an estimate, we are entirely in sympathy; it is a great mistake, and an entirely unnecessary one, to hurry builders over estimates for an important work—a mistake which may lead to trouble and inconvenience afterwards. Builders are also entirely justified in objecting to their lists of priced quantities being opened, except that of the accepted firm. Those are trade secrets which ought to be respected, and if it is an actual fact (as we are informed) that in a Government competition recently such a sealed list was opened contrary to the advertised conditions, it was a most improper proceeding—so much so, that we should imagine it must have been the result of a misunderstanding or forgetfulness of the conditions on the part of some official. Government departments, in this country, at all events, are not in the habit of breaking faith with those who deal with them.

Quantities.

Much has been said recently on behalf of the builders as to the hardship inflicted on them by the refusal in some cases to

supply quantities; and where it is a case of competition tendering we quite concur in the complaint; in fact, it is not only a hardship, but an absurdity, to compel a dozen or a score of people each to do the same work, by which only one of them can profit. But it ought to be pointed out that the duty of the building-owner, through his architect or surveyor, to supply quantities and pay for them, only arises in the case of competition tendering. We have heard it mentioned as a sort of hardship on a builder that he should have to take out his own quantities, even in a case where there was no competition, and where merely one man's estimate was asked for. That surely implies a forgetfulness of the whole history of the subject. The very existence of the profession of quantity-surveyor arises out of the system of competition tendering; it is employing one man, at a fee, to do what otherwise a number of men would have to do without advantage to any but one of them. But apart from competition tendering, and before that system (a very bad one in many ways) became so general, the quantities were manifestly the builder's own business. It was nothing to the architect or the building-owner how many rods of reduced brickwork, or how many feet run of a stone cornice, there would be in a building; it was for the builder to find out that in order to make his estimate. The competition tendering system makes all the difference, of course; but that was the original position, and it is only in comparatively recent years that the quantities have been supposed to be anyone's concern except the builder's.

Contract Conditions.

No one can be surprised that the builders are beginning to grow restive under the drastic conditions often imposed on them in contracts and specifications, which, as it has been expressed, seem often to be drawn up on the "heads-I-win-tails-you-lose" principle. Everything is to be "the best," and the contractor is made responsible for other people's blunders and even for "the act of God or of the King's enemies," as the legal jargon runs. No doubt there are some contractors who require tying up very tight; there are others whose pride is to make a good piece of work, and who ought to be regarded and treated as allies rather than as enemies. Then the hotly debated question comes in of referees in case of dispute. It may be said that where there is a good architect on one side and a good builder on the other, disputes seldom arise; disputes are usually the result of one party or the other not knowing his business or having done something wrong; and the fault is certainly not always on the side of the contractor. The builders complain very strongly as to the injustice of having a dispute settled by the architect or (in the case of municipal work) by the Borough Surveyor, on the ground that this is putting the decision into the hands of a man who is really retained by one of the parties to the dispute. As far as concerns a salaried engineer or surveyor to a corporation, we quite agree. A professional man in such a position is no doubt a retained advocate; he is officially bound to satisfy his Board or Council, and may be dismissed if he does not. But an independent architect to a private client is not quite in the same position. The proper, the ideal position of a competent and high-minded architect is to be the natural arbitrator between the building-owner and the builder, and to see that neither gets any wrong; and so far from his being necessarily regarded as a retained upholder of the building-owner, we knew an actual case in which, in regard to a dispute, the client said to the architect: "Of course, you naturally lean to the side of the builder"; a soft impeachment which was denied. But the remark showed that the client did not regard the architect as counsel retained on his side; and we could certainly name not a few architects in whose fairness in settling a disputed point all builders would have confidence. Unfortunately, the high-minded and clear-headed architects (for the mere ability to see a thing rightly may be wanting in some) have to pay in reputation for the misdeeds or mistakes of the other kind; and builders who have been victimised by high-handed and unfair treatment not unnaturally wish to safeguard themselves in future by a general recurrence to or threat of arbitration whenever there is a difference. We regret to know that there have been cases which went far to justify this attitude. But we may nevertheless remind them that the real position of the architect (where he is not holding a salaried office) is that of an arbitrator between client and builder; that an architect of the best type of ability and character is likely to be as impartial as any outside arbitrator, and knows much more about the work, and that such a man would regard the calling in of an outside arbitrator over his head as an undeserved insult, and would be justified in feeling it as such; and therefore the provision of arbitrators as a necessary condition of contracting ought not to be pushed too far, or regarded as a *sine quâ non*. There are some architects who would resent it very much, whatever the Institute form of contract may provide; to be sure, they are just the architects who would not be likely to afford any pretext for arbitration.

General.

We may group into one paragraph some miscellaneous subjects of complaint on the part of the building trade. One of these is a very serious one; the frequent delay in the settlement of accounts. We have heard of this complaint often, and we have certainly known cases in which it has arisen from unreasonable delay on the part of the architect to certify accounts. That is acting most unfairly to the builder, who has in some instances been most seriously injured by it. The builders also complain of contractors being eliminated by corporations employing direct labour. That is a question of the public interest. If corporations believe that they can save public money by employing direct labour, they will be justified in doing it. As a general rule, however, experience has shown that direct labour has not resulted in a saving to the ratepayers; there are notorious instances in which it has resulted in very considerable loss; and therefore it is not a system to be encouraged. That, however, is the principle on which the question must be decided. In the case of public work, contractors have no right to claim that they should be employed because it is for their advantage. What they must do is to show that it is not to the public advantage; where hey can do that they win their case.

The complaint that they should be made liable for the consequences of an outbreak of dry-rot in a building is a matter in which, as recent events have shown, builders are in the same boat with architects. It is now beginning to be recognised that dry-rot is a most insidious building disease which may get into a building without the fault of anyone concerned, and without any obvious reason. There are certain mistakes in construction which are favourable to it, which are even likely to cause it; and those mistakes have been more often the fault of the architect than of the builder, who only carries out the orders of the architect. We may suggest, however, that in cases where the builder's past experience has shown him that dry-rot would be likely to result from the construction employed, he would be doing right in calling the architect's attention to this, though we do not say that he is bound to do so. He cannot be considered legally responsible if he carries out the architect's orders, and no one ought to attempt to make him so.

The heavy liabilities which contractors lie under in respect of accidents to workmen in their employ, and which often bear most hardly and unfairly on them, are the result of legislation, some of which is very unwise, but which it is to be feared there is no chance of getting amended now. Liability for accidents to third parties, that is, to the general public, which has also been a subject of complaint, is only a matter of common law, and is in no way peculiar to building operations.

We have endeavoured to consider this chapter of grievances from an entirely impartial point of view, holding a brief neither for architects nor for builders, and sympathising very strongly with the latter in regard to some of their complaints.

In regard to others, as we have endeavoured to show, there is another side to the question which has been sometimes overlooked.

Lead Poisoning.

CASES of lead-poisoning among painters are undoubtedly very numerous—it is stated that 241 have been reported in one year—but since it is not necessary to report them, and since the fatal results are not always made the subject of an inquest, the full extent of the mischief is but little appreciated by the general public. The victim usually dies of a lingering illness, as in the case of a Tooting painter upon whom an inquest was held last week. About eight years ago, his widow told the coroner, the painter had suffered from the too familiar symptom of "wrist-drop," for which he was treated at a hospital. The trouble recurred at intervals, and occasionally the patient lost his speech. Finally he died, at the age of thirty-nine. The man's employer, when asked by the coroner whether there was no way of preventing such misery, replied significantly, "Well, if a man goes to his dinner after mixing paint without washing his hands, he may get lead in his food." "You believe," said the coroner, "that it depends on a man's habits?" "Yes," was the reply, "if a man is careful, there is no reason why he should have it." The pity of it is that so many men are absolutely reckless of their own vital interests as well as of the interests of their employers, from whom compensation is exacted. The law compels the employer to provide facilities for cleanliness; but then arises the difficulty that is recognised in the proverb about leading a horse to the water, and it is obvious that the best intentions may be easily frustrated by the very persons for whose benefit they have been conceived and shaped. The matter of lead-poisoning seems ripe for further inquiry.

Mr. John Slater.

IT is announced that Mr. John Slater has retired from election to the Council of the Institute of Architects, of which he has been a member, if we are not mistaken, for many years. The event ought not to pass without a word of recognition of his valuable work for the Institute, on the Council and in other ways. Mr. Slater's qualities of good sense, tact, exceptional knowledge of the practical side of architecture, and sound judgment in regard to questions of professional practice, rendered him an exceedingly valuable member of the Council, and on his retirement he will carry with him the respect of all those who have been associated with him.

Some Points of Order at the Institute.

THE persistent unpunctuality of the President and Council in making their appearance at the ordinary meetings, which cannot be commenced of course without them, is becoming a serious inconvenience to the general body of members. At the last meeting the chair was not taken till a quarter past eight, a matter which was the subject of a good deal of grumbling among the audience, who had taken their seats at eight. Ten minutes past eight is, as far as we have noticed, the usual thing; but it is a slipshod habit for a society to get into; and when a meeting is advertised in print to be "at eight o'clock precisely," the chair ought to be taken at eight, and not at ten minutes or a quarter past the hour. The stumbling-block is, no doubt, the Council Dinner before the meeting, which gets prolonged a little beyond due time; but that is unbusinesslike. Surely the advertised meeting-hour should be kept in mind and acted on. Another point is that the names of new members coming up to the chair to be received should be audibly announced to the meeting. As it is, the name of the member is usually a kind of confidential communication between the Secretary and the President, and, except the new member's personal friends who may be present, no one knows who he is. A third point is that men who are to be brought forward and formally admitted by the President at a general meeting should show a little respect to the Institute by donning a more formal costume than tweeds for the occasion. We caught a *sotto voce* remark on this head at the last meeting, and hereby give it publicity.

The Cottage Conservatory.

A NEW "petite-culture" cottage that has been evolved from the fertile imagination of an ingenious correspondent of the "Times," has the peculiar advantage that it will not only pay its own rent, but support the tenant and his family. It represents a "departure from the conventional mode of construction which will enable the owner to make it pay for itself, and while blessing the individual will redound to the benefit of the nation." Note the remarkable chain of reasoning which led up to the momentous deduction: "One finds that wherever there is a cottage there is a garden attached"—an important discovery: previously one was rather uncertain as to the universality of the phenomenon. Then, the "cottager or plotholder who wishes to raise early flowers or vegetables must assist Nature to overcome the vagaries of our changeable climate by erecting a greenhouse or setting frames upon hotbeds. . . With every extension of ground under glass there is increased productiveness, for one square yard here is as much consequence as five square poles in the open. The cottager cannot go on indefinitely adding glasshouse to glasshouse. Indeed, many men cannot raise the money to start one. But why not have a glass roof on his cottage from the start? The area is larger than he would think of setting up as an auxiliary in his garden. The roof is strong and serviceable as any other, and the expense of construction—even with the addition of hot-water piping and staging for boxes—will not add more than 10 to 20 per cent. to the price usually paid for a slate or tile roof. Under the best designed roof not less than one-tenth of the whole space is lost or is unavailable, but with the glass roof the whole space is saved, and the practical utility of the building is ample recompense for the augmented first cost." He adds (quite unnecessarily) "that there may be some who think that I am overstepping the bounds of possibility. But it is not so; the thing is done every day, and when the conditions are considered it is not unreasonable." Exactly; and even greater things are done every night under the names of that now eminent firm of architects Messrs. Ventimore and Pringle, at the sign of "The Brass Bottle." We should not be surprised, however, to learn that this great idea may occasionally fail of fruition owing to the obstinacy of cottagers who prefer not to raise families under hot-house conditions. Besides, the suggestion is somewhat inopportune in view of the growing popularity of aviation. When the upper air is thick with aeroplanes, the delicacy of the glass roof is merely physical. The modern Asmodeus would not need to remove the roofs of the cottages in order to pry upon their inmates. But no doubt the ingenuity of the advocate of this new system of construction is sufficient for the pulverisation of these and all possible objections to his very fascinating scheme.

The Institute Premises.

THOSE who are anxious that the extension of the Institute premises should be carried out in the manner most convenient and useful for its members will regret to hear that there is reported to be a backsliding on the part of the Committee towards the heresy of retaining the present meeting-room as such, and dividing the library over three storeys of the building. Such an arrangement would be ruinous for the working of the library, besides needing extra trouble and an increased staff. What is wanted is that the library should be as concentrated as possible, and the meeting-room kept separate from it; and there should be (which could in that case be possible) larger accommodation for readers. It is not uncommon now for a reader coming to study some books to find all the tables occupied.

THE ART OF THE MONUMENT.

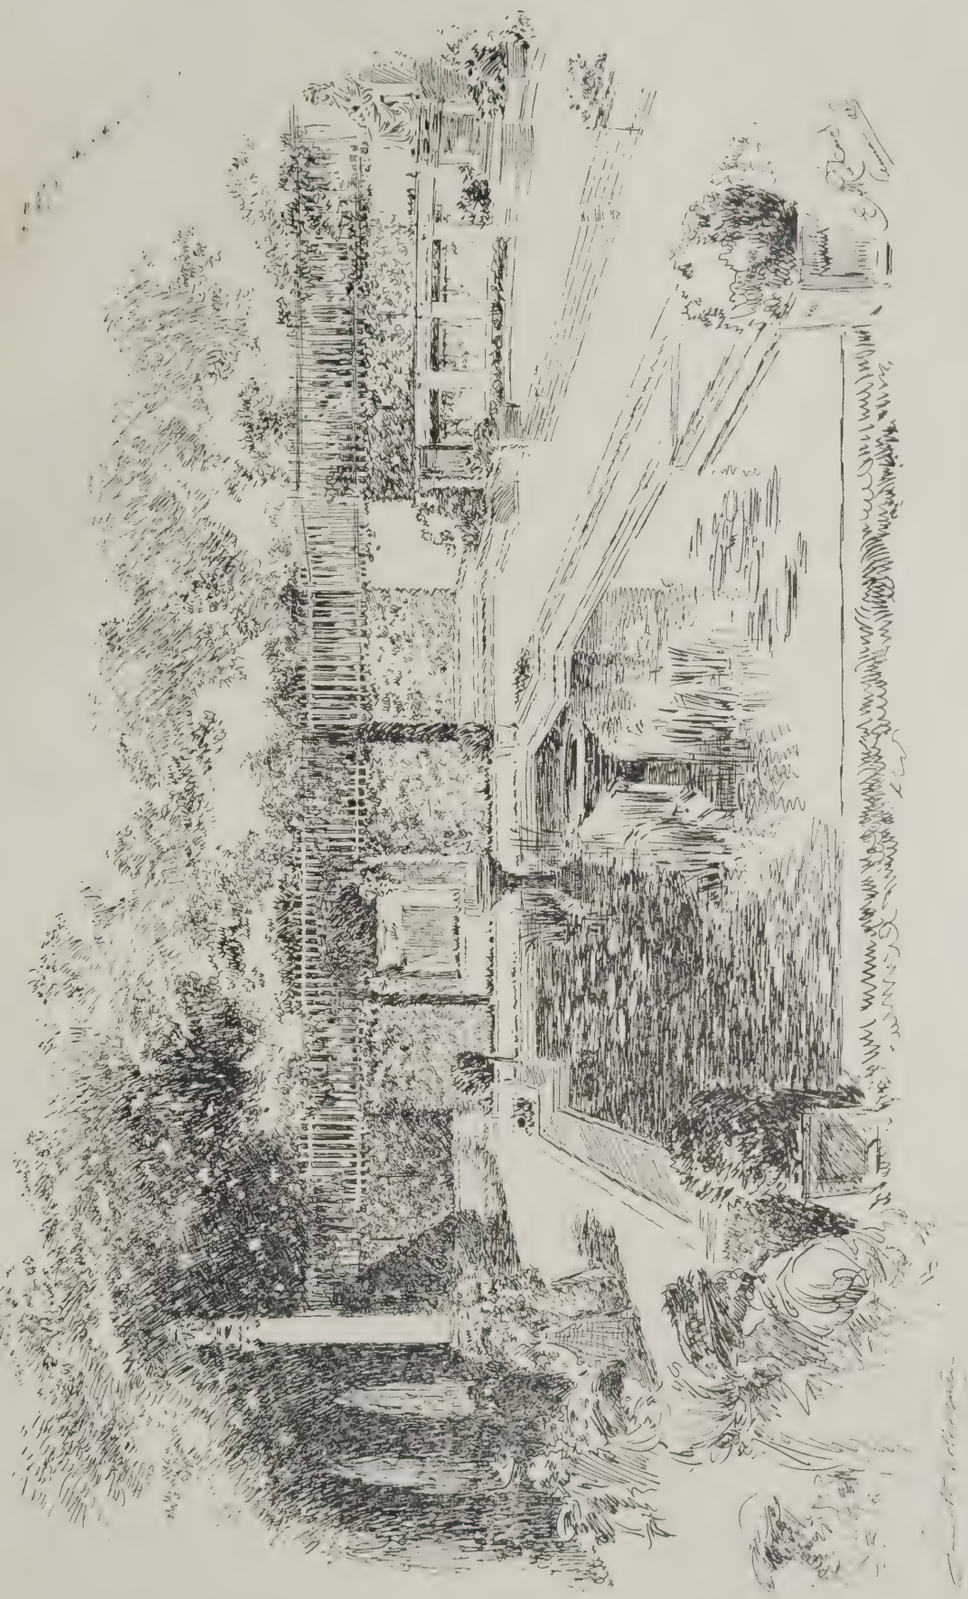
By E. A. RICKARDS, F.R.I.B.A.

[*Mr. Rickards, in his paper at the R.I.B.A., thought that he would be expected, most probably, to catalogue the acknowledged masterpieces, analyse them, and derive lessons from the analysis which would amount to something like rules for guidance in composing modern works of art to serve the same purpose. Such ground had "been trodden wearisomely level"; to compile such a list would bore him extremely and weary his audience. His paper therefore turned largely on the ethics of monument design, and the relation of monuments to their surroundings.*]

The point I wish to make about the smaller monument is that its intimate nature demands that it should be easy of approach and yet have nothing of the vulgar display of the shop-window. Its subtle appeal should be apprehended above the din of the noisier world; it should speak as one who speaks in a low tone and yet carries to the farthest limits of the theatre. This is the theory which should underlie its placing, and when this is disregarded the resulting effect brings about the ridicule which is always bestowed when it is thus invited. The very quality of such realism I have attempted to describe, which is so attractive in the smaller monuments, necessitates a small oasis in which we can come to terms with it; and, besides, the *ensemble* of any small composition is neither to be observed in the crowd nor appreciated in the full glare of the open, where it is lost in space. The presentment of a philosopher, for example, seated or standing on a lonely base in the centre of a large piazza or open traffic-space is as ridiculous as that of a graceful allegory raised slightly above ground-level in the heart of city traffic.

Public monuments should be allotted to positions which have been prepared in advance for such adornments; if not to form an integral part of our buildings, at least to be in

STUDY FOR SETTING OF STATUE OF JOHN WESLEY, NEW WESLEYAN METHODIST HALL, WESTMINSTER. BY E. A. RICKARDS.



IN THE BOBOLI GARDENS, FLORENCE. FROM THE DRAWING BY E. A. RICKARDS.

the shadow of such of those as have that dignity and breadth which might enhance the more plastic art of sculpture, and, in addition, would suggest material for the architectural portions of each monument itself; so that its harmony with immediate surroundings would be secured, and a resultant scale of detail, perhaps unconsciously, but instinctively, adopted in all its parts. The time is not so far distant, I hope, when those of us who are fortunate in having to carry out work of a large and public character will be allowed some jurisdiction over those things which should really be necessary to the general or dominating composition; but the fact remains that once the building line is crossed this is very rarely allowed us. Yet we are more and more embodying sculpture in our architecture, often as a literal advertisement of the purpose of the building itself, and in some cases the chance of including an almost detached monument or a series of monuments does occur. It would be taken advantage of much more frequently if we, as architects, had not such a cold and an aloof attitude towards the art of sculpture. I mean this literally.

I give an example of setting a monument within the containing lines of a building I am concerned with at the present time. The base to the foundation is made of a continuation of the details of the base to the general building, and the sculpture takes its place with that on the main façade, and will probably be carried out by the same artist.

When the smaller monument, which embodies a single figure, is placed in such an atmosphere as a large park, or garden, or expanse, multiplication certainly enhances the value of each individual design, and I cannot help thinking that some standardisation in the matter of the pedestal and accessory foundations (of course, with every variety of detail suitable to each separate case) would result in a great development of this art of exploiting and enhancing the work of the sculptor. The sculptor would then have something of a definite scale to which to attune his creation, and though free within limits, would be led, as were the Greeks, to a consistency of treatment of portrait figures which might lead to great perfection in style, or at least some parallel methods which might be commonly developed.

In the case mentioned, I presume the figure would be usually a foot or so over life-size, and would be seen in each example from much the same angle and distance. Where it

MEMORIAL TO THE EMPRESS ELISABETH, IN VOLKSGARTEN, VIENNA. FROM THE DRAWING BY E. A. RICKARDS.

would have a standing pose and would be free to be seen from all sides, a pedestal more or less square in form would naturally suggest itself, and the general lines would, I think, find the same proportion and contrasts in relation to the figure.

When I speak of standardising a pedestal, I would admit varieties, of course, and variations in each type; but I suggest this as against the absolute freedom of design so generally allowed. There is a scale in these things, as in any other form of decoration or architecture, and the reason we are not always conscious of this is because the right pitch is seldom maintained in any considerable number of examples in any comprehensive scheme. I give an example of a single figure and pedestal, consisting of a portrait figure in a quiet pose, which might be the same scale and bulk as a hundred others in a city, or portion of a city, such as a park or symmetrically arranged neighbourhood where such adornments might occur. This shows a pedestal simple in effect, which, in the nature of scale and detail, might be designed in harmony with the accessories of adjacent buildings; presuming this to be placed in a position such as I have hinted at in my preceding remarks, it would be seen in fairly close proximity and from all sides.

This raises a point of difficulty with the usual square pedestal—the greater width on the diagnal, which gives the pedestal quite a different proportion against the same bulk of figure, thus presenting the figure in proper proportion with its pedestal from only certain points of view.

You will see by the next figure that this may be overcome without departing materially from the general square lines of the design. In fact, I think it has with it certain advantages in blending the cylindrical form of the single figure with the square lines at the lowest part of the base. The dotted lines show the bulk which a square pedestal would entail, of the same width which this presents from the front view. Yet the reduction in the width on the diagonal is as much as is shown at A. (see p. 548). The result would be a pedestal with all the strong vertical lines of a square pedestal, and from every point of view the bulk shows the same proportion to the figure above. I have not exhibited this idea as the last word in design of a monument of this type, but simply as an example of reasoning out an *ensemble*.

Rather than advocate more conventionality of treatment of the figure, I would appeal for as much plasticity and variety of detail as possible in the treatment of its setting. There is no doubt that delightful freedom is equally welcome in a setting, as I can best instance in the water garden of the Boboli Gardens at Florence. Here the statuary is far removed from the severe forms and strong horizontal lines of the Palace architecture, and just as these are reflected in a softened

THE FOUNTA'N BY DONNER, VIENNA. FROM THE DRAWING BY E A. RICKARDS.

IN THE SCHWARZENBURG GARDENS, VIENNA. FROM THE DRAWING BY E. A. RICKARDS.

manner by the formal clipped hedges and enclosing curved lines of the garden and basin, so the monuments themselves are treated in this freer manner of substituting entirely plastic forms for their architectural portions. It is comedy, but beautifully constructed as any other instance of architectural drama might be.

With nearness of approach, the monument has still to be of very small proportions if the portrait figure is to be sufficient to dominate the whole structure. Even with any accessories which it is possible to group with it, it is difficult to compose a mass of adequate weight to do this unless the scale is increased to proportions too coarse to be considered. It seems to me that more legitimate means might be found to surmount the monument, perhaps by a graceful form of some allegory or purely decorative feature, and the portrait figure introduced rather as a salient feature, within the range of intimate approach, but not necessarily to be seen and recognised from any distant view. Certainly the sculptor's delicacy of treatment in the case of a presentment of a distinct personality would be more appreciated than if silhouetted, as it would be in the former case, sometimes unavoidably against the light, and great opportunity is introduced by the more abstract form which might be employed in its place. The difficulty of designing a monument of sufficiently commanding proportions and yet keeping the sculpture within the necessary limits of legitimate treatment might thus be solved.

With regard to monuments including an equestrian figure, the added bulk of the horse and figure, of course, dominates more successfully any considerable size in the remainder of the design, and a very successful *ensemble* is possible by means of these forms, as many beautiful examples attest. Still, I should like to see an attempt on the lines I have just suggested for the placing of the portrait figure. A most original and beautiful composition, I am sure, could be arrived at in this way provided that an artist or artists of the right understanding were employed.

In considering this art of the monument we therefore arrive at a stage where its size and importance necessitate that the one element should take up its due relation with regard to the whole composition, and by its very reserve and dignity of appeal reach further than in a vulgar attempt to shout down its fellow.

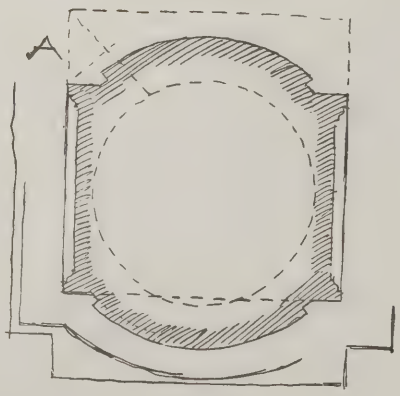
In illustration of this is a sketch of this from the model originally made by Stevens for the Wellington Memorial in St. Paul's. It is well known to us all in the South Kensington Museum, yet I fear that few of us could tell the main points of difference between the complete work and this very beautifully balanced design. There can be no questioning the fact that in the sketch the sculpture is the dominating factor—the architecture is reduced to the merest support for the display of the figures. Its reticence is remarkable; although it is delicately elaborate and in all harmony with the more plastic forms it seems to tie together (witness the resolution of the side figures into the horizontal lines of the cornice to grouped columns around the sarcophagus); there is no architectural form which asserts itself in competition with the sculptured portions of the monument. It frankly asserts its position as furniture of a large interior where these forms can be employed on an adequate scale, and attempts no display of imitation beyond the fine, simply treated and more delicate mouldings which are necessary to secure the balance of the parts and bring the whole design gracefully to the horizontal rest at its base. There is a resiliency and play of design which almost amounts to movement. In a word, there is life in the whole structure, from the horse and figure at the summit to the varying perspective of the grouped columns which screen the beautiful and free lines of the sarcophagus and the recumbent figure of the duke. I think I describe it

STUDY FOR EQUESTRIAN MONUMENT. BY E. A. RICKARDS.

in giving it the quality of furniture, and though it is of considerable dimensions, one must remember the size of the interior for which it was intended.

How much of this quality has been lost in execution it is easy to see by comparison. The introduction of the arbitrary forms of the curved pediment to the arch, the little pediments under the side figures which destroy the beautiful resolution of the swirl of the sculpture into the cornice line beneath, and a general feeling of tightness which is augmented by the harshness of contrast between materials, all go to support my argument that here was a case in which the sculpture was the predominating of the two elements and the insistence of the architectural forms uncalled for.

To pass on to a scale of monument in which the sculpture to predominate would pass all bounds of due relation to the life and surroundings in the midst of which the memorial might be set: The only way, it seems to me, in which it could be conceived satisfactorily would be as a unit of the whole, either as the focal point of interest in a scheme of abstract or architectural forms of design or repeated as points of emphasis and subordinate to the general composition. I can think of no more effective illustration of the former idea than the memorial to the Empress Elisabeth at Vienna which occupies a corner of the Volksgarten adjoining the Hofburg Theatre. This is composed by an enclosure of formal hedge and trellis work, with occasional more solid features inset, surrounding a basin and fountains of square form, the design of which enhances the general placidity and restfulness so appropriate to the scene. At the end of this retreat, on a slight eminence, as though it were a shrine, is placed the portrait statue, and this figure, though only a little above life-size, is the culminating interest of the memorial, which is so arranged as to lead one gradually to the intimacy of a close inspection of the features of the Empress.



In the case of one placed in an open square under the shadow of buildings of a certain scale, and in close relation to the life and human interest of a city, a repetition of interest spread over the whole monument, or rather what I might call a composite design, might solve the question of scale and relation to the neighbourhood of its setting. In my imaginary illustration I have shown an equestrian figure of little more than the scale which would be fitting if this constituted the whole memorial, but, in combination with the accessory figures at its base and the fountains and other details which complete the group, the whole monument would amount to a general mass of sufficient proportions. The units of this

STUDY FOR A MONUMENT WITH THE FIGURE SUBSERVIENT TO THE ARCHITECTURE. BY E. A. RICKARDS.

composition are all within the range of close inspection which their scale necessitates, and the dignity and scale of the surrounding architecture is left undisturbed by any undue competition with their salient and decorative features.

In compositions of any greater proportion than this last example, sculpture, figuratively speaking, should be at the feet of a master element as its limits of possible scale and treatment are defined, but also I believe that any purely

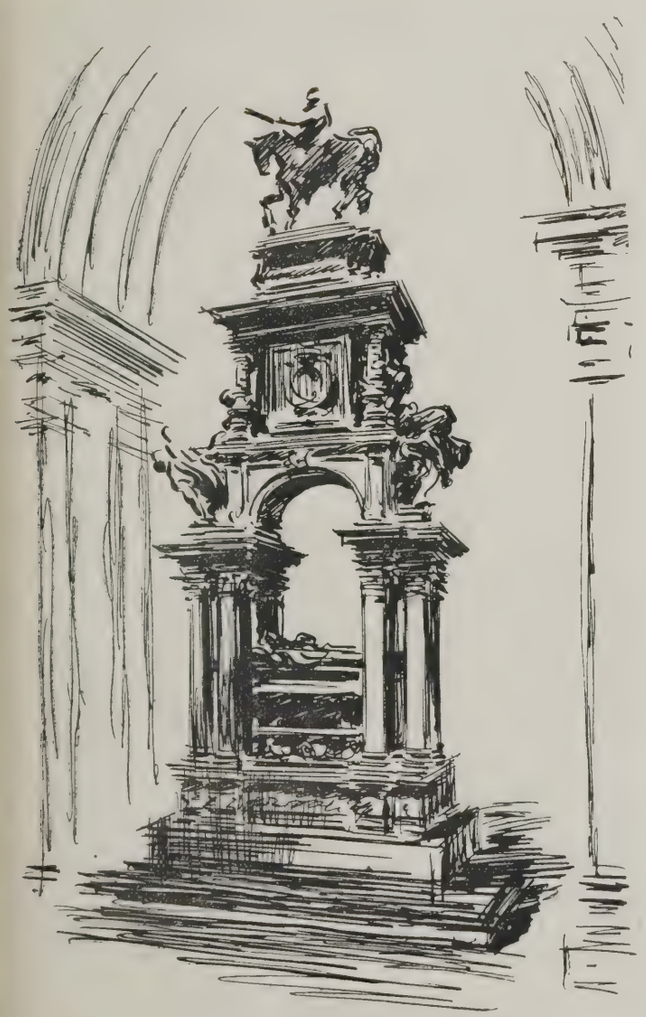
Elevation.



DETAILS OF PEDESTAL TO PORTRAIT STATUE. BY E. A. RICKARDS.

decorative composition, such as we have so far discussed, cannot very greatly exceed in size the dimensions suggested in my illustration, unless it serve some semi-utilitarian purpose, such as a triumphal arch, gateway, or water approach or similar architectural composition. I have endeavoured to show the reasons which define the limits of proportion in sculpture, such as its relation to life and the accessories of buildings within its range, and I think that the same rules might apply to the architectural or abstract forms which in their turn have their vassalage to perform.

I have one more sketch in illustration of the theory of complete subordination of a monument to an architectural mass. It will be seen that this constitutes almost a return to the monument of a smaller scale than that which is of the largest possible size to stand alone with dignity, and is, as it were, sheltered by the containing lines of the gateway behind; the whole forming a monument which we will suppose takes its place in a general decorative and utilitarian scheme in the combination of park and city.

Discussion.

Mr. Howard Ince, in proposing a vote of thanks, said that Mr. Rickards spoke not as a mere theorist, but as one who had given particular attention to his subject. There was, he believed, on the part of the architect a sincere desire to advance the art of the monument in London. The art of the monument was the making of history, and, though the nation might be careless, the degree of civilisation attained would be judged by the work of the sculptor and the architect in combination. This involved on the part of the sculptor a sense of reciprocity—an ability to join hands and work in combination. In this they would only be following the example of their French confrères. He was personally a great believer in æsthetic analogy. They would not think of a picture as being complete without the frame; and, in like manner, no work of sculpture could be complete without its architectural frame. Monuments in London were invariably put on refuges in the midst of traffic, were irregularly formed, and had no basis in architectural *motif*. The speaker then commented favourably on a small monument to Cardinal Newman at the Oratory. The back view of a supported statue, he continued, was usually no more interesting than the stretchers at the back of a canvas. Indian monuments to Queen Victoria had no canopy; but an interesting example of the proper use of the canopy was the Albert Memorial, where the quiet rest of the statue placed beneath gave a very fine effect. The statue of the late Duke of Cambridge occupied a singularly unstrategic position, and he would have preferred to see it in the courtyard of the Admiralty. The screen at Hyde Park Corner, although a fine piece of work, would not lose, but, on the contrary, he believed, would gain by the addition of figures at either end—two facing inward, and two facing outward. It was unfortunate that the Commissioners of Works were not present to gain much instructive information from the lecture. Mr. Rickards had had considerable influence upon his fellow-architects, and he (the speaker) hoped that opportunity might present itself for the utilisation of Mr. Rickards's undoubted qualifications.

SKETCH OF STEVENS'S ORIGINAL MODEL FOR THE WELLINGTON MEMORIAL, ST. PAUL'S CATHEDRAL.

Mr. Bertram MacKennal seconded the vote of thanks, and said it occurred to him that a monument to a man should be set in surroundings significant of his life and work. Take, for instance, a monument to a great horticulturist. This would be utterly ridiculous if not situated in a position having some bearing upon his life. A monument to Darwin, in like manner, would require a huge square to itself. What he wanted was every man to be honoured by his work and his life, and not merely by his image.

Mr. H. H. Statham supported, and said, with regard to the remark about French sculptors and architects working together, this was not an innate virtue, as Governmental authority always saw that an architect designed the pedestal. Nothing was more depressing than the figures of the frock-coated gentlemen to be seen at the Octagon Room of the Royal Academy. He wanted to urge that the French had hit on the right way of treating monuments. They put a bust on top of a pedestal, and arranged around it symbols of the subject's work.

With regard to the placing of a monument in a fit setting, an example ignoring this requirement could be seen in that to Alfred de Musset. It seemed quite out of place in its present setting, and should have been withdrawn from the material world. A suggestion had been made by an anonymous writer in the "Times" that the best possible monument to the late King would be a new façade to Buckingham Palace. It was an excellent suggestion; otherwise, at the completion of the Victoria Memorial, this great sculpture group would have but a poor background. He had great pleasure in supporting the vote of thanks to Mr. Rickards for his lecture, and for his fine drawings.

Mr. Rickards, in reply, said he was not disappointed with the audience, in spite of the absence of Commissioners of Works. They heard much about the Victorian frock-coat in sculpture, but he was not sure that the sculptor of the period could altogether afford to ignore it. He disagreed with Mr. Statham about the monument to Alfred de Musset, which he had intended to mention as an appropriately situated example, not altogether satisfactory, perhaps, but approximating the desired setting.

NOTES AND NEWS.

Restoration of Chester Cathedral.

In connection with the restoration work the Dean and Chapter have issued a fresh appeal for help. Two years ago they asked for £6,000 for the rebuilding of the organ and the restoration of the south transept door. Subscriptions amounting to £4,500 were received, and the work has been done, and payments amounting to £5,490 have already been made. The Dean and Chapter now wish to raise the remaining £1,500, and an additional £1,500. The last-named sum is required, partly for urgent repairs to the cloisters, which it was discovered last year were in a dangerous state, and for extra work done, by order of the architect, to the south transept. The restoration account is overdrawn at the bank to the extent of £972, and £699 is owing to the organ builders.

Kirkwall Cathedral Restoration.

The Town Council of Kirkwall have again considered the question of the restoration of St. Magnus Cathedral. Bailie Garden moved that it was desirable that the Town Council and the Presbytery of Kirkwall should hold a joint meeting to discuss the draft agreement with regard to the restoration, and endeavour to adjust existing differences of opinion, and that the Town Clerk be authorised to approach the Clerk of Presbytery so as to arrange for the joint meeting being held on an early date. Bailie Baikie and Mr. Scott suggested that the opinion of counsel which had been obtained should be published. They were dealing with public property, and were attempting to drive a bargain, while the public did not know what they were bargaining about. Bailie Garden's motion was agreed to, on the understanding that the conference with the Presbytery would be arranged within a month.

The Art of the Landscape Architect.

Mr. Thomas H. Mawson, Lecturer on Landscape Design at the School of Civic Design, Liverpool University, writes to correct "an obvious but pardonable error" in an abridged extract from his remarks made at the annual meeting of the Country and Municipal Engineers. Speaking to Mr. Haynes's admirable paper on "Town Planning," he said that if engineers wished to secure a scholarly grasp of the principles of town planning, they could no longer afford to neglect the work of the landscape architect—a profession which had given us Le Notre, Alphand, Dr. Stuben, the Olmstead brothers, and Mulford Robinson. The two first-named had given us the "grand manner" in town planning, arranging boulevards, squares, streets, parks, and buildings in one coherent scheme; and the last-mentioned has given us the lead in an enthusiastic form of literature with the theme of civic art as its inspiration. In order to emphasise the loss suffered in this country, due to ignoring the profession of landscape architecture and its principles, Mr. Mawson "compared our private gardens—which are superb, and by general consent the most beautiful in the world—with our public parks and open spaces, which, in so far as they depend upon design, are the worst in Europe. This," he continues, "is far from saying that our national and public parks and gardens are visually disreputable. The fact is that the ideal sought in private gardens is different from what should be the ideal in a public park. In a garden a person initially begins with a slice of our beautiful country, and seeks to conserve what is there and suitably adapt, dress, and add to its charm, so that it may minister to his private rest, seclusion, and delight. To secure this happy consummation the landscape architect's advice is usually sought and followed. In a public park, where the object is 'the greatest good to the greatest number,' you must first study grand and comprehensive effects, ease of access, and the composite civic perspective; afterwards, where possible, you may adorn and beautify according to the art of the garden designer. Thus, then," he explains, "it was not the parks dependent upon natural features which I spoke against, but the fact that in this country what is added is the work of amateurs, practical gardeners, or nurserymen, whereas on the Continent and in America they are arranged in accord with the anatomy of their respective towns by professional landscape architects. This statement can be substantiated by reference to the officials entrusted with this work in almost any of our important towns, from the London, Liverpool, Manchester, and Glasgow County Councils downwards. For our art, and also nationally, it is unfortunate that foreign municipalities send to Paris, Berlin, or America for qualified advisers; they would come to England if we could show stimulating examples."

"The Siege of Edwardes Square."

Apparently because just now there seems to be rather a dearth of news, the daily papers have given up many columns to the incidents that have occurred in the attempt to assert a right of way or right of entry to Edwardes Square, near Kensington Road. The "picturesque" descriptive writer has been let loose on the subject, and has in some instances succeeded in getting himself arrested as a trespasser. In others he has let himself go in similar terms to these: "The beautiful gardens where Miss Evelyn Millard has been wont to study her parts, where Laurence Housman has dreamed his poetry, where Professor Bradley has mused, and Frank Cadogan Cowper the artist has got new ideas of colour scheme, were abandoned to the birds." It is also insinuated that they are likely to be abandoned to the builders. The freeholders have asserted their rights by padlocking the gates, the public, supported by the Kensington Borough Council,

("*The Art of the Monument.*")

See previous pages.

who are under obligation to maintain a certain carriage-way that is involved, have retaliated by sawing and filing through the chains. Then the freeholders set up barricades, which were soon chopped away. Huge balks of timber were next set up, and whether they remain in position we do not know; but a practical-minded war correspondent at the front ("of the railings," it is explained) remarks that "the local timber trade is looking forward to a period of unexampled prosperity." We understand that this expectancy is shared by the lawyers.

Manchester Society of Architects.

The "Programme of Summer Visits and Prize Competitions, 1910," of the Manchester Society of Architects contains particulars of the prizes offered for designs, for measured drawings and sketches, for the result of the year's work as a whole, for the best set of architectural notes, and for the best work done in the School of Architecture Elementary Design Class. The summer visits take place on Tuesdays and Saturdays, as follows: May 28, Gawsworth Church, Hall, and Rectory; leader, Mr. A. E. Corbett. May 31, St. Michael and All Angels' Church, Bramhall (Messrs. H. Gibbons and Son. Bramhall Hall, architects; leader, Mr. Roger Oldham. June 11, Over Peover Hall; leader, Mr. Isaac Taylor. June 14, Middleton, Two Schools (Messrs. Edgar Wood and Sellers, architects). June 28, Royton, Church (Mr. Temple Moore, architect). July 2, Shrewsbury; leader, Mr. H. B. Laycock. July 23, Nantwich; leader, Mr. J. H. Somerset. July 26 "The Oaks," Fallowfield (Messrs. T. Worthington and Son, architects); leader, Mr. J. H. Woodhouse. August 16, St. Augustine's Church, Pendlebury (the late G. F. Bodley, architect). August 20, Leeds, St. Chad's Church, additions (Messrs. J. H. Gibbons and Son, architects); St. Margaret's Church (Mr. Temple Moore, architect; leader, Mr. J. H. Sellers. September 6, Y.M.C.A. premises, Peter Street (Messrs. Woodhouse, Corbett, and Dean, architects). September 10, Ormskirk and Latham Hall; leader, Mr. P. S. Worthington, M.A. The Tuesday visits take place in the evenings. Mr. J. Herbert Somerset is hon. sec. of the Education Committee, and Mr. J. Theo. Halliday, 16, St. Mary's Parsonage, Manchester, hon. sec. for summer visits.

Crosby Hall Rebuilt.

In the intervening three years since Crosby Hall disappeared from its City site much work has been done, with the result that the old building has been very carefully and reverently re-erected on part of the country garden of one of its famous mediæval owners. At least it is contended that Sir Thomas More wrote part of his Utopia within its walls, and as cruel fate condemned the old hall to be either destroyed or taken down and re-erected in another place, the best possible course has been taken in rebuilding it on its present site, where it will form part of the New University Hall of residence. Needless to say, the work of transferring the building has entailed unremitting care on the part of the architects, Messrs. Wratten and Godfrey, of Carteret Street, S.W., and the builders, Messrs. Trollope and Colls, West Halkin Street, S.W. The initial work involved an exhaustive examination and measuring up of the old building, and the plotting on paper of the various stones and timbers, so that they could be placed in the same positions on re-erection. The materials themselves as they were taken down were also marked to correspond to the charts that had been made, and the care and labour required to carry out these necessary preliminaries can hardly be over-estimated. The old stone floor was too damaged to be removed; and so a wooden one replaces it. The floor timbers of the Musicians' Gallery have been re-erected; but the oak screen below it and the wooden front to the Gallery will have to be replaced, as they had been improved away in the old structure. Two new windows have been inserted at one end of the Gallery to correspond with those at the other end of it; they had been blocked up by adjoining buildings in Bishopsgate. A roof lantern has also been added. The exterior stonework was faulty in many places, but has been retained and re-used wherever possible.

Engineering Institutions' New Homes.

The Institution of Civil Engineers, the Institution of Electrical Engineers, and the Institution of Mechanical Engineers are securing new homes. The first-named, who have occupied premises in Great George Street, Westminster, since 1838, are about to begin building on a site at the corner of Great George Street and Princes Street. Their present building, which was erected in 1896, is to make way for new Government offices. Although the existing premises are so recent and so large, the Institution, which has now a membership of more than nine thousand, and may reasonably anticipate further expansion, is apparently in need of further accommodation. Its new building will occupy an area of about 21,000 sq. ft. The first floor will be occupied by the lecture theatre, the great hall, and the main library, these apartments being conveniently planned for the accommodation of large assemblies. An interesting feature in the construction will be the introduction of timbers and certain other products of various parts of the British Empire, so as to symbolize the widespread membership of the Institution. Mr. James Miller, F.R.I.B.A., is the architect. The Institution of Electrical Engineers is not building, but, having acquired the Examination Hall of the Royal College of Physicians and Surgeons on the Victoria Embankment, has carried out an extensive scheme of reconstruction which is now so near completion that occupation will begin on June 1st. In its remodelled form the building will possess a handsome marble entrance hall, through which access will be gained to the lecture theatre, which has been doubled in size. The floor of the new hall is of teak, laid on a solid concrete foundation, and the walls are of Spanish mahogany. Invisible top lighting by metallic filament lamps will be employed, while in the space above the glass roof powerful arc lamps will, it is understood, be fixed. The offices of the institution will be in the east wing, adjoining the entrance hall, the west wing being utilised for the council chamber and tea and smoking rooms. On the first floor will be located the library, a spacious room over 100ft. long overlooking the river Thames. The second and third floors of the building will be retained by the old proprietors pending the erection of their new premises in Queen Square. In the wiring for the lighting of the reconstructed building the "Kalkos" watertight system has been employed, every joint being soldered. The contractors for the reconstruction are Messrs. Prestige and Co., the amount of the contract being £12,000. An enlargement scheme is also being put in hand by the Council of the Institution of Mechanical Engineers. The necessity for additional accommodation has long been evident, and the adjoining site to the existing premises has now been acquired. This will give the institution an unbroken frontage along Princes Street from Great George Street to Old Queen Street.

German Professor's Profound Researches.

For five-and-twenty years a German professor, with appalling patience, has devoted himself to investigation and experiment with respect to noises in dwelling-houses. He has made some tremendous discoveries—as that "the more solid and tough and strong the building material is, the more quickly and loudly it conveys sound." We suppose that he is prepared to prove, with every circumstance of scientific ascertainment, what we had long dimly suspected—that sounding brass and tinkling cymbal respond more promptly and stridently to percussion than, for instance, freshly gauged plasterers' putty. When, however, the savant proceeds to develop the theory that "another sound-law in building is that the conductivity increases with the tension, as is perceivable in the case of the wires of a piano," we must confess to some slight suspicion that he is straining after sensational effect. There are limits to human credulity. Nor do the results of

the professor's experiments with partition walls greatly reassure us that his imagination is not more luxuriant than is quite becoming in a German professor. "The loudest noise," we are told, "was transmitted by those of tiles and cement, while the last was transmitted through walls of solid clay." This deduction is so startling that one would like to follow step by step the doubtless very complete series of delicate experiments which led up to it. Other daring propositions (derived from careful experiment) are that the more a brick is burned, the more noise it carries; that when a floor is covered with sand, and cork mats are spread over it, hardly any noise penetrates to the room below; that the thicker the walls the less penetrating the sound; that double windows and double doors sensibly diminish sound, and that wall curtains and hangings have a like effect. It takes (in Germany) a quarter of a century of unwearied research to establish these staggering conclusions, and thus to enrich the world's scanty store of scientific knowledge. The proofs that fire burns and ginger is hot i' the mouth presumably lie outside this learned professor's lines of investigation. We observe, by the way, that his name is given as Nussbaum, which, being interpreted, is "Nut-tree." Can it be a chestnut?

Excavation and Architecture.

The chief results of the work of the British School of Archæology in Egypt during the first half of the season have been in illustrating the rise of the architecture and sepulchral system. The field of the work—at Meydum, about forty miles to the south of Cairo—is, says a "Times" correspondent, important in the history of architecture, as it contains the oldest of the pyramids and the earliest group of tomb sculptures. In the burial chamber of the largest tomb (which is a mound 340ft. long), it was found that a short sloping way led to a lofty passage 45ft. long, from the middle of which branched a cruciform hall, 31ft. long and 20ft. wide. At the head of this was a sarcophagus of red granite—the oldest known, having been cut about half a century before that of the Great Pyramid. The chamber is 16ft. high, and is finer than any private tomb known, even

exceeding many of those in the pyramids. The main discovery at Memphis has been the remains of a large shrine built of quartz rock by Amenhotep III., from which two fine blocks with figures of the king and a goddess have been brought away, as well as a perfect portrait head of King Amasis. Photographs of the discoveries were shown at the annual meeting of the British School on May 24th. The work that is being done by the various excavating schools is gradually producing a mass of data which, in a short time, must necessitate the extensive revision, if not the rewriting, of architectural history.

The Strand Improvements.

The Improvements Committee of the London County Council propose to proceed with the rebuilding of 143 and 145, Strand, and have accordingly considered the question of arranging for the setting back of the frontage of the premises to a line agreeing with the frontage of the Strand at its junction with Wellington Street, and inquiring whether in the event of the improvement proceeding, the Westminster City Council would contribute one-sixth of the cost of the improvement, which was estimated at £7,500. The Westminster Council recommended the Council to make a one-sixth contribution.

The Illuminating Engineers.

With the annual general meeting of the Illuminating Engineering Society at the Society of Arts last week, the work of the first session of the society was brought to a close. The society was created in order to bring together engineers, architects, members of the medical profession, and others who are interested in various aspects of lighting, so that they might exchange views and help to bring about better conditions of illumination. In their report presented to the meeting the council stated that the anticipations of success have been fully realised. Lectures and papers dealing with various aspects of lighting had been read, and the fundamental ideas in which the society was interested had spread in all directions. The desirability of better educational facilities in connection with photometry and illumination at technical institutions and colleges had been discussed. A movement to organise lectures on the subject was on foot. The membership of the society exceeded 230. Three distinguished

honorary members of the society had been elected: Sir William Preece, one of the earliest to study the measurement of illumination; Sir Joseph Swan, one of the inventors of the electric incandescent lamp; and Professor A. G. Vernon Harcourt, the inventor of the ten candle-power Pentane standard of light. The society had also received an official invitation to be represented at the International Medical Congress to be held in Brussels this year, and proposes to send delegates. At this Congress the question of the hygienic conditions of factories and schools and the effect of light on the health of employees would be studied in connection with the engineering aspects of illumination.

THE EIGHTEENTH CENTURY ARCHITECTURE OF BATH.

A REJOINDER BY HAROLD FALKNER.

[*Mr. Falkner speaks strongly in favour of Baldwin and his work, and denounces the destruction of Bath Street, which he says is an "everlasting disgrace" to the City of Bath and the present generation of architects.*]

I was amused to read the discussion on Mr. Mowbray Green's paper at the Architectural Association. We were told that the architecture is "dull monotony," and that the houses are "unsavoury." Mr. Green says that Baldwin's mouldings are "attenuated and poor"; the detail of a door by him "is debased, and it lacks the strength and vigour of that of the two Woods."

This sort of thing is all very well for an Architectural Association meeting, where a certain amount of exaggeration is necessary to command the attention of the very young; but it is apt to be repeated, and in fact has been, in the arguments for the destruction of Bath Street. The layman hears these varying voices, and concludes that Architecture is a word of very doubtful meaning, and—as it suits his convenience—down goes the finest thing in Bath!

The real fact is that Baldwin was a very great architect who has been much under-rated. His work is—as was the work of his time—refined to the last degree. He was a master of detail. Compare the detail of the Cross Bath with a recent small addition to it on the South End, and you will see that we are not even able to copy it. Like all great masters of detail, he was by no means a copyist. Suiting his detail to his building, or the occasion, he arrives at results which, when compared with the copy-books, may be termed "debased," and what he gained in refinement he lost in coarseness or "vigour," as our critics term it.

Not only was he a master of detail, but also of planning. The Pump Room, with its arcades; Bath Street, with its colonnades; and the approach to the Tepid Bath and the Quadrants (forming an approach and setting to the Cross Bath) are, or *were*, one of the finest examples, rare enough in all conscience, of town planning in this country; and it is to be remembered that they were carried out with many existing difficulties concerning buildings and sites which had to be preserved, and in the face of a cantankerous corporation for employers.

Part of this, to the everlasting disgrace of the City of Bath, and the architectural profession of our time, has now been destroyed. It is perhaps a curse on the architects of Bath, who took so little heed of the older architecture, that the work they spent their lives, their energy, and, in some cases, their fortunes upon, should be destroyed by a later generation of vandals.

[The four excellent sketches on this and the opposite page are by Mr. Falkner.]

THE ROYAL INSTITUTE AND ITS LATE PATRON, KING EDWARD VII.

Representatives at the Memorial Service.

The President, Vice-Presidents, and Hon. Secretary attended the Service of Solemn Supplication at St. Paul's Cathedral on Friday, May 20th, as representatives of the Royal Institute.

Address to the King.

The following address has been forwarded to His Majesty King George V.:—

THE HUMBLE AND LOYAL ADDRESS OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

To His Most Gracious Majesty the King.

May it please Your Majesty.—We, your dutiful subjects, the President and Council, on behalf of the Members of the Royal Institute of British Architects, and of the Societies both in the United Kingdom and in the Dominions beyond the Seas in alliance therewith, beg leave humbly and respectfully to approach your Majesty, and to offer our deep and heartfelt sympathy in the loss your Majesty, the members of the Royal Family, and the Nation have sustained by the death of your Royal Father, our late Most Gracious Sovereign King Edward VII. His late revered Majesty encouraged with his Royal and generous patronage the art that is so dear to us, and we mourn with deepest sorrow not only in common with the rest of the British Empire our beloved Ruler, but also the gracious and beneficient Patron of the Royal Institute. We most respectfully and dutifully tender to your Majesty our sincere devotion and loyalty on your Accession to the Throne, and earnestly pray that the Almighty will grant your Majesty and your Royal Consort Queen Mary a long, happy, and glorious reign, during which the Nation may prosper, the Arts flourish, and your Empire enjoy all the blessings of peace.

Given under the common seal of the Institute.

Town Planning Conference Postponed.

The Town Planning Conference of the Royal Institute of British Architects (July 11-16), and the Annual Dinner of the Institute (July 16) have been postponed till October owing to the lamented death of His Majesty King Edward VII., the Patron of the Royal Institute.—IAN MACALISTER, Secretary.

NOTES FROM ROME AND ITALY.

The publicity which has been given to the discussion in regard to the Passeggiata Archeologica or Zona Monumentale at Rome has produced a useful effect. It became clear that the Commission which had been placed in absolute charge of the work, while its intentions were good, was not realising them in the best way. Its conception of an "archæological park" was apparently a boulevard (or several parallel boulevards with gardens between them), in the valley 150 yards or so wide, through which the Via Appia passes between the Aventine and Cælian Hills, on each side of which the monuments already visible were to stand. A considerable amount of levelling and demolition of buildings, in some cases necessary, in others regrettable, has already been carried out—the disappearance of the Renaissance casino, attributed to Vignola, is one of the instances of the latter class—and trees and verdure were not respected as they should have been. But the Italian Press was on the watch, as were the foreign correspondents, and the resignation of Commendatore Boni brought matters to a head. His protest has not been without its effect, for when his place, after an interval, was taken by Professor Lanciani, it was under different circumstances, and, it seems, under better auspices. Public opinion had been thoroughly aroused, a committee of the Chamber of Deputies had been appointed, and the work of the Commission is to be continued under different principles; the natural contours of the ground are no longer to be altered, trees are to be respected, cart traffic is to be diverted from the zone by a subsidiary road, and it is to be hoped that the boulevards, which are by no means necessary in this part of Rome, will be far less extensive than under the original scheme. Excavation is for the present expressly excluded, the idea being to expropriate as much ground as possible with a view to the future; but it is to be hoped that nothing will be done to compromise the possibility of thorough archæological investigation.

* * *

In Rome itself no discoveries of great importance have been made during the past winter; the clearing of the Basilica Aemilia is still going on, and some fine architectural fragments belonging to the interior have been brought to light. The Doric order of the exterior was known to the architects of the Renaissance, and a very good measured drawing of it is given by the unknown draughtsman whose sketch-book, now in the Soane Museum, is attributed to Andreas Coner (*Papers of the British School at Rome*, ii. pl. 74), but remains of the architecture of the interior were unknown until the excavations of the last few years. On the Palatine the examination of the House of Livia is proceeding, and the building presents some complicated problems.

* * *

Investigations have been carried on under the church of S. Crisogono, on the right bank of the Tiber, resulting in the discovery of remains of the house of the saint, into which was built the earlier church; paintings of the eighth (?) century have been found, some of which show a strange similarity with the so-called Cosmatesque decoration, and may throw some light on its origin. Further excavations have also been made under the church of SS. Giovanni and Paolo, on the Cælian, and more rooms belonging to the house of the saints, over which the present church was erected, have been brought to light. The removal of a considerable portion of the slum quarter of the Via di Marterio, under the north-east side of the Capitoline Hill, in order to give a better view of that side of the Monument to Victor Emmanuel, is leading to the discovery of brick walls belonging to the south-west hemicycle of the Forum of Trajan, upon which the modern houses were built. To this work neither archæologists nor artists can have any objection; but the demolition of the picturesque Palazzetto di Venezia, which to a certain extent obstructs the view of the front of the monument, is more regrettable. It was built in 1466-9, and contains a beautiful Renaissance arcaded court, while outside it is battlemented. It is, however, to be re-erected on the other side of the Piazza di San Marco, and this may be some consolation to us.

* * *

Those portions of the Baths of Diocletian which were not already the property of the State have now been expropriated. They are to be freed of the modern buildings which disfigure them, and the church of S. Maria degli Angeli is, as far as possible, to be restored to the state in which it was left by Michelangelo, with the entrance at the south-east end, instead of on the south-west side, as at present (the change was made in 1749 by Vanvitelli); the scheme for a new façade on the south-west, facing the Via Nazionale, is therefore to be abandoned. That part of the Baths which was previously a Carthusian monastery has for some years been the seat of the national archæological museum; and the parts now expropriated are to serve in the first instance to contain the archæological exhibition of 1911 (the fiftieth anniversary of the proclamation of the Italian kingdom), which is in large measure to consist of objects from the various provinces of the Roman Empire, illustrating their relations with Rome itself. On the same occasion a "retrospective art exhibition" is to be held in Castel S. Angelo, dealing with the Middle Ages and Renaissance, and containing sections devoted to Roman topography, costume, armour, etc., and also to the relations between Rome and foreign countries, as exemplified in the life and works of the artists, architects, men of letters, etc., of the various nations.

* * *

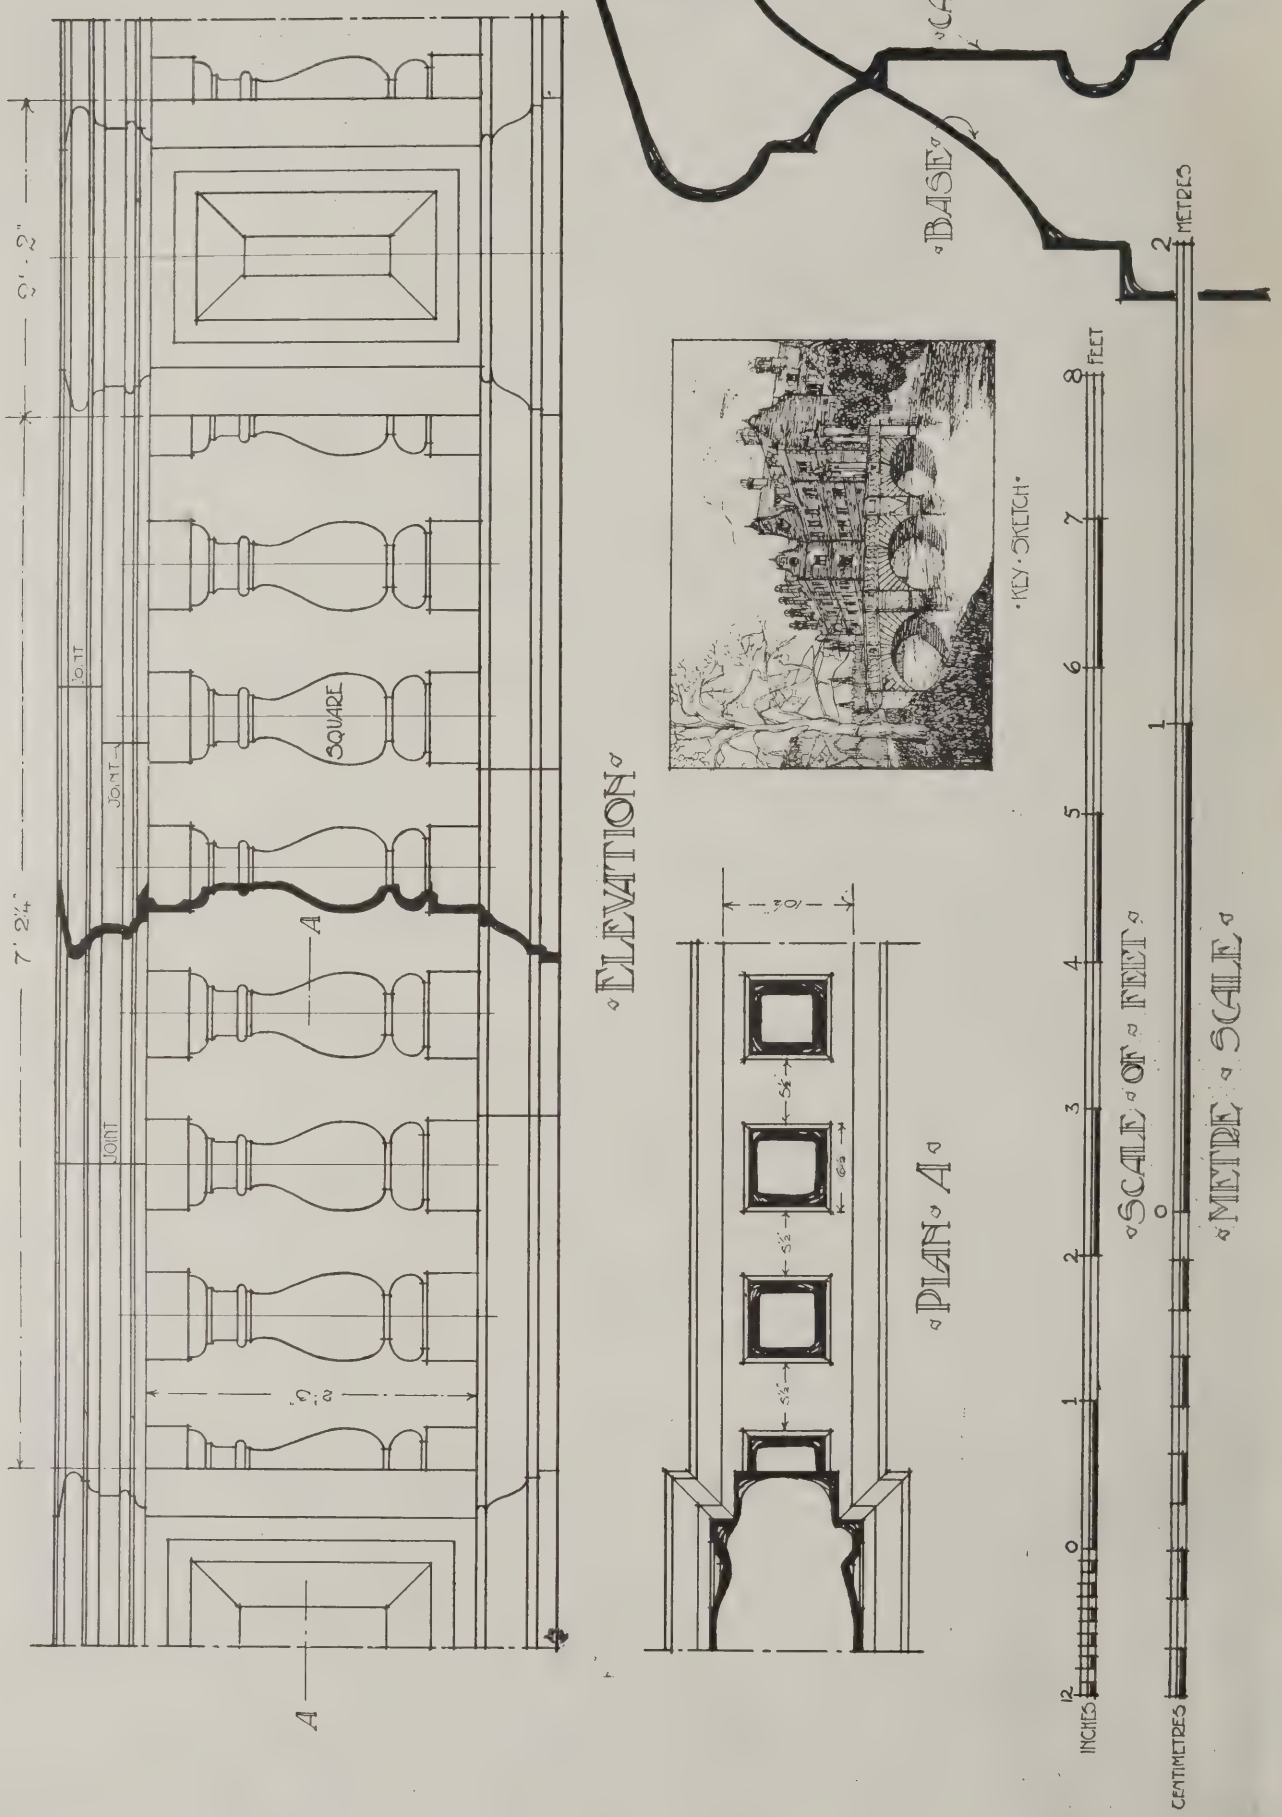
There has been considerable activity at Ostia, where the work of excavation, after an intermission of twenty years, was resumed in 1908. Several streets have been discovered, one of them of considerable width, flanked by a large brick portico, while a portico of the Republican period has also

been brought to light; the city gate towards Rome has been found, with a portion of the town wall. A number of tombs have been excavated along the Via Ostiensis, and various inscriptions and works of art have already been added to the treasures that this city has produced. The construction of an electric tramway has been projected, and, as the distance from Rome is only 14 miles, and there are no natural difficulties in the way, it is not inconceivable that it may be completed by 1911. In interest it can in some ways rival with Pompeii, though of course the perfect preservation of even the smallest objects found at the latter city is one of the greatest factors in its charm. There the excavations still continue, slowly but surely, and the policy of having as much as possible on the spot, and restoring the buildings sufficiently to allow of this being done, e.g., with frescoes and mosaics (instead of their being, as before, transported to the museum at Naples), is being carried on with success. In the modern Calabria we may mention the commencement of work at the temple of Hera Lacinia, near Croton, and its continuation at Locroi Epizephyrioi, at the southern extremity of Italy (where a necropolis of two periods, seventh and fifth centuries B.C., the burials in both cases being under tiles, is being excavated), under the direction of Professor Orsi, who has added the charge of Calabria to that of Eastern Sicily, where he has for many years been in charge of the museum at Syracuse, and of archæological investigations in its neighbourhood, while in Sardinia the Italian authorities have been carrying on excavations in a prehistoric sanctuary, with results of considerable interest.

MANCHESTER'S MISTAKE.

The Manchester City Council appears to be suffering from a severe fit of—let us, in politeness, call it—economy. It has decided (by a majority of one vote) not to make the annual supply of £2,000 for the purchase of works of art, and it has also refused the customary further grant of £400. The gain to the ratepayer, we understand, will be about one-fifth of a penny in the pound; the loss to the community in values that are indefinable in the terms of single and double entry is incalculable, and the loss in prestige to the city is by no means inconsiderable. Hitherto, as we found occasion to remark only a fortnight ago, we had always looked to Manchester for exemplary policy in the matter of art, but it would now appear that for once in a way the City Fathers of Manucium have been less noble than themselves, and have to a slight degree discredited their descent from those ancestors who in remote antiquity may perchance have imbibed from the Greeks of Marseilles with whom they traded some of that respect for art which to-day they have seemed to renounce. Perhaps by now they have repented of their hasty action, and of their momentary forgetfulness that, as one of their excellent daily newspapers promptly reminded them, "a municipal collection of pictures is a civilising force; from the largest and sanest point of view it is hardly less a necessity for the inhabitants of a large and closely populated industrial and commercial community than their parks and open spaces." Wise and true economy does not starve and belittle and estrange the arts, but fosters and encourages them; whereas near-sighted niggardliness in this respect loses most where it is most grasping. Nor is the action of the Council regrettable upon æsthetic grounds only. It strengthens the hands of the opponents of economy, who will not be slow to point a moral from their own point of view. They will see here a proof that what is called economy is really unenlightened parsimony, and one can only hope that the Corporation will take prompt steps to rob this fallacious argument of its sting so far as Manchester is concerned. Important issues, affecting the welfare of a large community, should not be determined by a bare majority of one, obtained, apparently, as the result of most inadequate discussion. Such a result is a serious reflection on municipal methods of administration, and suggests the necessity for revision of the rules of procedure.

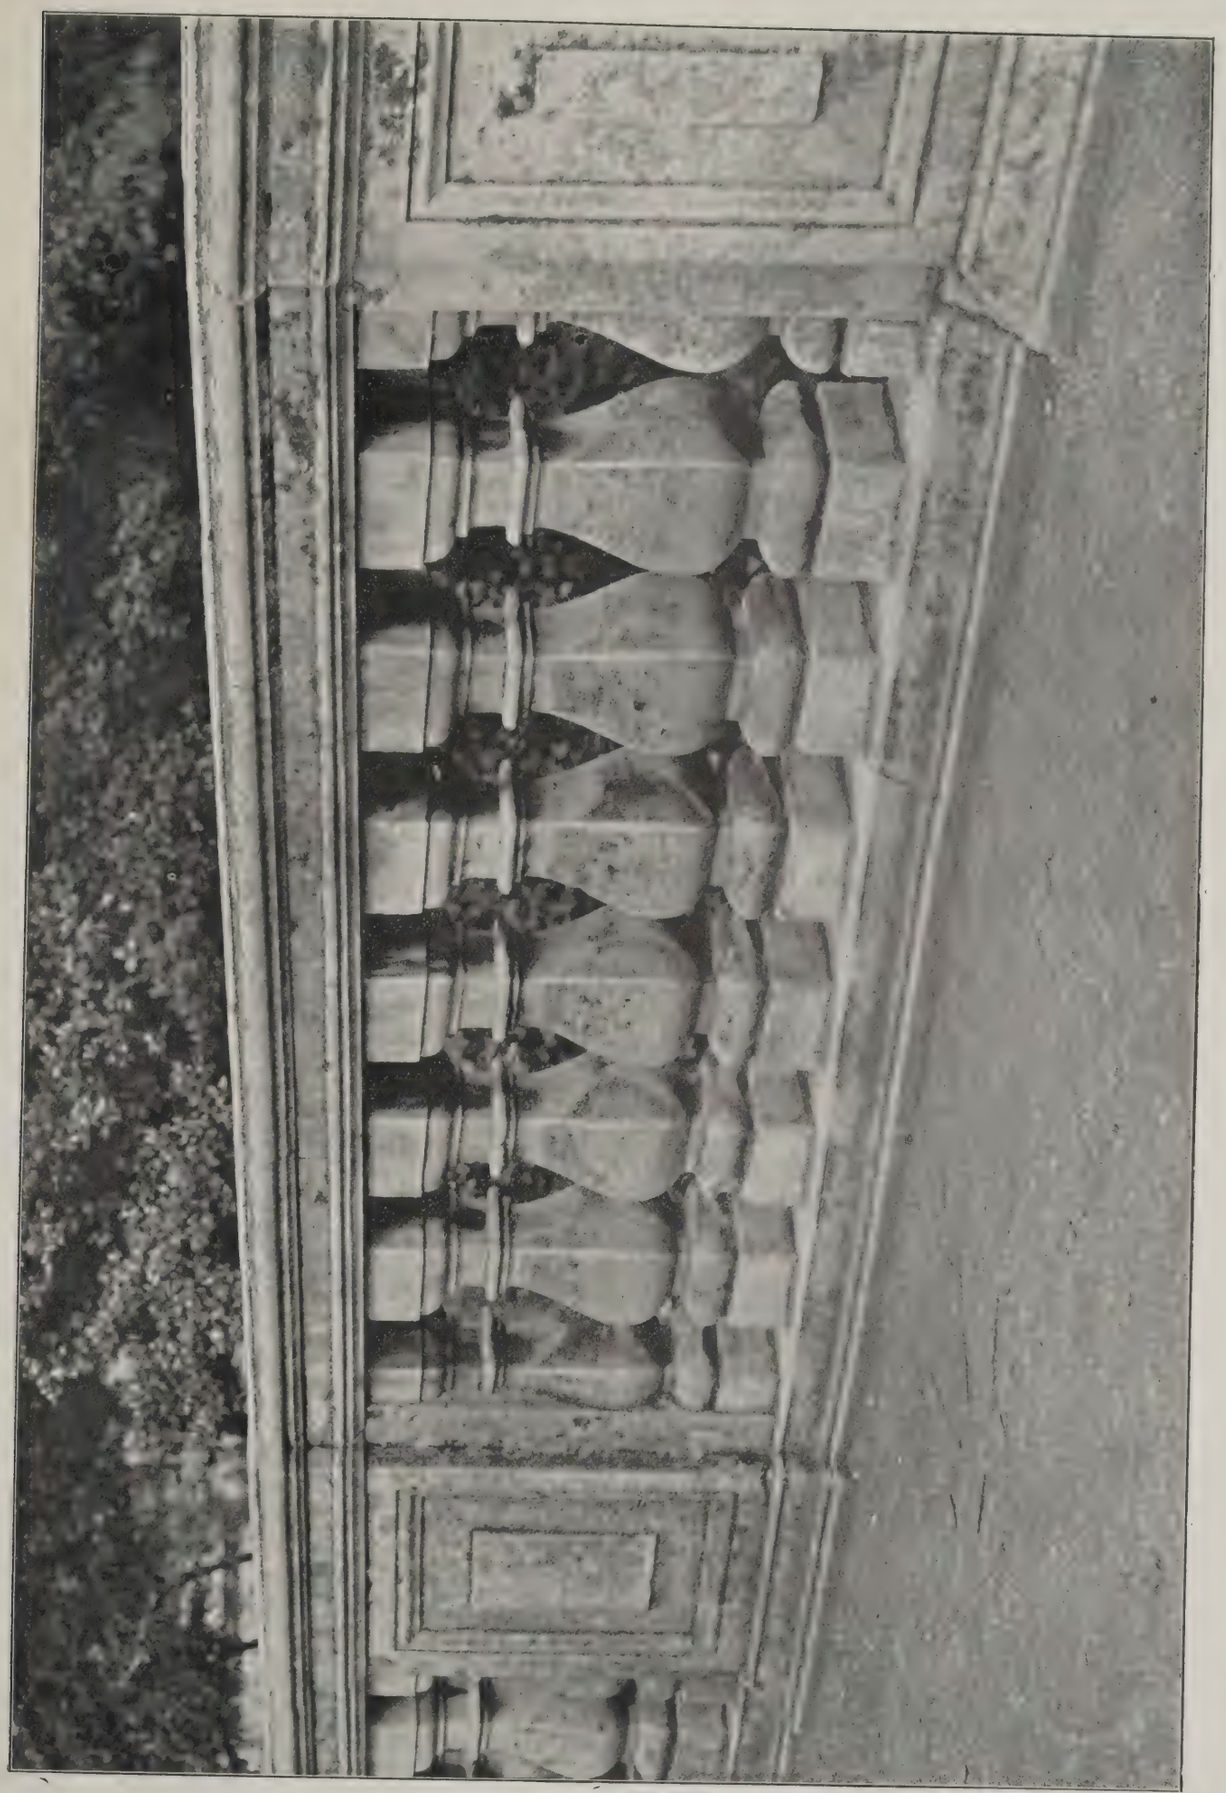
SOCIETY FOR THE PROMOTION OF ROMAN STUDIES.



It is now announced that the Hellenic Society, the Classical Association, and the British School at Rome have come to an agreement to promote the foundation of a new society for the special study of Roman Archæology, and for the conducting of a Roman Journal on the same lines for Roman work as that of the Hellenic Society for Greek work. A special meeting is to be held on June 3rd, at the lecture theatre of the Civil Service Commission, in Burlington Gardens, to consider the subject in detail, and pass some formal resolutions as to the status and aims of the proposed society, for which no precise title seems yet to have been formulated. The objects of the Society, as stated in the second Resolution to be brought forward on that occasion, are as follows:—

To deal with the archæology, art, and history of Italy and the Roman Empire down to about A.D. 700, by publishing a journal, forming a library, holding meetings, assisting (as soon as funds permit) the British School at Rome, and generally promoting a better knowledge and understanding of the Roman world.

The union for this object of the British School at Rome with the other two Societies named above, it is observed, "would prevent that overlapping of publications and of work which causes so much waste of energy." But surely this object would be still better attained by adopting the title of "British School at Rome" for the new Society, and simply regarding it as an enlargement of the British School with wider objects and more powers. The Annual Volume of the existing British School at Rome is already an important publication; to found a new Journal for Roman Studies under another title would really be to promote that "overlapping of publications" which is deprecated, besides making confusion by creating another Society for Roman Studies where one already exists. The true policy, as it seems to us, would be to start the existing "British School at Rome," under the same name, on a new and wider basis, instead of endeavouring to keep up two different societies to do the same work.



FOUNDATIONS OF ART STUDY.

Sir W. B. Richmond, R.A., opened the Byam Shaw and Vicat Cole School of Art, in Campden Street, Kensington, and in an interesting address said that art was a very serious thing. It was not only a pastime, but it was an intellectual pursuit, which, in his opinion, was so serious that it would be better if people who did not intend to go through all the labour which success implied contented themselves by remaining only amateurs. The amateur was very valuable, but one did not see in him the accomplishment that one saw in a professional artist. Sometimes, however, he had an enthusiasm and freshness of view which perhaps became a little obliterated by professional life. Art covered a great field, and though it might be regarded as a platitude he must enforce the principle that a student must first learn to draw. Drawing was the skeleton of all art, and unless the student was able to draw well he would never be able to paint well. It was very difficult to make young people understand how essential it was that they should study drawing and form. Design was the basis of true art, and for those who wished to succeed he would recommend the study of artistic anatomy. It should not be restricted to human anatomy, but should be comparative, which would help them to arrive at the wonderful unity of Nature. He hoped that there might be in time schools for painting out of doors, which was one of the distinguishing features of what was called the new art. He disliked the term, but it was, at any rate, a new phase of art. Observation was the note of the present moment, but students must first prepare themselves with a certain amount of academic study. There was such a thing as tradition, and if they lost tradition they would not recover it for a hundred years.

St. John's vies with Clare in being the most graceful of the little bridges that span the river at the rear of the Cambridge Colleges. The bridge, of stone, was built in 1696-1712, the work being executed by Robert Grumbold, Freemason, though, from an entry—"spent with Mr. Longland and others in advising a modell for ye Bridge, 0.19.9"—it seems evident that the design is not to be attributed to him. But, whoever may have been the designer, the bridge is certainly a fine composition, and the treatment of the balustrade is excellent in every respect.

NEWS IN BRIEF.

A fund has been started for rebuilding the south transept of Selby Abbey. Mr. William Liversedge, of Millgate House, Selby, has promised £1,000, and hopes that the transept will be erected as a memorial to King Edward VII.

* * *

"The Little Theatre," which is being constructed in part of the old premises of Coutts's Bank, Adelphi, is to be decorated, very appropriately, in Adam style. The colour scheme is to be blue-grey and white, suggestive of Wedgwood ware; and the old chimney-pieces are to be retained. Miss Gertrude Kingston, for whom the work is being carried out, has notions as to the setting of scenery, and she contends that sky borders have usually a very unreal effect, and ruin an otherwise fine piece of work. To her artistic soul it was suggested that above the stage should be an arched ceiling of pale blue to represent the heavens, and this theory is being put into practice.

* * *

Mr. Nicholas White Reed, aged 80, a retired builder and contractor, has died at his residence in St. George's Terrace, Newcastle. His firm built the Newcastle County Court, Bath Lane Church and Schools, Hexham Hydropathic, St. Augustine's Church, Westmorland Road Board Schools, Newcastle Workhouse Hospital, St. Luke's Church, Wallsend, the Abbot Memorial Schools, Gateshead, and extensions to Ushaw College.

* * *

An Aldgate builder has been fined £5 and £2 4s. costs for breaches of the L.C.C. by-laws. The foundation of a large building erected by him was found to be composed of broken bricks and builders' rubbish, and not mixed with lime or cement. When the building was completed there was a settlement of seven inches. The structure was condemned as dangerous by the District Surveyor. For other breaches the defendant had to pay an additional sum of £3 12s., time to pay being refused.

* * *

The Yorkshire Building, Sanitary, and Allied Trades Exhibition, which will be held in the Artillery Drill Hall, Edmund Road, Sheffield, October 14th to 22nd, 1910, will be "under the direct patronage of the Sheffield Master Builders' Association, the Sheffield Society of Architects, and the Yorkshire Federation of Building Trades Employers; the honorary executive committee consisting of the following gentlemen, who are all connected with the Sheffield Master Builders' Association: W. Longden, president; Charles Boot, vice-president; A. T. Biggin, treasurer; Thos. Smith, secretary; and the following vice-presidents: A. J. Forsdike, J. D. Cook, A. Mastin, T. Roper, G. E. Powell, T. Eshelby, and W. W. Mears. The Sheffield office is at 12, York Street.

* * *

In our issue of May 11th we gave illustrations and particulars of the town hall extension at Stoke-on-Trent (Messrs. Wallis and Bowden, architects). We are requested to state that the constructional steelwork for this building is being carried out by Messrs. E. F. Blakeley and Co., Vauxhall Ironworks, Liverpool, who are also supplying and erecting steelwork at the Carnegie Library, Brassey Street, Birkenhead, for the Picture Theatre at Crewe, in the building for the Electrical Engineer, Blackpool, and the steel and ironwork for Messrs. Lever Bros., Ltd., Port Sunlight. The same firm have, during the last 18 months, erected 18 skating rinks, steelwork for car sheds, generating stations, etc., etc.

* * *

Already Cardiff and Sheffield are moving for monuments to the late King. At Cardiff it has been informally suggested that a memorial should be erected on the space immediately in front of the City Hall. The site is near the King Edward VII. Avenue opened by his late Majesty during his visit to Cardiff to open the Queen Alexandra Dock. The citizens of Sheffield are anxious to adorn the city with a statue of the late King, "not merely as a monument of a beneficent reign, but as a memorial of his Majesty's visit to Sheffield in 1905," and it is suggested that a statue might well be erected in front of the University, which King Edward then opened.

* * *

The Easton Lift Company, Ltd., announce that owing to the increase of their business they have been compelled to seek larger and more commodious premises in London. They have therefore vacated their workshops at College Street, Lambeth, and their offices at Broad Sanctuary Chambers, Westminster, and the address of their head office is now "Express" Works, Short Street, Southwark, S.E., which is five minutes from Waterloo Station. The new premises (to which offices are attached) will afford increased facilities for quick delivery generally, and for prompt attention to repair work.

* * *

The Hexham Urban Council have refused to purchase the Abbey grounds offered by Lord Allendale for £6,000. It was announced that a contribution of £1,000 had been offered by the Benson family of Allerwash towards the cost; but the Council thought the whole of the sum might be raised by subscription.

* * *

Nottingham house owners appear to be suffering from the extension of the City suburbs. The older property within a mile radius of the Market Place is becoming exceedingly difficult to let, and an enormous amount of new property built or building on the outskirts of the City is drawing people from the centre.

* * *

There is a proposal to erect at Aberdeen a statue of the late King, in granite, facing Marischal College. Mr. A. Marshall Mackenzie, A.R.S.A., F.R.I.B.A., LL.D., is of opinion that, given the right sculptor and the right material (which he thinks should be Corennie granite), they ought to have a statue which would command instant admiration, and be worthy memorial of a great monarch and his great reign.

* * *

Presiding at a meeting of the Medico-Legal Society, Sir John Tweedy said a movement had been started for the inauguration of a memorial in memory of the late Dr. Stanley B. Atkinson. It was proposed that the memorial should take the form of a permanent series of health lectures on the prevention and extirpation of infectious and communicable diseases, particularly phthisis, and that a bust should be prepared and placed where the Stepney Borough Council should direct. The chairman of the movement is the Hon. Harry Lawson, M.P.

* * *

Messrs. Henderson and Duncan are contractors for the foundation work, site levelling and road-making of the new barracks at Redford, near Edinburgh. The drainage work contract is in the hands of Messrs. G. Mackay and Son, of Edinburgh. A railway line for the conveyance of material from Slateford is being constructed by Mr. William Jackson and Messrs. J. and A. Leslie and Reid, a steel girder bridge across the canal at Slateford forming part of the work.

* * *

The tender of Messrs. Martin and Co., Calcutta, at 5,469,926 rupees (£364,662) has been accepted for the erection of the Queen Victoria Memorial Hall, Calcutta. Sir William Emerson, F.R.I.B.A., is the architect.

* * *

The Swansea Cottage Exhibition appears to be hanging fire a little. About 27 cottages are to be erected, and as the majority are to be in blocks of two or four, there will not be many different types of buildings. "The Cambrian" says that having regard to the preliminary expense of between £600 and £700, and the £4,000 spent by the Corporation in laying out roads, the result does not seem adequate to the outlay.

* * *

The battle of Flodden is to be commemorated by a memorial to be erected near the centre of the battlefield, on Piper's Hill, Branxton, Northumberland. The memorial is to be erected in rough grey, Rubislaw granite, and consists of a cairn or base, built with about twenty stones, 6ft. high, over which there is to be a monolith Celtic cross 14ft. high. Around the memorial is a 12ft. square enclosure, formed with posts of rough granite carrying iron rails.

* * *

According to a circular issued from the Emigrants' Information Office, 31, Broadway, Westminster, the building trade of the Transvaal is stated to be in a better position than it has been for some years, and a great many buildings are being constructed. There is not, however, reported to be any difficulty in procuring sufficient labour.

* * *

After six weeks of the lock-out, the representatives of the masters and men in the German building trade accepted the renewed offer of the Government to mediate, and negotiations for a settlement were subsequently resumed. The employers claim to have enforced the lock-out against 180,000 men.

* * *

The Works Committee of the Holborn Borough Council has received a letter from the chief ordnance officer of the London district forwarding a list of old guns and carriages for sale. The committee are unable to suggest any suitable position for any of these relics, and recommended that the offer of the chief ordnance officer be declined with thanks. The ordnance officer might meet with more success "along the shores that round our coast from Deal to Ramsgate span," where the taste for that kind of decoration seems to be more luxuriantly developed.

* * *

It is reported that cottages on Penistone Road, Sheffield, have changed hands at from £20 to £30 apiece. It is stated that not very long ago it was new property occupied by translated slum dwellers. "Whereupon some of our readers may wish to be left alone to their own reflections," says the "Sheffield Independent." Our contemporary seems at a loss for an explanation of the slump, but it adds "Doubtless the Corporation could furnish one." What is the mystery?

At a meeting of the Southampton Harbour Board, it was decided to authorise the Works Committee to advertise for tenders for carrying out the dredging of Thorn Knoll, just outside Southampton Docks, the cost of which, about £16,000, is being borne in equal proportions by the Harbour Board and the South-Western Railway Company. It was further decided, on the recommendation of the special sub-committee which has been dealing with the matter for some time, to dredge other portions of the river between Thorn Knoll up to Fawley Beacon to a depth of thirty-five feet. This work, which will cost £12,000, will be undertaken solely by the Harbour Board.

* * *

Messrs. Griffiths and Co., Ltd., of London Wall, E.C., have secured the contract at £4,250,000 for the southern section of the Chilian Government Railways. The new line will be about 375 miles long, and will run from Cabildo—which is in railway communication with Valparaiso—to Toledo, near Copiapo. The system is intended to open up nitrate deposits and copper mines which have in the past suffered for want of a railway running north and south. In places the gradients will be so steep as to necessitate the use of a rack rail.

* * *

A correspondent of the "Liverpool Daily Courier" proposes, as a memorial to the late King from the Liverpool Church-people, the completion of the two centre towers of the Cathedral. One tower, he suggests, should be called the Edward Tower, and one the Alexandra Tower.

* * *

Mgr. Duchesne, who is at the head of the French School of Archæology at Rome, was on May 26th elected a member of the French Academy. He was born at St. Servan, Brittany, in 1843

TOWN-PLANNING TOPICS.

Tring Adopts Town Planning. The Tring District Council has announced its intention of putting the Town Planning Act into force. Lord Rothschild has therefore determined to build some 50 cottages in order to find homes at suitable rents for some of the tenants who will be dispossessed, and has given notice that he is prepared to buy in deserving cases the condemned properties of some of the poorer owners or to compensate them on terms arranged by an independent authority. But for his lordship's action many poor owners would be practically ruined.

A National Park for New York. Americans are now planning the acquisition and development of a wonderful national park for the people, which will be worthy of the metropolitan City of New York. The site begins at New York and stretches right along the left bank of the Hudson River almost to Newburg, including a magnificent driveway, with a view of the beautiful scenery of mountain, lake, and river of over fifty miles. This park, concerning which great enthusiasm has been aroused, is contingent upon the action of the Senate of the State of New York, and its consent for the issue of £500,000 worth of bonds, and also the acceptance of various gifts by the Park Commission, including £500,000 from private subscription, £100,000 from the State of New Jersey, and various sums given by Messrs. Pierpont Morgan, John Rockefeller, William Vanderbilt, and William Rockefeller, with the sum of £200,000 and a great tract of land from Mrs. Harriman, the widow of the Railway King. Some of the ground is a virgin wilderness, and many of the sites adjacent to the banks of the Hudson to be enclosed offer unexampled opportunities for millions in search of health and pleasure. Here, as elsewhere, vandals, in the form of jerry-builders, rural advertisers, and real estate speculators, are spoiling much of the most beautiful country adjacent to the big cities, and prompt action is necessary on the part of the State Park Commission to develop the project.

The Edinburgh Society. The annual meeting of the Garden Cities and Town Planning Association (Edinburgh and East of Scotland Branch) was held in the hall of St. Andrew's U.F. Church, Edinburgh, last week, Sir James P. Gibson, Bart., M.P., in the chair. It was intimated that Mr. J. H. Whitehouse, M.P. for Mid-Lanark, who was to have delivered an address on the Housing and Town Planning Bill, was too ill to attend. He had started on the journey to Edinburgh, but had had to return home. Professor Lodge submitted the annual report. He said that if they could solve the housing problem they would have gone far towards solving a number of other problems. When one contemplated the moral evils of the time and their suggested remedies, one was frequently driven to the conclusion that the ordinary attempt to deal directly with moral evils was an attempt to put the cart before the horse. So many of those moral evils were associated with and largely caused by physical evils that it was, he thought, often impossible to look for a moral cure unless one could remedy those physical ills. What seemed to him the most efficient, at any rate partial, remedy of those evils was to bring the land to the towns—that was to say, to produce in town life something like the conditions of country life. That was the basis of the garden city movement. Mr. W. Robertson, of the Carnegie Trust, Dunfermline, spoke of the great practical difficulties facing them in dealing with virgin soil such as they had at Rosyth. The attention of the association must centre largely in what was done with the 600 acres of land which the Government was prepared to feu. He did not see how it was possible to be generous in the way of wide roads, open spaces, low houses, and low feus. The Admiralty might be willing to feu their 600 acres at a very low price, and a fairly good start would be made. The best solution would be if the Government handed over the acres to the Garden City Association to develop.

Town Planners Tour. A party of nearly seventy delegates left Charing Cross on May 25th to take part in the International Housing Congress at Vienna. The next day was spent in Paris, where the City Council have a great town planning scheme in hand. This was fully explained at a municipal reception at the Hôtel de Ville in the afternoon, the morning being devoted to a visit to the Eiffel Tower, where the Chief of the Paris Parks Department gave an account of the planning of Paris parks. On May 27th the party went to Ulm; Sunday was spent at Salzburg; and on Monday Vienna was reached. The next four days were to be devoted to the sittings of the Congress. On Saturday, June 4th, a visit will be paid to Dresden, where the party will remain on Sunday and Monday, proceeding to Berlin on the evening of the latter day. Here the International Town Planning Exhibition will claim attention. On June 8th the return journey to London will be made viâ Cologne. Among those who are going to the Congress, and taking part in the tour, are Councillor W. Wilkins (treasurer), Councillor Harold Shawcross (Chairman of the Finance Committee), and Mr. H. R. Aldridge (Secretary), of the National Housing and Town Planning Council. In addition, there are representatives of the Civic School of Design, Federation of Master Builders, British Medical Association, and medical officers of health.

OBITER DICTA.

"Stone Parlours." The smoking-room is not so recent as some people suppose. Sir John Collum's "History of Hawsted" describes Hawsted Place as boasting a smoking-room as early as 1570, and mentions that right from Elizabethan days almost every house possessed such a room. Paved with flagstones to guard against fire, in the North of England these rooms were often referred to as "stone parlours."—"*Daily Chronicle.*"

* * *

The Late Prof. Aitchison. We lose more than the architect in Mr. George Aitchison, who died last Monday. True, he began with wharves and offices and warehouses, but when he came to know Leighton he had the chance to develop his natural taste for the finer arts. All through he loved the classic Greek, and his detailed work in marble and stone is witness of this. As lecturer and teacher his influence was widely felt, and the societies at home and abroad gave their honours perhaps more to the teacher than to the craftsman. His erudition was deep, but did not dull the edge of his conversation or blunt his fine perception of the beautiful. He could always brighten a lecture with anecdote of all ages, and in discussion was full of parallels and instances. Moreover, to the end his mind was never shut to new ideas and methods.—"*Saturday Review.*"

* * *

Jungle Cities. Modern man (in his sick reaction) is ready to march nowhere—so long as it is the other end of nowhere. The case of building houses is a strong instance of this. Early in the nineteenth century our civilisation chose to abandon the Greek and mediæval idea of a town with walls, limited, and designed with a temple for faith and a market-place for politics; and it chose to let the city grow like a jungle, with blind cruelty and bestial unconsciousness; so that London and Liverpool are the great cities we now see. Well, people have reacted against that; they have grown tired of living in a city which is as dark and barbaric as a forest, only not as beautiful, and there has been an exodus into the country of those who could afford it, and some I could name who can't. Now, as soon as this quite rational recoil occurred, it flew at once to the opposite extreme. People went about with beaming faces, boasting that they were twenty-three miles from a station. Rubbing their hands, they exclaimed in rollicking asides that their butcher only called once a month, and that their baker started out with fresh hot loaves which were quite stale before they reached the table.—*G. K. Chesterton in "Daily News."*

CORRESPONDENCE.

The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

"Licentiate R.I.B.A."

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In recent issues of your journal you have published letters from Associates regarding the use of the affix L.R.I.B.A. for Licentiates. I do not know if my view is correct, but my reading of the Bye-Law is that Licentiates may use the affix "Licentiate R.I.B.A.," *not* L.R.I.B.A. If this view is not correct, then I agree with your correspondents that it is most unfair to Associates, as the general public will not be able to discriminate.

ANOTHER ASSOCIATE.

THE POSTAL TRADE AND BUILDERS' SUPPLIES.

By ALFRED B. SEARLE.

A large company has recently been started in Kansas in order to sell builders' supplies direct through the post instead of by the more usual method through dealers, and already a considerable amount of uneasiness has been caused by the success of this firm. Now we learn that a similar firm is to be started in this country, if the necessary capital can be raised, with a view to cutting out the ordinary dealer by forming a ring of manufacturers of different articles and products and selling direct to the builder.

It is quite unlikely that in a country the size of Great Britain any notable success will be gained, and the proposition may never be fully launched, for the difficulties in the way are enormous. In a rapidly developing country like the United States the matter is somewhat different, as there is plenty of room for competition, but with trade in the same state as in the past few years a postal business would fail except in a very small number of lines, on account of the present ability of builders to select what they require from so many places.

The manufacturer of bricks, tiles, and pipes, for example, can never sell from a catalogue only, or even from the distribution of a few samples—the methods chiefly adopted in the firms running postal businesses —for the colour and general appearance of these articles vary so greatly as to necessitate their being seen in bulk before any accurate ideas can be obtained.

Building materials can only be profitably handled through dealers of good standing, and even then only when the dealers are disposed to make efforts to create a trade. This s especially noticeable in the case of special rticles such as patent gullies, chimney-pots, and goods of a special design or possessing some particular advantage which the customer will not appreciate at the first glance.

It is obviously unfair for a dealer to accept an agency for an article unless he is prepared o display it, know its selling points, and to push its sales in a definite, instead of in a desultory, manner.

Too many dealers are so short-sighted that they will not give a new line any consideration, but go on steadily with "stock lines," forgetful of the fact that in a live business full regard must be paid to changed conditions and improved appliances. It is these firms which create in the minds of the manufacturers a desire to deal direct with the builders, particularly where new products are concerned, and it is precisely these dealers who are the first to complain if a firm cuts them out and begins a mail order business or adopts some other form of direct sales for the articles which the dealers are disinclined (for whatever reason) to sell.

A firm of sanitary ware manufacturers recently sent one of its partners—an excellent and experienced traveller—round to the chief supply dealers in the country with what appears to be a good proposition, but in almost every case he was refused a hearing even though the firms in question knew nothing of the qualities or special advantages of the goods or terms offered. Most of these dealers had long-established connections with other firms, and felt that there was ample capacity in these to supply any demand that was likely to arise, and consequently they turned the new firm away with scant courtesy. The natural result—inevitable with any progressive firm with a strong conviction of the merits of its goods—was the direct sales to the builders; and a number of the firms who had previously adopted the "high and mighty" spirit would now—to judge by their correspondence—be glad to accept an agency. This is, however, refused, as the more direct methods have proved to be more satisfactory.

This attitude is peculiarly unfortunate as far as general supplies are concerned, for the dealer must later suffer more than the manufacturer if it is to continue. There may be the best of reasons why the maker should not deal direct with the user, but these are nullified if the dealer is not willing to play his part.

Such articles as cement and lime may be sold direct, because they are of standard quality or composition, but others such as bricks must be stored in bulk so that they may be seen. In the case of bricks for ordinary building purposes it is not unusual for the works to be of so local a nature that the user may go direct and select what he requires, but with many other supplies the manufacturer is too far away for this to be done when a comparatively small order is to be given, or when the builder or his employer is uncertain as to his requirements. This being the case, the supply dealer is essential for the efficient storage and distribution of most supplies, and his familiarity with the needs and requirements of his customers gives him special advantages as a salesman which cannot be possessed by a firm conducting its business largely through the post.

Direct sales to be effective are expensive, because they need either a large expenditure on advertising in some form or other, or because they necessitate the employment of a staff of travellers whose expenses are necessarily much greater than those of the dealer who can assist a number of firms at the same time.

Quite apart from the ethics of the trade, it is, therefore, unwise for manufacturers to attempt to build up a trade on direct sales and for the dealers to continue, as many of them do, to neglect opportunities for enlarging their business by the introduction of new lines. The objections against this latter course are well known and need not be referred to, as it will be found on careful study that they are greater in appearance than in reality.

SOCIETIES' REPORTS.

Edinburgh Architectural Association.

Mr. John Watson, F.R.I.B.A., presided at the annual general meeting. It was agreed at the outset, on the motion of Mr. Hippolyte J. Blanc, to send to His Majesty King George an expression of the Association's sympathy and condolence on the death of King Edward, and congratulations to King George on his accession to the Throne. Reports by the Chairman of the Council, the librarian, and the convenors of various committees were submitted and approved of. That of the Committee of Management bore that at the suggestion of the Associate section the Committee considered the change made by the Edinburgh College of Art in shortening the summer term. This curtailment was considered detrimental to the studies of the students attending the art classes. On the matter being brought before the College of Art, the Board of Management resolved to alter the arrangements in order to meet the views of the Association. Prizes were presented by the Association to (1) Mr. Frank E. B. Blanc, and (2) Mr. J. S. Bennet (apprentices) for the design of a stone bridge across a small river. In the competition open to draughtsmen for a design for a rood screen with wood in a Renaissance college chapel, the prize was awarded to Mr. J. R. Mackay. Mr. J. S. Bennet was awarded the prize for measured drawing awarded on work done in the College of Art Summer Sketching Class. Office-bearers were elected for the ensuing session as follows:—President, Mr. J. B. Dunn, F.R.I.B.A.; past president, Mr. John Watson; vice-presidents, Mr. E. C. H. Maidman and Mr. J. Inch Morrison; hon. secretary, Mr. Jas. Kerr, 122, George Street; hon. treasurer, Mr. W. G. Walker, C.A.; hon. librarian, Mr. J. A. Arnott, hon. assistant librarian, Mr. John D. MacLeod. On the motion of the Chairman, seconded by Mr. H. J. Blanc, the Association extended to Mr. Thomas Ross hearty congratulations on his having conferred upon him by Edinburgh University the degree of LL.D. The president thereafter read his valedictory address, entitled, "The Duties of the Architect towards himself, his professional brethren, and his clients."

COMPETITIONS.

LIST OF COMPETITIONS OPEN.

JUNE 11. COVENTRY. ENLARGEMENT OF SCHOOL at STOKE. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

JUNE 15. ELEMENTARY SCHOOLS, ACTON. Particulars given in our issue of March 16th. The Royal Institute of British Architects has requested architects not to compete.

JUNE 20 YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Competitors to state terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

NO DATE. THE QUEEN'S UNIVERSITY OF BELFAST. The Senate of the University are prepared to receive designs for the enlargement of the present buildings at a cost of about £52,000. The Assessor appointed is Sir Aston Webb, R.A. Two premiums of £150 and £100 are offered for the two designs placed second and third respectively. Full particulars of the accommodation required, with plans of the site and the existing buildings, together with conditions of the competition, can be obtained on application to J. M. Finnegan, Esq., B.Sc., Secretary, the Queen's University, Belfast, on payment of £2 2s., which sum will be refunded on receipt of a bona-fide design, or on the return of the particulars within three weeks.

COMING EVENTS.

Wednesday, June 1.

ROYAL SOCIETY OF ARTS.—"The Restoration and Discoveries at the Guildhall, London," Mr. Sydney Perks.

CARPENTERS' HALL.—Exhibition of works in Wood and Wood-working. Opening by the Lord Mayor, 4.30.

Saturday, June 4.

NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to Sunderland.

Monday, June 6.

R.I.B.A.—General Business Meeting. 8 p.m.

SOCIETY OF ENGINEERS.—Mr. C. V. Biggs on "The Inspection and Testing of Engineering Materials and Machinery." 7.30 p.m. at Room 18, Caxton Hall.

TRADE AND CRAFT.

A Steelwork Catalogue.

Now that the London Building Act has been amended to provide for steel-frame construction, such becomes almost a commonplace of modern building methods. Official sanction and official ruling bring the need for revision of the catalogues of steelwork specialists, and this new edition of Messrs. Drew, Bear, Perks, and Co.'s catalogue is particularly interesting in this respect. This firm have now achieved a foremost position in the trade of supplying architectural steelwork, and this catalogue illustrates many of the very important buildings for which they have been the engineers or have carried out the steelwork to consulting engineers' designs. Their factory at Battersea, which is also illustrated, is equipped with the latest and most powerful machinery, and they keep a large quantity of standard sections in stock, so that they are in a position to do the best and speediest work of the kind. This catalogue comprises tables giving safe loads on steel joists and beams and stanchions calculated in accordance with the requirements contained in the London Building Act Amendment Act, 1909. The formulæ for eccentric loads and grillage foundations are given in connection with stanchions, while load tables are given for solid steel and cast-iron columns. Other useful tables are those giving areas and weights of angles, tees and flats, and weights of black bolts and nuts, shearing and bearing values, and weight of rivets. Standard cleats or connections for beams are illustrated. The address of the firm is Battersea Steelworks, Wellington Road, London, S.W.

The Patent "Amalgaline" Lead Joint.

It cannot be said that the old methods of jointing lead are entirely satisfactory. The wiped joint, for instance, is not a thing of beauty, and it is never easy to make, and this difficulty is much intensified where it is necessary to make an upright joint against a wall. In these circumstances it is not surprising that there should be considerable demand for a more efficient form of joint, and an invention recently introduced by the Metal Jointing Company, Ltd., of Adelphi House, 71, Strand, London, W.C., appears to supply the need. "Amalgaline," as the product in question is called, consists of a metallic ribbon 0.05 millimetre thick, treated with a composition to prevent the formation of oxides. Upon placing a strip of this material between any two cleaned surfaces to be joined, and applying heat sufficient to melt the strip, the surfaces of the lead fuse, and in fusing amalgamate. The advantages of such a method as this are obvious. A new and unquestionably neater joint than that resulting from the old method is obtained by the use of a special tool which the company supplies. With this tool it is possible to cut the ends of the pipes to be joined to a true fit in the form of spigot and socket or coned joint. A piece of Amalgaline then being inserted, heat is applied, and a perfectly sound joint is made. By a test imposed by the Metropolitan Water Board, the strength of the joint is conclusively verified. A piece of half-inch No. 30 gauge service pipe four feet in length was fitted at one end with a brass nipple, and a joint was also made, Amalgaline being in each case the bonding substance. The pipe, having been bent round a piece of one and a half inch iron barrel, was then subjected to a pressure of 1,000lbs. per sq. in., which was increased to 1,200lbs. per sq. in., whereupon the pipe burst, neither the joint nor the nipple, however, giving way. Waste and soil pipes, and flanging pipes are also capable of successful treatment. By use of a special mould supplied by the Metal Jointing Co., much trouble is obviated in the last-mentioned type, the flanging and plumbing being reduced to a single operation. To a variety of uses, in fact, Amalgaline may be applied, as, for instance, to brass and copper unions, zinc sheets, and power cables. Tee joints on cables, telegraph, telephone, and dry-cove cables lend themselves also to this convenient and single method of amalgamation. By its simplicity and efficiency, the process should commend itself to the trade.

Ronuk Company's New Premises.

New premises for the Ronuk Company were opened at 16, South Molton Street, W., on Thursday last. Beautifully panelled in oak, which with the oak block floor has been treated and polished by the company's staff of workmen, the showroom furnishes a good example of the best English joinery, and bears testimony to the excellent results obtained by the use of Ronuk. The appearance of the room is considerably enhanced by the heavy oak beams in the ceiling, while the exterior, with its oak shop-front, is exceedingly attractive. A notable feature of the interior is the entire absence of the characteristics of the ordinary shop carved oak Jacobean chairs, tables, Persian rugs, blue and white Delft china on the ledges over the panelling, combining to produce an extremely pleasing effect. To meet the difficulties which attend the introduction and maintenance of polished wood floors, the Ronuk Company has invented a sanitary floor polish, the use of which has been adopted by the leading art galleries, hospitals, and public institutions of the country, and is in use in many private mansions. They have also established a polishing Contract Department, and undertake the initial preparation of floors and their proper maintenance by a staff of specially trained workmen. Some of the many advantages of the use of Ronuk are that scrubbing and the dampness resulting are dispensed with; the pores of the wood are filled up, and a hard, bright and durable surface is produced, in which germs cannot obtain a harbouring, while the floor can be cleaned with little labour at a small cost. Another invention of the company is a special staining by which floors of ordinary deal can be converted into polished floors. Information with regard to prices and contracts for polishing can be obtained at the company's new London depot. Their head office and factory is at Portslade, near Brighton, while they have in addition a depot at 285, Deansgate, Manchester.

FEDERATION NEWS.

National Federation.

A meeting of the Journal Committee was held on May 23rd.

The annual meeting of the National Board of Conciliation was held on May 24th, and lasted from 10.30 a.m., with an interval of an hour for lunch, until 5 p.m., in addition to the usual formal business, in the course of which Mr. Jas. Storrs was again elected chairman, and Mr. Stranks, Operative Stonemasons' Society, was elected vice-chairman; Mr. A. G. White and Mr. F. Chandler being re-elected joint secretaries. Consideration was given to various proposals to amend the rules, most of which failed to carry. The following were adopted unanimously:—

(a) Recommendation to the parties to the scheme for a new rule to provide:—

"That members of the various Conciliation Boards, who may be members of any Board having considered a case, shall not sit personally on any subsequent hearing of the said case, but shall send substitutes."

(b) An amendment to Rule 12.

"The side which fails to provide a quorum at any meeting shall pay the 3rd class railway fares and 10s. a day expenses of the representatives of the other side who have attended."

(c) A new rule as to giving notices for alterations of rules while cases are before Conciliation Boards.

"If any dispute or question has been referred to any of the Boards of Conciliation it shall not be competent for either side to give notice for an alteration of any local working rules having reference thereto, pending completion of the procedure for Conciliation set forth in these rules; but in the event of no decision being arrived at, or if a decision is given without stating the period for which it shall endure, it shall be competent for the appellants to give notice for alteration of rules if delivered within 14 days thereafter, and counter notices, if delivered within a further 14 days, notwithstanding the provisions of any local working rule as to notice; provided always that such notices shall expire on the date given in the said local working rules."

An appeal of the Operative Bricklayers from Nottingham was brought before the Board, but was deemed not to be quite in order. After some discussion it was resolved "that without creating a precedent, in the circumstances this case be heard." The result was that a decision was given by which the operatives receive an advance of ½d. per hour, as from 1st January next, to remain in force for three years, and some minor alterations made in the proposed rules.

Consideration was given to a report on the working of the Workmen's Compensation Act, with special reference to Arbitration Committees and the Durham Miners' Scheme, and eventually the matter was referred to a sub-committee to further consider and report as to the feasibility of adopting something analogous for the building trade.

The question of sub-contracts from lower paid districts was also discussed, with special reference to the increasing practice of inserting large provisional amounts in contracts which the workmen claim results in much work being imported from low paid districts to the detriment of both contractors and their workmen. This question was also remitted to the aforesaid sub-committee.

Cardiff.

The monthly meeting of the committee of Cardiff Master Builders' Association was held at the association rooms on Thursday, May 19th, the President (Mr. S. Shail) in the chair..

With respect to the tenders for additional wards for Merthyr Tydfil Union, the president reported that the advertisement inviting tenders contained a paragraph stating that the contract would contain a trade union clause involving employment of trade unionists. He considered this condition highly objectionable, and against the public interest, as it would prevent the contractor from employing free labour if it should become necessary to do so, and would also enable the trade unionists to dictate their own terms. The president reported that representations had been made to the Clerk to the Guardians on the subject, and letters had also been written to the Master Builders' Associations at Swansea, Newport, and Pontypridd, calling their attention to the matter, and requesting them to take such steps as they might consider advisable with a view to getting this objectionable condition withdrawn. The secretary read a letter received from the Newport Association, stating that they had written a strong letter of protest to the Clerk to the Guardians on the subject, and enclosing copy, which was considered satisfactory, and the hope was expressed that in view of the representations made, the objectionable condition would be withdrawn.

The secretary reported that the new Speculative Builders' Association wished to know on what terms they could become affiliated with our association. It was resolved that the matter stand over for further consideration.

A letter was read from the general secretary of the National Federation, written on behalf of the Bristol Association, asking for particulars as to how "pointing" is done in our town, and particularly as to whether the men employed to do "pointing" are bona-fide tradesmen, or merely labourers, or men who have "picked it up." It was resolved that a reply be sent stating that in our city bricklayers do the pointing in brickwork, and masons in stonework. In no case are labourers employed to do this work, and a preference is given to those men who have been engaged in the building.—I. Watkins, Secretary.

Wakefield and District.

A meeting of the members of Wakefield and District Master Builders' Association was held at the Great Bull Hotel, Wakefield, on May 3rd. In the absence of Alderman Judge (president), who was in London on Corporation business, Mr. Henry Fallas (a vice-president) was elected to the chair.

The secretary submitted to the meeting the printed form of building contract for sub-trades, which he had received from the secretary of the Yorkshire Federation, and, on perusing same, it was found that certain amendments which the Association had suggested for insertion in the Agreement for the protection of sub-contractors had not been included therein, and a strong feeling was expressed that the Agreement as printed was, from a sub-contractor's point of view, unfair, and, on the proposition of Mr. Crook, seconded by the chairman, the secretary was directed to write to the secretary of the Yorkshire Federation and explain to him the objections of the association to the form as it now stands, and suggest the insertion therein of certain provisions for the better protection of the interests of sub-contractors.—J. Beaumont, Secretary.

OBITUARY.

We regret to announce the death of Mr. George Humphreys, founder of the firm of George Humphreys and Son, builders and contractors, of Woodborough Street, Stapleton Road, Bristol. Mr. Humphreys was a valued member of the Bristol Master Builders' Association for forty years. He filled the presidential chair on two occasions, and was honorary treasurer of the association for twenty years. At the recent annual banquet he was presented with a silver tray as a mark of appreciation of his services in that capacity. He was a regular attendant at the annual meeting of the National Federation.

We regret to have to record also the death of Mr. A. Krauss, of Bristol, Past President of the Nat. Fed. of B.T.E. If report speaks truly, Mr. Krauss was a self-made man, who came to Bristol a stranger from a strange land, and yet raised himself to the position of a contractor for large public works. He enjoyed an enviable reputation for straightforwardness and reliability.

NEW BUILDINGS.

PROPOSED.

Aldershot.—The following plans have been approved by the District Council: Additions to Wellington Works for Gale and Polden; two houses, Ash Road, for W. Elliott; proposed additions to Prince of Wales, High Street, for Friary Breweries, Ltd.; proposed alterations to the Alexandra Hall; additions to stable and coach-house, St. George's Road, for Mr. Pfrangley; extensions to West End Farm.

Avonmouth.—Mr. R. H. Bicknell, M.I.C.E., one of the Local Government Board Inspectors, held an inquiry recently at the Council House concerning an application of the Town Council to borrow £2,300 to defray the cost of erecting cottages for firemen and policemen at Avonmouth.

Barnsley.—The Town Council has approved the following plans:—Greenhouse, off Park Grove; 2 dwelling-houses, West View; villa, Huddersfield Road; 8 dwelling-houses, Charles Street and St. John's Road; 2 dwelling-houses, Park Grove; scullery to house, 137, Doncaster Road; enlargement to shop, Dodworth Road; stable, cart shed, etc., Beaconsfield Street; wash-house to Miners' Rest, Old Town.

Brentwood.—The Urban Council has approved the following plans: Motor garage, in the High Street; two lock-up shops and two shops and houses combined in the High Street and Ingrave Road.

Chorley.—The Rural Council has approved the following plans:—Three dwelling houses, Chapel Lane, Coppull; six houses, Coppull Moor Lane, Coppull; two houses at Whittle-le-Woods; alterations at Town Lane Farm; Whittle-le-Woods; stable to Green Lane Farm, Coppull; drainage of additions to farm buildings, Rigby's Farm; Ulnes Walton; and drainage of additions to farm buildings, Billinge Farm, Eccleston.

Hendon.—Owing to the rapid growth in the population of the district, it is proposed to enlarge the parish church of St. Mary, Hendon, at a cost of £6,000, and to increase the seating accommodation from 457 to 807. The edifice was built in the fourteenth century.

Irvine.—The Dean of Guild Court has passed the plans of the new drill hall, which is to be erected in the High Street at an estimated cost, with offices, of £2,800.

Kingskerswell.—A new Wesleyan Church and Institute is to be erected in this village, Mr. F. G. Moore, of 9, Fleet Street, Torquay, being the architect.

Margate.—The Town Council has approved the followings plans:—One house, Beresford Gardens; four houses, Victoria Avenue; motor spirit store, Railway Goods Yard, Margate Sands Station; amended plan of Windsor and Richmond Avenue.

Newcastle.—Mr. Courtenay Clifton, of the Local Government Board, has held an inquiry at the Town Hall regarding an application by the City Council for leave to borrow £1,256 for the purpose of providing a new mortuary for the city.

Rawtenstall.—The following plans have been approved by the Town Council:—Additions to Albert Works, Whitewell Bottom; wash-house, etc., at St. Anne's Vicarage, Edgeside, Waterfoot; closets in The Fold, Rawtenstall; cart and tool shed at Bonfire Hill Lane, Crawshawbooth; out-building at 10, Alder Street, Rawtenstall; and porch at St. James' Rectory, Rawtenstall.

Richmond.—The following plans have been passed by the Town Council: Additions to Firfield, Broomfield Road; two new houses, Mortlake Road, North Sheen; two new houses, Beechwood Avenue; additions to No. 4, Spring Terrace, Paradise Road.

Seaforth.—The Liverpool Consistory Court has granted a faculty for the erection of a parochial hall on a portion of the churchyard of St. Thomas's Church, Seaforth, at a cost of about £1,650.

Sedgefield (Durham).—The Rural Council has approved the following plans: House and shop at West Cornforth; warehouse at Sedgefield for J. Newcombe; 3 houses and flats at Bishop Middleham; and 4 houses at Windlestone Colliery.

Slough.—The Urban District Council has approved the following plans:—Two houses in Upton Road, one in Alexandra Road, three in Uxbridge Road, motor garage in High Street, and extension of a shop front in High Street.

Southend-on-Sea.—The Town Council has approved the following plans:—Alterations, "Sudbury," Leigh Road, E.; one house, Bournemouth Park Road; two houses, Beedell Avenue; two bungalows, Branksome Road; one house, Tintern Avenue; six houses, Fleetwood Avenue; one house, Galton Road; conversion of two shops into one, Clarence Street; additions, Park Road; eight houses, Stromness Road; bungalow, Trinity Road; bungalow, Victoria Avenue; stable, Southchurch Road; two houses, Tintern Avenue; three houses, Leigh Road East; three houses, Carnarvon Road; three houses, Central Avenue; one house, Grand Drive; infants' department, Chalkwell Hall Schools; two bungalows, Glenwood Avenue; one house, Drake Road; one house, Leigh Road East; two houses, Kingsway, Chalkwell Park; alterations to premises, Alexandra Street; addition to "Shirley," Southchurch Road; addition to house, 106, Valkyrie Road; seven houses, Wenham Drive; six houses, South Avenue; two houses, Shaftesbury Avenue; lavatories, Queen's Hotel; two houses, Tintern Avenue; and two houses, Northview Drive.

South Shields.—A Local Government Board inquiry has been held at South Shields into the application of the Corporation for sanction to borrow a further sum of £10,000 in respect of the new municipal buildings, bringing the total amount required for the purpose up to £70,000. The Town Clerk stated that the original estimate of the architect for the main building was £44,175. When the foundations were being laid it was discovered by boring that the sub-soil was water-logged, and this had necessitated an additional cost of £4,000. Other contingencies, such as the clock tower, the clock, the fore-court, and the furnishings, had involved the expenditure of £8,566, and he proposed to add £1,061 for contingencies, bringing the additional expenditure up to £9,627. They had borrowing powers for £60,000, repayable in 60 years.

Spennymoor (Durham).—The Urban Council has approved the following plans: Two houses in North Road, iron staircase for exit door of gallery at the theatre; two cottages in Rock Road; alterations to premises in Coulson Street; stable, etc., in South Street; 20 cottages in Pearson Street; photo studio in Barnfield Road; extension to mineral water works.

West Hartlepool.—The Town Council has approved the following plans: Alteration to house, 37, Hutton Avenue; alteration to premises, Roker Street; altering house into house and shop, Tower Street; five houses, Granville Avenue; alteration to shop, 30, Church Street (on the understanding that the premises are not to be occupied as a dwelling-house); altering four houses into club premises, Walter Street; bringing forward shop front, Elwick Road; alteration to basement of Cafe, Church Street; alteration to house, Park Square.

Wosbro'.—The following plans have been approved by the Urban Council:—Two houses at Birdwell, and house in West Street.

Yarmouth. — The Town Council has approved the following plans:—Additions to fishing premises, Admiralty Road; new roads, Lowestoft Road, Gorleston, West Cliff estate; extension of garage, Northgate Street; shed, Row 138; rebuilding salt store, Fish-wharf; additions to offices, Factory, Messrs. Grout and Co., Ltd.; villa, Park Road, Gorleston; shop front, Bell's Road, Gorleston; footbridge, over Row 70; shed, 18, Stafford Road, Southtown; fishing shelters, Bell's Marsh Road, Gorleston; stable Avondale Road, Gorleston.

IN PROGRESS AND COMPLETED.

Bridgwater.—A new church and schools are being built on a site in Monmouth Street to cost £4,052.

Brighton.—The Duke of Devonshire has laid the foundation-stone of the additions to the church of St. Michael and All Angels, which comprise the erection of a nave and tower at a cost of £8,000. Mr. Granville Streatfield is the architect, and the contractors, Messrs. Mark Martin and Sons.

Scarborough.—A new Baptist Church is in course of erection at Columbus Ravine at a cost of £2,500, and the foundation-stones were recently laid. The building will be of brick with stone dressings, and the contracts have been let as follows:—Brickwork, masonry, and plastering, Hunter and Smith; joinery, T. Marshall and Son; slating, Joseph Hardgrave; plumbing, R. Simpson; ironwork, Brogden and Wilson; painting, H. Dodgson. Mr. Caleb Petch is the architect.

Cambridge.—The foundation stone of the new Museum of Archæology and Ethnology, has been laid by the Baroness Von Hugel. The new building, which consists of three storeys, immediately adjoins the Law Schools in Downing Street, and is being built on to the party wall of the Law School lecture rooms. It will occupy the space between the Law Schools and Tennis Court Road, having a frontage of 70ft. to Downing Street and 72ft. to Tennis Court Road, and is being built so as to harmonise with the existing block of buildings of which it will be a partial completion. When the whole range of buildings is completed it will extend along Tennis Court Road to the south end of the Botany School, and the cost is estimated at something like £30,000. The cost of the block now being erected, which was concluded in December last, and which, it is hoped, will be finished in about twelve months, is about £10,000. The builders are Messrs. Kerridge and Shaw, and the building will be warmed by hot water radiators and coils by Messrs. Crittall, of London. Mr. T. G. Jackson, R.A., is the architect.

Gosport.—The contract for the new Wesleyan Church and schools in Stoke Road has been placed with Messrs. Lear and Son, of Alverstoke, and building operations will commence forthwith The new church will adjoin Oak Street, and the schools will be at the Peel Terrace corner, Messrs. Gordon and Gunton, of London, being the architects. Eight months is allowed for the completion of the buildings.

Seven Sisters (Cardiff.)—The new St. Mary's Church is in course of erection near the site of the present iron building, at a cost of £5,600, and the corner stone was recently laid. The church will be Gothic in treatment, and consists of nave, with north and south aisles and organ chamber, the latter being divided off from the nave by arcading with clerestory chancel and clergy and choir vestries. Accommodation is provided in the nave for 386 worshippers, and in the chancel for 20, making a total of 406. The walls are faced with blue native stone, with Doulton stone dressings, with the interior dressings of Bath stone and Portland stone. The building will be heated by means of the low pressure hot-water system. The roof will be in wrought open timber work in pitch pine, and covered with green Westmorland slates. Mr. J. Cook Rees is the architect, and Mr. Evan Thomas, the contractor.

Wigston Magna (Leicester).—The new hall and stores built by the Co-operative Society, and situate in Long Street, have been formally opened on completion. The ground floor consists of three large shops, over which is the New Public Hall, occupying the whole of the first floor, and which is capable of seating about 400 people. It is 65 feet in length by 30 feet in width, and can be divided into two smaller halls of different sizes by a large folding screen. The whole block has been erected at a cost of about £3,600, Mr. F. H. Jones, M.S.A., Leicester, being the architect, and Mr. Joseph Hassall, of Wigston, the contractor.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 30—June 8. **TIDWORTH, HANTS (Assaye Barracks).**—Erection of twelve blocks of troops' stables, including drainage, water supply, pavings, etc., at Assaye Barracks, Tidworth, Hants, for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Tidworth, on May 25, 26, and 27. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than May 30, and the application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders to be delivered addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

May 30—June 8. **TIDWORTH, HANTS (Mooltan Barracks).**—Erection of twelve blocks of troops' stables, including drainage, water supply, pavings, etc., at Mooltan Barracks, Tidworth, Hants (or other selected site within the barrack area), for the Secretary of State for War. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction Office, Tidworth, on May 25, 26, 27. Those desiring to tender and to receive a copy of the bills of quantities must apply to the Director of Barrack Construction not later than May 30, and the application must be accompanied by a deposit of 10s. Cheques or orders to be made payable to the Assistant Financial Secretary, and crossed "Bank of England for Credit to Army Funds." Tenders must be delivered addressed to the Director of Army Contracts, War Office, Whitehall, London, S.W.

May 30—June 15. **DUNSTABLE.**—Erection of a new Council school, for the Bedfordshire C.C. Drawings, specifications, and form of contract may be inspected at the office of Gotch and Saunders, architects, Kettering. Builders desirous of tendering must send their names and addresses to the architects on or before May 30, together with a deposit of £1 1s., when a copy of the bill of quantities and form of tender will be forwarded to them. The contractor will be required to find sureties for the due performance of the contract. The acceptance of a tender will be subject to the approval of the Local Government Board. Tenders must be sent to W. W. Marks, Clerk of the County Council, Shire Hall, Bedford.

June 4. **SHOSCOMBE (near Bath).**—Erection of schools, offices, etc. Contractors desirous of tendering must make application, in writing, to the Rev. Le Gendre Horton, Wellow Vicarage, Bath, on or before June 4th.

June 6. **MANCHESTER.**—(See "Miscellaneous.")

June 6. **ASTON.**—(See "Sanitary Engineering.")

June 6. **OSWALDTWISTLE (Lancs.).**—(See "Engineering.")

June 6. **ARNSIDE.**—Erection of additional school buildings at Inglemere girls' school, for Herbert Higham Llewellyn. For all particulars apply to R. Bradley Barker, architect and surveyor, Arnside.

June 6. **CHESTERFIELD.**—Erection of new warehouses, stabling, etc., in Theatre Yard, for the Corporation. Plans, etc., may be seen, and bills of quantities, etc., obtained on application to the Borough Surveyor's Office, Salter Gate, on deposit of £1 1s.

June 6. **EAST PRESTON (Worthing).**—Erection of a verandah to the Infirmary, and the conversion of existing premises as a meat store, at the workhouse, for the Guardians. Plans and specifications may be seen at the workhouse. Tenders must be sent to "The Chairman of the Board," East Preston, near Worthing.

June 6. **ABERFAN (Merthyr Tydfil).**—Erection of covered play shed at Pantglas boys' school, Aberfan, for the Merthyr Tydfil Education Committee. Particulars can be obtained from the Deputy Surveyor, Town Hall, Merthyr Tydfil. Tenders to be delivered to E. Stephens, clerk to the Education Committee.

June 6. **KENDAL.**—Erection of proposed garage and power station at Hawesmead, Kendal, for Mr. C. H. Clegg (whole or separate tenders). Plans may be seen and quantities and specification may be obtained at the office of John F. Curwen, F.R.I.B.A., F.S.A., architect and sanitary engineer, 26, Highgate, Kendal, to whom tenders must be sent.

June 6. **FOREST HALL (Northumberland).**—Erection of proposed police station (whole or separate tenders). Plans may be seen at the office of J. A. Bean, county architect, The Moot Hall, Newcastle-on-Tyne, and bills of quantities will be forwarded on receipt of cheque for £2 2s. as deposit. Tenders to be delivered, in envelope supplied, at the Architect's office.

June 6. **GRIMSBY.**—Erection of a new Council school in Strand Street, for the Borough Education Authority. Plans may be seen at the offices of Herbert C. Scaping, architect, Court Chambers, Grimsby. Bills of quantities will be supplied on receipt of a deposit of £2 2s. Tenders to be delivered to Douglas Chandler, Clerk to the Education Authority, Education Offices, Grimsby.

June 6. **PENGAM (Wales).**—Erection of an infectious diseases hospital, near Pengam, consisting of two pavilions, lodge, laundry, stables, and administrative block, for the Gellygaer U.D.C. Plans and specifications can be seen and bills of quantities and all particulars may be obtained on application to the Council's architect, P. V. Jones, Bank Chambers, Hengoed, on deposit of £2 2s. Tenders to be delivered to Frank T. James, Clerk, Council Offices, Hengoed.

June 7. **OLDHAM.**—Alterations to gas and water offices, Greaves Street, for the Corporation Gas Works Committee. Plans may be inspected and copies of specification and quantities obtained on deposit of £1 1s., on application at the Gas and Water Offices, Greaves Street.

June 7. **HENSINGHAM.** — Erection of two houses. Plans, specifications, and conditions of contracts may be seen on application at the office of the architect, J. S. Stout, 36, Lowther Street, Whitehaven, and to whom tenders are to be delivered.

June 7. **UPPINGHAM (Rutland).**—New music-rooms at Uppingham school. Bills of quantities can be obtained by application to the Bursar, the Bursar's Office, Uppingham school, at whose office the plans can also be inspected by appointment. Tenders are to be delivered to above address.

June 7. **CAERAU (Glamorgan).**—Erection of a new goods shed, stable, etc., at Duffryn Sidings, Caerau, Glamorganshire, for the G.W.R. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Newport Station. Tenders to be addressed to G. K. Mills, Secretary, Paddington Station, London.

June 7. **CORTACHY (Scotland).**—Mason, joiner, slater, and plasterer works at (1) addition to dwelling house at Rottal, Cortachy, and for joiner and corrugated iron roofing of covered court at Do; (2) new barn, cart shed, and granary, etc., at Coiliamy, Cortachy, joiner and slater works only. For all information, etc., apply to John Black, factor, Airlie Estate Office, Cortachy.

June 7. **WIMBLEDON.**—Erection of two cottages at the rear of the central fire station, Queen's Road, for the Corporation. Plans and specification may be inspected, and bills of quantities obtained at the Borough Engineer's office, Town Hall, Wimbledon, upon payment to the Borough Treasurer of a deposit of £1 1s. Tenders must be addressed to the Chairman of the Watch Committee.

June 7. **KILKEEL (Ireland).** — Enlarging labourer's cottage, No. 81, in Tollymore, for the R.D.C. The works must be executed in accordance with the Council's standard specification, and a plan prepared by John M'Aleenan, C.E., Castlewellan, at whose office and the office of the Council the documents may be inspected. Tenders must be on the prescribed form, which may be obtained on application to W. Hughes, clerk, Board Road, Kilkeel.

June 7. **SNATCHWOOD (Abersychan).**—Erection of 18 houses, with boundary and retaining walls and formation and making of roads at Snatchwood, Abersychan, for the Abersychan, British, and Talymain Industrial Co-operative Society, Ltd. Plans and specifications, with sections of ground, may be seen at the office of A. Gordon Babbidge, Architect and Surveyor, Clarence Chambers, Pontypool. Tenders to be delivered to the Managing Secretary, at the Central Stores, Abersychan.

June 7. **WARWICKSHIRE.**—Alteration of the premises at the Aston Lower Grounds to fit the same for the requirements of the Territorial Units who will be there located, for the Warwickshire Territorial Force Association. Bills of quantities, form of tender, etc., may be obtained from the architects, James and Lister Lea and Sons, 19, Cannon Street, Birmingham, on deposit of £3 3s. The plans and conditions of contract may be seen and all further particulars obtained at the architect's offices. The contractor shall pay rates of wages and observe hours of labour not less favourable than those commonly recognised by employers and trades societies in the building and allied trades in the Birmingham district. Further, the conditions of employment generally accepted in the Birmingham district in the trade concerned shall be taken into account in considering how far the terms of the fair wages clauses are being observed. The contractor shall be prohibited from transferring or assigning to any person or persons whatever any portion of his contract without the written permission of the Association. The contractor shall be responsible for the observance of the fair wages clause by the sub-contractor. Tenders should be delivered at the offices of the Association, 46, High Street, Warwick.

June 8. **LONDON, W.C.**—(See "Sanitary Engineering.")

June 8. **EBBW VALE.**—Erection of 64 cottages, for the U.D.C. Plans and specification may be seen at the office of T. J. Thomas, the Town Surveyor. Tenders should be delivered at the office of Tho. Hughes, Clerk, Ebbw Vale.

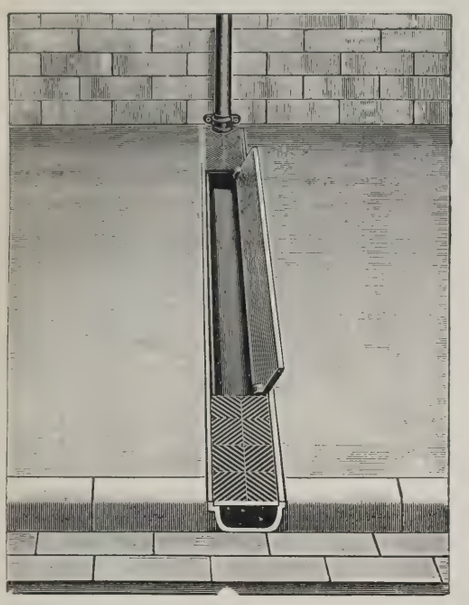
June 8. **BUCKINGHAM.**—Re-erection of almshouses, for the Trustees of the Buckingham General Charities. Drawings, etc., may be seen on application to Henry Small, solicitor, Town Hall, Buckingham, or to G. H. Manning, architect, 6, Walton Street, Aylesbury, and forms of tender may be obtained on deposit of £1 1s.

June 8. **LAMPHEY (near Pembroke).**—Erection of a new Council school building, for the Education Committee. Drawings and specifications may be seen on application to the Head Teacher at the present school at Lamphey, and also at the office of the architect, D. E. Thomas, 17, Victoria Place, Haverfordwest. Bills of quantities and forms of tender may be obtained at the architect's office upon deposit of £1 1s. Tenders must be delivered to W. Davies George, Clerk, County Education Offices, 9, Quay Street, Haverfordwest.

June 9. **LEICESTER.**—Extension of the engine-room, offices, etc., at the tramways power station, for the Corporation. Plans may be seen and copies of the general conditions, specification and bill of quantities obtained, at the Borough Surveyor's Office, on deposit of £2. Cheques, etc., should be crossed and made payable to the Leicester Corporation. Tenders must be addressed to "The Chairman of the Tramways Committee, Town Hall, Leicester."

June 9. **MANCHESTER.**—(See "Miscellaneous.")

June 10. **STAINLAND-WITH-OLD-LINDLEY (Yorks.).**—Stainland-with-Old-Lindley, Bowling Green Council School, new woodwork centre (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen and specifications, etc., obtained, on application to the Education Architect, County Hall, Wakefield. A deposit of £1 must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield.



June 10. **KIRKCALDY.**—Extension of Kirkcaldy post office, for the Commissioners of H.M. Works and public buildings. Tenders are required for the whole work and not for separate trades. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the postmaster of Kirkcaldy. Sketch plans may be seen, and bills of quantities and forms of tender obtained, at H.M. Office of Works, 3, Parliament Square, Edinburgh, on deposit of £1 1s. Tenders must be delivered addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

June 10. **BRADFIELD AND STAINLAND (Yorks.).**—Whole or separate tenders for the following works:—Bradfield: Stannington New Council school; Swinton: Roman Terrace Council school, alterations and additions; Stainland-with-Old-Lindley: Bowling-green Council school, new woodwork centre (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to the Clerk of the County Council, Wakefield.

June 10. **BENTHAM, LONGSTAFFES (Yorks.).**—Alterations and additions to Bentham, Longstaffes, and Lower Council schools (builder, joiner, slater, plumber, plasterer, painter, asphalter, whole or separate tenders). Plans may be seen and specifications with quantities obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

June 10. **BRISTOL.**—Extensions of the Royal Infirmary, comprising the erection of new wards for about 180 beds, operating theatres, and casualty department, on a site in Marlborough Street, Bristol, for the Committee, in accordance with plans, specifications, and conditions of contract prepared by H. Percy Adams and Charles Holden, architects, 28, Woburn Place, Russell Square, London, W.C. Bills of quantities and forms of tender may be obtained from the quantity surveyors, Bernard and Son, 26, Orchard Street, Bristol, on deposit of 5s. Tenders to be delivered to W. E. Budgett, Secretary and House Governor, Bristol Royal Infirmary.

June 10. **LYDFORD, UGBOROUGH AND HARFORD (Devon).**—Construction of the works necessary for developing and working a China clay sett in the parishes of Lydford, Ugborough, and Harford, in the County of Devon, for the Directors of the China Clay Corporation, Ltd. The works will comprise adits, shafts, removal of overburden, C.I. pipe-line, mica drags, tanks, about eight miles of 9in. stoneware double pipe-line, about eight miles of light railway, four clay drys or kilns, with tanks and other works. Plans and specifications may be seen, and bills of quantities obtained, on deposit of a £5 Bank of England note at the office of R. Hansford Worth, Mem.Inst.C.E., 42, George Street, Plymouth, to whom tenders must be sent. Note.—The Directors are also prepared to consider alternative schemes and plans, which must be delivered at the same time and be accompanied by specification and lump-sum tender.

June 11. **HOLMES CHAPEL (Cheshire).**—Alterations and additions to the Agricultural College Holmes Chapel, Cheshire. Plans and specifications can be seen at the office of H. Beswick, F.R.I.B.A., county architect, Newgate Street, Chester, and quantities obtained on deposit of £1. Tenders are to be delivered to R. P. Ward, Director of Education, County Education Offices, Chester.

June 11. **GLOUCESTER.**—Erection of a new Council school, at Deacon Street, Gloucester, for 336 boys, for the Education Committee. Plans and specifications may be seen on application to J. Fletcher Trew, M.S.A., County Chambers, Station Road, Gloucester, and quantities will be supplied on deposit of £1 1s. Tenders to be delivered to P. Barrett Cooke, Secretary to the Committee, Berkeley Street, Gloucester.

June 11-20. **LONDON, E.**—(See "Painting.")

June 13. **HULL.**—(See "Engineering.")

June 13. **BIRKENHEAD.**—(See "Miscellaneous.")

June 14. **DURHAM.**—Alterations and additions at Black Boy and Eldon Council Schools, Manual Instruction Room, at Cockton Hill, and Caretaker's House at Murton Colliery, for the C.C. Sole tenders are invited for the above. Plans, specifications and general conditions of contract may be seen and bills of quantities obtained as follows:—1, for Black Boy Council School, at the office of F. H. Livesay, architect, Newgate Street, Bishop Auckland; 2, for Eldon Council School and Murton Caretaker's House (plans, specification, and general conditions only for the latter), at the office of F. E. Coates, Shire Hall, Durham; 3, for Cockton Hill Manual Instruction Room, at the office of W. Rushworth, Shire Hall, Durham. Tenders (endorsed with name of school) are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

June 15. **TROON.**—Erection of a new orchestra at the United Methodist Church. Plans and specifications can be seen at Joseph Rodda's House, Treslethan Road, Troon, to whom tenders must be sent.

June 15. **CHISLEHURST.**—Erection of a new post-office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Chislehurst. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered addressed to the Secretary, H.M. Office of Works, Storey's Gate, London, S.W.

June 20. **WATERLOO WITH SEAFORTH.**—Erection of the Crosby Road North Council school, Waterloo, near Liverpool, for the U.D.C. Bills of quantities may be obtained from John I. Thompson, Clerk to the Council, Town Hall, Waterloo, near Liverpool, upon deposit of £1 1s. Drawings and specifications may be seen at the office of Appleyard and Quiggin, architects, 67, Lord Street, Liverpool. Tenders must be delivered to the Clerk to the Council.

June 27. **MERTHYR.**—Alterations and additions for the conversion of Cyfarthfa Castle into a secondary school, and the erection of science laboratories, art and lecture rooms, with latrines, playgrounds, and other works in connection therewith. Specification, quantities, and form of tender may be obtained from T. F. Harvey, M.Inst.C.E., Borough Engineer, on and after June 6, on deposit of £5 5s. Plans and drawings may be seen at Cyfarthfa Castle, and other information obtained, on and after June 6. Tenders must be sent to T. Aneuryn Rees, Town Clerk, Town Hall, Merthyr Tydfil.

June 13. **CHELMSFORD.**—Heating and ventilating works at the Trinity Road Council School, which is now in course of erection, for the Borough Education Committee. Persons tendering are to submit their own schemes for these works. The plans of the school building may be inspected at the office of the architect, W. H. Pertwee, the Institute, London Road, Chelmsford, from whom all particulars may be obtained. The contract for the erection of the school building has been let to Henry Potter and Son, of Chelmsford, and the person whose tender is accepted for the before-mentioned works will be, and act as, sub-contractor to, and will be paid by, that firm. Tenders, which must be on forms to be obtained from the architect, together with detailed schemes or specifications, must be addressed to W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

June 14. **STAFFORD.**—Supply and erection of a triple-expansion vertical rotative direct-acting pumping engine and Lancashire boiler, together with all machinery, pipes, valves, and other works in connection therewith, for the Corporation. Conditions of contract, specification, form of tender, and bill of particulars may be obtained from W. Plant, borough and waterworks engineer, Borough Hall, Stafford, on deposit of £5. Tenders to be delivered at the office of Richd. Battle, town clerk, Borough Hall, Stafford, addressed to the Chairman of the Waterworks Committee.

June 16. **PEMBROKE.**—Supply and erection of a weighbridge at the Union Workhouse, including the erection of necessary house, which must be described in the tender, for the Guardians of Pembroke Union. Persons tendering are requested to submit tenders for a machine of 3 tons, 4 tons, 5 tons, and 6 tons capacity, stating the name of maker of machine. Tenders to be sent to J. S. W. Jones, clerk, Union Office, Pembroke.

No date. **KIRTON (Boston).**—Erection of a brick and slate warehouse (size 26oft. long, 38ft. wide), in two floors, and proposed to be built on a site adjoining Kirton Station Yard, for W. Dennis and Sons, Ltd. Plan and specification may be seen by application to Mr. Henry Kidd, Solent House, Kirton.

ENGINEERING.

June 6. **MARGATE.**—Excavating and refilling trenches and laying jointing and fixing about 1,030 yards of six inch main in the west and centre roads on the Cliftonville Estate, with all necessary valves, hydrants and fittings. Specification and plan can be seen, and particulars and form of tender obtained, on application to F. Stanley, Waterworks Manager, 13, Grosvenor Place, Margate. Tenders to be sent in to Edward Brooke, Town Clerk, Town Clerk's Office, Margate.

June 6. **OSWALDTWISTLE (Lancs.).**—Excavating, concreting, and brickwork, etc., in the building and constructing of waterworks filters, clean water tank, and other works at the Jackhouse reservoir, for the U.D.C. Plans and specifications of the works may be seen on application being made to R. N. Hunter, water engineer, Town Hall, Oswaldtwistle, and a copy of conditions, specifications, bills of quantities and form of tender obtained on deposit of £2 2s. Tenders must be addressed to the Chairman of the Waterworks Committee, and delivered to B. T. Westwell, clerk, Town Hall, Oswaldtwistle.

June 7. **CHATTERIS (Cambs.).**—Work connected with a steel water storage tank, including foundations, connections, and laying about 140 yards of 6in. pipe, for the U.D.C. Specifications and general conditions, with forms of tender, may be obtained of A. Harold Ruston, clerk, Chatteris, Cambs., on deposit of £1. Plans of the work can be obtained from the Clerk at a cost of 5s. each, which will not be returned. Tenders to be sent to the Clerk.

June 9. **LEICESTER.**—(See "Iron and Steel.")

June 10. **UXBRIDGE.**—Construction of an underground pumping chamber, the laying of about 1,093 lineal yards of cast iron rising main and appurtenant works at Vine Lane, Hillingdon East, for the Uxbridge R.D.C. Plan and section can be seen and copies of specification and quantities obtained at the office of John Wm. Harrison, engineer and surveyor, Corn Exchange, Uxbridge, on deposit of £1 1s. Tenders to be sent to the office of Charles Woodbridge, clerk, 38, High Street, Uxbridge.

June 13. **WEXFORD.**—Erection of ferro-concrete bridge (Hennebique principle) over River Slaney, for the C.C. Plans, etc., can be seen at Mouchel and Partners, 38, Victoria Street, Westminster, London, S.W.

SANITARY ENGINEERING.

May 23—June 10. **NEW MILLS (near Stockport).**—Sewerage and sewage disposal works at Birch Vale, for the Hayfield R.D.C., comprising:—1,520 lineal yards of earthenware pipes, 9in. diameter; 150 lineal yards of steel tubes, 9in. diameter, on rubble piers; and 35 lineal yards of cast-iron pipes, 9in. diameter, under railway, with all manholes, lampholes, flush tanks, and ventilators. Also extensions to the existing disposal works, including precipitation and stormwater tanks, percolating filters, and revolving sprinklers (55ft. diameter), dosing tank, carriers, distributors, etc. Plans and specifications may be seen at the offices of the engineers (John Newton, Son and Bayley, civil engineers, 19, Cooper Street, Manchester), and copies of bills of quantities and form of tender may be obtained from them or from J. R. Bowden, clerk, 16, High Street, New Mills, near Stockport, on deposit of £1 1s. Contractors proposing to tender are requested to send their names to the Engineers by May 23. Tenders to be delivered at the Rural Council Offices, 16, High Street, New Mills, by June 10.

June 6. **GNOSALL (Salop).**—Laying of about 5,000 yards of 12in., 9in., and 4in. glazed earthenware and cast-iron pipe sewers, the construction of manholes, tanks, filters, engine house, etc., and other appurtenant works in the parish of Gnosall, for the D.C. Drawings may be seen and copies of specification, tender, and bill of quantities, may be obtained at the offices of the engineers, Berrington, Son and Watney, Bank Buildings, Lichfield Street, Wolverhampton, and 28, Victoria Street, Westminster, S.W., on deposit of £5 5s. Tenders must be delivered at the office of H. G. U. Elliott, clerk, Newport, Salop.

June 7. **RIPLEY.**—Construction of sewerage, and sewage disposal works, comprising sewerage, subsidence tanks, percolating filters, and other appurtenant works, for the U.D.C. Plans and specifications may be seen and bills of quantities and forms of tender obtained on application to George W. Bird, Surveyor to the Council, Town Hall, Ripley, Derby. A deposit of £1 1s. will be required. Tenders must be delivered at the office of George Whitcombe, Clerk, Town Hall, Ripley, Derby.

June 8. **STANLEY.**—Construction of sewers, for the U.D.C. Drawings, etc., may be seen, and quantities, etc., obtained, by personal application to the Surveyor to the Council (Joseph Routledge).

June 8. **LONDON, W.C.**—Construction of an above-ground convenience for both sexes, in Brooke's Marget, for the B.C. Forms of tender may be obtained, and drawing and specification inspected, on application to the Borough Surveyor at the Council's Offices. Quantities will not be supplied. Tenders must be delivered to Lionel Walford, Town Clerk, Council Offices, 193-197, High Holborn, W.C. The contractor will be required to indemnify the Council against all liability (including third party risk) under the Workmen's Compensation Act, Employers' Liability Act, and the Common Law. The firm whose tender is accepted will be required to enter into a contract and bond with two sureties, which contract and bond will be prepared by the Town Clerk, at whose office the form may be inspected.

June 9. **DAVYHULME (Manchester).**—Construction of about 1,586 yards of brick sewers and 6,523 yards of pipe sewers, with syphons, flushing chambers, and manholes, in the township of Davyhulme, for the Barton-upon-Irwell R.D.C. Plans, sections, and specifications may be seen and forms of tender and bills of quantities obtained (upon deposit of £3 3s.), at the office of A. H. Mountain, A.M.I.C.E., 16, John Dalton Street, Manchester. Tenders to be addressed to J. W. Whitworth, clerk, Union Offices, Patricroft, Manchester.

June 11. **PENISTONE.**—Kirkwood Sewer Extension—Contract No. 6.—Construction of about 300 yards of 9in. earthenware pipe sewers, with manholes, and all contingent works, for the U.D.C. Drawings and specifications may be seen, and quantities and form of tenders obtained, at the office of the Engineers, Spinks, Piling, and Rodwell, 20, Park Row, Leeds, on deposit of £1 1s. Tenders are to be delivered to Chas. Hodgkinson, Clerk, Council Offices, Penistone.

June 14. **DUNDALK.**—Providing and laying of about 1,100 yards of sewer, together with the building of manholes and other works, for the U.D.C., shown or described on the plans, sections, and specification prepared by Maurice Sellars, town surveyor, which can be seen at his office, Town Hall, Dundalk, and from whom forms of tenders, etc., can be obtained, on deposit of £2. Tenders, giving the names and addresses of two solvent sureties willing to join in a bond of £500, to be lodged at the office of Mathew Comerford, town clerk, Town Hall, Dundalk. The acceptance of any tender sent in will be contingent on the loan being granted by the Board of Works, and the accepted contractor must be prepared to await the granting of same, and to proceed with the work when called upon without any extra to the amount of the accepted tender in consequence of such delay.

June 14. **WEYMOUTH.**—Constructing and maintaining surface-water and other sewers for the diversion of surface water, Park District, Melcombe Regis, consisting of 16in. and 21in. cast-iron sewers, 21in. and 24in. steel-ribbed granite concrete sewer tubes, manufactured by John Ellis and Sons, Limited, Leicester; 6in., 9in., 12in. and 15in. glazed stoneware socket drain pipes, with outlet and flap chamber, manholes, overflows, stoneware gullies, and other works incidental thereto, for the B.C. Plans and specifications may be seen, and form of tender obtained at the office of the Engineer, W. Barlow Morgan, 4, York Buildings, Weymouth. The contractor must deposit with his tender Bank of England notes to the value of £10, also state on his tender the name and address of a properly-registered Guarantee Association willing to be jointly and severally bound with him in the sum of £1,000 for the due performance of his contract. Tenders, addressed H. A. Huxtable, Clerk to the Council, to be delivered at the Municipal Offices, Clarence Buildings, Weymouth.

(*Contracts continued on page xiv.*).

June 15. **WORKINGTON.**—Provision and laying of about 2,900 lineal yards of 18in. diameter stoneware pipe sewer, with sea outfall, consisting of about 714 lineal yards of 18in. diameter cast-iron pipes supported on timber piling, together with manholes, lampholes, storm water overflow chambers, and other works in connection therewith, for the Corporation. Drawings may be seen at the office of H. Bowman Williams, Borough Engineer and Surveyor, Town Hall, Workington, from whom copy of the specification, bill of quantities, and form of tender, can be obtained on deposit of £3 3s. Tenders to be delivered to the Town Hall, addressed to John Warwick, Town Clerk, Workington.

June 20. **YSTRADGYNLAIS.**—Schemes and estimated cost for sewering the Parish of Ystradgynlais Lower, for the R.D.C., who will pay a sum of £20 for the scheme which they consider most suitable, and the decision of the Council must be accepted as final. Competitors to state their terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars of the area to be drained and any other information may be obtained from T. Watkins, Surveyor to the Council, Ystradgynlais. Schemes to be sent in to D. L. Moses Evans, Clerk to the Council, Commercial Street, Ystalyfera.

IRON AND STEEL.

June 6. **WREXHAM.**—Supply of wrought-iron entrance gates, ornamental railings, and unclimbable fencing, for the "Parciau," for the Corporation. Plans may be seen, and specification, bill of quantities, and form of tender obtained on application to John England, borough engineer, Willow Road. Tenders to be delivered to Lawson Taylor, town clerk, the Guildhall, Wrexham.

June 6. **RUTHERGLEN.**—Steelwork to be provided in the reconstruction of Farme Loan Road bridge, Rutherglen, at 98 miles 75 chains, for the Directors of the Caledonian Railway Company. Drawings may be seen at the office of the company's engineer, Buchanan Street Station, Glasgow, where copies of the specification, etc., may be obtained on deposit of £2 2s. Tenders must be sent to J. Blackburn, Secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow.

June 7. **LONDON (for India).**—Supply of steelwork for piers, for the Secretary of State for India. Conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., to whom tenders must be delivered.

June 9. **LEICESTER.**—Supply and erection of steel roof trusses and other work for an extension of the engine-room at the tramways power station, for the Corporation. Plans may be seen, and copies of the general conditions, specification, and bill of quantities obtained, at the Borough Surveyor's Office, on deposit of £1. Cheques, etc., should be crossed and made payable to the Leicester Corporation. Tenders must be addressed to "The Chairman of the Tramways Committee, Town Hall, Leicester."

June 11. **MANCHESTER.**—Iron and steel work. —Supply of iron and steel work required for an installation of horizontal retorts at their Rochdale-road Station, for the Gas Committee. General conditions of contract and specification can be obtained on application to F. A. Price, superintendent, Gas Department, Town Hall, on deposit of £3 3s. Drawings may be seen and any other information obtained on application to the engineer, J. G. Newbigging, M.I.C.E., Rochdale Road Station. Tenders (addressed to the Chairman of the Gas Committee) must be delivered at the Gas Offices, Town Hall, Manchester.

PAINTING.

June 6. **NORMANTON.**—Painting the outside of Cemetery House and the entrance gates, for the Burial Board. Specifications and full particulars may be had from Edwin Backhouse, Clerk and Curator, Cemetery House, Normanton.

June 8. **CHERITON (Kent).**—Painting cottage homes, for the Guardians of Elham Union. Tenders to be sent to R. Lonergan, clerk, 29, Bouverie Square, Folkestone. Specification can be seen at the Clerk's office.

June 8. **LONDON, S.W.**—Painting, distempering, general repairs, etc., at their Infirmary in the Fulham Road, S.W., for the Guardians of St. George's Union. Specifications may be obtained from Thomas Worlock, Clerk to the Guardians, Prince's Row, Buckingham Palace Road, S.W., to whom tenders must be sent.

June 9. **KING'S NORTON AND NORTHFIELD.** —Painting of the following schools:—Stirchley Street Council School (exterior); Rubery Council School (exterior); Woodgate Council School (interior); Tiverton Road Council School (interior and exterior); Moseley C.E. School (interior); Bartley Green C.E. School (interior), Northfield C.E. School (interior); Dawlish Road C.E. School (interior); Selly Oak St. Mary's C.E. School (interior); St. Edward's R.C. School (interior), for the U.D.C. Education Committee. Forms of tender, together with copies of the conditions and specification, may be obtained from John F. Moore, Secretary, Education Offices, King's Norton, to which address tenders must be sent. When applying for forms contractors should specify the schools for which they wish to submit tenders.

June 11-20. **LONDON, E.**—Cleansing, repairs, and painting of thirteen schools, new covered playground at one school, for the Education Committee of the Borough of West Ham, to be executed during the summer vacation. Contractors desiring to tender for either are requested to make written application to William Jacques, A.R.I.B.A., Architect to the Education Committee, 2, Fen Court, Fenchurch Street, E.C., for copies of specifications, conditions, and forms of tender, not later than June 11. Each application must be accompanied by a deposit of £1 (cheques will not be accepted). Tenders must be delivered by registered post at the Education Department, 95, The Grove, Stratford, E. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract.

June 14. **CHORLEY.**—Painting and decorating of the secondary school, Union Street, for the Education Committee, according to specification and conditions, which may be seen at the Borough Surveyor's Office, Town Hall. Tenders to be sent to Jno. Mills, Town Clerk, Town Hall, Chorley.

June 16. **LONDON, E.**—Painting at the Scattered Homes, or elsewhere, for the Mile End Guardians. Forms of tender, with specifications, may be obtained upon application to Benjamin Catmur, Clerk to the Guardians, Guardians' Offices, Bancroft Road, Mile End, E., by letter, enclosing stamped directed foolscap envelope. Persons tendering will be required to state in their tender that they pay such rates of wages and observe such hours of labour as are generally accepted as fair in the trade to which the work refers. Tenders to be sent to the Clerk to the Guardians.

ROADS AND CARTAGE.

June 4. **DORSET.**—Supply and delivery of about 22,000 tons of best description of hard road stone, at various seaports and railway stations in the county, for the repair of the rural main roads during the ensuing year, for the C.C. For further particulars and forms of tender apply to Walter J. Fletcher, County Surveyor's Office, Wimborne, Dorset. Tenders to be sent to the County Surveyor, Shire Hall, Dorchester.

June 6. **SOUTHAMPTON.**—Carting of material for the repair of main roads, New Forest Division and Romsey Division. Specification and form of tender from W. J. Taylor, County Surveyor, The Castle, Winchester.

June 6. **ILFORD.**—Supply of about 5,860 superficial yards of either Norway granite, Jarrah wood, or grey royal granite paving, laid on each side of the tramway in High Road, Ilford, from the Broadway to Green Lane, for the Highway Committee of the Essex C.C. Plans can be seen, and specification and form of tender obtained, at the Chief Surveyor's Office, Chelmsford.

June 6. **PONTYPRIDD.**—Carrying out of the following private street works, for the U.D.C.:— Contract No. 1, St. Michael Street (Stow Hill); (2) Tower Street, Graig; (3) Tyvica Road extension; (4) lane at rear of Richard Street and William Street, Cilfynndd; (5) Laundry Road, Pwllgwaun. Plans and specifications may be seen and forms of tender obtained on application at the office of W. E. Lowe, engineer, and surveyor to the Council, upon receipt by the clerk of a deposit of £1 1s., in respect of each contract. Tenders, on the prescribed form, must be sent to J. Colenso Jones, Clerk, Municipal Buildings, Pontypridd.

June 6. **THORNABY-ON-TEES.**—Forming, draining, paving, curbing, flagging, and channelling of Palmer Street; Langley Avenue (part of); Teesdale Terrace (part of); and for forming, sewering, and paving Back Britannia Street, Trafalgar Street, and Norton Place; Back East Mansfield Avenue (part of); Back Langley Avenue and Ellerburne Street; Back West Mansfield Avenue (part of); Back South Langley Avenue (part of); Back East Salisbury Street; Back South Langley Avenue (part of); Back Roseberry View, and Salisbury Street, for the Corporation. Plans and specifications may be seen, and copies of the bills of quantities obtained, at the Borough Engineer's Office, Town Hall. Tenders must be delivered at the Town Clerk's Office, Town Hall, Thornaby-on-Tees.

June 6. **ELY.**—Supply and delivery of 1,142 tons (more or less) of Leicestershire granite (separate prices for machine and hand-broken to be quoted), to be delivered as follows, for the U.D.C.:—100 tons of 11in. to 1¼in. Leicestershire granite at Ely railway station; 300 tons of 1¼in. Leicestershire granite at Ely railway station; 12 tons of 1¼in. Leicestershire granite at Chettisham railway station; 20 tons of 1¼in. Leicestershire granite at Black Bank station; 150 tons of 11in. clean screenings to Ely railway station; 140 tons of 1¼in. Leicestershire granite by water to Adelaide Bridge; 160 tons of 1¼in. Leicestershire granite by water to Prickwillow Bridge; 30 tons of 1¼in. Leicestershire granite by water to Burnt Fen Bank, between Prickwillow Bridge and Mr. John Sindall's house; 100 tons of 1¼in. Leicestershire granite by water for Miles End Drove, to be delivered at Burnt Fen Bank, and tipped into carts near Mr. John Sindall's house; 130 tons of 1¼in. Leicestershire granite, in heaps every ten chains along the bank of the River Lark, towards the Branch. No form of tender is issued by the Council. All the above to be delivered at such times and in such quantities as the Council by its Surveyor may from time to time appoint. Samples should be sent to W. McKelvie at the City Surveyor's Office, Ely (carriage paid), by June 4. Tenders to be delivered or sent by post to Geo. Martin Hall, Solicitor and Clerk, Market Square, Ely. Each contractor will be required to enter into the Council's usual contract, and give security for the due performance of his contract.

June 7. **PORTSLADE-BY-SEA.**—Supply of team labour for the U.D.C. Form of tenders and full particulars can be obtained on application to the Surveyor, 46, St. Andrews Road, Portslade-by-Sea.

June 7. **LONDON.**—Repaving with wood blocks of a portion of the carriageway of the Victoria Embankment, for the L.C.C. Persons desiring to submit tenders may obtain drawings, specifications, bills of quantities, forms of tender, etc., on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon deposit to the Cashier of the Council of £1. Full particulars of the work and conditions of contract may be obtained at the County Hall, before payment of above fee. Rate of wages, etc., clause to be observed.

June 7. **BROMLEY (Kent).**—Sewering, levelling, paving, metalling, channelling, and making good a portion of Southlands Road, in accordance with the plans, sections, and specifications, which may be seen, and bills of quantities, etc., obtained, at the office of the Borough Engineer, on deposit of 10s. at the office of Fred. H. Norman, Town Clerk, Municipal Offices, Bromley, Kent, to whom tenders are to be sent. Tenders, endorsed "Southlands Road," must be delivered not later than 3 o'clock on Tuesday, the 7th day of June, 1910. The Council does not bind itself to accept the lowest or any tender.

June 8. **ORSETT.**—Supply of about 1,100 yards of 2in. broken Cherbourg quartzite, 600 tons of 2in. broken granite or basalt, about 1,100 yards of 2½in. Kentish rag, and about 1,500 yards of Kentish flints, to be delivered to the various wharves and railway stations during the period ending March 31, 1911, for the R.D.C. Forms of tender can be obtained from F. T. Johnson, Highways Surveyor, or James Beck, Clerk to the Council, 2, Orsett Road, Grays, and tenders must be sent to the latter.

June 8. **LOUGHTON.**—Supply of the following materials, and for hire of steam roller, for the U.D.C.:—(1) Six hundred tons of granite, broken to pass 1¼in. ring; (2) twelve hundred tons of clean, sharp gravel; (3) fourteen hundred feet run of 4in. by 10in. rough granite edge kerb; (4) hire of a six-ton steam roller for rolling granite and gravel, at per day, including all firing, oil, use of water cart, etc.; (5) for the supply of destructor clinker, brick hard core, and clean, sharp hoggin, in truck loads as required. The granite and gravel will be required to be delivered at Loughton or Chigwell Lane stations (G.E.R.) in quantities as directed, and all other materials at Loughton station in quantities as directed. Further information and forms of tender may be obtained from Horace White, District Surveyor, Loughton, Essex, upon receipt of a stamped and addressed envelope. Tenders for each item are to be in a separate sealed envelope, endorsed with the names of the material or work tendered for, and are to be delivered (with samples in the cases of tenders for granite, gravel or hoggin) at the office of Leonard W. Liell, Clerk to the Council, Loughton, Essex.

June 8-15. **EPPING (Essex).**—Making-up of Smeaton Road, Chigwell, Essex, and for laying a surface water drain therein, for the Epping R.D.C. Plans and specifications can be seen and bills of quantities can be obtained of H. Tooley, surveyor, Council Offices, Buckhurst Hill, Essex. Applications for quantities must be made before June 8, accompanied by a deposit of £2. Tenders to be delivered at the office of R. D. Trotter, clerk, Epping, Essex.

June 9. **CASTLEFORD.**—Tarring, etc., of a number of street surfaces for the U.D.C. Full details may be obtained and specification inspected on application to the surveyor, W. Green.

June 11. **STRETFORD (Manchester).**—Paving with granited rock asphalte, etc., Carlton Street and Norton Street, for the U.D.C. Drawings and specifications may be seen and forms of tender, with schedule of quantities and other particulars obtained on application to Ernest Worrall, surveyor, on deposit by cheque of £2 2s.

MISCELLANEOUS.

June 6. **MANCHESTER.**—Supplying and fixing tiled dados at the Brookdale Park Municipal School, Newton Heath, and the Moseley Road Municipal School, Fallowfield, Manchester, for the Education Committee, in accordance with the specification, which may be obtained at the offices in Deansgate, Manchester, on a deposit of £1 1s. Tenders and samples of dados must be delivered at the Education Offices. Cheques to be made payable to the Accountant, Education Offices, Deansgate, Manchester.

June 13. **BIRKENHEAD.**—Plastering three wards at the Union Infirmary, Church Road, Tranmere, for the Guardians of Birkenhead Union. The premises may be inspected any day between 9 a.m. and 12 noon. Forms of tender, with specification, may be obtained at the office of John Carter, clerk, Poor Law Offices, Birkenhead, and must be delivered to him. Rate of wages and hours of labour clause to be observed.

June 14. **SOUTHAMPTON.**—Supply of deals and matched boarding, for the Director General, Ordnance Survey. Application for forms of tender and specification should be made to the Officer in Charge of Stores, Ordnance Survey Office, Southampton.

JUST A WORD ABOUT WHITEWASH.

No one denies that the old method of preparing whitewash was both insanitary and wasteful. It is now rendered **obsolete.**

"CEELINKOTO"
(Registered)

does away with it.

WHY? Because just mixed with a little clean cold water it forms a **perfect sanitary whitewash** for ceilings and friezes.

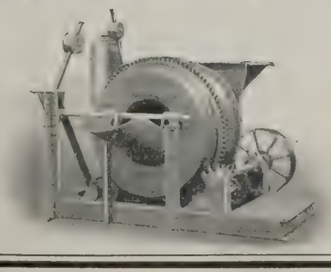
When an article of sterling merit has been successfully placed on the market imitations are bound to spring up. Protect your own interests by making sure that you use

"CEELINKOTO"
(REGISTERED)

It is made in White Cream, and Ivory, and is packed in casks weighing about 1¼cwt. It is sold by all Builders' Merchants and Colour Houses. If any difficulty is experienced in obtaining

"CEELINKOTO"

the Proprietors will be glad to furnish the name of their nearest local agent.



Sole Manufacturers:

THOMAS JENKINS & CO.
(ESTABLISHED 1848),
ST. GEORGE'S WHARF, GRAND SURREY CANAL, Camberwell, London.

Telephone—1119 HOP. Telegrams—"OGMORIAN," LONDON

Try "CEELINKOTO." Its great advantages will be at once apparent.

UNIFORMITY is everything in CONCRETE for REINFORCED CONCRETE CONSTRUCTION

Insure it by always using the

RANSOME CONCRETE MIXER
(Manufactured by RANSOMES & RAPIER, Ltd., Ipswich),

It turns out **PERFECT CONCRETE** at a minimum of cost, labour and time.

LATE CONTRACTS.

ENGINEERING.

June 6. **DERBY.**—Carting, laying, and jointing cast-iron mains along the Nottingham road, from Alice Street to the Cemetery, consisting of about three-quarters of a mile of 8in. diameter pipes, together with the necessary valves, hydrants, etc., for the Corporation. Plans, etc., may be seen, and printed specification, schedule of quantities, and form of tender obtained, at the office of John Ward, M.Inst.C.E., Borough Surveyor and Waterworks Engineer, Borough Surveyor's Office, Babington Lane, Derby, on deposit of £1 1s. Tenders to be sent to the Town Clerk, 15, Tenant Street, Derby.

June 10. **INGATESTONE (Chelmsford).**—Excavating the trenches, supplying, laying, and jointing about 711 yards of 3in. cast-iron water mains, and other incidental work at Ingatestone, for the Chelmsford R.D.C. A copy of the conditions, specifications, quantities, and drawings may be had on application to the Engineer. Tenders must be sent to James Dewhirst, A.M.I.M.E., Engineer, Bank Chambers, Chelmsford.

June 13. **HULL.**—Construction of a bridge over Stoneferry Road, in lieu of the existing level crossing, the diversion of the railway, and works in connection therewith for the Directors of the N.E.R. The work consists of about 90,000 cubic yards of earthwork, a new bridge, consisting of about 1,200 cubic yards of brick and concrete abutments on timber piles, and about 200 tons of steel girders and decking, the lowering of Stoneferry Road and connecting streets, the construction of retaining and boundary walls, fences, etc., a loading dock, and a passenger subway and timber platform at the new station. Plans may be seen and specification, detailed quantities, and form of tender obtained on personal application at the office of C. F. Bengough, the Company's Engineer, at York. Tenders to be sent to the Secretary, at York.

June 17. **HASLEMERE (Surrey).**—Laying about 1,250 yards of C.I. pipes, fixing valves, etc., for the Hambledon R.D.C. Copies of the specification and forms of tender can be obtained at the office of John H. Howard, The Cottage, Lower Street, Haslemere, on deposit of £2 2s. Tenders must be sent addressed to Ferdinand Smallpeice, Clerk, 138, High Street, Guildford.

SANITARY ENGINEERING.

June 6. **ASTON.**—Construction in brickwork, concrete tubes, and iron pipes, of a storm-water overflow, near Wharf Street, Aston, for the Joint Sewerage Committee. Plans and specification may be seen, and bill of quantities obtained, at the office of the Borough Surveyor, Council House, Aston Manor, on deposit of £1 1s. Tenders to be addressed to the Chairman of the Joint Sewerage Committee, and delivered at the office of the Clerk, Joseph Ansell, 27, Bennett's Hill, Birmingham. Fair wages clause

June 20. **CHELMSFORD.**—Extending the sewer in Trinity Road, for the T.C. Forms of tender, and full particulars may be obtained, and the plans and specification may be inspected, at the office of the Borough Surveyor, Cuthbert Brown, 16, London Road. Tenders must be delivered at the office of W. Smith, Town Clerk, Municipal Offices, Chelmsford.

IRON AND STEEL.

June 6. **DERBY.**—(See "Engineering.")

June 7. **HASLEMERE (Surrey).**—See "Engineering.")

PAINTING.

June 8. **CHELTENHAM.**—Cleaning and colouring at St. John's, St. Luke's, Leckhampton; St. Gregory's, St. Paul's Girls', St. Peter's, St. Mark's, Alstone; St. Mark's, Roman Road; and Hatherley Lane Schools, to be carried out during the summer holidays, for the Education Committee. Specifications may be obtained from Chatters and Smithson, architects. Tenders to be sent to the Secretary, Education Offices.

June 10. **GREAT BADDOW (Chelmsford).**—Repainting the iron and woodwork at the water tower and engine house at Great Baddow, for the Chelmsford R.D.C. A copy of the conditions and specification may be obtained on application to the Engineer. Tenders must be sent to James Dewhirst, A.M.I.M.E., Engineer, Bank Chambers, Chelmsford.

ROADS AND CARTAGE.

June 14. **LONDON, E.**—1, private street works, Falcon Street, and Third Avenue (part of); 2, wood paving Upper Road and Helena Road; 3, attendants' quarters, Convalescent Home, The Grange, Harold Wood, for the West Ham B.C. Plans may be seen, and specifications, forms of tender, and further particulars obtained, at the office of the Borough Engineer, Town Hall, West Ham, E., upon deposit of £1 in respect of each form of tender. Note.—No tender will be considered unless the same is delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post, not later than 4 o'clock on June 14. The contractor will be required to enter into a bond with two sureties for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trade unions and in force at the time of signing the contract, and shall not assign, nor under-let or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

June 15. **LANCHESTER.**—Draining, levelling, forming, kerbing, paving, and flagging Pine Street, Back Bridge Street, Wood View, etc., etc., Langley Park, for the R.D.C. Drawings and specifications may be seen and bills of quantities obtained at the Surveyor's Office, The Grove, Lanchester. Tenders to be sent to W. H. Ritson, Clerk to the R.D. Council, Lanchester.

June 17. **MANCHESTER.**—Supply of special (permanent way) track work, for the Tramways Committee of the Corporation. Specifications and forms of tender may be obtained on application to J. M. M'Elroy, general manager, Corporation Tramways, 55, Piccadilly, Manchester, on deposit of £2 2s. Tenders to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester.

June 17. **TOTTENHAM.**—Repair of the tar and asphalte paving throughout their district, for the U.D.C. Specifications and forms of tender can be obtained on application to W. H. Prescott, A.M.I.C.E., Engineer to the Council, at the Council Buildings, The Green, Tottenham. Persons tendering will be required to deposit with the Treasurer, when handing in their tenders, in a Bank of England note or cash, the sum of £5 in respect of each tender, which will be forfeited by the person whose tender is accepted if the contract be not executed within seven days from the date he is informed it is ready for signature, otherwise it will be repaid. This deposit will be repaid to the parties tendering who are unsuccessful. The contractor will be required to pay all workmen on the Council's work the recognised trade union rate of wages. A schedule of such wages will be inserted in the contract, and a copy of the schedule must be exhibited on the pay office at the works. Tenders to be delivered to Edward Crowne, Clerk of the Council, Tottenham.

June 25. **LEWES.**—Supply of 600 tons of 2in. broken granite, 150 tons of coarse granite screenings, and 500 tons of broken surface picked flints, for the T.C. Forms of tender, etc., may be had, and further information obtained, at the Borough Surveyor's Office, Town Hall, Lewes.

MISCELLANEOUS.

June 9. **MANCHESTER.**—Faience work and tiling at the Crumpsall Library, for the Libraries Committee. Specification may be obtained at the office of the City Architect, Town Hall, upon deposit of 10s. 6d. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders to be delivered at the City Architect's Office.

Practical Works for Architects

Practical Exemplar of Architecture.

Edited by Mervyn E. Macartney, B.A., F.R.I.B.A., F.S.A.

Being measured Drawings and Photographs of Fine Examples and Details for the use of those who desire to study the work of the masters in Architectural Design and Construction. The Plates are finely printed on stout art paper and collected in a neat portfolio so that each sheet can be detached for convenience of reference or study.

First Series, 120 Plates with Portfolio.
Second Series, 112 Plates, 8 pp. Notes and Portfolio.

Price 12/6 each Nett.

Recent English Domestic Architecture.

1909-10.

Comprising a collection of Choice Examples of Recent Domestic Work by Architects who have achieved distinction in this class of design. The Examples are not restricted to any particular school or style, intrinsic merit being the only test.

Over 200 pages, superbly illustrated, printed on heavy art paper, and bound in limp cloth.

Price 5/- Nett.

Practical Notes for Architectural Draughtsmen

By Alfred W. S. Cross, M.A., F.R.I.B.A. and Alan E. Munby, M.A., A.R.I.B.A.

Gives in most convenient form for use on the drawing board, examples with concise rules, explanations, and dimensions for preparing designs, perspective, and working drawings for classical architecture.

In handsome Portfolio.

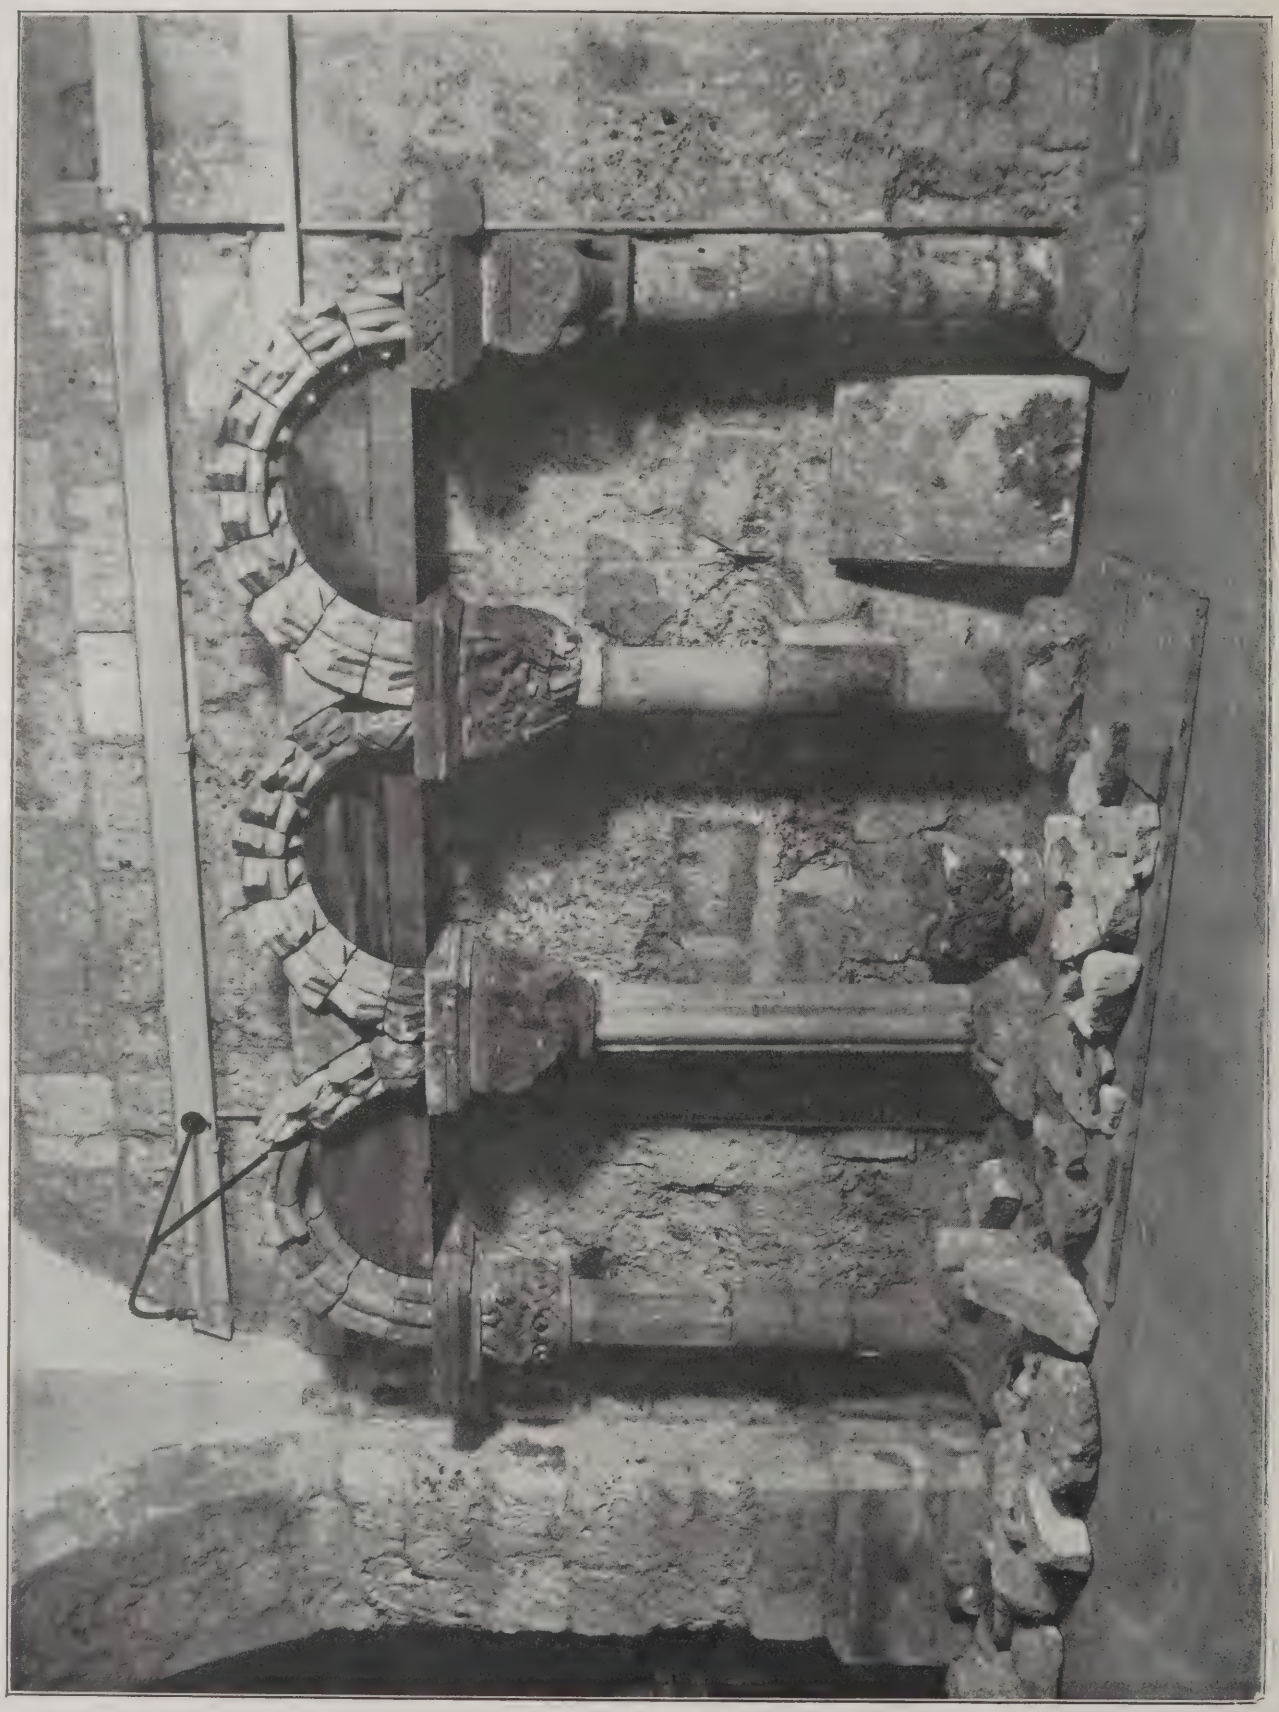
Price 12/- Nett.

PARTICULARS OF THE CONTENTS OF THE ABOVE PUBLICATIONS WILL BE SENT ON APPLICATION.

TECHNICAL JOURNALS, Ltd., Caxton House, WESTMINSTER, LONDON, S.W.

THE ARCHITECTS' & BUILDERS' JOURNAL.

WEDNESDAY,
JUNE 8th, 1910.



Volume XXXI. No. 801.

[*Photo: G. P. U.*

This, the only complete remaining portion of Edward the Confessor's building, forms the substructure of the old dormitory of the monks. By the removal of partitions it has been formed into one long chamber, and may now be inspected by the public on payment of a small fee. In it are housed some of the old wooden effigies of kings and queens—the earliest being that of Edward III.—and various architectural relics. Further details will be found on page 579.

THE NORMAN UNDERCROFT, WESTMINSTER.

RECONSTRUCTION OF PORTION OF OLD NORMAN ARCADE, IN THE UNDERCROFT, WESTMINSTER.

(*See article on page* 579.)

THE ARCHITECTS' & BUILDERS' JOURNAL.

JUNE 8th, 1910. *CAXTON HOUSE, WESTMINSTER.* VOLUME 31. No. 801.

Note: The List of Contents will be found on Page V of the front advertisements in this and subsequent issues.

The Architectural Treatment of Reinforced Concrete.

THE attempts which have been made at giving some architectural expression and decorative effect to buildings executed in reinforced concrete, have not hitherto been very successful, chiefly for the reason that they have been mostly founded on forms of treatment which originated in stone architecture. It is, of course, exceedingly difficult to shake off the effect of long habit and tradition in architectural design, but it is necessary to do so in order to evolve forms of design suitable to a new material which has no traditional architectural style connected with it.

Gothic Excluded.

Gothic tradition means the employment of arches, and of heavy sections of moulding, both of which are unsuitable to reinforced concrete. Arches, in masonry, are introduced to bridge over openings which are too wide to be covered by single stones used as lintels. In masonry, therefore, the arch is a form of strength peculiarly suited to the material. But the arched form adds nothing to the strength of reinforced concrete, and is even inconvenient as breaking the lines of the steel reinforcement, and the depth and forcible expression of Gothic mouldings arises from the practice of building with stones set in receding rings, a method entirely arising from the use of comparatively small stones, and therefore quite at variance with a material which is set up in the mass and not in small pieces. And mouldings of any great girt are only to be obtained at all in reinforced concrete by planting on to the surface a certain thickness of cement or of a very fine concrete, in which to run the mouldings; so that any such decoration is of a very artificial character, and not expressive of the material. Nor is anything like corbelling out, which is also a purely masonic device. Yet we have seen designs, mostly by engineers, for houses in reinforced concrete, in which corbelled out turrets formed prominent features, as if they were suggested by Scottish baronial castles

Gothic therefore evidently will not help us; there is no affinity between its structural methods and those proper to reinforced concrete.

Classic More Hopeful.

There is more to be said for the possibility of some suggestions from Classic styles. In these the traditional form of the openings (if we exclude the Roman rather unlawful marriage of the column and the arch) is suitable to reinforced concrete. The use of the pilaster with its carved capital as a means (some people think a rather senseless means) of giving architectural expression to an exterior could hardly be adopted in its Classic form; the carved capital could be inserted, no doubt, but it would look out of place, and stone in any case does not go well with concrete, as a matter of texture and colour. But projections of pilaster-like form, marking the interior arrangement or the points where extra strength is desirable, would come into the programme well enough, and might have some decorative finish of different shape and material from the carved stone capital. For this purpose terra-cotta is one material that might be suggested, and terra-cotta goes very well with the general surface and tone of concrete, giving a contrast in warmth of colour which stone wants. Any imitation of the built-up projecting cornice of the classic building would be out of place; any kind of cornice used as a finish to the wall should be developed vertically rather than horizontally; a decorative band with an enriched face treatment, and not much projection, to crown the edifice.

Circular Columns.

There seems no reason why columns of circular plan should not be introduced into internal reinforced concrete architecture; some forms of steel reinforcement, which are banded or tied horizontally at intervals, are rather suggestive of columnar form. One might fancy, for example, a church interior on the lines of the early Christian basilica, with concrete columns banded with (say) terra-cotta at intervals to symbolise the interior ties of the reinforcement, and with the same kind of flat panelled ceiling which was the usual covering of the ancient basilica. If any attempt were made at a church in reinforced concrete, the basilica form would be the one to adopt, and in many respects it is one of the best forms for a modern church, irrespective of exigencies of material. And, of course, when we come to speak or roofing, the dome is a form which can very well be carried out in reinforced concrete.

Oriental Suggested.

But for exterior architecture in reinforced concrete, it seems probable that the best inspiration might be drawn, not from either Gothic or Classic, but from some forms of Oriental architecture, where we find flat walls with little moulding, but susceptible of being treated in colour by applied or inlaid material. There is a large field for decoration of this kind, by marble, terra-cotta, or tiles, in the exterior surface of reinforced concrete buildings. And a good deal of effect might be produced also by the employment of that rather neglected process, sgraffito; a mode of decoration which seems almost as if made for reinforced concrete, and which admits of every kind of design and any degree of elaboration, combined with entire freedom of line. It must not be overlooked, either that a certain degree of colour treatment and contrast in the general mass of the wall surface is possible, not by applied colour, but by the use of different kinds of aggregate, or by the mixing of some colouring matter such as would not interfere with the action of the cement.

Possibilities of the Material.

These are some indications of the direction in which the architectural or decorative treatment of reinforced concrete may be attempted with most chance of success. That monuments erected in this material can ever rival the beauty of the Greek temple or the Gothic cathedral we cannot promise; but they may, rightly treated, acquire a beauty and expressiveness of their own, not copied from any traditional forms of architecture.

Drawings in the Institute Collection.

THE President's smoking "At Home" at the Institute Rooms last week was adorned by a large collection of drawings belonging to the Institute, the selection being confined to original works possessing either historic or pictorial interest. The exhibition proved to be a very interesting one, and was all the better appreciated because a printed catalogue had been provided, with which aid many of the visitors went conscientiously round the walls. The general arrangement was approximately chronological, and the early drawings, the first set bearing the name of Inigo Jones, served to show for how little finish of drawing counted with the early Renaissance architects. An elevation by Palladio showed his use of Roman Doric without bases. The name of E. C. Sayer was attached to a beautifully executed elevation and section drawn from the model of Wren's first design for St. Paul's; a finer drawing than Wren himself ever thought of. Repton's "Country House," with concave curved wing colonnades, was creditable to Repton's ideas of a classic country house among trees. A set of drawings (anonymous) of the triumphal arches erected for the entry of Charles II. into London at the Restoration were historically interesting, and not bad designs for temporary things of the kind; better perhaps than would be produced now. Among some drawings of Sir G. Scott's was a beautiful little pencil sketch for a classic pilaster capital—not what one would have expected from Scott; it was perhaps a capital for the Foreign Office, his classic building carried out *invitâ Minervâ*. In a very different way Burges's elaborate, though roughly executed, measured drawing of the wooden spire at Châlons-sur-Marne formed a characteristic memorial of that indefatigable student of Gothic construction. M. de Vogüé's fine drawing of the Basilica at Shakka-Houaran—the one reproduced in his "Syrie Centrale," is also among the Institute possessions; was it presented by the author? A fine coloured perspective view of Hyde Park Corner, with the Constitution Hill arch in its original position, and the quadriga on the top of it, bore the name of Decimus Burton, but we should doubt if it was a drawing by his own hand, though it showed his architectural work. Those who do not know how much better Hyde Park Corner looked before the arch was moved to its present ineffective position, could have an opportunity of judging from this drawing. With the arch flanking the roadway, parallel with Hyde Park Screen and Apsley, this point formed a kind of monumental entrance into London, the dignity of which is quite gone now. Some of Stuart's drawings for his "Athens" impressed one more as good watercolour drawings (in the school of the period) than as good architectural drawings. In relation to these one may ask: If Stuart made the drawings, what did Revett do? Some studies of Elmes's for St. George's Hall, Liverpool, showed how far superior his actually executed design was to his first ideas for the building. Waterhouse's large coloured perspective of his design for the Law Courts took back the memory of the older among the visitors to that historical competition, which made such a noise in its day, and reminded us of a time when the architect who wished to make an impression in such a competition relied greatly on towers, introducing in this case no less than four into his design. We have become a little more reticent as to towers in these days of assessors.

Cobwebless Beams.

A CURIOUS belief has been recalled with reference to the roof of Westminster Hall. A newspaper paragraph contradicts the common supposition that Westminster Hall roof, "one of the glories of timber architecture," is formed of the far-famed oak of Shillelagh, co. Wicklow, and asserts that the oak was procured from the site of St. Michan's Church, Dublin, whose records contain the following entry with reference to the site: "From thence, anno 1098, King William Rufus, by licence of Murchard, had that frame of timber which made up the roofes of Westminster Hall, where no English spider webbeth or breedeth to this day." The date of this entry is not stated. Any spider found in the roof at the present day may, however, be conveniently presumed to be of Irish descent; or, alternatively, perhaps the wood, by its long absence from Ireland, may be reasonably assumed to have lost its ancient virtue. But the vulgar belief that spiders could not live in it was shared by Thomas Fuller, who refers to the "cobwebless beams" of what is at all events the finest roof of its kind in the kingdom.

The Society for Promotion of Roman Studies.

THE meeting held in Burlington Gardens on Friday to inaugurate the promotion of this society was large and unanimous, and we may consider that to get the society into working order is now only a question of time. It is intended that the society should be regarded as in an analogous position to the Hellenic Society, and the British School at Rome in the same relation to it as the British school at Athens is to the Hellenic Society, a position which does away to some extent with the charge of multiplying societies for the pursuit of the same object. It was agreed that the new society should be constituted on the same lines as the Hellenic Society, and some suggestion was made as to the interchange of library facilities between the two societies. Roman studies are on a somewhat different line from Hellenic studies in this sense—that while Roman art and literature are not on the same level of excellence as Greek, the influence of Rome is much wider and more extended than that of Greece ever was, and comes nearer to us in its influence on comparatively modern history. It is true that the scope of work of the Roman Society is limited in point of time, by the prospectus, to the year 700 A.D., supposed to mark the commencement of the Middle Ages (we should prefer to put it at 800); but that does not alter the fact that the whole development of the plan and structure of the mediæval cathedral and church, the outward and visible symbol of all Western Christianity, is traceable, if not to the plan, at all events to the sectional construction, of the Roman basilica. We should be inclined to expect that the ultimate result would be the amalgamation of the Hellenic and the Roman societies into one society for the prosecution of classical study and archæology. In the meantime, it would be very desirable that some arrangement should be made for placing the libraries and the collections of photographs of the two societies in contiguity in one building, so that materials in the one library may throw light on those of the other.

The Cheap Cottage Craze.

ONE of the ill effects of "cheap cottage" exhibitions is their tendency to debauch the public mind with regard to the question of cost. They are apt to create a very general, if rather vague, impression that a commodious and artistic cottage ought to be built for about £150, and that any price beyond that implies excess of luxury, or extravagant superfluity. One suspects that this evil influence was at work when, as the local paper puts it, the members of the Cardiff Public Works Committee were "staggered" on being told by the City Engineer that the lowest tender for a workman's cottage at Lavernock, for the use of the valve attendant and sewerage inspector, was £600. One member remarked that such a house could be built for £250; another asked whether the plans included a billiard saloon. It was explained that the "abnormal cost" was due to the expenditure on haulage and the increased price of labour at Lavernock. Ultimately it was decided to accept the tender, only one member voting against it. The rest had evidently learnt, in the course of the discussion, what the housing reformers and the cheap cottage specialists so often fail to teach—that circumstances alter prices, and that local conditions often play havoc with nice calculations.

The Institute Prizes and Studentships List.

THE list of subjects for the prizes to be competed for by students of the Institute of Architects, in December next, has just been issued. The most important of these are the Soane Medallion and the Tite Prize, as these alone involve the original design of an important architectural scheme. It is not, of course, a very easy matter to find a sufficient variety of suitable subjects. The programme for the Soane goes rather out of the beaten track; it is "A Gateway and Gatehouse to a Capital City, approached by a bridge over a river flowing from left to right." We do not know whether many students would appreciate the reason, though it should be obvious enough, for giving the direction of flow of the river; it is that the design of a bridge in a stream, and not in a tidal river, should be influenced in some of its details by the fact that one side of it faces against the current, and the other with it. It must be admitted that it is a condition which has very seldom been recognised as a factor in bridge design, though occasionally we may meet with an old country bridge over a stream with cut-water piers on the upstream side only. But there is no question that such different conditions on opposite sides of a bridge as water impinging against it on one side, and escaping from it on the other side, ought to have some effect on the design. The subject is one capable of very effective treatment, and gives opportunity for the students to show what they can suggest in bridge design, a matter in which there is a good deal of special interest at present.

The scheme for the Tite Prize errs rather in being too extensive, and making too much demand on competitors—having regard, that is to say, to the usual style and extent of students' designs in England; at the Ecole des Beaux-Arts it would be considered a very suitable subject, and would not alarm anyone; but here we are not used to such grandiose competitions. The subject is "A Campo Santo," on a rocky island in an inland lake, rising sheer from the water for 30 feet, and then by a gradual rise of 150 feet to the apex. A landing stage and accommodation for boats is to be provided, and the Campo Santo must comprise a chapel, with choir, organ, sacristies, etc., in addition to the cloisters for monuments. A very fine thing might be made out of this, no doubt, but it makes a very large scheme, and we doubt if many competitors will face it. The time may come when it will be necessary to reconsider the provisions of Tite's bequest, and whether it can always be usefully applied in the manner directed. The prize was instituted to promote the study of "Italian Architecture," which Tite believed in as the best style for modern life; and it was really a kind of counterblast to revived Gothic. But revived Gothic has nearly died a natural death, and it may be a question presently whether we want any more to promote the study of "Italian Architecture"; and then the question may arise whether the trustees are justified in continuing to spend the money on what Tite wanted half a century ago, but no one wants now. The point may prove an interesting subject of consideration in regard to the law of Trusts and the conscience of trustees.

The programme for the Essay Medal betrays an inclination on the part of the Prizes Committee to alter the character of this competition, and make it a study of construction rather than a literary effort. It is an open secret that there are members, both within and without the circle of the Prizes Committee, who look upon literary composition as a waste of time, and as having nothing to do with architecture. In a sense it has not, but it has a great deal to do with the general standard of culture and education among architects, many of whom write very bad English, and are even weak in spelling. (We have seen "symmetry" with one *m* many a time in architects' letters and documents.) The faculty of treating the history or æsthetics of some important architectural subject in an adequate literary manner is by no means unimportant, and the capability of doing it well would argue a higher level of general education than the average architect, we are afraid, can at present be said to possess. But the programme advertised for the essay, "On the design and construction of belfry stages and spires in stone or brick," accompanied by illustrations, looks very much like making a second Grissell Medal of it; nor is it made in the least clear whether this means the illustration of existing constructions of the kind named, or an essay on the method of constructing them. We expect the wording will give rise to a good many questions. But the point is that there is an evident desire to turn this into a constructional essay instead of a literary and æsthetic one; and if so, it is a mistake. The Essay Prize is the only one which makes an appeal to general education and culture, and the power of literary expression; and as such it is of value, and ought to be kept in its right place as a means of literary training.

Town Planning Simplified.

AT length the long-expected twentieth-century house has been evolved—where but in America? Hitherto we have been building houses upon radically wrong principles. It is really absurd to construct isolated or self-contained buildings, each aggressively and wantonly asserting individuality and independence, and to scatter them over the earth with a careless hand. This practice greatly disfigures the country. Any building must do that; but it might be done with more delicacy, so that the sensitive traveller need not be exposed to a series of shocks received from encountering buildings whose hideousness of design and iniquity of situation he could never have anticipated. It is always the unexpected. There are even "houses that swear at you as you pass." Mr. Edgar S. Chambless, of New York, has shown that the country need no longer be defiled by houses that differ in design and in every other respect without the excuse of a corresponding difference in use and purpose. Why this waste of ingenuity? Why this inconsistency of diversity? The "endless house" conceived by Mr. Chambless will get rid of these vagaries, will put an end to this riot of individualism; for he has "found a way to use the many inventions that are now made unavailable by our fashion of individual house construction and the private monopoly of transit and conduit facilities." There are to be no more towns and villages. Town-planning and architectural training will be vastly simplified. How? By the simple expedient of building your "endless house" on the lines of the railway—literally. It is to be three or four storeys high. In its basement will run the railway. On its flat roof will be the common street, prophetically known, centuries ago, as the highway, although we are not quite clear whether it is to be confined to pedestrian traffic. It is roofed in. Between the railway and the highway dwell the citizens of "Roadtown." They need never take the train in order to get into the country. That undulates sweetly to right and left or front and rear of them. You have only to look out of window on either side to see a landscape that, stretching out as far as the eye can reach, is undisfigured by a single building. But how you are to get across country from town to town does not appear. Perhaps the various towns will be "linked up" like the tubes and the trams. The economy of the system is undeniable. So is its absolute impossibility; although the "New York Independent" is confident and enthusiastic about "the realisation of the New Utopia." "Until someone," it says, "is able to show a flaw in Mr. Chambless's reckoning of human nature or the figures submitted by the engineers who have estimated upon the cost of 'Roadtown,' we must accept the endless house as one of the probable innovations of the near future—and a weird and wonderful innovation it will be, revolutionising our entire commercial, social, and artistic life." On what compulsion must we? Flaw or no flaw, most of us would rather die.

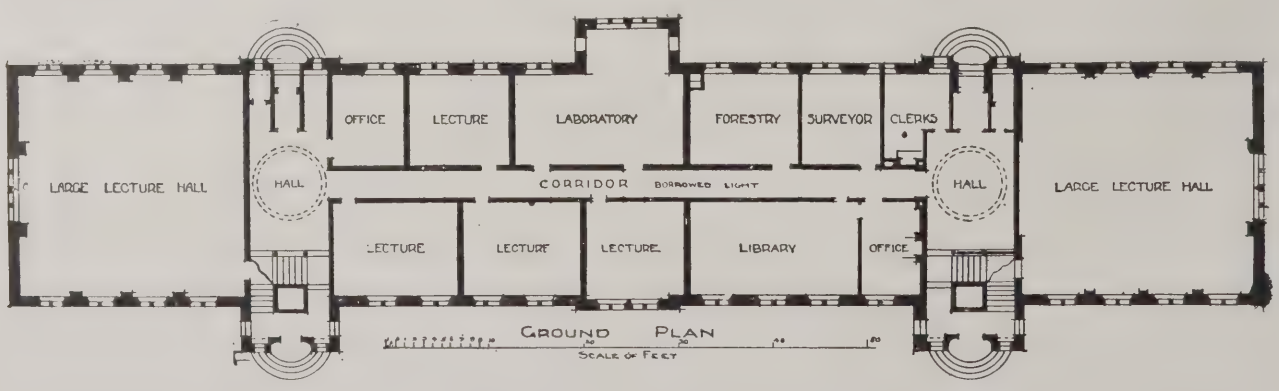
B

NOTES AND NEWS.

Further Discovery at Canterbury Cathedral.

Concerning the fabric of Canterbury Cathedral, Mr. W. D. Caröe has communicated a further discovery to the "Times." It will be remembered that Mr. Caröe, during the examination and the repairs to the north-west pier of the Angel Steeple, discovered that one of Lanfranc's original Norman piers was embedded in the present pier. The portion disclosed proved to be the central shaft of that part of the pier which carried the Norman Tower arch across the north transept. The Norman arch spring was some 15 feet below the present one. Mr. Caröe has now discovered *in situ* the capital of this early shaft, a simple cushion of Early Norman design, and of very considerable projection. Mr. Caröe draws attention to the value of the grouting machine in consolidating this pier and adding to its strength, no less than 1,140 gallons of cement grout having been introduced into the cavities of the pier—i.e., between the original shaft and the outer skin added by Prior Chillenden's men. The greatly increased strength resulting from this treatment has not only removed anxiety concerning the pier, but has enabled Mr. Caröe to leave a small recess exposing Lanfranc's capital to view. The south-west pier, which was also fractured, is now under similar treatment. Mr. Caröe also mentions that a curious and interesting painting of Canterbury Quire, painted by Thos. Johnson in 1657, has lately come into his possession. It is on record that a Mr. Johnson, of Canterbury, showed the Royal Society in 1685 a prospect of the Cathedral drawn by himself in oil colours. Whether the two are one and the same picture is not determined, but the painting shows the myrmidons of Richard Culmer (Blue Dick) in their fell work, breaking the windows and the thirteenth century stalls. The great value of this painting, which is a view from Chillenden's pulpitum or screen, is the laborious care in the details, which are exact, even to the number of stones in the pavement and the courses in the pillars.

Rossetti's Place with the Pre-Raphaelites.



Mr. W. Holman Hunt, the only surviving artist member of the Pre-Raphaelite Brotherhood, under provocation of a "Times" leader on "Mutual Admiration Societies," sends to that paper some interesting particulars about the "Brotherhood." He points out that the phrase "Mutual Admiration Society" was coined and applied to a circle working under the influence of D. G. Rossetti, but if this band (composed of William Morris, Edward Burne-Jones, and other Mediævalists) were fittingly named Pre-Raphaelites (as a large section of artistic theorists often state) it is clear that there were two bodies of young artists known under one and the same name. Mr. Hunt claims that the first one was initiated by Millais and himself in 1848, and was formally extended into the "Brotherhood" later in the year. This "Brotherhood" adopted the initials P.-R.B., with which they signed their pictures, under bond of secrecy as to their meaning. It was Rossetti, later, who effectually led to the break-up of this original "Brotherhood" by revealing the meaning of the initials; a revelation which "increased to a hurricane the prejudice against us in the Press, and alienated art patronage." It was about this time that Rossetti persuaded Mr. Hunt to take him into his studio as a pupil, where Hunt communicated to him the experience acquired by him in his several years' study of the Old Masters. Mr. Hunt resents the suggestion that it was a "joint studio," or that he was in any way influenced by Rossetti. His first painting, the "Girlhood of the Virgin," was entirely apart from those done by Millais and Hunt at the same time—it was even antagonistic to their aims. Mr. Hunt points out that Millais repudiated the myth of Rossetti's "influence" upon him, a fact that can be established by dates, pictures, and documents given in Mr. Hunt's book. These "undoubtedly determine," concludes Mr. Hunt, "that had Dante Gabriel Rossetti never come among us Millais's works would have been, as he says, exactly 'what they were,' and it will follow that mine also would have been what they are."

Society of Architects' Travelling Studentship.

Sixteen sets of designs have been received in the competition for the travelling studentship of the Society of Architects, which is of the value of £25, and carries with it a silver medal. The problem set this year was to design a golf club to accommodate 175 members, at a cost not exceeding £4,000. The council has awarded the studentship to Mr. D. W. Coombs, 25, Portman Road, Boscombe, an assistant in the office of Mr. J. J. Shepherd, 115, Old Christchurch Road, Bournemouth. The work of Mr. Frank Brown, of Crumpsall; Mr. E. J. Williams, of Leicester; Mr. J. F. Dove, of Eastbourne; and Mr. A. J. Turner, of Tonbridge, was commended. The drawings will be on view at the society's premises, Staple Inn Buildings, Holborn, W.C., for one week, commencing June 6th, from 10 a.m. to 8 p.m., when admission will be free; and they will afterwards be exhibited in various provincial centres.

New Buildings for the School of Agriculture, Cambridge.

The block of new buildings which has just been erected for the School of Agriculture in Cambridge, and was formally inaugurated on Wednesday last by the Duke of Devonshire, lies behind the Geological Museum and the School of Botany; it has been built from the designs of Mr. Arnold Mitchell, F.R.I.B.A., of brick and stone. It consists of three floors, a basement, and an attic. On the ground floor is the large lecture hall, which is practically unfitted. When funds permit it will be provided with a gallery with museum cases underneath. This floor also contains the office and library. The first floor is devoted to the biological sciences; it contains a lecture room, elementary and advanced biological laboratories, and private rooms for the Professor of Agricultural

UNIVERSITY OF ILLINOIS

Botany, the lectures in Agricultural Physiology and Zoology, and the consulting Zoologist and Botanist of the Royal Agricultural Society of England, who are at present members of the staff. The second floor is designed for agricultural chemistry and physics, and contains a lecture room, a large elementary laboratory, an advanced laboratory, various other work-rooms, and the private room of the Drapers' Professor. The basement and attic provide store and preparation rooms, and the necessary greenhouse.

Tijou's Ironwork at Hampton Court.

A correspondent of the "Times" complains that the celebrated wrought iron screens made by Jean Tijou for William and Mary (and after being moved about to various parts of the grounds were re-erected in the Priory Garden facing the river in 1904) are suffering severely from the effects of the weather. The screens are twelve in number, two of each of the following designs:—The Rose, the Harp, the Thistle, Pomegranates, Monograms, and the Garter. It is stated that "portions of the ironwork are red with rust, and should be painted without a day's delay. Worse than this some of the eagles' heads are perforated by corrosion, the water does not drain off other parts, and the injury is going on. Indeed, nothing but immediate removal to a dry place can prevent the lighter parts of these screens from dropping to pieces with rust, and their becoming mere wrecks. The correspondent suggests that six of the screens should be housed in the Queen's Guard Chamber, and that the other six should find a home in the Victoria and Albert Museum. Mr. Ernest Law, however, writes from the Palace a reassuring letter, stating that the injury the screens show is due entirely to the neglect they suffered from during the 100 years that followed George III.'s accession and his abandonment of Hampton Court as a Royal residence. With the care they now receive they will last indefinitely. Mr. Law refers to Tijou's two great gates, of similar workmanship to the screens, which have stood in the open for 218 years, and having been cared for are practically unimpaired. Mr. Law states the moving of the screens at various times to different parts of the grounds was done in deference to the vagaries of taste of Early Georgian times, and not with the special idea of preserving them.

Ancient Verulamium.

There has been a move on the part of the Society of Antiquaries to promote extensive excavations on the site of the ancient Roman city of Verulamium, and that the undertaking is at present checked by a doubt as to the permission of the landowner, Lord Verulam, to excavate over his land. It appears that Lord Verulam presided at one of the meetings held to consider the subject, so it was assumed that he was favourable to it. Presumably the disturbance of ground would be very extensive, if the best is to be made of the opportunity, and one can understand that the owner of the soil might be disposed to think twice before allowing the commencement of an investigation which, once begun, might run farther than was expected; but we hope he will be able to see his way to permit the attempt. Arrangements might be entered into for excavating one portion only at a time, taking a plan of it, and filling it up again, to carry on with another section. Considering that Verulamium was one of the chief cities of Roman Britain, there is no knowing what may be below the surface of the ground. What a thing it would be to discover another Silchester.

The Late Sir Seymour Haden.

By the death of Sir Seymour Haden the artistic world loses one of its best etchers of the day; one who could not be classed as an amateur, though he practised the art only as a relaxation from his more serious avocation as a doctor. It was the merit of Sir Seymour Haden that he recognised exactly what etching can and cannot do; it was not with him a means of making large and highly worked plates, such as might more properly be called engravings, but an art for small studies showing the characteristic freedom of the etched line. Two or three of his etchings have become famous; all were executed in the true spirit of the art. He was also largely instrumental in founding the Society of Painter-Etchers, whose annual exhibitions have done much to develop a greater interest in this form of art.

DETAIL OF ENTRANCE, NEW BUILDINGS, SCHOOL OF AGRICULTURE, CAMBRIDGE. ARNOLD MITCHELL, F.R.I.B.A., ARCHITECT.

Wall Gardens.

In the June issue of "The Architectural Review," there is an article on wall gardens by a well-known writer, Mr. Wyndham Fitzherbert, illustrated by several examples of Mr. Thomas H. Mawson's work. The chaotic sterility which has been associated with the use of that most hideous material, clinker, demands a sharp distinction to be made between the right and the wrong way of forming wall gardens and rock gardens. Where possible it is always best to build walls specially for the reception of plants. If the ground is steep, terracing of some description is advisable, and this may be effected by building retaining walls, which are far more desirable in every way than the steep slopes or embankments of turf too often seen in gardens. These retaining walls, backed by earth many feet in depth, in which the roots of the plants delight to run and remain cool in the hottest weather, are better for their health than any rock garden. Those that would perish of drought if planted on the level, during long-continued summer heat, remain perfectly happy in the chinks of the wall, while in the winter, not being exposed to the cold and damp of surrounding earth, they endure with equanimity a temperature that would kill their relatives in the rock garden. For this reason all tender plants should be grown in walls, and it is surprising what severe frosts they will withstand in such sites.

Other features of the "Review" for June are an illustrated article on the work of Messrs. Smith and Brewer, including some admirable photographs of the Albemarle Club (formerly Ely House), Dover Street, W.; a further contribution by Mr. Lionel B. Budden, B.A., on recent

construction work on the Acropolis at Athens, the article this month being devoted to the Parthenon and the temple of Athena Nike, of both of which a number of fresh photographs are given; the "Exemplar," with drawings and photographs of the Guildhall at Rochester—a building which, if not by Wren, is at least by one of his pupils, embodying in its front one of the finest pieces of Renaissance brickwork in England; and an authoritative article on the planning of Bath, illustrated by photographs of portions of the city as existing to-day, and by some most interesting plans showing the growth of Bath from the days of the Woods and the Adams.

Woodwork Exhibition at Carpenters' Hall.

An exhibition of works in wood and wood carving which has been organised by the Worshipful Companies of Carpenters and Joiners, was opened on June 1st by the Lord Mayor, and will remain open until June 11th. The models in constructive carpentry, in which skill in obtaining the greatest amount of strength at the smallest expense of labour and material was the object, includes ordinary roofs, ornamental open-timbered roofs—one of them a model of the roof of Crosby Hall—and specimens of bridge centering, shoring, and staging. The first prize for an open-timbered roof truss, £7 and a silver medal, and the special gold medal presented by the Carpenters' Company, has been won by Mr. Charles J. Webb. A number of prizes were also offered for models with architectural and picturesque effects, and in this division are examples of lych-gate, including one from Ewelme Church In the third division are many specimens of staircases, doors, and circular-headed sash windows. The prize of £7 and a silver medal, and a special gold medal presented by the Joiners' Company, has been awarded for a semicircular staircase made by Mr. Herbert H. Durran. The exhibits in the carving section show considerable skill in design combined with power to carry the design into effect. They comprise friezes for the chimneypiece, folding screens, console brackets, mahogany panels, portrait frames, book-covers, writing desks, flower "drops," doors, and hanging cupboards. The promoters have also arranged a loan exhibition, which contains examples of Morris and Burne-Jones tapestries; the Master's Chair of the Joiners' Company, carved in 1754; a choice old Welsh cupboard; an oak "livery" cupboard, dated 1641, in which the rations for the servants were placed; and many carved chairs and coffers from the Victoria and Albert Museum.

Against Works Departments.

The Hull branch of the Yorkshire Federation of Building Trade Employers have sent to the "Hull Daily Mail" a strong protest against municipal works departments, for which, they allege, certain members of the Corporation have a manifest hankering. The President and Secretary of the Hull branch, who sign the protest, declare that this proposal amounts, in the first instance, to "a question of taking the living from a number of contractors who are heavy ratepayers, and are in the future to find rates to pay for competition against themselves." This is very forcibly put; and the objectors further proceed to show that the practice of eliminating the contractor is greatly against the interests of the ratepayers in general. After recalling that Manchester Corporation recently decided by 69 votes to 10 not to establish a works department, they cite as instances in which the contrary policy has been abandoned the case of Leeds, where the work was costing much more than it would have done if placed in the hands of contractors; of the London County Council, where the experiment was notoriously extravagant; and of Bradford, where a team labour department has cost the ratepayers dear. So far from the municipal works department "saving the contractor's profit," it has been found, in some instances, that work done by corporations has cost three times as much as when executed by private contractors. Corporation works departments are, in fact, unnecessary and undesirable, and, in face of the abundant proof that this is the case, their further extension will be a matter of considerable difficulty. We have but little doubt, therefore, that in this matter Hull Corporation will accept the timely advice of the associated master builders, whose promptitude in protesting is highly commendable; for, as a French writer has remarked, "There are few errors that can survive their clear exposition."

Japanese Gardens.

A writer in one of the London daily papers declares, in effect, that most of the "Japanese gardens" in England are sadly unorthodox—have, in fact, "no claim whatever to the description," and he naturally supposes that, as an effect of the Japan-British Exhibition, Japanese gardens will become fashionable in England. They seem but little likely, however, to become very much more authentic. There are, it appears, in Japan, seven distinct schools of gardening; and it is more than probable that in most instances we shall jumble them all together, producing a hybrid travesty that would gravely scandalise a Japanese horticulturist of purist proclivities. For Japanese gardening is a very difficult thing to understand, and perhaps (in its piety and purity) an equally difficult thing to admire; for "the thing to remember is that the Japanese artist sets, or may set, at least as much value by stones as by flowers." In these circumstances, we feel rather dubious as to whether "even a Western Philistine can feel that the garden [in the exhibition], as long ago in Eastern history, still remains a sort of church, a holy place, full of associations with worship"; and we feel rather concerned to think that our ignorant imitations may amount to profanation. But imitate them we doubtless shall, with structures to match; and, from our point of view, pedantic accuracy, either in the landscape or in the buildings, is quite beside the mark. For us, the inaccuracy of detail is comparatively unimportant, and the mystic symbolism is insignificant, so long as we succeed in creating a general Japanese impression. Even so might one speak of modern Gothic, which looks all right to the uninitiated, and so fulfils the simple object of the unambitious and unscholarly designer. The more periods and styles it combines, the more powerful its appeal to the average observer. But, supposing the cult of the Japanese garden to become really serious, the utmost scholarship and the most scrupulous care could hardly procure complete realisation. Our best Japanese gardens or buildings must always speak to us with an English accent, if only because of their environment, and it is therefore questionable whether free and courageous adaptation, rather than slavish adaptation, is not, after all, the most satisfactory course to pursue in submitting ourselves to the sweet influences of the gentle Japanese.

The Colour of London.

Those who believe, with Mr. Halsey Ricardo, that coloured architecture would add to the joys of life, will read with interest the observations of Mr. Yoshio Markino, in his very remarkable book, which he has both written and illustrated, "A Japanese Artist in London" (Chatto and Windus: 6s. net). Mr. Markino says: "Perhaps the real colours of some buildings in London might be rather crude. But this crude colour is so fascinating in the mists. For instance, that house in front of my window is painted in black and yellow. When I came here last summer I laughed at its ugly colour. But now the winter fogs cover it, and the harmony of its colour is most wonderful, and I am sure I need a great deal of study to paint this beautiful colour." But it appears that Mr. Markino, notwithstanding the many dire vicissitudes through which he has passed, remains a pronounced optimist, determinedly regarding everything in its best light; and it is doubtless that very estimable quality, plus a touch of true Oriental politeness, which leads Mr. Markino to attribute to us a subtlety of device which we fear is foreign to us. Our very polite critic is probably very well aware that we do not consciously arrange colour effects that shall become lovable in the fog. Is this genial Japanese gentleman a master of subtle sarcasm?

This panel, representing a sprite driving two dolphins, is cast in bronze. It is a pleasing though not well-known fancy of the sculptor, who also designed the architectural work. Water issues from the dolphins' mouths into a basin below. The panel is 2 feet wide and 2 feet 9 ins. high, The fountain, which cost £4.132, commemorates the founder of the College—Henry the Sixth.

THE NORMAN UNDERCROFT AT WESTMINSTER.

(See Frontispiece and Illustration on half-title page.)

The illustration on our half title-page and our frontispiece are two excellent views of the Norman undercroft which forms the sub-structure of the old dormitory of the monks, adjoining the Chapel of the Pyx on the east cloister work. It has been fitted up as a museum for certain architectural and other relics, under the supervision of Professor Lethaby, and can be inspected by the public for the small fee of 2d. on days when the Royal Chapels are open. The undercroft, said to be the only complete remaining part of Edward the Confessor's building, is a chamber 110ft. long by 45ft. wide, roofed in by five vaulted bays. It was formerly divided into three parts by partitions which have been removed. The four pillars which divide the undercroft into five bays are situated in a line in the centre of the chamber. In two of them much of the original stonework of Edward the Confessor's buildings is visible. The second pillar from the north end presents a curious appearance. On one side it slopes inwards and downwards from the capital, forming a recess which might be used for a small altar or an image. The pillar has now been buttressed. One of the bays and part of another contain the original vaulting. Portions of the eleventh-century carving of the capitals of some of the pillars remain. The use which was made of the undercroft in mediæval times is not known. It is possible, perhaps, that it was used as a school for novices.

Relics which have been found in various parts of the Abbey have been collected in the undercroft. Among the worked stones which were brought to light while the floor of the undercroft was being relaid are fragments which seem to have formed part of the Norman arcading of the original cloisters. These fragments have been fitted together at the south end of the chamber as a tentative reconstruction of three arches of the old arcade. They are shown in our frontispiece. The three bosses are elaborately carved—one of them, which depicts a scene from the Judgment of Solomon, has for some years been on view in the vestibule from the cloister wall to the chapter house. Among the other architectural fragments is one which is supposed to have been one of the bosses of the old Chapel of St. Catherine. The carved oaken Jacobean pulpit of the Abbey is also preserved here.

Most interesting of all, however, are several of the old wooden effigies of Kings and Queens of England, which it was the custom at Royal burials to carry upon the coffin. These images are of older date than the wax effigies which are still preserved in the Islip Chapel. Those of Edward III., Elizabeth of York, Henry VII., Catherine of Valois, and Anne of Denmark are fairly complete; but the figure of James I. is without the head, and that of Henry Prince of Wales is simply a bare trunk without vestige of clothing.

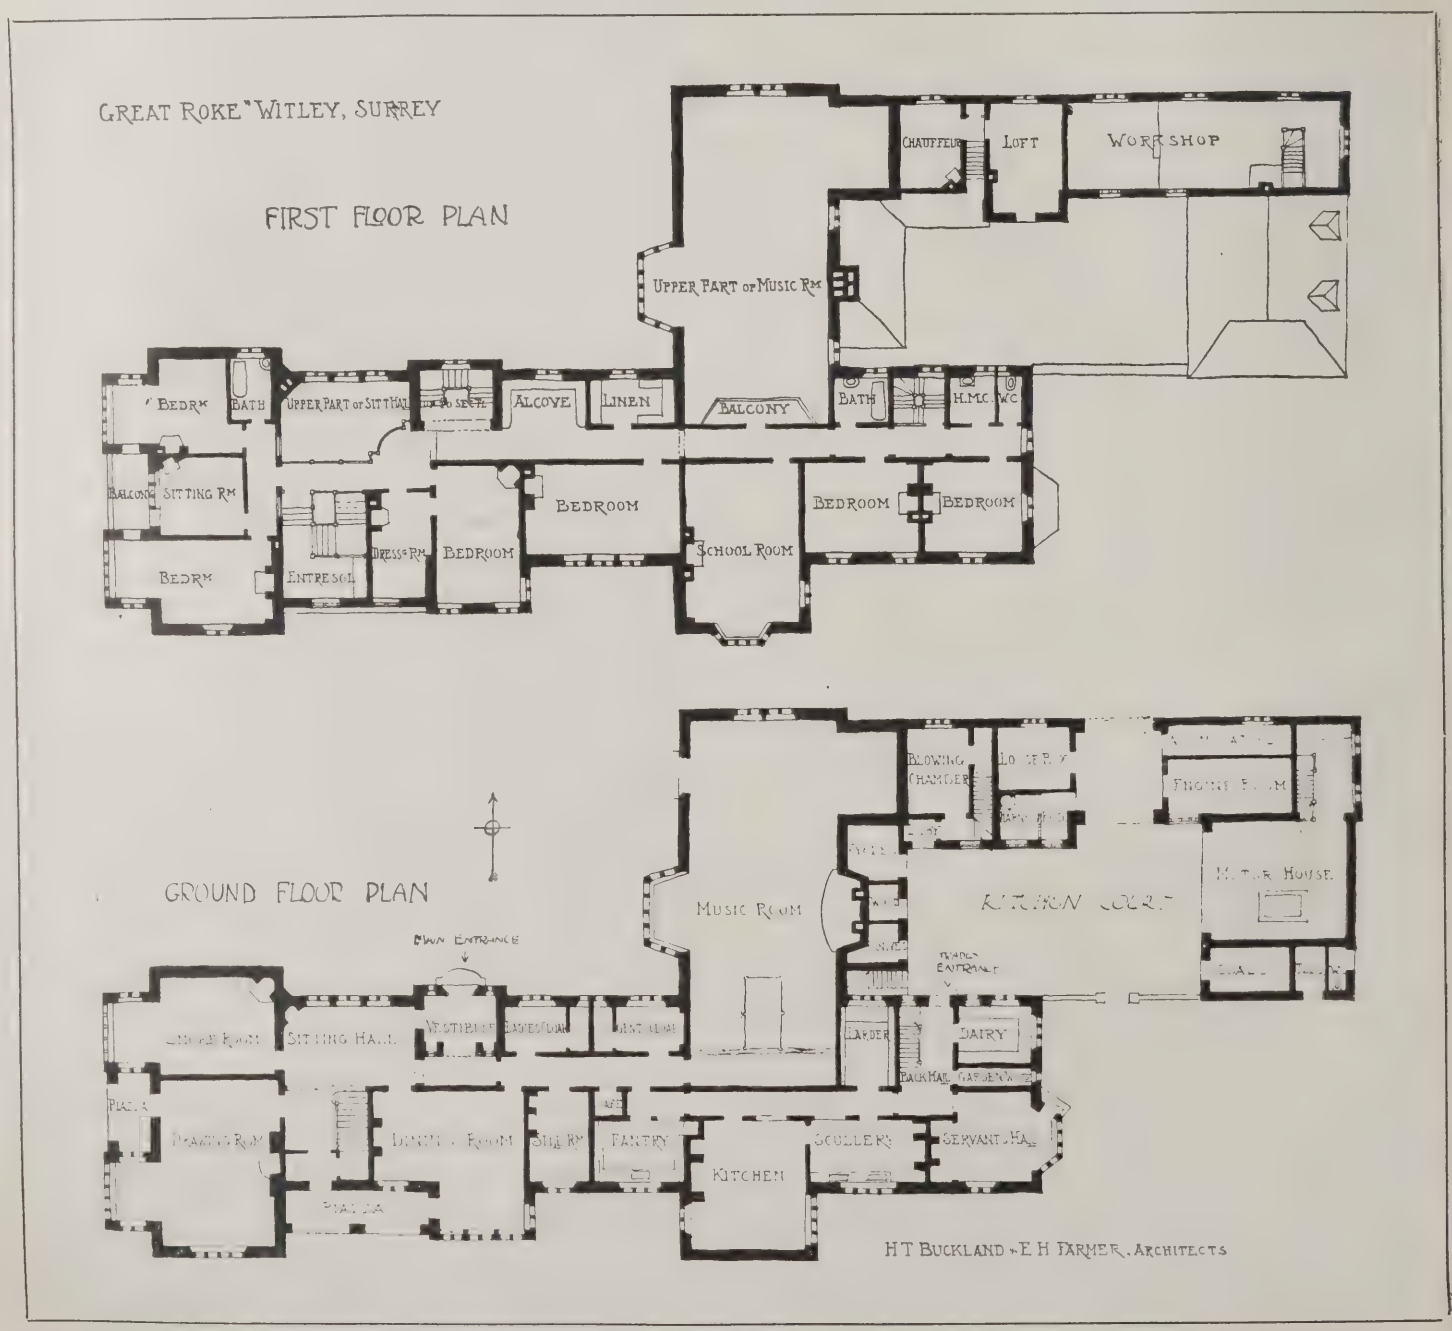
SCOTTISH AND ENGLISH HOMES.

A writer in the "Daily News" contrasts the home of the Scottish artisan with that of his English confrère, rather to the disadvantage of the former. Scotland is a land of flats, and the absence of the small two-storeyed dwelling or villa, so common in the South of England, may account in some degree for the disgust of the Woolwich workers when they went up to inspect their future homes at Greenock. These Scottish flats (called by Scotsmen "houses") are solidly built of local stone, and have slate roofs. To the English eye their solidity may appear somewhat sombre and sunless. But the main idea is the conservation of warmth; the ideal home has, therefore, "thick stone walls, small bedrooms, a large kitchen, double doors, and is fortress-like beside the flimsier English dwelling. And the internal arrangements and features of the newer Scottish homes are far superior. A modern Scottish flat of, say, £28—£30 rental has a large hall (not the "passage" parody of it), out of which open four or five rooms. The dining-room will be large, lofty (about a foot higher than in England). The kitchen will contain a large range and probably a recessed bed-cupboard. It was this latter feature, by the way, to which the Woolwich workers took so much exception. Hot and cold water and fixed shower baths are common, and so are the capacious porcelain wash-tubs (about eighteen inches deep) and sinks (15 or so inches). Usually there is hot water to the copper and a waste pipe from it. The latent backaches thereby averted only an English housewife plagued with shallow sinks, heavy, laboriously emptied by hand basin coppers, can properly calculate.

Another labour-saving item in the new houses is the nickel tap. Cupboards are fixed in every room (no Scots wife would put up with the bare walls of some of the English houses), and are usually spacious and well placed. Where flatted-villas have been built in the outer suburbs, there is generally a fair-sized "front plot" and a "back-green," to use the local expressions.

ARCHITECTS AND ARCHITECTS.

The delinquencies of architects forms the subject of an indictment, under this heading, in the "Field," of May 28th. It is not altogether pleasant reading, for it reiterates all the commonly accepted complaints about the profession, and our contemporary feels that a landowner who may come across a stray copy of an architectural journal may learn what the able members of the profession think "of men who, while imposing themselves on the public as architects, have few claims to the status they have obtained."



That there are such architects we are bound to admit; that they are a very serious drawback to the body politic is undeniable; but the complaints catalogued are rather too sweeping. We would not go so far as to say that of these what are new are not true; but undoubtedly what are true are not new. The gravamen underlying most of the complaints is that the architect is not a business man. Our contemporary quotes one to the effect that with an architect "a client never knows what his house is going to cost, and it is an admitted axiom among the public that the cost will be exceeded by one-third to three times the figure estimated." One can only say that the client who does not know what his house is going to cost ought not to be allowed to build at all. Curiously enough our contemporary does not attempt to draw a comparison between the success of the "business" architect in erecting large warehouses and business premises for stipulated sums, and the difficulty of the "Art" architect in getting his houses put up at the estimated cost. We have seen this comparison drawn more than once by the "business" man as a sly dig against his artistic confrère. In reality the comparison is not merely odious but unjust. The "business" man deals with business men, who know what they want; and who, having once decided on the plans, are only concerned in getting their building up as quickly as possible, so that they may begin to reap the advantages of their investment. The average client who starts house building is, usually, more vague in his requirements, and (though we have no wish to be ungallant) his wife has a reputation among architects for changing her ideas from day to day. She suffers from the well-meaning but unpractical advice of friends, and the cartoon which we republished from the "Daily Mirror" in our issue of April 6th hardly exaggerates this aspect of the case. To the client and his wife it may seem a small matter to shift the position of an internal wall, though such an alteration may involve the preparation of a new plan and a fresh specification. We know some eminent architects who work these commissions upon a schedule of prices agreed with the builder, and this allows for considerable alterations in the original scheme as

the work proceeds. But the client who fixes a contract on the basis of the lowest tender, and who subsequently desires all kinds of alterations or amendments to the scheme on which the contract was based, must expect an increased cost. He can hardly expect the builder to undo his work for nothing, or to stand the loss on material specially ordered for a contract, and subsequently discarded because by some whim of the client it is no longer required.

In the matter of decoration it is only too easy to run up the bill. The architect who is asked to design a house with certain accommodation for a given sum first sees to it that his structure is sound and substantial; to ensure this he may have to eliminate much of the decorative effect that he would like to employ. Probably this fact was most forcibly put by a well-known architect, who, asked by a client's wife what the decoration of her house would cost, said: "Madam, I can decorate your house for £20, or for £20,000. It is not what the decoration will cost but what you are prepared to spend on it. Tell me that, and I will get out a scheme accordingly." The client who wants to add modelled plaster work, wood panelling, special metal work, and other expensive items, must be prepared for a large additional cost. One can only suggest that the architect might more often protect himself by informing his client in writing what additions will mean in the way of increased cost before they are put in hand. If he keeps copies of such communications the blame for running up the bill will not fall, as it so frequently and undeservedly does, upon his shoulders.

Clients expect too much of architects at the present day. They are too keen on competition tendering, which, as our contemporary says, "is a system which gives work not to the best builder but to the man who, for one reason or another, is willing to do it for the lowest sum." It is a system that the architects dislike, and one that we believe the builders would be glad to abolish. In the old days each architect of standing had a number of builders round him whom he knew, had proved, and could trust. They competed for his various works, and carried them out to mutual satisfaction. It is the client, and client alone, who benefits or hopes to benefit by open tendering; and it is the client, moreover, who at the present day expects much more for his money than can reasonably be expected, despite the greatly increased cost of building.

Still, it is satisfactory to find that our contemporary believes the evils would be cured "if the public were to take a more intelligent interest in the immediate problems of architecture." It is what architects have been saying for a decade. If the public could be brought to study architecture intelligently they would select the right architects for their work.

This house occupies the crown of a hilly site on the borders of the village of Witley, Surrey. The walling externally s faced with local stone quarried within two hundred yards of the site, built in random rubble with thin coursed rubble quoins and strings. The dressings for doors and windows are of Doulting stone. The chimneys are of local bricks of excellent colour, and the roofs are covered with hand-made tiles, sand-faced. Messrs. Henry Lovatt, of Darlington Street, Wolverhampton, are the general contractors for the work. The casements and leaded lights and heating arrangements are being supplied by Messrs. Henry Hope and Sons, of Birmingham. Messrs. Buckland and Haywood-Farmer, of Birmingham, are the architects.

"GREAT ROKE," WITLEY, SURREY. BUCKLAND AND HAYWOOD-FARMER, ARCHITECTS.

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

Builders' Grievances.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Permit me to thank you for the article contained in your last issue on builders' grievances. That such an article should appear in an architectural journal is in itself very remarkable and may probably be epoch-making.

I would disagree with you in your defence of the individual who regards the bringing in of an outside arbitrator as "an undeserved insult." It should be no more insulting than was the introduction of Magna Charta into the British Constitution, nor of trial by jury into the institutions of free men. To the wise and beneficent architect autocratic power may be very convenient, but in hands not so qualified it has been wantonly used and has been most cruel in its incidence, and for this reason ought to be abolished.

Although, generally speaking, architects have long since resigned the title to arbitrate upon all matters in dispute arising out of their contracts with builders, there is still the large field of "method of execution" and the "finish of work," besides that of "quality of materials" over which they hold undisputed sway, where the builder, however unjustly treated, has no right of appeal. Protests are certain to be raised against the suggestion that upon these matters also arbitration should be possible, but it is surely due to the most elementary principles of justice that it should be conceded. Frivolous references to arbitrators by offending builders and by unfair architects need not be feared. These would soon cease to be made if the arbitrators were empowered to penalise those who were responsible for them.

Your article refers to many other burning questions that cannot be adequately ventilated by correspondence. I would therefore respectfully suggest that the R.I.B.A. and the Builders' Federation arrange for an early conference where the grievances might be set forth and subjected to expert criticism and where the changes demanded by experience and equity may be incorporated into a new form of contract.

J. M. M.

R.I.B.A. PRIZES AND STUDENTSHIPS, 1911.

The list of R.I.B.A. prizes and studentships, 1911, gives particulars which may be here usefully abridged:—

Essay medal and 25 guineas. Age limit, under forty. For the best essay on "The Design and Construction of Belfry Stages and Spires in Stone or Brick."

MEASURED DRAWINGS. Medal and ten guineas. Age limit, under 30. Subject: Any important building—classical or mediæval—in the United Kingdom or abroad. The following subjects are suggested as worthy of illustration: One of the colleges of Oxford or Cambridge; *(Scotland)* Holyrood Palace, Edinburgh; the Register House, Edinburgh; Jedburgh Abbey; *(Wales)* Chirk Castle, Denbighshire; *(Ireland)* Cashel Cathedral, or any monastic building; Holy Cross, Cashel; the Custom House and any other eighteenth century domestic work in Dublin; *(London)* St Alphege, Greenwich; St. George's, Hanover Square; the Confessor's shrine and the tomb of Edward III., Westminster Abbey; All Hallows, Barking; the west portico of St. Paul's Cathedral; St. Mary-le-Strand; *(Bedfordshire)* Houghton House; *(Cambridgeshire)* the Lady Chapel, Ely; *(Derbyshire)* Ashbourne Church; *(Dorsetshire)* barn at Abbotsbury; Manor House, Athelhampton; *(Essex)* Waltham Abbey; *(Gloucestershire)* Retland Chapel, Clifton, Bristol; *(Hampshire)* Church and Hospital of St. Cross; Netley Abbey Church; Ramsey Abbey; *(Hereford)* Abbey Dore; *(Lancashire)* Bramhall Hall; *(Monmouthshire)* Chepstow Castle; *(Norfolk)* St. Peter's Mancroft, Norwich; St. Nicholas, King's Lynn; the Custom House, King's Lynn; *(Northamptonshire)* Higham Ferrers Church; *(Northumberland)* ruined buildings at Lindisfarne; *(Nottinghamshire)* steeple at Newark; *(Oxfordshire)* Abingdon Town Hall; *(Somersetshire)* the Chapter-house and the Lady Chapel, Wells; St. Cuthbert's Parish Church, Wells; *(Staffordshire)* the Lady Chapel, Lichfield; *(Suffolk)* Blythborough Church; *(Surrey)* Mereworth Castle; *(Sussex)* Boxgrove Priory Church; Cowdray House, Midhurst; *(Wiltshire)* Lacock Abbey; *(Worcestershire)* Pershore Abbey, near Worcester.

SOANE MEDALLION and £100 Age, under 30. Subject: Gateway and gate-house to a capital city approached by a bridge over a river flowing from left to right. Successful competitor to study abroad for not less than six months, and afterwards submit evidence of studies.

PUGIN STUDENTSHIP, silver medal and £40. Age, between 18 and 25. For the best selection of drawings and testimonials. Special value attached to perspective sketches done on the spot, explanatory rather than pictorial, and to measured drawings. Attention should be directed to mediæval subjects, and preference is given to measured drawings. Successful candidate to make tour of not less than eight weeks in the United Kingdom for study of mediæval architecture.

GODWIN BURSARY and WIMPERIS BEQUEST. Silver medal and £65. For best practical working drawings or other evidence of special practical knowledge, and testimonials. No age limit, but knowledge of a foreign language necessary. Successful candidate undertakes to spend at least five weeks abroad, and to present a memoir of his observations on modern planning and modes of construction, drainage, water-supply, ventilation, and other sanitary arrangements.

OWEN JONES STUDENTSHIP. Certificate and £100. For the encouragement of the study of architecture, more particularly in respect to ornament and coloured decoration. Testimonials, with drawings, some of which must be from existing buildings and from other examples, exhibiting acquaintance with colour decoration and with the leading subjects treated of in Owen Jones's "Grammar of Ornament." Age not more than 35. Successful candidate must tour for not less than six months, and must, by December 23rd, 1912, deliver an original design in coloured decoration.

TITE PRIZE. Certificate and £30. For best design, according to the methods of Palladio, Vignola, Wren, or Chambers, for a Campo Santo on a rocky island rising out of an inland lake, and comprising a chapel having a floor area of about 3,000ft., with choir, organ, sacristies, etc., in addition. Age under 30. Successful candidate must tour in Italy for four weeks.

GRISSELL PRIZE. Gold medal and 10 guineas. Subject, design for a skating rink of wood construction, actual rink 200ft. by 60ft. between the posts which carry the roof. Outside the posts will be shallow aisles strips or promenades. Galleries at a higher level may be constructed over aisles, and may project over the centre space. Provide vestibule, dressing-rooms, lavatories, etc.

ARTHUR CATES PRIZE. For the promotion of the study of architecture, more especially in relation to the application of geometry to vaulting, stability of edifice, and design. Candidate submits selection from the original testimonials of study which procured him admission to the Final Examination, and not less than two sheets comprising studies of Classical or Renaissance and of Mediæval architecture, and also detached studies of a groined vault of any period between A.D. 1100 and 1500. Candidates must have passed the Final in 1909 or 1910.

HENRY SAXON SNELL PRIZE. £60. For encouragement of study of improved design and construction of hospitals, convalescent homes, and of asylums for the aged and infirm poor. Subject, best design for a convalescent home to provide accommodation for 100 men of the working class. Open to any member of the architectural profession, who may associate with him any member of the medical profession. Successful candidate undertakes five weeks' tour at home or abroad to study and report upon type of building for which he has won the prize, delivering memoir by December 21st, 1911.

ASHPITEL PRIZE. Books, medal, money, or otherwise, to amount of income of shares and securities bequeathed by late Mr. Arthur Ashpitel. Open to students who pass the Final in 1910.

OBITER DICTA.

Modern Art. How characteristic of the liberality distinguishing the New English Art Club from its inception that it should hang pictures informed by a spirit entirely different from what inspires its orthodox members! In so far as they practice any common attitude, it can be claimed that all of them accept modern life and the visible world in which our life is set. They do not fret about the Middle Ages, lament the Renaissance, or hanker for the faith and chivalry of a bygone age. History they leave to historians, the Roman Empire to the stage managers and the ingenious reconstructors of such things at the Crystal Palace.—"*Morning Post.*"

"Middling" Art. The critic finds the best scope for his talent in writing about work that is superlatively good or promising, or wholly bad. In the first case he has an opportunity for displaying his wealth of adjectives, in the second he can exercise a sort of parental authority and give advice with a great show of learning and judgment, and in the third case he may show his wisdom by making silence a golden virtue. But it is difficult to deal with art that is "middling," that has ceased to grow and to create the unexpected. Many very capable artists fall into this condition, and continue producing clever and pleasant things that look nice when seen singly or in pairs in a drawing-room, but which, when brought together in large numbers, are apt to weary by monotony of handling and colour.—"*Morning Post.*"

NEWS IN BRIEF.

A Roman leaden coffin, found recently at Bratton, near Westbury, Wiltshire, has been presented by Lord Ludlow to the museum of the Wilts Archæological Society at Devizes.

* * *

The residents of Southfields, which has a population of 72,000, are petitioning the London County Council to extend their tramways from Wandsworth to the County Boundary at Southfields. The district is said to be badly served with transit facilities.

* * *

The monument to Liberty, commemorating the annexation of the two Sicilies to the kingdom of Italy in 1860, has been unveiled at Palermo in the presence of the King and Queen of Italy.

* * *

An attempt is to be made to obtain an open space for Kilburn, and the movement is receiving strong support from the Metropolitan Public Gardens Association. An old house, The Grange, with 9½ acres of land, part of which abuts on the Kilburn High Road, is in the market, and it is hoped by acquiring this to secure a park in the poorest and most crowded part of the district.

* * *

Sir W. P. Treloar is appealing for subscriptions to make up the balance of £5,000 requiring to complete the sum of £24,000 required to purchase the Ironmongers' Almhouses in Kingsland Road. The London County Council are finding £16,000, and the Shoreditch Borough Council £3,000.

* * *

"Small Gardens," by T. U. Sanders, F.L.S., is a useful addition to the very cheap series of "One and All" garden books issued by the London Agricultural and Horticultural Association, Ltd., 92, Long Acre. Many of the illustrations show, alas! the advantages of covering up as completely as possible, with screens and creepers, the ugly brickwork of suburban dwellings.

* * *

With reference to the article in our issue of May 25th, descriptive of a visit to the New County Hall foundation works, we hear that the boat has now been almost entirely exposed, revealing some further timbering, indicating the probability of its having been a sea-going craft, which had fallen to pieces. The question of the date is under consideration of the L.C.C. and other authorities, who are considering what course shall be adopted for the preservation of such an interesting relic. The contractors engaged upon the work are Messrs. F. and H. F. Higgs, of Loughborough Junction. The river wall, now nearing completion, has been for the last two years in the hands of Messrs. Price and Reeves.

* * *

After nearly a year's careful work, the first step towards the building of London's County Hall has been completed. On the erection of the Embankment wall, which is a necessary prelude to the setting of the foundations, the best of modern engineering ingenuity has been brought to bear, and now along the Lambeth shore, where formerly the waters of the Thames lapped a line of dilapidated wharves and warehouses, there stands a solid rampart of stone. The next stage in the work will be to lay down the great "raft" foundation of concrete in the excavated space behind the wall. This work will take comparatively little time, but it would be inadvisable to start the building operations for the superstructure before eighteen months have passed, for it will take over a year for the concrete raft foundation to firmly settle upon the hard soil of the river bank. It is to be given fully a year and a half, in order to be on the safe side. Work on the County Hall proper will probably be begun in the beginning of 1912, and will be finished in 1915.

* * *

The building trade strike in South Australia has been declared off. The members of the Builders' and Contractors' Association having agreed to pay the 1s. 6d. an hour demanded by the men in lieu of 1s. 3d., work is again in full swing. Since the trouble which the Adelaide builders and contractors had with the bricklayers, masons, and stone-cutters some time ago, the former have offered, and are still offering, 12s. per day of 8 hours for competent artisans. This was the amount asked for by the men. A number of warehouses, offices, and factories are in course of erection.

* * *

The London Building Acts Tribunal has been temporarily reconstituted for the purpose of hearing an appeal in respect of the "Protection against fire in certain new buildings," the building in question being an hotel in Berners Street. The reconstitution has been necessitated owing to Mr. John Slater, F.R.I.B.A., a member of the Tribunal, having to lodge an appeal on behalf of a client. The temporary tribunal is as follows: Mr. Felix Cassel, K.C., (president), appointed by the Secretary of State; Mr. J. W. Simpson, appointed by the Council of the Royal Institute of British Architects; and Mr. A. R. Stenning (president of the Surveyors' Institution), appointed by the Council of that institution.

* * *

At the recent annual meeting of the Incorporated Church Building Society, Sir Charles Nicholson, as a member of the committee of architects, referred to the criticism that they were rather hard taskmasters. They only rejected quite hopeless schemes, sparing no pains to bring others up to the society's standard. Church builders exercised an almost uncanny ingenuity to secure the society's approval. The committee might therefore be empowered to reject schemes complying with the letter but not the spirit of the society's rules, as well as to accept good schemes not quite complying with the letter. The committee approved of cheap, but not of cheap and showy, churches. If people could not afford to build handsomely, let them build simply and well. In cases of restoration, the committee tried to prevent the waste of money on unnecessary or even Grimthorpian work.

* * *

It is stated in an Edinburgh paper that there is a considerable depression in the decorative trades there. This is attributed to the increased taxation under the recent Finance Act, which has increased the imposts on well-to-do people, and forced them to economise, more particularly in luxuries. Houses are being "touched up" instead of being overhauled; and in many cases no orders are being given at all. The slackness is equally apparent both in Edinburgh houses and country houses.

* * *

A proposal is on foot to erect a crown on the Dundee old tower. The work, estimated to cost from £2,000 to 3,000, would follow the lines of a design prepared by the late Sir Gilbert Scott, R.A., and the money has been found by a Dundee citizen

Three special lectures on "The Illumination of Interiors" will be delivered at the East London College (University of London), two by Professor J. T. Morris, M.I.E.E., and the third by Prof. C. A. M. Smith, B.Sc. Lecture I, on "Principles and Daylight Illumination," will be delivered on June 8th; II., on "Artificial Illumination by Gas and Electricity," on June 15th; and III., on "Illumination by Petrol Air-Gas," on June 22nd. The lectures take place on Wednesday evenings, at 8 p.m. The college is situated in the Mile End Road, E., and applications for tickets should be sent to the registrar.

* * *

The contractors for the construction of the Rosyth naval base have entered upon the most difficult part of the undertaking, viz., the sinking of the steel shoes preparatory to the building of the great sea wall. These shoes weigh nearly 60 tons, and about 100 will be required for the wall of the dry dock. They are being sunk in the open sea, about a mile from the shore. After the shoe has been sunk a heavy shuttering is placed on the top of it and filled with concrete, this process being repeated until the shoe has been driven by sheer weight deep into the sea bottom. The concrete monoliths when completed will have a length of from 120ft. to 130ft. and a weight of between 10,000 and 12,000 tons.

* * *

Two local authorities near Birmingham not having adopted a fair wages clause for insertion in contracts, the Council of the Birmingham Association of Master Builders have written to urge that such a clause should be adopted, as being in the interests of employers and employees alike. They contend that as all the best builders and contractors, especially members of the Federation, pay the recognised standard rate of wages, it is therefore only reasonable they should be in this way protected against the employer who does not observe the standard conditions.

ART NOTES.

Sir Edward Tennant's Exhibition. Sir Edward Tennant's collection of pictures generously thrown open to the public on Wednesday and Saturday afternoons, between two and six, in his house at 34, Queen Anne's Gate, comprises choice examples of Gainsborough, Reynolds, Hoppner, Raeburn, Zoffany, Morland, Lancret, Fragonard, Watteau. Hoppner's famous "Sisters," and the equally famous "Leslie Boy," by Raeburn, are included, as well as Turner's small picture representing the burning of the Houses of Parliament.

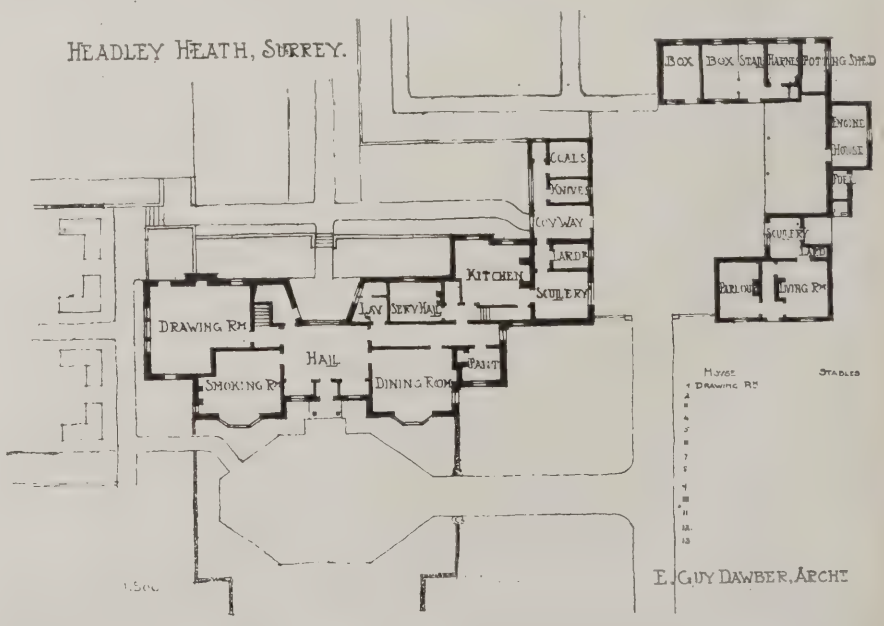
Waller Collection. Yesterday (June 7th), at Christie's, was begun the dispersal of the collection of the late Mr. Tom Waller, of Bradford, comprising old magolica and faience ware, busts, statuettes, old Worcester, old Chelsea, old decorative furniture, etc.

The Wax Bust. Mr. Albert Dürer Lucas, of Southampton, only son of the late Richard Cockle Lucas, sculptor, has sworn an affidavit that seems to settle the wax bust controversy. Mr. A. D. Lucas states that he was born in 1828, and that in the year 1846 he was living with his father at 40, Nottingham Place. The gist of his affidavit is as follows: Mr. Buchanan, a London art dealer, sent to Mr. R. C. Lucas

an oil-painting from which he desired to have a wax bust made. Of this picture Mr. A. D. Lucas made a small copy in oils, which is still in his possession. Mr. Buchanan's picture was at first attributed to Leonardo da Vinci, but afterwards to some artist of his school. This picture was traced to the possession of the late Miss Morrison, of Basildon Park, and by her was exhibited at the Grafton Gallery in November, December, and January last. Mr. A. D. Lucas not only saw his father at work from day to day on the clay model of the Flora bust, but assisted him in the preparation of the clay, in taking the plaster mould, and in rocking the mould in order to secure a proper distribution of the wax, which consisted of melted candle-ends. He also assisted by colouring the hair and the flowers on it, and in modelling and colouring the flowers for the right hand which rested near the left breast of the figure. The bust was thrown upon Mr. A. D. Lucas's hands, and was removed to the house which he built at Chilworth, where it remained for many years. On his father's death the younger Lucas removed to the house adjoining, which was purchased in 1888 by Mr. Simpson, a number of the elder Lucas's works, including the Flora bust, being included in the purchase. A further affidavit, by Mr. Thomas Whitburn, of Guildford, who was a constant visitor at the home of the elder Lucas, confirms these particulars. The full text of these affidavits is printed in the "Burlington Magazine" for June. Mr. Lucas's recollection of the matter is very vivid, notwithstanding his advanced age; and his affidavit, although it may not convince the firm believers in the Leonardo legend, and although it cannot be judicially regarded as being absolutely conclusive, will, for most minds, set the question at rest.

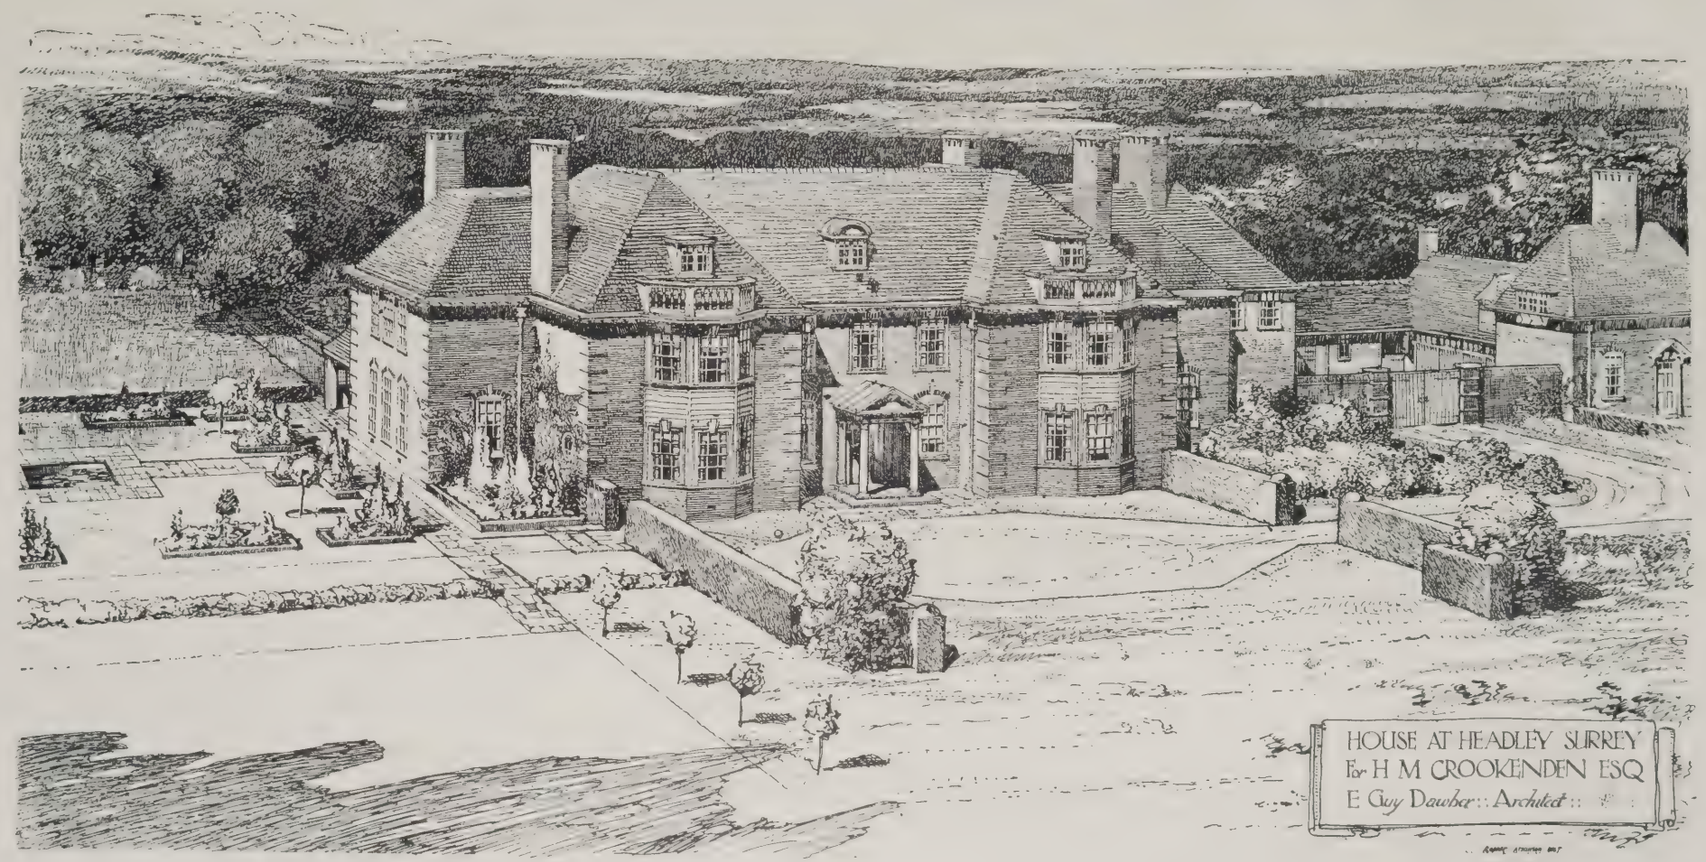
FIRE PREVENTION NOTES.

A Dangerous Area. The inquest on a fire in Australian Avenue, E.C., revealed once again the great need for reform in matters of fire prevention. The fire occurred in a six-storey building, which was very much hemmed in, and was very awkward for the brigade to get at. The narrow street in which the fire broke out was filled with big buildings, and was not far from the scene of the great fire in Barbican in 1902, and of the earlier (1897) and bigger fire in Cripplegate. The area, as one of the witnesses remarked, is an exceedingly dangerous one, and consequently the rate of insurance for the district is very high. Nevertheless, it did not appear that special precautions had been taken to prevent an outbreak which, but for the skill and energy of the firemen, might have been comparable in extent to the disastrous fires in Barbican and Cripplegate. The lessons of those fires do not seem to have been duly impressive.



Futility of the Building Acts. In the building that took fire there was a wooden staircase, and, according to the evidence of one of the firemen, there were "no exits built for the express purpose of escape by fire." There was, he said, a parapet at the top of the building, access to which was through the windows; "but it was very difficult to induce women and girls to get through windows." It ought to be possible to escape from a burning building without accomplishing an acrobatic feat. As one of the firemen-witnesses said, there ought to be an exit on to the roof. The coroner, Dr. F. J. Waldo, asked how it was that the building seemed to have escaped the operations of the London Building Acts, and the reply made by the District Surveyor for the City of London West was that it was because the London County Council had never had the building reported to them. "Have the London County Council no inspectors to look up these places and report about them?" the coroner asked. "Only if a complaint is made."—"It comes to this, then," said the coroner, "that if a fire happens and lives are sacrificed or property is lost, then you can act?"—"Yes."—"Would it not be more satisfactory if these buildings were reported to the London County Council before a fire came?"—"It will be for the London County Council to give orders to that effect. It will be a very great job to report on all these buildings."

Wise After the Event. It would be undoubtedly a very heavy task, but it might not be found to be wholly impracticable. It would be laborious and costly, and might occasionally operate somewhat oppressively, but it might result in saving a large portion of the vast amounts lost by or through disastrous fires, and would almost certainly prevent the loss of many precious lives. It would also afford relief from the absurd as well as disastrous practice of ignoring the principle that prevention is better than cure, and of being "wise after the event." Evidently there is a vast amount of work to be done in the fire-proofing of buildings of the warehouse class, and it should not be left undone until some sort of catastrophe renders it imperative. The jury recommended that means of escape should be provided.



Sprinklers. The sprinkler system, as a whole, is well adapted for the protection of every class of manufacturing and warehouse property, for installations are to be found in classes of risks, such as textile, woodworking, boot and shoe factories, corn mills, flock mills, oil mills, retail shops and stores, warehouses, sugar refineries, tanneries, floor cloth and linoleum works, biscuit and confectionery works, india-rubber works, paint and varnish works, theatres, paper mills, printing works, chemical works, maltings, jam factories, match factories, celluloid works, soap and candle works, wharves, tobacco factories, etc., etc. We are informed that the record of the Grinnell sprinkler at the present time is over 3,000 fires extinguished in all classes of risks, with an average damage, including both fire and water, of only about £60 per fire.

Geology and Fire Resistance. Since Government inquiries in our own country are apt to report on somewhat unexpected subjects—as when, for instance, the work of the Commission on coast erosion largely turned on the question of reafforestation and the timber supply—one is the less surprised to find that Bulletin 418 of the United States Geological Survey indicates the necessity of using cheaper fireproof materials in order that property owners may be encouraged to construct buildings that will better resist fire. The observations in the bulletin also show the necessity of better building codes in cities, and especially of a better enforcement of the codes already enacted if the present enormous fire losses are to be diminished. The investigations indicate that fireproof buildings will be constructed at less expense in the future than in the past, and that the difference in cost between fireproof and inflammable buildings will soon cease to be an encouragement to flimsy construction.

A Strong Contrast. There is recorded an extraordinary contrast between the small losses by fire to Government buildings, due to the great care taken to make them fireproof, and the immense losses reported from the country as a whole, and this difference led the Geological Survey to conduct an inquiry into fire losses in the United States, and their exact cost to the people. This inquiry covered not only the value of the property destroyed by fire, but also the cost of maintaining fire departments, the amount of insurance premiums paid less the amounts returned, the cost of protective agencies, the additional cost of water supplies, etc. The investigation disclosed the fact that the total cost of fires in the United States in 1907 amounted to almost one-half the cost of new buildings

HOUSE, HEADLEY HEATH, SURREY: GROUND PLAN. E. GUY DAWBER, F.R.I.B.A., ARCHITECT.

This house is now nearing completion. It is situated on a site overlooking Headley Heath, with some miles of open country. It is built of red bricks, with dark headers, with a wooden moulded cornice, and red tile roof. It will be seen that the house, cottage, and stables have been designed together as a whole. The garden has also been laid out by the architect. The interior is treated in a very simple manner, with white panelled walls in the parlour, and mahogany doors to the best rooms. The builders are Messrs. Oldridge and Sons, of Kingston. Theillustration has been reproduced from the drawing which is now at the Royal Academy Exhibition.

HOUSE AT HEADLEY, SURREY. E. GUY DAWBER, F.R.I.B.A., ARCHITECT.

constructed in the country for the year. The total cost of the fires, excluding that of forest fires and marine losses, but including excess cost of fire protection due to bad construction, and excess premiums over insurance paid, amounted to more than $456,485,000, a tax on the people exceeding the total value of the gold, silver, copper, and petroleum produced in the United States in that year. The cost of building construction in forty-nine leading cities of the United States reporting a total population of less than 18,000,000, amounted, in 1907, to $661,076,286, and the cost of building construction for the entire country in the same year is estimated at $1,000,000,000.

Amazing Fire-loss Figures.

Thus it will be seen that nearly one-half the value of all the new buildings constructed within one year is destroyed by fire. This may give a great deal of employment to the building trade, but is sadly wasteful to the community as a whole. The total fire cost in the United States is five times as much per capita as in any country of Europe. The actual fire losses due to the destruction of buildings and their contents amounted to $215,084,709, a per capita loss for the United States of $2.51. The per capita losses in the cities of the six leading European countries amounted to but 33 cents, or about one-eighth of the per capita loss sustained in the United States. In addition to this waste of wealth and natural resources, 1,449 persons were killed and 5,654 were injured in fires. In these circumstances it is not surprising that such strenuous efforts are being made in the United States to propagate fire-preventing methods.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

Church Architecture.

The drawings of church architecture at the Academy are nearly all grouped in one part of the room, so that they can be easily compared. There is not very much that is at once novel and important. Two or three of the smallest drawings are among those which contain new ideas. There are, as usual, a sprinkling of what may be called the regulation church designs—specimens of revival Gothic, with proper buttresses and traceried windows complete, which have nothing to distinguish them from fifty other designs of the same type, and which hardly call for notice. Though the idea that Gothic is the proper style for church architecture still largely prevails, we are now getting beyond the point when mere copyism of mediæval forms will be accepted as satisfactory.

The first church on the list is Mr. Dixon Spain's small elevation of the "Swedenborgian Church, Willesden Green" (1501: no plan); an elevation mostly in red brick with a round-arched entrance doorway in stone, with heavy arch mouldings in recessed orders. There is a good deal of character in this elevation chiefly derived from the treatment of the brickwork; and the rather low-pitched gable is broken in its lines so as to give it a certain special expression. We should have liked to have the opportunity of seeing what form of plan is demanded by the ritual of a Swedenborgian church. Mr. Hoole's "Church of St. Alban, Romford" (1503) has a small plan showing a short wide nave of three bays, with a choir and organ gallery at the west end. The perspective view is that of a brick church with octagon turrets at the west end of the nave, finished with an arcaded storey in stone; a large wall-arch between these encloses a central wall space decorated by a statue, and a long lancet window on each side of it. The gable is decorated with alternating squares of brick and stone. All this looks very well, but is rather spoiled by the row of three flat arches over the western door and adjoining windows, the lines of which do not harmonise with the remainder of the west front.

Mr. Edgar Wood's "Design for church" (1506) is one of the original suggestions—rather too original, perhaps. The plan is square, with a low tower at each angle, the centre mass rising higher, with a rather odd sky line, the whole looking rather more like a castle than a church. By the arrangement of the plan the axis of the plan seems to run north and south on the ground level, and east and west on the upper plan, with colonnaded galleries at the sides. Is is an odd affair altogether, but not without interest. The west end shows a large, semicircular, richly traceried window of somewhat Byzantine type. "Church of St. John, Herne Hill" (1508: no plan), by Messrs. Treadwell and Martin, is a pretty little perspective drawing of a plain brick church. The "Harrison Memorial Church, Wallasey" (1509), by Mr. J. Francis Doyle, resembles Wallasey Parish Church, a modern Gothic church with a square centre tower. Mr. Ambler's "Proposed church at Holbeck Woodhouse" (1511) is hung too high to be well seen. It appears to be a good example of modern Gothic. Messrs. Hall and Dods send a small pen sketch and plan of a rather interesting little "Proposed Anglican country church, Laidley, Queensland" (1512), a timber church with the roof brought out to form a veranda round three sides of the building (no doubt as a screen from heat), carried on timber framing. A small country church for Charlton, Hants (1516), by Mr. H. C. Benson, is pleasing as such. There is a narthex at the west end, expanding at the centre into a little circular baptistery which forms a semi-octagon bay externally. The square louvred bell-cot is rather commonplace, however. Messrs. Greenaway and Newberry's "Church of St. Andrew, Coulsdon" (1518: no plan) is a Gothic church with the south-east tower rather effectively treated. The window-grouping generally is good.

Mr. Caröe's "School Chapel, North-Eastern County School" (1522), is an interior perspective of the orthodox school chapel plan, with built arches over it in place of principals, and a timber wagon vault between. Mr Temple Moore's "St. Wilfrid's Church, Harrogate" (1523: no plan), is a slightly executed but effective perspective sketch of what seems to be a large church, with a square centre tower and small square towers at the angles of the transept; a kind of design that wants a plan to explain it. The general effect is very picturesque, but there are too many unnecessary buttresses and set-offs, very like what would be found in many mediæval churches, but with no other justification. "Proposed All Saints' Church, Pokesdown, Bournemouth" (1524), by Messrs. Oldrid Scott and Son, is a four-aisled church on plan. The exterior is of the regulation church Gothic, shown in a large pen-line drawing, with some very bad trees in the foreground. Mr. Temple Moore's "St. Anne's Church, Royton" (1527: no plan) is, like his other exhibit, a sketch of a picturesque church, of which no explanation is furnished by a plan, so that what the low building at the east end means, and why it is placed there, cannot be understood. This is no way of illustrating architectural design.

Mr. Bateman's "Hill Church, Sutton Coldfield" (1528) is an interior with a barrel vault decorated with flat bands of carved work (or plaster modelling). Mr. Clare Greene's "St. Gabriel's, Bishopwearmouth" (1530: no plan) is an effective church shown in a carefully executed water-colour. There is an octagon centre lantern with a spirelet growing out of it. The whole looks so well that it is doubly to be regretted that there is no plan to make the illustration complete. Mr. T. Roger Kitsell's "Alterations to Chancel, St. James-the-Less, Plymouth" (1536) is a good piece of pencil drawing, but there is no indication in what exactly the new work consists. Mr. Schultz exhibits a perspective view of his "Khartoum Cathedral," the elevation and plan of which have been previously exhibited. It is not a beautiful building, but in a sense it is no doubt characteristic of the place, the materials, and the class of labour available. The west window, composed of a colligation of circles, is cleverly treated. The decoration under the gable coping looks odd and unintelligible in the drawing. Mr. Houchin's "Baptist Church, St. John's Wood" (1542: no plan) shows a bold treatment of the west end with a deep arch. Mr. W. A. Pite is the only exhibitor of church architecture who shows, in his "Church of the Good Shepherd, Ealing" (1547), a proper and complete plan to a large scale, accompanied by elevations. It is a small church with a mission-hall attached, planned with narrow aisles for passage only, and a narthex and a square baptistery with a domed roof. The architecture is of the Georgian type, with a graceful small lantern or bell-cot on the roof. This is the only one among all the church drawings which is an example of architectural design properly illustrated with a complete plan and elevations, and should in this respect be held up as an example to others.

Some of the designs for church furniture and stained glass may be noticed here, in connection with the subject of church architecture. Of these, the most important is Mr. Joseph Phillips's "Design for a Processional Cross," in silver and oak (1497), the top of the cross showing the details to a pretty large scale—a good piece of work. Mr. Durrant exhibits a design for a cover for an old font in a church near Cromer (1514), a spire-shaped design of painted wood and gilt metal: not unsuitable, though it does not appeal to us very much. Mr. Jewitt's "Reredos in carved oak" (1520) seems a good piece of work, but is hung too high to be well seen.

Stained glass is never satisfactorily shown by small coloured drawings. One can only form a general judgment of the design. Among the designs that are worth comment is a small sketch by Miss Dorothy Courtney for a crucifixion subject and symbolical adjuncts, done almost entirely by lead lines. Mr. Walter Camm's "Easter Morn" window (1444) shows an unusual treatment, the figure of Christ being shown in the midst of a field of floral diaper. The window is divided by rectangular barring. The same artist's "Nursery Rhymes" window (1489), designed for execution in scrap glass for a nursery, is good; and Miss Florence Camm's small panel window, "St. Etheldreda" (1603), with a picture centre and a navy blue border round it.

In a final article we will deal with miscellaneous designs for domestic and other buildings.

PICTURE EXHIBITIONS.

The New English Art Club.

The exhibition of the New English Art Club at the Suffolk Street Galleries contains some brilliant things, and some which are striking and suggestive without being brilliant, amid a mass of crudities and vulgarities.

Mr. Orpen's "On the Irish Shore," purchased for the Johannesburg Gallery, and his large picture entitled "A Woman," a life-sized painting of a nude female, with no beauty of either face or form, we do not admire, but his half-length portrait of Mr. A. W. Rich, sketching in a wind with his hat off, is clever and characteristic. Mr. Wilson Steer, in "The Muslin Dress," seems anxious to paint the clothed woman in as ungainly an attitude as that in which Mr. Orpen painted the nude woman. The woman in the muslin dress is doubled up on a sofa in an attitude which reduces her to a kind of shapeless heap.

Among the brilliant things in the exhibition is Mr. Sargent's powerful sketch—it is hardly more than a sketch on a large scale—of the lower portion of the Church of the Salute, and in another room is one of his wonderful foreground sketches, "A Moraine," in which every touch has its meaning. He also contributes "A Florentine Nocturne," a painting of the Cellini Perseus and part of one of the piers of the Loggia, seen against a dark star-sprinkled sky. It is an interesting effort, but we do not quite understand the tone given to the statue as part of a night effect. Miss Alice Fanner's landscapes are admirable for bright and aërial effect, especially "The Riverside," certainly one of the best things in the gallery. Among other landscapes, Mr. Sydney Lee, who has established a style of his own in painting both mountain scenery and buildings, has made a grandly built landscape out of "Morning, the Valley of the Rhone." Among other landscapes to be noted are M. Thornton's "Rose Hill Farm," Mr. Spencer Gore's "Applehayes," Mr. Mark Fisher's "Overlooking the Bay" (a more extended scene than is usual with him), and Mr. Montague Smyth's "The Road to the Sea." We do not know what Mr. Nelson Dawson is aiming at in his large work supposed to be sea-painting, in the centre gallery; his small sketch, "The Schooner," in the first room, shows that he can draw the sea and a ship very well, when he does not aim at thunderous effects in oil. Mr. Henry Tonks shows good colour in the interior called "Rustic Pageantry," though the figures are not attractive (for a figure to be pretty or attractive seems to be cardinal sin at the New English Art Club); and Mr. Orpen, in "The Rest," a group of a male and female tramp and their show bear, has made what is a really pleasing composition, a picture in the true sense of the word. In the first two rooms there are a good many clever and interesting small sketches of landscape and buildings.

The Leicester Galleries.

At the Leicester Galleries there is a collection of some sixty of Mr. Herbert Marshall's water-colour drawings of London scenery—"The Streets and River of London," a class of subject which he has made his own, and which no one else treats so well in the way of getting out of London scenes all the picturesque effect which is inherent in them, but which many who are not painters do not seem to realise. There is, perhaps, however, one criticism to be made about them—that very well-known London sites do not always seem very recognisable in his translation of them into painting. The buildings may be all accurate in representation, yet somehow we find ourselves looking at the catalogue for the name of a square or a street which we are perfectly familiar with, but do not at once recognise in the picture. Perhaps the artist's reply would be that it is the business of his art to transfigure them out of their everyday aspect, and that if the spectator does not see that effect in the real scene he might be met by Turner's reply to a critic who could not see Turner's colouring in Nature: "Don't you wish you could?" However, of the artistic beauty of the drawings there can be no question, nor is it necessary to cite particular examples; all are good in an artistic sense; we only complain that in two of them the architecture of the War Office and of St. Martin-in-the-Fields is rather carelessly treated. In another room at the Leicester Galleries is a collection of water-colour drawings of "Egypt and the Italian Lakes" (a rather curious juxtaposition) by Mr. Talbot Kelly, who has been hitherto best known as an illustrator of Egypt. Mr. Kelly draws architecture exceedingly well, both in his Italian and his Egyptian studies, in which buildings or ruins of them are the dominant subject. His landscape effects give a little too much impression of "picture-making," except in those which show the sandy solitudes of the Arabian desert, which have a great look of reality about them. Some of the Italian lake scenes, however, if they seem a little conventional, are very charming in their way, notably "Cold Wind at Bellagio" and "A Quiet Afternoon on Lago Maggiore."

NOTES FROM PARIS.

It may be remembered that in commemoration of the visit of Queen Victoria to Paris in 1855, the name of "Avenue Victoria" was given to the large street opposite to and axial with the Hôtel de Ville. To carry on the same idea, the Paris Municipality now propose to give the name "Rue Edouard VII." to the part of the Rue St. Martin comprised between the Quai des Gesvres and the Rue de Rivoli. This joins the Avenue Victoria at right angles.

The Service des Promenades of the Paris Municipality have transformed into a garden the portion of the Champs Elysées formerly occupied by the Franconi Circus. In the centre of the new garden will be erected the bronze equestrian statue by Pradier, which formerly decorated the façade of Hittorf's building called the Cirque de l'Imperatrice.

An exhibition of drawings of architects now or formerly pupils of the Ecole des Beaux-Arts, has been opened at the Ecole.

The Académie des Beaux-Arts has elected, as a corresponding member in the section of architecture, Herr Von Ihne, of Berlin.

Two interesting exhibitions have been opened in Paris; one of the works of modern medallists, at the Petit Palais; the other of works in glass and crystal, at the Musée Galliera.

The Municipal Council is to be occupied shortly with a scheme for the prolongation and enlargement of the canal de l'Ourcq. This will include the formation of two large basins at la Villette, near the Porte d'Allemagne and the Porte de Flandre. The cost of the whole scheme is estimated at 140 million francs.

The Government have commissioned M. Dernaz as architect for the transformation into a museum of the old Seminary of the Place Saint Sulpice, which is eventually to take the place of the Luxembourg Museum. The work, which will be commenced at the close of the present year, will occupy two years, and is estimated to cost upwards of £50,000.

A society, under the name of "Société d'Etudes," has been formed with the object of erecting a large exhibition building on part of the ancient fortifications site near the Porte Maillot, Bois de Boulogne.

M. Besnard, the eminent French painter, has been commissioned by the Dutch Government to decorate the large hall of the Palace of Peace at the Hague.

A committee has been formed with the object of raising a colossal monument, in the form of a pyramid or obelisk, on the heights above Algiers, in memory of French soldiers who fell in the campaigns in Algeria.

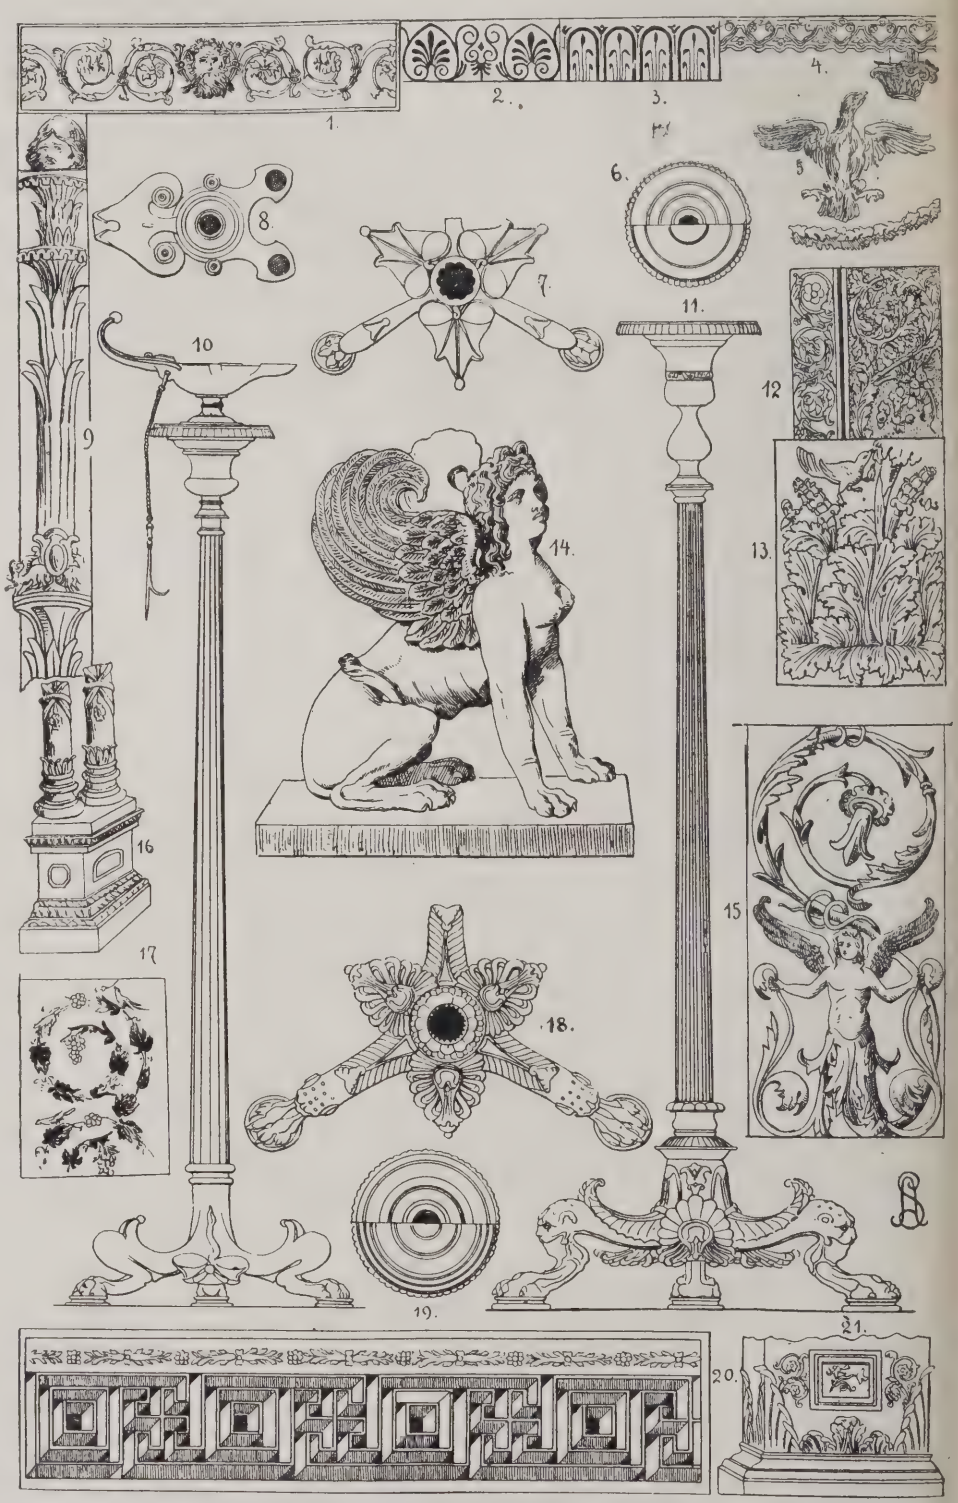
FIRE PROTECTION IN A LONDON HOTEL.

An appeal, under section 22 (1) (*a*) of the London Building Acts (Amendment) Act, 1905, by Mrs. Mary Clark, against the refusal by the London County Council to issue a certificate pursuant to the section of the said Act relating to "protection against fire in certain new buildings," in respect of the building known as the Berners Hotel, Berners Street, W., came before the Tribunal of Appeal at the Surveyors' Institution. As the appellant was a client of Mr. John Slater, a member of the Tribunal, it had been temporarily reconstituted as follows: Mr. Felix Cassel, K.C. (president), appointed by the Secretary of State; Mr. J. W. Simpson, appointed by the Council of the Royal Institute of British Architects; and Mr. Alexander R. Stenning, past president of the Surveyors' Institution, appointed by the Council of that body.—Mr. Bodkin (instructed by Messrs. Bennett and Ferris) appeared for the appellant; and Mr. Cecil Walsh (instructed by Mr. Chilvers, of the Solicitors' Department of the London County Council) for the respondents.—Mr. Bodkin submitted that the building had been constructed with the most scrupulous care to provide proper means of exit, and that, having regard to the size and character of the building, to put up screens in the corridors, as required by the County Council, would not only defeat the object of that body, but would be a serious inconvenience in the management of the hotel. The guests and servants would have to go through swing doors every time in getting to the lifts and staircases. Moreover, the presence of such doors might facilitate robberies, as the doors could easily be wedged by criminals. The appellant therefore asked that the stipulations as to screens should be reviewed.—Mr. Frederick Izant, chief surveyor to the Phœnix Assurance Company, Ltd., said that he had specialised in the study of buildings with a view to fire and smoke prevention. The Berners Hotel was constructed of incombustible materials, and the corridors and staircases were entirely free from draperies of every kind. The passages were exceptionally roomy and well ventilated. In the unlikely event of a fire occurring there was no fear of smoke entering the staircases, as any outbreak would be practically stamped out at once.—Mr. John Slater, the architect of the hotel, said that in his opinion there was no reasonable risk of smoke or fire, and he did not think there was a safer building in London.—The hearing of the appeal was adjourned until June 9th.—"*Times.*"

D

BOOKS.

The Styles of Ornament.



Of the two most obvious methods of dealing with the styles of ornament, the chronological method has much to recommend it in preference to the comparative method. It is not only more simple but is more logical, and perhaps on the whole more useful than any more purely arbitrary method, because it enables one to trace the successive stages of development. It is also necessarily more prolific of examples than would have been required by the other method, and the 400 plates, many of them comprising more than a score of separate figures, bear testimony not only to the author's patience and industry but also to his skill as a draughtsman. These, of course, constitute the value of the book, the letterpress being naturally subsidiary. It is written in simple and straightforward, not to say absolutely bald, style, but on the whole one is rather grateful for the absence of disquisition. Enough is said to elucidate the illustrations, and in such a work anything further would be rather a hindrance to its utility as a reference book; in which capacity it is likely to prove of signal service, since it deserves, we think, the description applied to it by Mr. R. Phené Spiers in his "Editor's Preface," that "indeed the volume forms a veritable encyclopædia of the evolution, development, and application of ornament in architecture and the decorative arts throughout the ages."

Beginning with prehistoric and primitive ornament, the author couples these terms in consideration that the ornament of the prehistoric races is still current among the uncivilised tribes of to-day. The author remarks of this class of ornament that it is "purely geometric," consisting mainly of zigzags, curves, and circles, the artist seldom venturing to depict the figures of men and animals, and succeeding very indifferently when he is bold enough to make the attempt.

Egyptian ornament, with its wearisome insistence on the flowers of the lotus and the papyrus, and its many peculiar conventions, is on the whole rather lacking in life and spirit, though not in skill of draughtsmanship. Persian ornament was more elaborate in detail, but less dignified in the general result. The Phœnicians, who were a nation of traders, strongly imbued with the commercial rather than with the artistic spirit, were more imitative and eclectic than creative, and in their work Egyptian-Assyrian influence is chiefly observable.

Indian work reveals much more spirited conception and luxuriousness of detail, and shows, at various periods, traces of Persian and Greek influence. With Greek ornament we reach almost the perfection of grace in decorative design. The author adopts its classification into four epochs: (1) The Mythical or Heroic, from the earliest times to 1104 B.C.; (2) the Doric or Archaic, from 1104 to 470 B.C.; (3) the Attic-Doric and Attic-Ionic, the period of the Erechtheion; and (4) the Alexandrian, from 338 to 146 B.C., which included the development of the Corinthian style. Etruscan art owed much to the influence of Phœnicia and Carthage, and even more to Ionic influence, but nevertheless the Etruscans had strong characteristics of their own, which in turn had considerable effect on Roman art. Twelve plates, each containing about a dozen figures, illustrate Roman ornament, the examples shown being mainly architectural. Pompeian art reached a high degree of excellence, and is with difficulty differentiated from Roman art, but shows more of luxuriant fancy, more freedom, and less severity.

Sections on Celtic ornament (1) in France and Germany and (2) in Great Britain and Ireland complete the relics of antiquity. Under the heading "The Middle Ages" we get synopses of early Christian onament, including Lombardo-Byzantine in Italy; Visigothic in Spain; Italo-Byzantine in Italy, and Frankish; Byzantine, Romanesque, Russian, Mahometan, including Arabian, Moorish, Saracenic, Ottoman, Persian, and Indo-Saracenic; Gothic, comprising France, the Netherlands, England, Germany, and Austria, Italy, and Spain; Chinese; and Japanese. Concerning Japanese work, it is remarked that the Japanese ornamentation is not so conventional as the Chinese, the former being more inclined to take their models from Nature. "The Japanese have adhered to the original models introduced from China through Korea, whereas the Chinese in some cases have entirely departed from them. Thus the Japanese pagoda represents "the same type of design as that which was first built by Korean carpenters at Horiuji in 607 A.D., and is still carried out at the present day, whereas the Chinese gave up the timber structure a few centuries later, and introduced one built in brick, which, in their country at all events, was not liable to be overthrown by earthquakes, as it might have

IONIC ORNAMENT.

(*From Speltz and Spiers' "The Styles of Ornament." By permission of Mr. B. T. Batsford.*)

been in Japan." The tonical interest of this extract is obvious, and it is further remarkable as showing how the more go-ahead people have been in this instance compelled to conservatism by climatic conditions. The examples of Japanese ornament are not altogether happy.

The examples of the ornament of Renaissance and modern times are naturally very copious, occupying about one-half of the book. We have not had time to examine them in detail, but a rapid glance through the 200 plates of figures shows that they are a representative collection, culled from very varied objects, and from all the periods and countries affected by the great revival. A very full index of illustrations, according to subject and material, greatly enhances the value of the volume as a work of reference; in which character it makes a very powerful appeal, not only to architects and designers, but to all who are interested in art—to all, in fact, who, in old-fashioned phrase, may be classed as "persons of taste."

*The Styles of Ornament, from Prehistoric Times to the Middle of the XIXth century. A series of 3,500 examples, arranged in historical order, with descriptive text, for the use of architects, designers, craftsmen, and amateurs. By Alexander Speltz, Architect. Translated from the second German edition. Revised and edited by R. Phené Spiers, F.S.A., F.R.I.B.A. London: B. T. Batsford, 94, High Holborn. 690 pages, large 8vo., cloth, gilt, 15s. net.

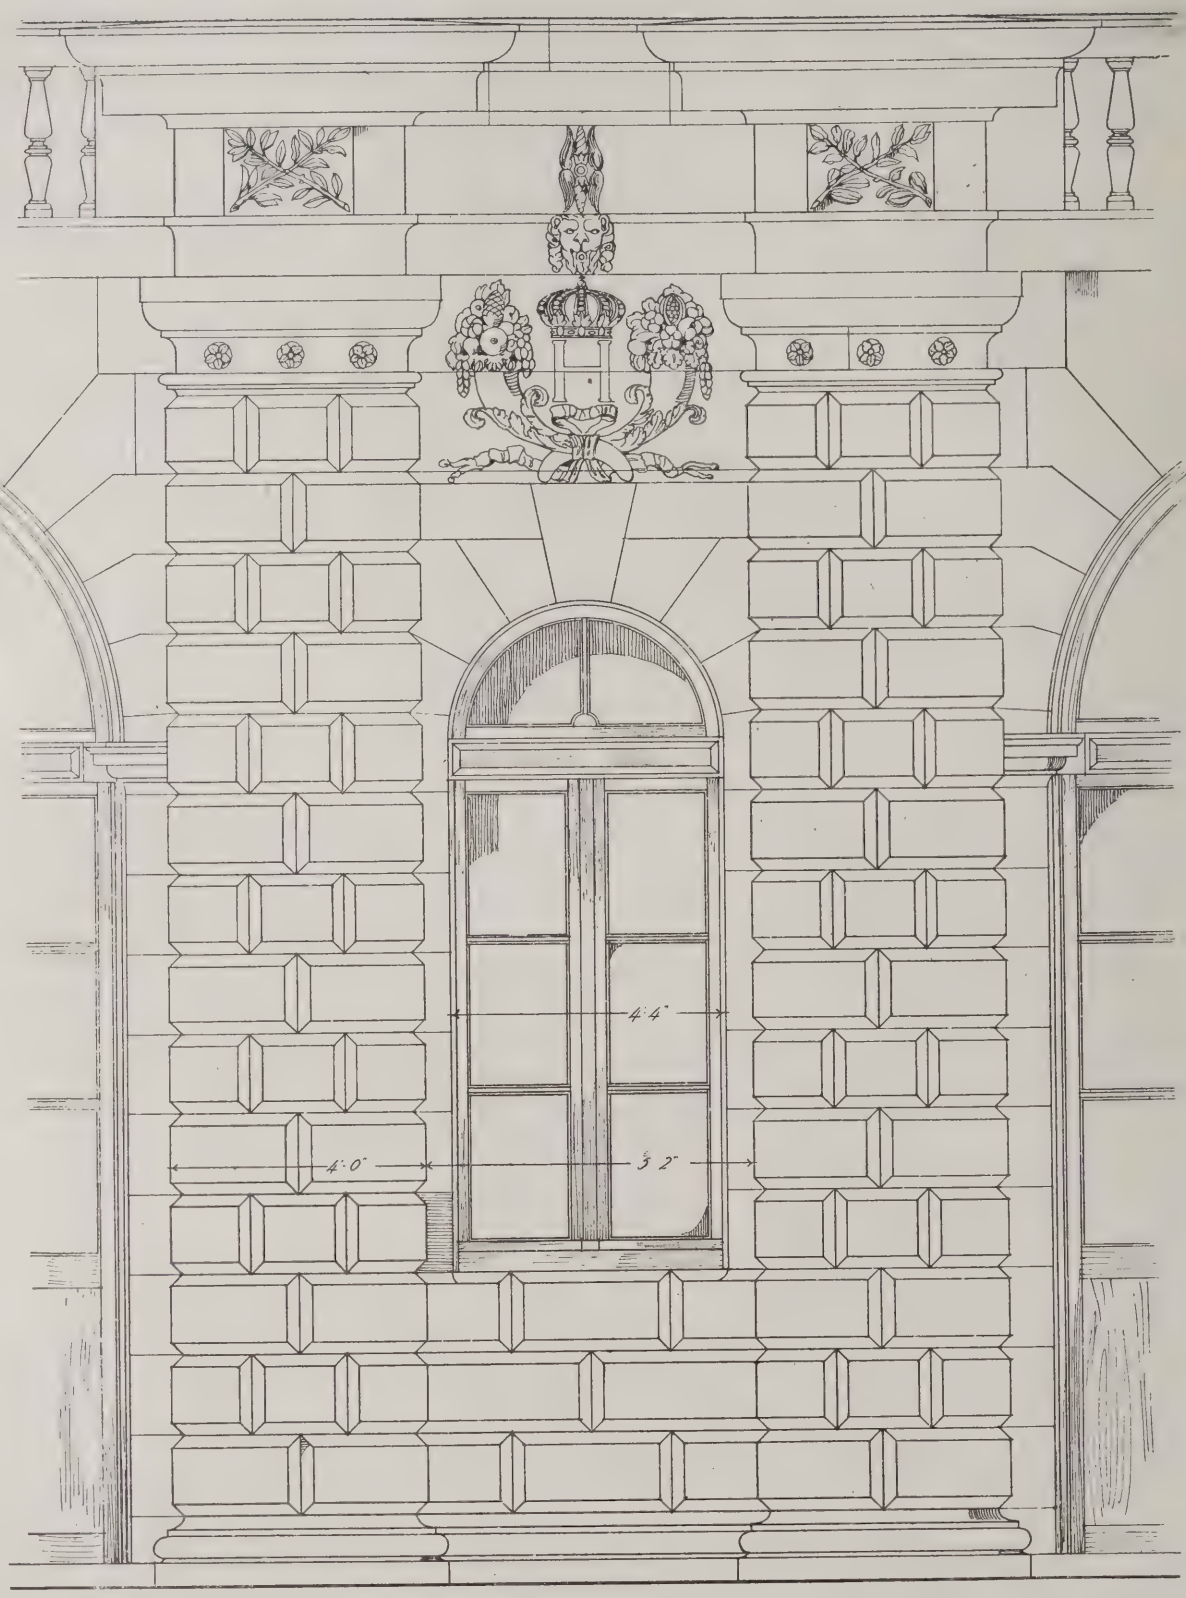
LEGAL.

Covenants Relating to Building.

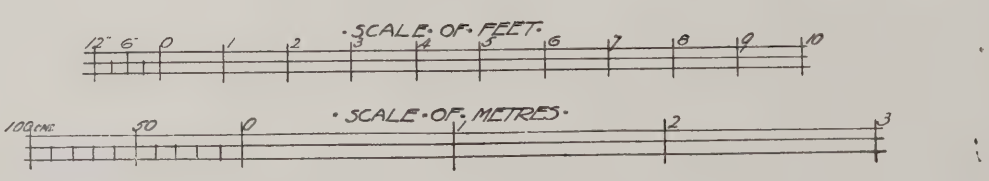
What Buildings May be Erected.

Where the lease of a farm for a term of years reserves to the landlord a right to sell part of the farm for "building sites," allowing £2 off the annual rent for every acre so sold, it was held that "land for building sites" was a well-understood expression, referring to something in the nature of shops or dwelling-houses, and that the landlord was not entitled against the tenant's will to sell part of the farm as a site for a small-pox hospital. It has been held, however, that a covenant not to build more than one house on a plot of land is not contravened by building a block of flats upon that plot. Nevertheless, a building structurally divided into two tenements on different floors, with no internal communication, common staircase, or common front door, constitutes two houses within the meaning of a covenant "not to erect more than one house."

As to the Amount to be Expended.

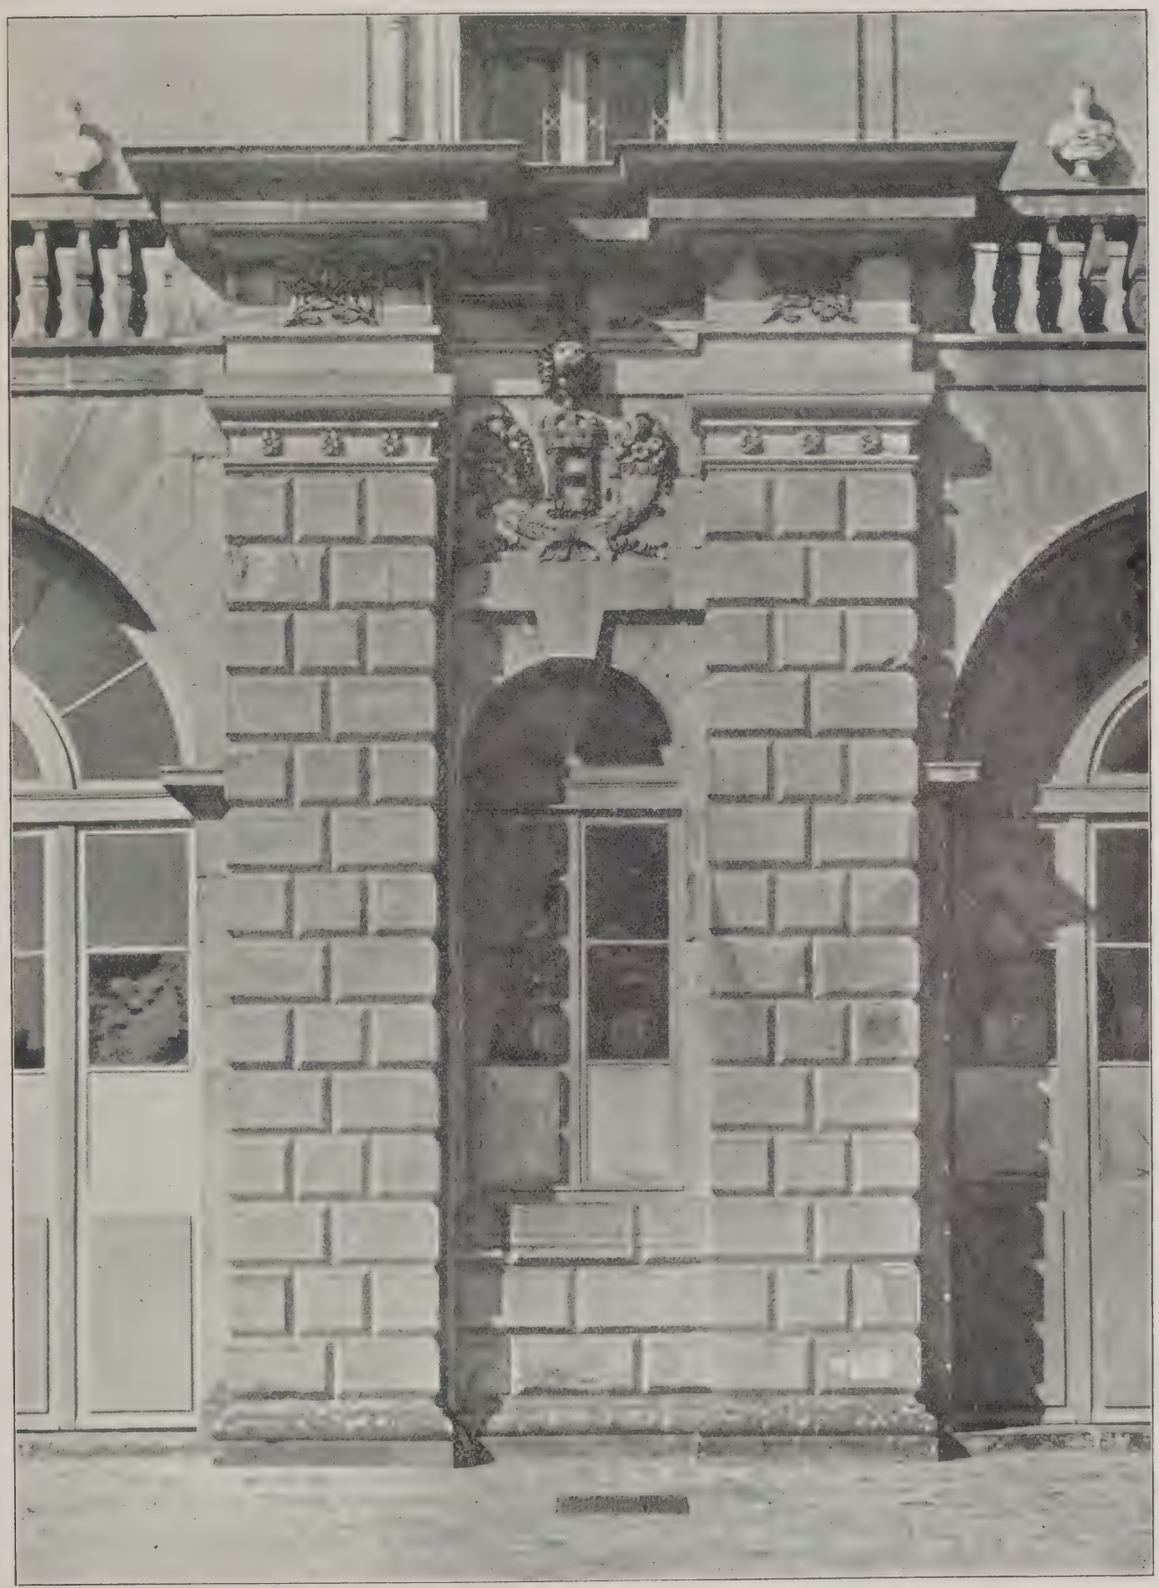


Where it was provided that a house of not less value than £400 shall be erected on certain land, the covenant was held to be broken by building two houses with certain common conveniences, each of less value than £400, but together of greater value. The meaning of the term "private house" in such a case has also been considered, but in no narrow sense, for it was held that a covenant to the effect that private houses only of a certain minimum value were to be built on several plots of land was not broken by the erection on one of them of a stable with a bedroom over it of such dimensions and in such a position that it would still be possible to build a house of the stipulated value upon the plot.



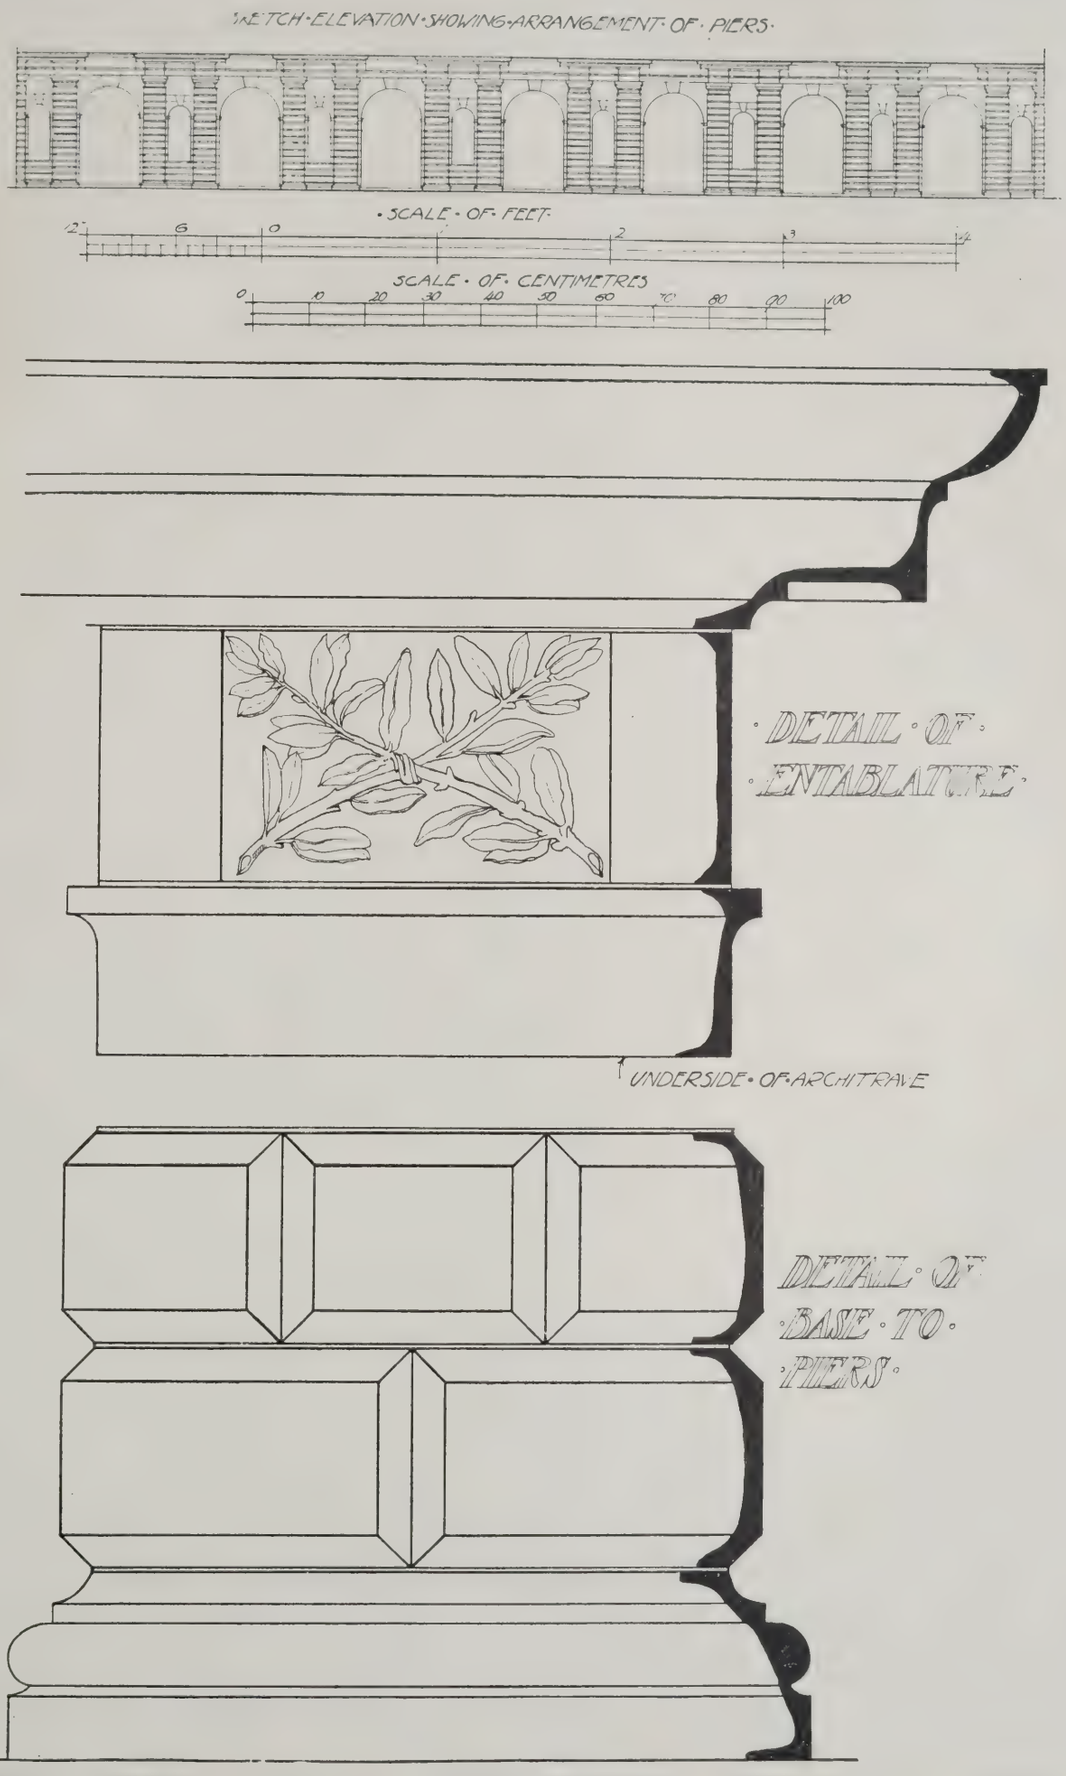
Covenant to Build to the Satisfaction of the Landlord's Surveyor.

A building lease frequently provides that the tenant will erect a house or houses "in all respects in conformity with the specifications, and to the satisfaction of the architect or surveyor for the time being of the landlord, and under his direction and inspection." This is a formidable covenant from which there is no way of escape, inasmuch as by signing the deed which contains it, the tenant voluntarily submits himself to the judgment of the landlord's surveyor. Nevertheless, the appointment of a surveyor by the landlord is a condition precedent to the tenant's liability. In one case, however, where a man covenanted to erect certain buildings within a fixed time, "the whole of which were to be left to the superintendence of the plaintiff and the defendant's son," it was held that the covenant to erect buildings was absolute, and that the clause respecting the superintendence merely granted the liberty for the parties to superintend, but did not impose any duty so as to make the superintendence a condition precedent or concurrent.



What Amounts to a "Building."

It has been held that the erection of a hoarding for the purposes of advertisement is a breach of a covenant not to erect or make any building on any part of the demised premises. Again, the construction of a railway embankment was held to be a breach of a covenant not to erect any buildings on the land conveyed other than private dwelling houses. Again, where building was not to exceed a certain building line, it was held that bay windows carried from the foundation up to the roof, and projecting 3ft. beyond the building line, were an infringement of covenant.



ELEVATION OF PIERS IN THE COUR DE LA FONTAINE, FONTAINEBLEAU, FRANCE.
DRAWN BY E. A. R. RAHBULA.

There is a range of these piers across the entire width of the façade, fronting the long apartment known as the Galerie de Henri IV., and they are among the few strong pieces of design that remain at the second Palace of the French monarchs. Piers and walling are in stone. Philibert de l'Orme did a considerable amount of work at Fontainebleau; but this example of French Renaissance is of later date, being by one of the several architects employed by Henri IV. to carry out the extensive alterations and additions he made.

NEW BUILDINGS.

PROPOSED.

Ashington.—It has been decided by the Urban Council to undertake the erection of a new Council chamber and municipal offices on a site leased from the Duke of Portland, near the railway station, and tenders for the work will be invited at an early date. The new building will have a frontage of 48ft. to the Station Road, and one of 72ft. to a proposed new side street 30ft. wide. A central entrance on the ground floor will give access to the whole suite of offices, which will include two large offices for the surveyor, and a spacious rate-collector's office on the ground floor, also two large rooms for the purposes of the lighting department, and one for the accommodation of cycles. On the first floor will be the Council chamber, measuring 46ft. by 22ft., with a large ante-room and two committee rooms, while the upper storey will be devoted to storage purposes. The front is to be of stone in the Georgian style, and a tower will figure at the head of the south-west corner. The estimated cost of the buildings is about £3,000, and the designs are by a local architect, Mr. Osborne Blyth.

Belfast.—Mr. P. C. Cowan, M.Inst.C.E., Chief Engineering Inspector of the Local Government Board, has generally approved a scheme concerning which an enquiry has been held in the City Hall, with regard to a petition of the Belfast Corporation praying for an order confirming a scheme made by them within the meaning of the Housing of the Working Classes Act, 1890. This concerns the improvement of certain unhealthy areas, known as the Hemsworth Street, Boundary Street, Gardiner Street, Hamill Street, Stanley Street, Little York Street, Matilda Street, and Christian Place areas. The application for sanction to a loan of £116,342 5s. for the purpose of carrying out the above scheme was also approved.

Bispham.—The following plans have been approved by the Urban Council:—Villa residence, Queen's Drive; estate plan, Queen's Drive; alterations to outbuildings, Nos. 3 and 5, Warbeck Drive; villa residence, Queen's Drive.

Chorley.—The Town Council has approved the following plans:—Five houses in Geoffrey Street; shop fronts to Nos. 122 and 124, Pall Mall; workshop in Yarrow Road; detached cottage in Queen's Road; house in Bolton Road; addition to Central Bakery in George Street; three cottages in Hollinshead Street; conversion of Chorcliffe House into two houses.

Clydebank.—The Dean of Guild Court has approved the plans of a new higher grade school in the burgh, which is to be erected close to Clydebank Public School, with accommodation for 390 pupils, at a cost of about £14,000. A workshop is provided for manual instruction, together with a laundry, cooking-room, laboratories, drill hall, gymnasium, art-room, etc.

Coventry.—The Borough Council has approved the following plans:—Two houses, Broomfield Road; extensions to erecting shop, Radford Fields; warehouse and carpenter's shop, Upper York Street; eleven houses, Milton Street; additions to factory, Foleshill Road; workshop, etc., Hill Top; eight houses, Berkeley Road; two houses, Stoke Park; one house, Mickleton Road; six houses, Huntingdon Road; additions to the Constitutional Club, Priory Row; two houses, Huntingdon Road; two houses, Stoke Park; house and shop, stores, etc., Stoney Stantion Road; twenty-four cottages and four lock-up premises, Highfield Street and Cross Road; three new streets (to be named "Coniston Road," "Highland Road," and "Aston Road") off Earlsdon Lane; covered yard, Bramble Street; three houses, Caldecote Road; two poultry houses, Nos. 79 and 81, Northfield Road; four houses, Swan Lane; extensions, Jordan Well; polishing shop, Edgwick Works, Canal Road; additions to factory, Far Gosford Street; experimental pulp room, Foleshill Road; packing shed, White Friars' Street; eleven houses, Mayfield Road; institute, with accommodation for caretaker, Stoney Stanton Road; sixteen houses, Mickleton Road; twenty-three houses, Silverton Road; two houses, St. Michael's Road; lock-up shop, St. George's Road; coach-house and stable, Stoney Stanton Road; two houses, Shakespeare Street; two houses, Lythall's Lane; thirty-one houses, Stepney Road; extension to iron shed, Foleshill Road; store shed, Kingston Road; mess room, cycle shed, etc., Station Street West; offices, Harnall Lane East; two houses, Raleigh Road; seven houses, Hamilton Road; house and shop, Caludon Road; four houses, Kingston Road; shedding, Much Park Street; three houses, Centaur Road; two houses, Raleigh Road.

Dundee.—The new college for the training of teachers is to be built on ground immediately behind University College. It is understood that the purchase price for this site amounts to £17,000. Some time will elapse before a start is made with the erection of the buildings, but it is believed that in all about £50,000 will be expended on the scheme, and, if the present negotiations are carried through, there will be ample space available for the erection of a model school, which may eventually be built on the ground.

Hoddesdon.—The Urban Council has approved the plans:—Two cottages in Essex Road for Lord Salisbury, and four houses in the same road for Mr. Maurice Smith.

Stockton.—The following plans have been approved by the Urban Council:—Eight houses in Marlborough Road; two houses in Raby Road; 10 houses in Gladstone Street; 18 houses in Vicarage Avenue, Newtown; three houses in Sydenham Street; and two houses in Dundas Street.

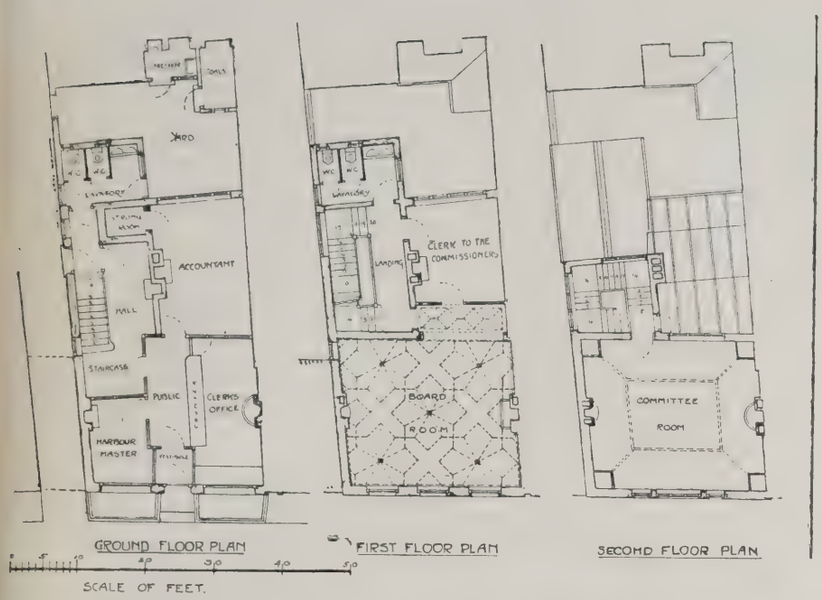
Sunderland.—The Corporation Building Committee has approved the following plans: House and shop, Brandling Street; two houses, Sea View Gardens; grain drying house, 93ft. by 33½ft., Castle Street Brewery; two houses, Belle Vue Drive.

Swansea.—The report of the Swansea Hospital Building Committee recommends the adoption of the entire scheme for additions and alterations to the institution, at a cost of £25,000. The principal items are the raising of the whole of the north and south wings one storey, and enlarging the western block of the north wing (casualty department and Patti Ward).

Walthamstow.—It is proposed to erect a central Church Hall for the parish of St. Mary, Walthamstow, at a cost of £4,000.

Wakefield.—The Corporation has approved the following plans: House in Horne Street; addition to Grammar School, junior department; two houses in Manygates Lane; alterations and additions to house and shop in Kimberley Street; house in Hanover Street; two houses in Dewsbury Road; house in Barnsley Road; six houses in Marsland Avenue and Marsland Terrace; three houses in Welbeck Street; w.c. to house in Welbeck Street; urinal to Trades and Labour Club, Queen Victoria Street; and additions to house at Peterson Road; wash-house to house in Richmond Road; four houses in Berlin Street and Lonsdale Road; four houses in Welbeck Street; latrines and urinal to Sandal Endowed School, Barnsley Road.

IN PROGRESS AND COMPLETED.



Bishop Auckland.—The foundation stones of the new Baptist Church, at Cockton Hill have been laid, and the total cost of the building, inclusive of site and contingent expenses, will be about £3,500. The architects are Messrs. Clark and Moscrop, of Darlington, and the contractor is Mr. T. Hilton.

Derby.—The foundation-stone of the new chancel, crypt, and vestries, in connection with St. Augustine's Church, has been laid,

This building is erected on the South Quay. The elevation is in Cornish granite and squared Norfolk flints.

GREAT YARMOUTH PORT AND HAVEN COMMISSIONERS' OFFICE.
OLLEY AND HAWARD, ARCHITECTS.

GREAT YARMOUTH PORT AND HAVEN COMMISSIONERS' OFFICE.
PLANS: OLLEY AND HAWARD, ARCHITECTS.

and by the addition of the former the seating accommodation of the church will be increased from 700 to 900. The estimated cost of the additions is £3,250, the contractor being Mr. Henry Chattle, of Empress Road, Derby, and Messrs. Naylor and Sale, Market Place, Derby, the architects.

SOCIETIES' REPORTS.

Gloucestershire Architectural Association.

A business meeting was held in Gloucester, the president (Mr. H. W. Chatters) being in the chair, and others present included Messrs. E. A. Pryer, A. H. Smithson, G. P. Milnes, W. F. Jones, J. F. Trew, H. S. Davis, A. L. Iredale, H. O. W. Grosvenor, D. R. Lyne, and T. Overbury (hon. secretary). Several gentlemen were elected honorary fellows, following which a general discussion of matters closely affecting the welfare of the architectural profession took place.

London Master Builders' Association.

A Council meeting was held on May 26th, when the President (Mr. Leonard Horner) took the chair.

Reports of meetings held on May 3rd and May 24th by the Emergency Committee were submitted, together with report of a Conference held on the latter date.

The Council approved the recommendations made with reference to affiliation fees, and appointed a committee to consider and report upon the question of measurement of slating and roof tiling.

The Organisation Committee's report was submitted by Mr. F. Higgs (chairman), and was approved. Several new ordinary and associate members were recommended to and elected by the Council.

Cases were reported where sub-contractors were specified to do work usually done by builders, and action was determined upon in order to check this growing and objectionable practice.

Amendments of the agreed form of building contract, proposed by a branch of the National Federation, were considered, and referred to the Institute of Builders for consideration.

A Parliamentary Bill to amend the law relating to trade unions was referred to the Parliamentary Committee.

Correspondence relating to various trade and other matters were considered, and instructions given regarding the subjects mentioned.—THOS. COSTIGAN, Secretary.

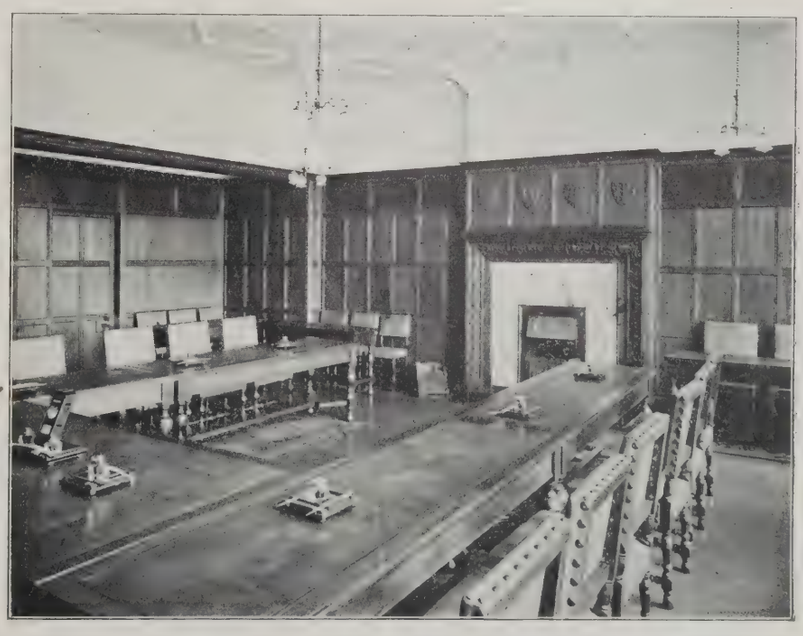
GREAT YARMOUTH PORT AND HAVEN COMMISSIONERS' OFFICE.

This building is erected on the South Quay, Yarmouth, overlooking the River Yare, and is next to the Custom House and the Old Subscription Library. The building comprises the public, the accountant's, and the harbour master's offices on the ground floor, the board-room and clerks' room on the first floor, and the committee room on the upper floor. On the South Quay there are several very interesting old buildings, which have original early oak panelling and ornamental moulded panel ceilings. The exteriors of many of these buildings had squared flint facings, but have been faced with brickwork. These facts have not been lost sight of in designing this building. The elevation is in Cornish granite and squared Norfolk flints, the entrance doors, the windows, etc., being in oak, and plate glass in heavy leads to the windows. The four coats of arms of Great Yarmouth, Norwich, Norfolk, and Suffolk are in cast bronze. The roofs are covered with the darkest tinted Rosemary tiles. The interior is fitted in oak, the staircases being in keeping with the bulk of the work. The board-room is pannelled in oak and has a moulded plaster ceiling. The contractors for the building were Messrs. Carter and Wright, of Gt. Yarmouth, the sub-contractors being: Messrs. Howard and Son, carvers; Messrs. Manuelle and Sons, London, Cornish granite work; Mr. A. R. Pank, the electric work. The oak furniture was specially designed, and has been carried out by Messrs. Gill and Reigate, of London. The architects are Messrs. Olley and Haward, 5, Queen Street, Great Yarmouth.

COMPETITIONS.

Otley Grammar School.

The plans sent in by Mr. Walter H. Brierley, of York, have been selected in the above competition; the second place (premium £15) was secured by Messrs. Oliver and Dodgshem, of Leeds; and the third place (premium £10) by Messrs. Holliday and Patterson, Manchester.



LIST OF COMPETITIONS OPEN.

JUNE 20 YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

SEPT. 9. THE QUEEN'S UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

GREAT YARMOUTH PORT AND HAVEN COMMISSIONERS' OFFICE
THE BOARD ROOM. OLLEY AND HAWARD, ARCHITECTS.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries which have been questions set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned. but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Compensation after Expiration of "Maintenance."

A. J. B. (LONDON) writes: "Have I any way of obtaining compensation under the following circumstances? A house was in course of erection when the owner wanted an alteration in one of the rooms which necessitated placing the fireplace further into the room than shown on the original drawing. The architect furnished the builder with an amended drawing, but the workmen, instead of cutting out the floor joists, put a thin slab of concrete on the top (this being the only protection between a 'well fire' and the joists), with the result that a fire broke out some time afterwards when the 'maintenance' period in connection with the builder's contract had expired."

—It is clear that a building owner is entitled to rely on the skill and judgment of the builder whom he employs. He may ask for an alteration: it is the business of those who carry it out to see that it is properly done. If, in the case which is mentioned, the architect supplied proper dawings, and directed that the work should be properly done, then he is exonerated, unless, indeed, it can be said that he should have supervised the builder. If a remedy is sought it should be pursued against the builder by action for negligence. He cannot escape responsibility for for such a defect by saying that the maintenance clause has expired. The case of *Bahman v Thompson* (1875), H.B.C. 166, may seem to conflict with this view; but there the certificate of completion and satisfaction given by the employer's architect was made conclusive between the parties with regard to any such disputes. B.

Lattice Girders for Shed Roofs.

X.Y.Z. (DUBLIN) writes: "Please supply information about wooden lattice girders for shed roofs, to be covered with boards and Ruberoid, which I have to specify in detail for roofs of different spans, one being sixty feet. Kindly state the class of timber which is generally used for the purpose, and say what would be the best paint or solution to coat these with for the purpose of preservation. Kindly say also if you know of any book in which the particulars are to be had for the different parts, the same as for the king post roof principles of different spans in building construction books. I should also be glad to know the scantlings of wooden posts for supporting each end of girders, which I consider should be composed of planks bolted together."

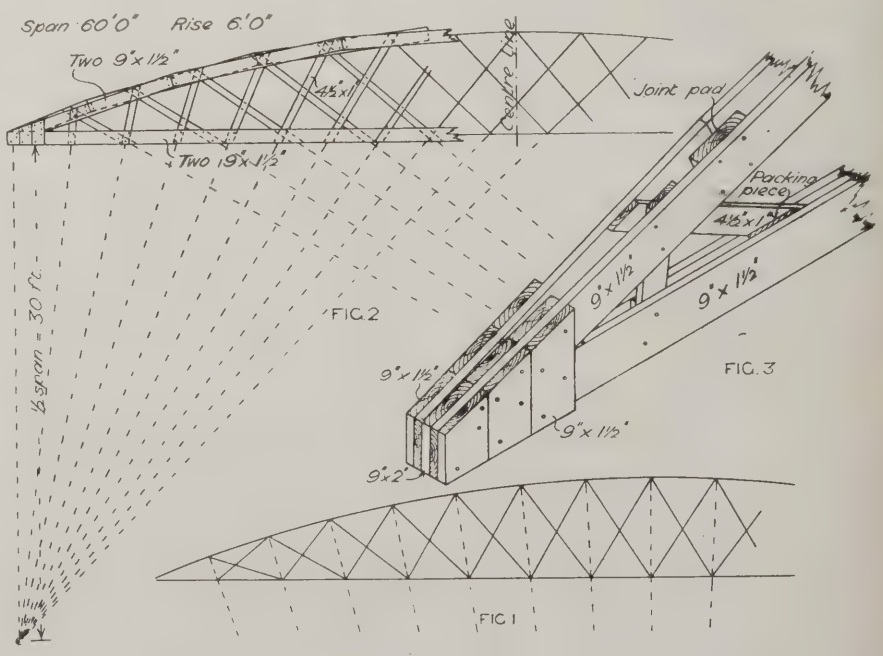
—These lattice trusses are generally supplied by a few makers who will give prices but do not publish details of the scantlings for different spans. The usual makers are McTear and Co., Ltd., Kirkliston Drive, Bloomfield, Belfast; The Rex Roofing Company, Greenville Street, Connswater, Belfast; and D. Anderson and Son, Ltd., Lagan Felt Works, Belfast. If the rise be made one-tenth of the span the radius of curvature will be thirteen-tenths of span. The bracing may be placed with the junctions radial, as Fig. 1, or sloping each way to two points equal to span apart and half span below tie-beam as Fig. 2. The scantlings and depth for various spans are somewhere about as follows:—

Span.	Rise.	Tie and Bow.	Braces.
20ft.	3ft. 4ins.	1—5×2	3×¾
40ft.	5ft. 0ins.	2—7×1¼	4×¾
60ft.	6ft. 0ins.	2—9×1½	4½×1

Part elevation of the truss proposed is shown in Fig. 2, and detail at support in Fig. 3. The posts for supporting the trusses will need to be braced to ensure the stability of the structure, and this question of bracing is of more importance than the actual scantlings. Red or yellow fir or deal, which is all one variety, but known in different districts by different names, is commonly used for these trusses; a good preservative, if it be desired to do anything to them, is "Solignum," which is a stain as well as preservative, and made by Major and Co., Ltd., Hull; another is "Carbolineum Avenarius," made by C. A. Peters, Ltd., 8, Castle Street, Arcade, Liverpool.

HENRY ADAMS.

Tunnelling for Sewer.



F. T. (NETLEY ABBEY) writes: "A tunnel is to be made between two manholes for a 24in. sewer. The work is to be commenced simultaneously from each manhole. Please give a simple method of procedure to ensure a true meeting?"

—The length of the tunnel from manhole to manhole being only about 250ft., no intermediate shaft will be required, but the tunnel should be driven from each end. At each manhole excavate a shaft 14ft. long and of the width required for the construction of the manhole. Set out the line of the sewer on the surface of the ground and drive in four pegs, one at each end of the two shafts to mark the centre line; then stretch a cord across each shaft between the two pegs, drop a plumb line down at each end from the cord and mark the position of each plumb line by driving a nail into the walling of the shaft next above the head tree of the tunnel. Small plumb bobs on short cords are hung from these nails, and a line sighted through the cords gives the direction of the tunnel. As the depth to which the tunnel is driven increases, further centre nails should be lined in and fixed in the head trees for the use of the miners. Although it would give a more accurate result, it is not necessary to use a theodolite to give the direction; sufficient accuracy being easily attained by the naked eye. Assuming that reasonable care is taken to drive the tunnel according to the direction lines laid down, the accuracy of the meeting will depend primarily upon the care with which the centre lines are fixed and maintained. The engineer or clerk of works should watch carefully for any movement of the timber which would affect the centre nails, and see that the nails do not get accidentally broken off and refixed by the workmen in a different position. He should also have the plumb bobs hung up and check the line of the tunnel each day.

HENRY C. ADAMS.

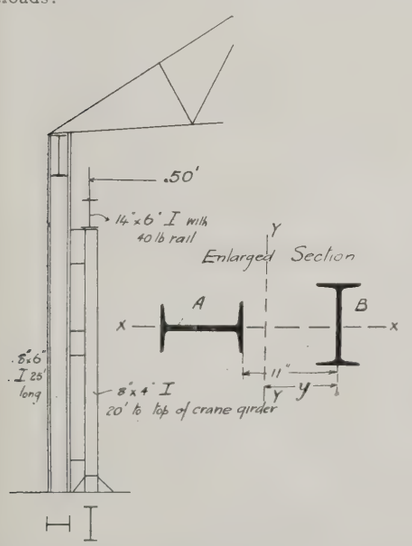
Percolation of Rain Through Reinforced Concrete Roof.

"CONFERRO" (KINGSTON-ON-THAMES) writes: "I have recently executed a roof in reinforced concrete to cover a room 20ft. ×10ft. on plan, in accordance with accompanying details (not reproduced), but now find that rain percolates through one or two cracks. (1) Could you suggest the cause of these cracks? (2) Under the circumstances, if I tar and pitch over the roof, would this make a good job, or will the cracks open wider? (3) Since designing this roof it is proposed to use the same as a floor. Do you consider it is strong enough as it stands, or how should it be strengthened for this purpose? The flat is largely exposed to the sun, but I presume the amount of sunshine we have had just recently

ILLUSTRATING ANSWER ON "LATTICE GIRDERS TO SHED ROOF."

(March-April) has not been sufficient to cause these defects."

—As our correspondent does not give the size of the reinforcement employed, nor the proportions of the concrete, we are unable to calculate the strength; but we should think the cracks are due to the use of coke breeze as an aggregate. Also, it would have been better to have built the roof level on top, and let the haunching round the joists be below, thus securing better continuity. Probably the reinforcement, owing to the way the roof is constructed does not provide sufficient resistance to reverse bending moment over supports. We do not think the sun has been the sole cause of cracks. If the coke breeze is not of good quality the roof may eventually completely fail. Such concrete should not be expected to be weatherproof without a protection, and we suggest covering it with several layers of tarred paper or felt and sand, or the use of one of the sheet roofings like "Ruberoid" or "Congo." If our correspondent will let us have full details we shall be prepared to consider the strength of the flat for use as a floor. D.



Columns and Crane Girders.

P. E. (BRADFORD) writes:—

I. How is the strength of any stanchion (designed on the principle shown) calculated —viz.—its B.M. Section modulus, and (1) its neutral axis, and least radius of gyration, when standard sections R.S. twist are used?

II. Would it be sufficiently strong if the roof stanchions were calculated separately (one end fixed), the top portions above rail level being found strong enough to resist B.M. from roof truss; and the crane stanchion taken out as least radius of gyration between ties to main stanchion, and $\frac{1}{2}$ value found for same; then for greatest radius the whole length of stanchion taken from rail girder to base, this seems a ready and quick way of arriving at the sections required, if it should be practically correct?

III. Are crane girders sufficiently strong, when the dead load of crane and live load is taken, and x 2, then calculated as concentrated at the wheels on girder, equal distances from centre of girder span, as dead loads?

ILLUSTRATING ANSWER ON "COLUMNS AND CRANE GIRDERS."

(1). The Fig. shows the proposed arrangement redrawn.

Taking the sections given in the sketch, viz., 8″×6″ for section A, and 8″×4″ for section B, we obtain the following data from the tables of standard sections:—

	Area.	Moment of Inertia Parallel XX.	About Centroid Parallel YY.
Section A -	10·29	17·95	110·5
Section B -	5·29	55·66	3·58

∴ Total area of combined section = 15·58 in.². Position of neutral axis YY obtained by moments

$15{\cdot}58 \times y = 10{\cdot}29 \times 15$, $y = \frac{10{\cdot}29 \times 15}{15{\cdot}58} = 9{\cdot}91$ in.

The moment of Inertia of the whole section about YY = $110{\cdot}5 + 10{\cdot}29\,(15{\cdot}921)^2 + 3{\cdot}58 + 5{\cdot}29 \times 9{\cdot}91^2 = 910$ inch units nearly.

Section moduli will be $\frac{910}{11{\cdot}91}$ and $\frac{910}{12{\cdot}09}$ i.e., 76·3 and 75·4 nearly.

Radius of gyration about YY = $\sqrt{\frac{910}{15{\cdot}58}} = 7{\cdot}65$ in.

$I_{xx} = 55{\cdot}69 + 17{\cdot}95 = 73{\cdot}64$.

Radius of gyration about XX = $\sqrt{\frac{73{\cdot}64}{15{\cdot}58}} = 2{\cdot}18$ in.

(2.) The suggested method of procedure would apparently give safe results except that the Bending Moment from the roof truss should be taken for the whole section at the base. An example of the calculations for a case like this will be found in "The Builders' Journal" of April 14th, 1909; in the present case we have first to proceed as above to get the modulus and radii of gyration of the section.

(3.) The writer has dealt somewhat fully with the question of rolling loads on Crane Girders in "The Builders' Journal" of August 11th, 1909. If L is the span of the girder and $\frac{1}{1}$ the distance between the wheel centres, the maximum B.M. if $\frac{L}{1}$ is greater than 1·707 occurs when one wheel is $\frac{1}{4}$ from the centre, and the other wheel $\frac{3l}{4}$ from the centre. The max. B. M. is $\frac{W}{4L}\left(L - \frac{1}{2}\right)^2$ where W is the total load. This will be more accurate than the method suggested by the querist which amounts to B. M. $= \frac{W}{2}\left(\frac{L}{2} - \frac{1}{2}\right)$

The error is $W\left(\frac{L^2}{4L} - \frac{1L}{4L} - \frac{l^2}{16L}\right) - \frac{W}{2}\left(\frac{L}{2} - \frac{l}{2}\right) = \frac{Wl^2}{16L}$. W may very safely be taken as a dead load equal to twice dead load of crane reaction + live load on crane, but many designers would use 1½ times.

Assistants' Qualifications, etc.

C. G. (WATFORD) writes: "Please inform me where I can inspect "Deutsche Bauzeitung." Kindly state also the qualifications essential to an architect's assistant."

—"Deutsche Bauzeitung" can be seen at the Patent Office Library. Generally speaking, it may be said that good draughtsmanship is very essential to success as an architect's assistant. If you feel that you are weak in this branch of the work you should concentrate all your efforts on improving yourself, and more particularly we should advise you to study regularly all forms of freehand drawing, sketching from nature (i.e., from actual buildings), and from the casts of architectural ornament in schools of art and museums. As you have passed the R.I.B.A. intermediate examination you must presumably have arrived at a certain standard of efficiency, and might well study the designing of small buildings, and more particularly of detail, as we should say it is only in exceptional cases that you will need any advanced knowledge of statics, etc., in an architect's office, and presumably you do not want to become an engineer. Such knowledge as it is necessary to obtain in order to pass the R.I.B.A. final examination is about all that an architect usually requires, and judging from what you say you can probably get this from such books as Middleton's "Stresses and Thrusts," Adam's "Designing Ironwork," Hardy's "Graphic Statics." The chief value of a tutor in such cases is that if he knows his business he can save you much time that is otherwise spent in a somewhat tedious groping after first principles.

Right of Drainage.

R. M. G. (ST. ALBANS) writes: "My client recently purchased the two corner houses as etched on plan [not reproduced], and after completing the purchase found that the drains of 11 other houses belonging to one owner ran through his back gardens. There is no mention in the deeds of either owners of any easement or right of drainage, and the property has not been built more than 14 years. The property was originally built by one owner, who was compelled by the local authorities to sign an agreement to the effect that neither he nor his heirs, etc., or assigns would ever call upon the corporation to maintain or repair the drains. This agreement is not mentioned in either sets of deeds. There was a sewer at the time of erection in both roads, and you will notice that houses 3, 4, 5, 6, 7, 8, 9, could have been run through right of way between houses 6 and 7, and that houses numbers 10 to 13 could have been drained into the sewer in the other road. Could you inform me (1) whether the owner of 1 and 2 has the right to disconnect the drains of the other 11 houses, also (2) if the houses have been built long enough to have acquired a right of drainage over my client's property, (3) as the main drains are really sewers, owing to more than one house draining into them, has the corporation the power to prevent my client from cutting the others off? (4) would you consider that the owner of the 11 houses could claim an easement of necessity as contended in *Pyre v. Carter* (about 1876, I believe)? (5) there might have been some difficulty with regard to falls (which I doubt), would this in your opinion go against my client in the event of a law suit? (6) in the event of a blockage occurring on my client's property, has the adjoining owner or the corporation the right to repair same without my client's permission?"

—This is one of those cases where it is difficult to give an answer without seeing all the deeds and documents. R. M. G., the owner of houses 1 and 2, having taken these houses with implied knowledge that the drainage of 11 houses passed beneath the garden, it appears that on the authority of the case cited R. M. G. is bound to permit the sewage to flow through the drain. As to prescription, it is clear that a right to allow sewage to flow through a neighbour's drain can be acquired in 20 years; but nothing less than that is sufficient. The question whether the local authority is or is not liable to repair the drain in the place mentioned depends on whether it was originally a "sewer made for profit" within the Public Health Act, 1875, S. 20. If it was, then the local authority cannot be held liable. But if it was not a sewer made for profit, R. M. G. could call upon the local authority to look after it as a public sewer. He would not be impliedly controlled by the covenant, though it will probably appear that he is expressly affected by it in some clause in his conveyance. X.

Small Churches to Measure near York and Beverley.

"STUDENT" (GLASGOW) writes: "Kindly give the names of some small churches in the vicinity of York or Beverley (suitable for the R.I.B.A. final examination), where permission to measure would be easily obtained."

—A better subject than Skelton Church, four miles N.W. of York, would be hard to find. It has, of course, been frequently measured so that permission is apparently not difficult to obtain. The church throughout is of Early English date, and exceedingly complete. The south doorway is a highly ornate example of the period; in fact, rather unusually so for a parish church, and it is probable that it was executed by the cathedral masons. If a less hackneyed subject is desired, the little church of Kirk Ella, five miles south of Beverley, has a fine Early English chancel, with a good east window, and would be worth measuring on that account. There are also several small parish churches in the City of York suitable for study. G.

Acoustics of a Small Court.

"ACOUSTICS" (BRADFORD) writes: "The enclosed pencil tracing (not reproduced) shows a room with the acoustics of which I have experienced considerable difficulty. The trouble, in addition to street noises, is that, although the magistrate, prisoner, witness, and solicitors are so near to each other, they all have difficulty in hearing the others. About 100 yards of fine wire and half-a-dozen flags have been suspended across the room about half the height, without any appreciable effect. I understand that stronger wire and hollow tubes might be experimented with to advantage, but am at a loss to know on what principles to distribute them or any other gear. If you can put me on the track I shall be greatly obliged, and will notify you as to results."

—We have made calculations so far as the information afforded allows in order to determine the absorption of sound by the bounding surfaces of the room, according to the different materials of which they are composed. From a consideration of the cubical contents and the absorption by the surfaces, we conclude that if the public benches, witnesses, and solicitors' seats are only half filled, there is a probable duration of residual sound about 3 seconds, though if completely filled, about 2.2 seconds. Now, although 2.3 seconds is desirable in a hall intended for orchestral music or singing, it is desirable that there should be none in a hall used for speaking. The residual sound, though in this case it is not in the nature of an echo, gives a distressing reverberation which is often met with in small rooms, and we advise that every endeavour should be made to reduce the duration of the residual sound. This may be done by several means, all consisting in bringing in sufficient absorptive material. Having regard to architectural effect, however, we advise that the plastered walls be covered with a thick canvas, the floor, wherever possible, covered with very thick felt carpet, the witnesses and solicitors' benches furnished with substantial stuffed cushions, thick curtains hung at the sides of the windows and over the doors at side of bench. These measures ought to reduce the duration down to about 1-13 seconds when half filled, and 1 second when filled with people. If there is still some slight annoyance, try lining the inside of the fence to bench with felt, and then finally cover the ceiling with canvas. We shall be interested to hear the result of these remedies from our correspondent in due course.

Corbelling Out on Party Wall.

J. H. H. (MANCHESTER) writes: "I should be obliged if you would enlighten me on the following points. I have on hand an extension to a Wesleyan church, and I find that the owner on one of the adjoining sides has built a cart shed on the whole of the party wall. This was allowed to take place, but he has built brick corbels out to carry a wooden gutter. The height to the eaves is only 5ft. 9ins. above. Can he acquire a right of corbelling out on our ground in this manner? If so, how long will it take? If I want to build against such a wall, can I force him to remove this spout and make a lead gutter, or shall I be forced to do this for him? Shall I have to connect this portion to a drain, as I am removing the present one, which is ours?"

—A right to use the gutter and to corbel out might be acquired by 12 years' continuous user without objection. As it appears that the neighbour in this case is only a bare licensee, the licence can be withdrawn at any time. It would be well to make him give an acknowledgment and pay 1s. or some other nominal sum each year. As he has been allowed to erect the works which he has erected, it seems that if our correspondent desires to build against the wall he must remove the obstruction himself. In drawing up an agreement it would be wise to stipulate that he shall remove the gutter at his own expense when called upon. X.

Hooton Hall, Cheshire.

G. H. (NEWCASTLE, STAFFS), writes: "I shall be glad if you can give me some information respecting Hooton Hall, Cheshire."

—I am unable to find any information relative to Hooton Hall, Cheshire, beyond the guide-book statement that it is modern and now occupied by the Hooton Club.

G.

FEDERATION NEWS.

(*For London Master Builders' Association Report see page 595.*)

Northern Centre.

The quarterly meeting of the Northern Centre of the National Federation of Building Trades Employers was held at the County Hotel, Newcastle-on-Tyne, on Wednesday, May 11th, the President, Mr. A. J. Forsdike, Sheffield, in the chair.

The minutes of the annual meeting held in London on January 4th, which had been circulated, were taken as read, confirmed, and reported upon.

The secretary was instructed to write Mr. G. Macfarlane, expressing the regret with which the members learnt of his illness, and congratulating him on his appointment to the Commission of Peace for Manchester.

The further proposals of the Lancashire and Cheshire Federation for amending clause 30 of the National form of contract were then considered, and representatives of that Federation explained the same. Ultimately it was resolved that the amended proposals now submitted be recommended to the National Federation in substitution for those sent from the annual meeting in June last.

The proposal to amend Rule 4 of the National Federation rules to provide that the ex-president shall become a member ex-officio of the National committees was considered, when the following resolution was adopted:—"That it be a recommendation from this Council to the National that the rule be amended so as to allow ex-presidents to hold office on the various committees of the National for at least two years after giving up office."

The subscription sub-committee reported that they had not yet been able to come to any agreement on the re-allocation of the centre subscription to the National, and stated that they had that day instructed the secretary to again communicate with the Lancashire Federation thereon

The same sub-committee reported that they had deferred the question of "uniformity of Federation rules in the centre" until they had decided something definite regarding the subscription allocation.

The secretary reported that, in accordance with the resolution passed at the annual meeting, the account of the representative on the N.A.O.P. Joint Committee had been before the National Federation, and it was agreed that the same be sent on to the L.C. and N.W. Federation.

It was agreed that the half-yearly meeting of the Centre be held at Chester in the evening prior to the National Council meeting in July.

Attention was called by the Northern Counties representatives to a case which had recently been before Mr. Justice Ridley, of one of their members who had contracted to do certain plumbing work according to plans and specifications, the quantities for which had been found insufficient, requiring the member to have to supply extra materials and labour for which he had lodged his claim. The decision of Mr. Justice Ridley, however, was given against the employer, on the finding—"That the quantities being the basis of the contract, he was held by those quantities for the completion of the work, though they may not be fully sufficient." It was also reported that the Northern Counties Federation had lodged an appeal against the decision, and, after some considerable discussion thereon, it was felt that the same was a National question, and one which should be taken up by the National Federation, and it was agreed:—"That the case be drawn up, and that the same be sent on from this Executive to the National Federation, with the request that they will take the matter up in the interests of the National Organisation." — JAMES DENVER, Secretary.

Northern Centre Board of Conciliation.

The annual general meeting of the above Board was held at the County Hotel, Newcastle-on-Tyne, on Wednesday, May 11th, Mr. Thomas Wilkinson, Middlesbrough, presiding over a full attendance of representatives of the employers and operatives.

The minutes of meetings held during the year, which had been printed and circulated, were taken as read, and were duly confirmed.

The accounts for the year ending April 30th, 1910, were passed for payment in accordance with statement presented by the secretaries.

Mr. Thomas Wilkinson, Middlesbrough, was re-elected chairman for the ensuing year, and Mr. D. Richards, J.P., Southport, was re-elected vice-chairman.

Messrs. James Denver, Manchester, and Coun. Alfred Gould, Hull, were re-elected the joint secretaries of the Board by the respective parties.

The proposals to amend the Conciliation Board rules as sent up by the various operative societies were then considered seriatim, and after some considerable discussion thereon, and votes having been taken on the various proposals, it was decided to make no recommendation to the National Board.

The secretaries reported that they had received an appeal from the Sunderland Local Board, in the case of an employer who was importing ready-worked masonry into the Sunderland district against the local working rules, and although the local Conciliation Board had given a decision against the employer, he had not carried the same into effect.

The representatives from both sides then attended and explained the case, and, after hearing the explanation of the employer complained of, it was felt that he had unwittingly entered into a contract arranged by the architect, and ultimately a resolution was passed requesting the employer to conform to the working rules, and affirming the right of the men to decline to work on the job in question.

It was decided to hold the next annual meeting of the Board in May, 1911, at Southport.

JAMES DENVER, Employers' Sec.

Lancashire, Cheshire and North Wales Federation.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the Boardroom, Manchester, on Thursday, May 12th, Mr. W. Cooke, jun. (president) in the chair.

A deputation from the Manchester master masons attended with respect to the difficulty they were experiencing through the introduction of ready-worked masonry into the Manchester district from lower-paid towns, and after explaining their positions they suggested that the worked stone rule should be amended. It was ultimately agreed to refer the subject to the Masons' Trade Committee of the Federation to consider and report.

A letter was read from Mr. R. Williams, the Divisional Officer for Labour Exchanges, complaining of the lack of support accorded the Exchange by building trade employers. After some consideration, it was resolved that the secretary reply as follows:—"That no doubt the scarcity of work is the reason for the Exchanges not being more frequently called upon for men, and that when more workmen are required employers will probably avail themselves of this means of obtaining them."

A recommendation from the Bricklayers' Trade Committee on the question of terra-cotta manufacturers supplying materials direct to architects and proprietors without allowing any margin of profit to the builder was considered and adopted.

The question of appointing a consulting solicitor for the Federation was then further considered, and a recommendation was adopted thereon to send to the annual general meeting in June.

Replies from the local associations were read respecting the suggested appointment of a building surveyor or surveyors to the Federation, but as most of them were adverse to the proposal, it was agreed "that no further action be taken in the matter at present."

Correspondence was read with the Crewe Works Department of the L. and N.W. Railway Co., respecting the charge of 5s. for copies of the specification for new stables at Liverpool, and it was agreed to take no further action in the matter until other complaints are received.

A recommendation from the Offices Sub-committee "that notice be given on June 24th next to vacate the present offices, and that the secretary be authorised to look out or advertise for more convenient premises," was duly confirmed.

A letter was read from the Leigh secretary reporting that one of the Bolton members was employing four operative painters who were strike-hands from Leigh, whom he could not conveniently discharge. The secretary was instructed to communicate with the Bolton Association accordingly.

The secretary reported a complaint from Birkenhead against a Chester employer for importing ready-worked stone into the Birkenhead district, where wages were higher, but, pending a reply from Chester, it was considered that no action could be taken at present.

A letter was read from the Liverpool Association on the subject of the Federation generally, and it was agreed that a deputation be invited to attend the next meeting of this committee on June 10th.

—JOHN TOMLISON, Secretary.

Manchester, Salford and District Association.

A meeting of the Committee of the Plasterers' and Painters' branch of the Manchester, Salford, and District Association was held at the Boardroom, Manchester, on Wednesday, May 4th, Mr. James Cadman presiding.

A complaint which had been received from the Operative Plasterers' Society against a firm of fireproof construction specialists (members of the association) to the effect that they were employing other than plasterers to do plastering work was considered, and a representative of the firm attended and explained their position. After considerable discussion it was felt that the question was one of demarcation of what is plasterers' work, and it was ultimately agreed to refer the matter to the Joint Standing Committee, under the N.A.O.P. agreement, to be held on May 10th.

A special meeting of the joiners' and builders' branch of the association was also held on May 5th, when the question of the depositing of open schedules to architects and public bodies was considered, and several members gave their experiences thereon. It was ultimately resolved that the following be recommended to the annual general meeting of the association for adoption as a rule of the association on the subject.—"That no member of this association shall deposit open schedules with architects or public authorities for any work within the Manchester area, unless with the consent of the general committee of the association."

An application for membership from Messrs. John Hibbert and Co. was approved and recommended to the general committee.

The annual meeting of the Manchester Board of Conciliation was held at the Employers' Boardroom on Thursday, May 5th, when Mr. Macfarlane occupied the chair.

The minutes of the annual meeting held in May, 1909, were read and confirmed. The accounts of the Board for the year were passed for payment.

Mr. Henry Matthews, J.P., was elected chairman of the Board for the ensuing year, and Mr. T. R. Jones was re-elected the vice-chairman.

Messrs. James Denver and J. M. Hughes were elected the Joint Secretaries of the Board.

A vote of thanks was passed to the officers and members of the Board for their services during the past year, which concluded the formal business, and the meeting terminated.

The annual meeting of the Plasterers' and Painters' Branch of the association was held on Tuesday, May 10th, when Mr. James Cadman presided.

Mr. Chas. E. Harwood was elected chairman of the branch for the ensuing year, and Mr. James Cadman was elected the vice-chairman.

Messrs. T. A. Locan, John Cadman, James Higson, J.P., O. Corrigan, W. J. Roberts, J. W. Hindshaw, together with the chairman and vice-chairman ex-officio, were elected on the branch committee, and also the joint standing committee under the N.A.O.P. agreement for the ensuing year. Messrs. Locan, Jackson, and Gibbons, were elected on the joint working committee with the Manchester Master Painters' Association.

A meeting of the Joint Committee under the N.A.O.P. agreement was held at the close of the above meeting to consider a complaint received from the Operatives' Society against one of the members for employing other than plasterers to do plasterers' work. After hearing the evidence of both sides, it was felt that the question was one which could only be dealt with by the "Demarcation Committee," to whom it was agreed to refer the same. The operative secretary also called attention to the complaint he had lodged against one of the Bolton members who was working in the Manchester district and not paying walking time expenses, and it was explained that the matter had been taken up with the Bolton Association.

Some discussion arose regarding the interpretation of clause 3 of the agreement contained in the working rules, and correspondence which had taken place between the secretary and the operative society was read. It was ultimately agreed that, prior to any action being taken in future by the employers, the same be reported through the association secretary to the operative society, who will take the matter up with their member with a view to having any defective work made good immediately.—JOHN TOMLISON, Secretary.

Sheffield.

The monthly meeting of this association was held on May 12th, the president (Mr. Wm. Longden) in the chair.

Building Trades Exhibition.—A report was given as to the Building Trades Exhibition to be held at the Sheffield Drill Hall from the 14th to 22nd October next, under the auspices of the Sheffield Association, the Yorkshire Federation of Building Trades, and the Sheffield Architects' Society.

Proposed Excursion to France and Belgium.—As will be remembered, the Sheffield builders, accompanied by their friends from several other Yorkshire associations, paid a visit to Belgium two years ago, and last year the Belgian builders who received them so enthusiastically in Antwerp and Brussels paid a return visit, and, in addition to spending a couple of days at Sheffield, they were entertained by the Liverpool and London Associations. On their visit last year, the Belgian builders practically extracted a promise from their Yorkshire friends that they would visit the Brussels International Exhibition this year. The matter has been considered, but, in view of the congestion in Brussels during the period the Exhibition is open, and also of the fact that many of the members who have recently visited Brussels have not had an opportunity of comparing it with Paris, it has been thought that the excursion would be more interesting if made by way of Paris. A circular has been issued fixing the excursion to start from Sheffield at 8.50 a.m. on Saturday, July 2nd, friends coming from towns north of Sheffield catching this train, so that the whole party will go forward together. The party will go by way of London, Folkestone, and Boulogne, reaching Paris the same evening. As at present arranged, Sunday, Monday, Tuesday, and Wednesday are to be spent in Paris, and the party are to leave on Thursday morning for Brussels, where they will meet their Belgian friends once again, and visit the exhibition. The homeward journey is to be made by way of Ghent, Bruges, Ostend, and Dover, on the following Saturday, but as the tickets will be available for fourteen days, members of the party may stay longer at any of the main points in England, France, or Belgium.

Plumbers and Heating Engineers.—A report was given of the circumstances which led to the strike of the operative plumbers at the Grand Hotel, in consequence of a dispute as to the precise line of demarcation to be drawn between the respective work of plumbers and heating engineers and fitters. The question is constantly cropping up, not only at Sheffield, but in various parts of the country. A deputation from both the master and operative plumbers met a committee of the association and discussed the matter. Subsequently the association were approached by the National Society of Heating and Domestic Engineers, and a communication was also received from the operative heating engineers, with the former of whom they had a consultation. The heating engineers drew attention to the Leicester award, which made all lead work plumbers' work, and, in general, work in other metals either plumbers' work or heating engineers' work, as might be specified. The representatives of the association said they were from time to time being drawn contingently into these disputes, and while they had no direct interest in them, their works were laid down when the plumbers struck, and they suffered considerable loss, more especially in the case of a contract with a time limit. They were anxious that an agreement should be come to between the parties, but it appeared to them that so long as the present arbitrary method of strike by way of protest continued, the breach would be widened and the issue embittered. After hearing both sides, they had come to the conclusion that the only method of adjusting the issue was to bring all parties together in a joint conference, composed of master builders, architects, master and operative heating engineers, and master and operative plumbers. After obtaining the consent of all parties, it was decided to hold a joint conference in June, when it is hoped that at least the question may be settled locally, with some prospect of settlement on a national basis.

Bricklayers' and Joiners' Working Rules.—A report was given of the meeting with the operative bricklayers and joiners for the fixing up of the new working rules in accordance with the recent decisions of the Northern Centre Conciliation Board. The only hitch in the proceedings was caused by a claim on behalf of the bricklayers to have return fares in certain cases paid once a week to men working out of town, whereas the joiners had already agreed that such fares should be paid once a fortnight. An attempt was made to prove that the old rule in regard to payment once a week had not come under the notice of the Northern Centre Board, although the rule was distinctly submitted to the Board in the printed draft. The bricklayers eventually agreed to the rule being inserted in the same way as for the joiners.

Annual Meeting of Conciliation Board.—A report was given of the annual meeting of the Conciliation Board, when Mr. A. J. Forsdike, who had occupied the position of President since the inception of the Board, was re-elected. Mr. F. Limage was re-elected as vice-chairman, and Mr. Thos. Smith and Mr. J. T. Welburn, joint secretaries. The business was of a formal character, and the meeting afterwards discussed an extract from "The Builders' Journal" in reference to the scheme of a Joint Committee for the settlement of workmen's compensation claims in the same way as has been inaugurated by the Durham miners. The operatives' representatives said that they had not had an opportunity of considering the scheme in detail, but, on the broad issues, it seemed that the scheme should work to the undoubted advantage of both employer and operative.

Rights of Trade Union Officials.—A complaint was made by a member, of a trade union official coming on a job without permission. The matter was very strongly commented upon, and the secretary was instructed to write the Bricklayers' Society that such proceedings would not be permitted by members of the association.

The New By-laws.—The new by-laws of the City Council were again discussed on the report of the committee. It was still contended that the by-laws should specifically state the material and mode of construction of a new road, so that it might subsequently be taken over by the Corporation without further cost. The Corporation had agreed to allow the flue of a set-pot to be connected with kitchen chimney. The objection to the by-law making it imperative that every attic should have a vertical window was still very strongly pressed, and the special committee of the Corporation were advised that the members of the association, as practical builders, knew that a dormer window was more difficult to render weather-proof than a skylight, and was equally efficient for purposes of ventilation. If the objection was persisted in, the result would be that a large number of small houses would be built without an attic, and so tend to necessary overcrowding and insanitary conditions in the reduced number of rooms. The association could not see the point of the Corporation committee that they should waive this objection, because they were making a concession so as to allow a three-storey cottage to be carried to a height of 33ft. instead of 30ft., with a 9in. brick wall, and considered that such an unnecessary addition to the cost was in diametrical opposition to the avowed object of the Council, which was to provide an efficient artisan's dwelling at the lowest possible cost. With respect to the provision of a tray to cut off the entire waste from a domestic building to the sewer in addition to the ordinary traps, it was considered that where inside closets do not exist, such outside traps should only be put in where there was sufficient fall. In theory the insertion of such traps seemed all right, but in practice there was excessive trouble with them, and, in consequence, a large number had been removed. A special committee of the association had considered the timber sizes in the new by-laws, which in many cases were widely different from those in use. One of the greatest objections was that the sizes which had been incorporated would in several cases not cut out of the imported sizes without waste, while a further objection was that while a distinction was rightly made in the strength of floor joists between buildings of the domestic class and those of the warehouse class, no such distinction was made between the strengths of the roof timbers. The consequence was that the roof timbers of domestic buildings were very greatly and unnecessarily increased, and the Committee saw no reason why a cottage should contain timbers as strong as those which in warehouses had machinery attached to them. The unnecessary strengthening of roof timbers was a mystery, and they asked the Corporation if they had any case or generality of cases in mind where accidents had been attributable to roof timbers being of the size now in use. On the other hand, the association were unable to understand why the floor timbers were in some cases stipulated to be of less strength than those in general use. At the request of the Corporation committee, a list of suggested sizes for various roof timbers was given by the association. A further meeting with the Corporation committee has been arranged.

Trade Committees.—As at present constituted, there is only an Emergency Committee in addition to the General Committee, separate committees being temporarily formed for the purpose of dealing with matters as occasion requires. It is now thought that the time has come when there ought to be departmental committees, each dealing with its own particular branch of the trade, and it was also suggested that, in addition to the ordinary trade committees, the advisability ought to be considered of forming a Speculative Builders' Committee, and even a Contractors' Committee. It is felt to be unfair that the same members should be called upon to deal with practically all questions, whether or not such questions may affect any branch of their own particular business. Moreover, if a question is dealt with in the first instance by those only who are intimately connected with it, it is much more likely to be presented to the general body in more succinct form. It was decided that the matter be referred to the committee for a detailed scheme to be presented at a subsequent meeting.

Labour Exchanges.—There has been at Sheffield, as in other centres, some little misapprehension in regard to the working of the Labour Exchanges, and for the purpose of removing this, Mr. Hilliard Stevens, the manager of the Sheffield Exchange, attended and addressed the meeting.

In reply to questions, Mr. Stevens said that although they had only been established three months, they had reason to congratulate themselves on their success. The trades unions were handing the names of their unemployed to the Exchange, but the Exchange, in filling vacancies, made no distinction whatever between union and non-union men, nor was the question asked except at the express wish of the prospective employer. Men in employment were allowed to register, but they must state to what date they were continuing with their present employer, and a man was not entitled to use the Exchange until such period expired. In other words, the Exchange would not be allowed to act as a medium for the advancement of men already in employment, or to enable them to leave the service of one employer to enter that of another.

Mr. Forsdike, in moving a vote of thanks to Mr. Stevens, recognised the initial difficulties with which exchanges had to contend, and said that as a result of Mr. Stevens's visit, the members of the association would probably be prepared to assist in the way indicated. If men could be induced to register at the Exchange, and employers would always apply to the Exchange, they would in the long run do away with the misery incident to the search for work. One or two members mentioned that they had been satisfied with the men sent them by the Exchange, while others mentioned that after the explanations they had received they would be pleased to give the Exchange a trial.—THOS. SMITH, Secretary.

Barnsley.

The monthly meeting of Barnsley Federation was held at the King's Head Hotel on May 11th, Mr. E. Broley (president) in the chair, supported by fourteen members. In respect to the matter of a Halifax member and Barnsley contract, the local secretary (Mr. J. Denton) was, by general consent, exonerated from blame.

Present conditions of work under Local Education Committee received further attention, and the matter was left to the committee to deal with and report upon to next monthly meeting.

With respect to building tenders and contracts, a circular from the National, being reprints from "The Builders' Journal" of June 26th and February 23rd ult., was submitted by the secretary, and met with unanimous approval as steps in the right direction.

The secretary submitted a statement from the Leicester Federation, taken from "The Builders' Journal" of May 4th, and after discussion, sympathy was expressed with the Leicester Federation, and sincere hopes that they would be successful in their protest.

It was unanimously resolved that all members and operators abstain from all work on the day fixed for his late Majesty's funeral.—J. DENTON, Secretary.

FORTHCOMING MEETINGS.

20th June.—5 p.m., at 31 and 32, Bedford Street, Strand, W.C., Annual Meeting of the Standing Joint Committee of Appeal under the Agreement with the N.A.O.P.

21st June.—Noon, at above address, Meeting of Journal Committee, 2.30 p.m.; Meeting of Administrative Committee.

26th July.—2.30 p.m., at Chester, meeting of Executive Council of the National Federation.

27th July.—10.30 a.m., at Chester, General Meeting of the Federation.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 13. **HULL.**—(See "Engineering.")

June 13. **BIRKENHEAD.**—(See "Miscellaneous.")

June 13. **WINDSOR.**—Alterations and additions to the boys' and girls' schools in the Bachelor's Acre, for the Managers of the Windsor Royal Free Schools, in accordance with plans and specification, which can be seen at the offices of the architects, Edgington and Spink, 52, High Street, Windsor. Tenders to be delivered at the offices of the architects.

June 13. **CHESTER.**—Erection of a new fire station at the premises in Northgate Street. Plans and specifications can be seen either at the Town Hall, Chester, or at the offices of the architect, James Strong, 11, Dale Street, Liverpool, and quantities obtained on deposit of £1. Tenders to be sent to the Town Clerk, Town Hall, Chester.

June 13. **NEWHEY (Rochdale).**—Erection of an elementary school for 350 scholars at Newhey, near Rochdale, for the Lancashire Education Committee. The plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, 16, Ribblesdale Place, Preston, by deposit of £2. Tenders must be delivered to J. A. Grindrod, 32, Lord Street, Rochdale.

June 13. **SHREWSBURY.**—Persons desirous of tendering for the erection of Public Abattoirs, Roushill, are requested to forward their full name and address to Arthur E. Williams, Architect and Surveyor, County Chambers, 12, High Street, Shrewsbury, not later than the 13th inst., together with a deposit of £2 2s. Bills of quantities, and form of tender, will be forwarded in due course.

June 13. **SWANSEA.**—Erection and completion of new school premises for the Trustees of the Wesleyan Chapel, Sketty, Swansea. Plans and specification may be seen with P. Watkins, Sketty Avenue, Sketty, Swansea, or at office of W. Beddoe Rees, Architect, 3, Dumfries Place, Cardiff, where bills of quantities may be obtained on deposit of £1 1s. Tenders are to be delivered to the secretary, Mr. Watkins.

June 13. **CHELMSFORD.**—Heating and ventilating works at the Trinity Road Council School, which is now in course of erection, for the Borough Education Committee. Persons tendering are to submit their own schemes for these works. The plans of the school building may be inspected at the office of the architect, W. H. Pertwee, the Institute, London Road, Chelmsford, from whom all particulars may be obtained. The contract for the erection of the school building has been let to Henry Potter and Son, of Chelmsford, and the person whose tender is accepted for the before-mentioned works will be, and act as, sub-contractor to, and will be paid by, that firm. Tenders, which must be on forms to be obtained from the architect, together with detailed schemes or specifications, must be addressed to W. Smith, Town Clerk, Municipal Offices, 16, London Road, Chelmsford.

June 14. **WALLASEY.**—Supply and erection of a water-cooling tower, for the U.D.C. Copies of the specification may be obtained on application to the Engineer and Manager, Mr. J. A. Crowther, at his office, Seaview Road, Liscard, Cheshire.

June 14. **OLDHAM.**—Alterations to the registrar's office at Greenacres Cemetery, for the Cemeteries Committee. Particulars may be obtained at the Borough Surveyor's Office. Tenders must be addressed to the Chairman of the Cemeteries Committee, Town Hall, Oldham.

June 14. **BIRKENHEAD.**—Building repairs at their stable and yard, Oliver Street, for the Guardians. The premises may be inspected any day between 10 a.m. and 11 a.m. Forms of tender, with specification, may be obtained at the offices of John Carter, Clerk, Poor Law Offices, Birkenhead, and must be delivered to him. Fair wages clause.

June 14. **TADCASTER.**—Conversion of Tadcaster old police station into two cottages, for the West Riding Joint Committee. Plans may be seen at Tadcaster New Police Station, and specifications, with quantities, obtained on application to the West Riding Architect, County Hall, Wakefield. Tenders must be addressed to J. Vickers Edwards, County Hall, Wakefield.

June 14. **DARLINGTON.**—Converting paint shop into power-house, for the Directors of the N.E.R. Plans and specifications may be seen, and quantities and further information obtained upon application to William Bell, the Company's Architect at York. Duplicate plans may also be seen upon application to the Station Master, North Road Station, Darlington. Quantities supplied on personal application to parties tendering for the whole of the works. Tenders to be sent to the Secretary at York.

June 14. **DURHAM.**—Alterations and additions at Black Boy and Eldon Council Schools, Manual Instruction Room, at Cockton Hill, and Caretaker's House at Murton Colliery, for the C.C. Sole tenders are invited for the above. Plans, specifications and general conditions of contract may be seen and bills of quantities obtained as follows:—1, for Black Boy Council School, at the office of F. H. Livesay, architect, Newgate Street, Bishop Auckland; 2, for Eldon Council School and Murton Caretaker's House (plans, specification, and general conditions only for the latter), at the office of F. E. Coates, Shire Hall, Durham; 3, for Cockton Hill Manual Instruction Room, at the office of W. Rushworth, Shire Hall, Durham. Tenders (endorsed with name of school) are to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

June 15. **HALIFAX.**—"See Painting.")

June 15. **TROON.**—Erection of a new orchestra at the United Methodist Church. Plans and specifications can be seen at Joseph Rodda's House, Treslethan Road, Troon, to whom tenders must be sent.

June 15. **JOHNSTONE.**—Additions and alterations to the Post Office, Johnstone, Renfrewshire, for the Commissioners of H.M. Works and Public Buildings. Drawings, etc., may be seen on application to the Postmaster of Johnstone. Bills of quantities, etc., may be obtained at H.M. Office of Works, 3, Parliament Square, Edinburgh, on deposit of £1 1s.

June 15. **HULL.**—Erection of a park-keeper's lodge in the Pickering Park, for the Corporation. Drawings and specification may be seen at the office of Joseph H. Hirst, City Architect, Town Hall, Hull, and quantities obtained upon a deposit of £2 2s. Remittances to be made payable to the City Treasurer. Tenders, addressed to the Chairman of the Parks and Burial Committee, to be delivered at the Town Clerk's Office.

June 15. **CHISLEHURST.**—Erection of a new post-office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Chislehurst. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered addressed to the Secretary, H.M. Office of Works, Storey's Gate, London, S.W.

June 16. **PEMBROKE.**—Supply and erection of a weighbridge at the Union Workhouse, including the erection of necessary house, which must be described in the tender, for the Guardians of Pembroke Union. Persons tendering are requested to submit tenders for a machine of 3 tons, 4 tons, 5 tons, and 6 tons capacity, stating the name of maker of machine. Tenders to be sent to J. S. W. Jones, clerk, Union Office, Pembroke.

June 17. **BAILEY MILL (Bewcastle).**—Mason work required in the erection of a girder bridge at Bailey Mill, Bewcastle, for the Longtown R.D.C. Plans and specifications can be seen, and particulars obtained, from James Murray, Surveyor, Kirklinton, Carlisle.

June 18. **GUILDFORD.**—(See "Painting.")

June 18. **CHADDERTON.**—Erection of washhouses, etc., in connection with the caretaker's houses at Eustace Street and Stanley Road schools. Forms of tender may be obtained from J. Whitehead, Clerk to the Committee, Education Offices, Chadderton, to whom tenders must be sent.

June 18. **AGHADOWEY (Ireland).**—Erection of a combined hall and school at Aghadowey Presbyterian Church. Plans and specification can be seen with S. J. M'Fadden, C.E., architect, Queen Street, Coleraine. Tenders to be lodged with Hugh M'Fetridge, The Temple, Aghadowey.

June 20. **TENDRING (Essex).**—Erection of a reception home for children at the workhouse, for the Guardians. Plans and specification may be seen and forms of tender and other information obtained at the office of the architect, G. H. Page, Trinity Chambers, Colchester, and tenders must be sent to A. J. H. Ward, clerk, 42, Church Street, Harwich.

June 20. **WATERLOO WITH SEAFORTH.**—Erection of the Crosby Road North Council school, Waterloo, near Liverpool, for the U.D.C. Bills of quantities may be obtained from John I. Thompson, Clerk to the Council, Town Hall, Waterloo, near Liverpool, upon deposit of £1 1s. Drawings and specifications may be seen at the office of Appleyard and Quiggin, architects, 67, Lord Street, Liverpool. Tenders must be delivered to the Clerk to the Council.

June 20. **LEEDS.**—Erection of workshops for the Gas Department in Sovereign Street. The whole of the several trades will be let in one contract. Drawings may be seen and a copy of the specification, conditions of contract, and bill of quantities obtained at the office of W. T. Lancashire, city engineer, Municipal Buildings, Leeds, on deposit of £3 3s. Tenders must be received at the Town Clerk's Office.

June 21. **RICHMOND (Yorks.).**—Erection of public lavatories in the Ronaldshay recreation ground, for the Corporation. Plans, specifications, and full particulars may be seen at the office of H. W. Marsden, borough surveyor, Tower Street, Richmond, to whom tenders must be sent.

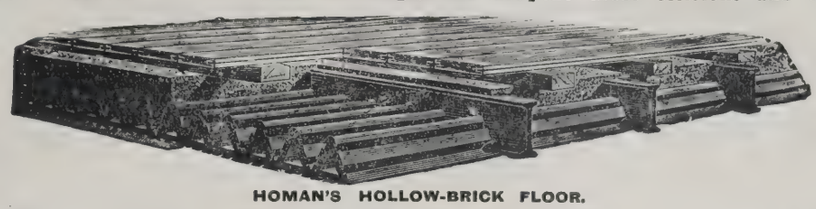
June 21. **FARNHAM.**—Repairs to be executed to Tilford East Bridge, for the R.D.C. Drawings and specifications can be seen at the office of the Surveyor, Arthur J. Stedman, South Street Chambers, Farnham, and quantities can be obtained from him upon deposit of 10s. 6d. Tenders to be sent to Ernest Crundwell, Clerk, South Street, Farnham.

June 21. **FARNHAM.**—To Builders and Contractors.—Erection of proposed cottages at their Ash and Hindhead Depots, for the R.D.C. Drawings and specifications can be seen at the office of the Surveyor, Arthur J. Stedman, South Street Chambers, Farnham, and quantities can be obtained from him upon deposit of 10s. 6d. each cottage. Tenders to be sent to Ernest Crundwell, Clerk, South Street, Farnham.

June 21. **CRAGHEAD (Durham).**—Erection and completion of a new Church at Craghead, S.O., Durham. Plans and specifications may be seen at the Colliery Offices, Craghead. Bills of quantities and other particulars may be had from the architect, Jas. W. Thompson, 63, Grey Street, Newcastle-on-Tyne, on receipt of a deposit of £1 1s. Tenders to be sent to the Rev. W. C. Chapman, Burnhope, Durham.

June 23. **BACUP.**—Erection of a new Post Office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster of Bacup. Bills of quantities and forms of tender may be obtained at Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, ets., Storey's Gate, London, S.W.

June 23. **LONDON, W.**—Providing and laying pitch-pine floor, plastering walls, and decorative works to Wards Nos. 8, 16, and 17 of their Infirmary, Marloes Road, Kensington, for the Guardians. Specification and form of tender can be obtained at the office of W. R. Stephens, Clerk to the Guardians, Guardians' Offices, Marloes Road, Kensington, W., or by sending a stamped directed foolscap envelope. The contractor shall on all work executed for the Guardians pay the rate of wages and observe the hours of labour agreed upon by the association of employers and the representatives of the workmen, but where no such agreement exists then the rate of wages and hours of labour must be those current in the district where the work is executed. The contractor must find two sureties in such sum as the Guardians may require, who shall enter into a bond in the form prescribed by the Local Government Board for the due performance of the contract. Tenders are to be made only on the forms provided, and are to be delivered at the above office.



June 27. **MERTHYR.**—Alterations and additions for the conversion of Cyfarthfa Castle into a secondary school, and the erection of science laboratories, art and lecture rooms, with latrines, playgrounds, and other works in connection therewith. Specification, quantities, and form of tender may be obtained from T. F. Harvey, M.Inst.C.E., Borough Engineer, on and after June 6, on deposit of £5 5s. Plans and drawings may be seen at Cyfarthfa Castle, and other information obtained, on and after June 6. Tenders must be sent to T. Aneuryn Rees, Town Clerk, Town Hall, Merthyr Tydfil.

(*Contracts continued on page xiv.*).

Homan's Fire-Resisting Floors

Have been executed in over 3,000 Buildings, and are the most efficient and economical.

Constructional Steelwork of all kinds, Cast Iron Columns, Concrete Staircases, Granitic Work, Asphalte, on Roofs, etc.

HOMAN'S HOLLOW-BRICK FLOOR.

Advantages of this Construction:—
No centering required,
Rapidity of Construction.
Is practically sound proof,
Qualities:—
Light in weight,
No discoloration of ceilings,
No backing of ceilings, the grooved bricks giving an excellent key for plaster,
Moderate in price.

HOMAN & RODGERS, ENGINEERS.

Offices:—17 GRACECHURCH STREET, E.C. Works:—NINE ELMS LANE, S.W., & WARE, HERTS.
Telegraphic Address—"Homan Rodger, London." Telephone No. 1026 Avenue.

June 23. **HALIFAX.**—Erecting eight dwelling-houses, etc., in Leamington Avenue. Plans and specifications may be inspected from June 5. Tenders must be delivered to Medley Hall and Son, Architects, 1, Harrison Road, Halifax.

June 28. **SOUTHAMPTON.**—Erection of a work-room block and sundry alterations at the County Lunatic Asylum, Knowle, Fareham, Hants. Specifications, conditions of contract, and plans may be inspected and copies of the bill of quantities and all other necessary information obtained on application at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, on and after, June 17. Drawings may also be seen at the Asylum. A deposit of £6 6s. will be required for copy of bill of quantities. Deposits must be made by cheque payable to the Hants County Council and crossed Bank of England, or the bills will not be sent. Tenders must be on forms supplied by the County Surveyor, and must be delivered to J. Railton, Clerk to the Committee of Visitors, Knowle.

June 30. **NEW MALDEN.**—Erection of church schools at Kingston Road. Plans and specification can be seen at the offices of Vincent Davison and Nicol, architects, Coombe Chambers, New Malden. Tenders to be sent to J. T. Thompson, Queensmead, Thetford Road, New Malden.

ENGINEERING.

June 13. **WEXFORD.**—Erection of ferro-concrete bridge (Hennebique principle) over River Slaney, for the C.C. Plans, etc., can be seen at Mouchel and Partners, 38, Victoria Street, Westminster, London, S.W.

June 13. **YORK.**—Supply and erection of steel-work in connection with the reconstruction of Holgate Road Bridge, York, for the Directors of the N.E.R. The work includes about 450 tons of steel-work, and about 350 cubic yards of concrete arching. The contract also includes the removal of the existing bridge, consisting of 200 tons of ironwork. Plans may be seen, and specification, detailed quantities, and form of tender obtained on personal application at the office of C. F. Bengough, the Company's Engineer at York. Tenders should be sent to the Secretary at York.

June 13. **HULL.**—Construction of a bridge over Stoneferry Road, in lieu of the existing level crossing, the diversion of the railway, and works in connection therewith for the Directors of the N.E.R. The work consists of about 90,000 cubic yards of earthwork, a new bridge, consisting of about 1,200 cubic yards of brick and concrete abutments on timber piles, and about 200 tons of steel girders and decking, the lowering of Stoneferry Road and connecting streets, the construction of retaining and boundary walls, fences, etc., a loading dock, and a passenger subway and timber platform at the new station. Plans may be seen and specification, detailed quantities, and form of tender obtained on personal application at the office of C. F. Bengough, the Company's Engineer, at York. Tenders to be sent to the Secretary, at York.

June 14. **WALLASEY.**—(See Buildings.)

June 14. **ABERCYNON.**—Construction of a two-span skew bridge across the River Cynon at Abercynon, for the U.D.C. The drawings may be seen at the office of, and copies of the specification, etc., obtained from, W. G. Thomas, Surveyor, Town Hall, Mountain Ash, upon deposit of £2 2s. Cheques or postal orders in payment of the deposit must be made payable to "The Treasurer, Mountain Ash Urban District Council."

June 14. **STAFFORD.**—Supply and erection of a triple-expansion vertical rotative direct-acting pumping engine and Lancashire boiler, together with all machinery, pipes, valves, and other works in connection therewith, for the Corporation. Conditions of contract, specification, form of tender, and bill of particulars may be obtained from W. Plant, borough and waterworks engineer, Borough Hall, Stafford, on deposit of £5. Tenders to be delivered at the office of Richd. Battle, town clerk, Borough Hall, Stafford, addressed to the Chairman of the Waterworks Committee.

June 15. **PONTEFRACT.**—Providing and laying about 1,681 yards of 3in. cast-iron pipes, 33 yards of 2in. hydrants, valves, etc., in the parish of Carleton, near Pontefract, for the R.D.C. Full particulars may be had from the engineer, R. Sidebottom, Tanshelf Drive, Pontefract, and tenders must be sent to J. Dickon Smith, clerk, Union Offices, Pontefract.

June 17. **HASLEMERE (Surrey).**—Laying about 4,250 yards of C.I. pipes, fixing valves, etc., for the Hambledon R.D.C. Copies of the specification and forms of tender can be obtained at the office of John H. Howard, The Cottage, Lower Street, Haslemere, on deposit of £2 2s. Tenders must be sent addressed to Ferdinand Smallpeice, Clerk, 138, High Street, Guildford.

June 18. **BRYNAMMAN (Wales).**—Sinking of a shaft, 18ft. diameter in the clear, at Gwaun-Cae-Gurwen Collieries, near Brynamman, South Wales, from the surface to the Brass or Peacock Seam, distance 380 yards or thereabouts, for the Gwaun-Cae-Curwen Colliery Co., Ltd. Full particulars may be obtained upon application to the Colleries Manager, Joseph Hargreaves, Gwaun-Cae-Gurwen Collieries, near Brynamman.

June 20. **BIGGLESWADE.**—Supply and laying of 12,133 yards of cast-iron water main as follows, viz.:—490 yards of 6in., 5,926 yards of 4in., and 5,717 yards of 3in., including the supply and fixing of waste water meter, sluice valves, wash-out valves hydrants, bends, branches, surface boxes, etc., required in connection therewith, for the R.D.C. Plans may be inspected and specifications obtained at the office of Henry Chaundler, clerk, Biggleswade, Beds., on deposit of £2 2s. Tenders must be sent to the Clerk.

June 22. **HOLMES CHAPEL (Cheshire).**—Carting, laying, and jointing of about 7,790 yards 2in. to 4in. cast-iron spigot and socket pipes, building meter chamber, etc., for the Congleton R.D.C. Plan and specification, bill of quantities and form of tender may be obtained from the Engineer, W. W. Wyatt, Whitchurch, Salop, on deposit of £1 1s. Tenders to be delivered at the office of H. Ferrand, Clerk to the Congleton Rural District Council, Sandbach, Cheshire.

June 23. **IPSWICH.**—Sinking one 18in. diameter or, in the alternative, one 24in. diameter borehole, into the upper chalk, including the provision of temporary pumping plant, and the carrying out the pumping to test the yield of the bore-hole up to 500,000 gallons, or, in the alternative, 1,000,000 gallons per 24 hours, for the Corporation Waterworks Committee. Plans may be seen and the site inspected by appointment with C. W. S. Oldham, engineer, Waterworks Offices, Ipswich, from whom copies of specification, form of tender, and schedule of prices may be obtained on deposit of £1 1s. Tenders must be delivered at the Town Hall, Ipswich, addressed to the Waterworks Committee.

June 23. **RHONDDA (Wales).**—Works for the U.D.C.:—Construction of a supply main and intakes from the head of the Rhondda River at Gareg-Lwyd, on the rough mountain lands at the head of the Rhondda Valley, Glamorganshire, together with an armoured concrete aqueduct overhead of 24 yards long in two equal spans, a valve-house, tunnel bywash, tunnel outlet face, retaining walls, etc., in concrete or rubble masonry, a balancing tank, and other works supplementary to the existing supply of water. The pipes and ironwork are for the most part lying near the site, and further pipes, valves, and ironwork required must be supplied by the contractor. There is a tramway connecting the tunnel works with the Taff Vale Railway at Fernhill, which may be extended and used for the work by arrangement. The works are about two miles distant from Blaenrhondda Station, on the Rhondda and Swansea Bay Railway. Drawings may be seen, and a copy of specification and form of tender, with a schedule of quantities may be obtained at the office of Joseph Vevers, engineer, Waterworks Offices, Treherbert, Rhondda, upon production of a receipt signed by the Accountant of the Council for the required deposit of £3 3s. The contractor will be required to pay the current trade union rate of wage prevailing in the district. Tenders, addressed to the Chairman of the Waterworks Extension Committee, at the Council Offices, Pentre, Rhondda, must be delivered at the office of W. P. Nicholas, clerk, Council Offices, Pentre, Rhondda, Glam.

July 4. **DUBLIN.**—Construction and erection of twin Scherzer rolling lift bridges across the entrance to the Royal Canal, North Wall Quay, Dublin, for the Port and Docks Board. Specification and drawings can be seen at the office of the Engineer of the Board, John P. Griffith, M.Inst.C.E., East Wall, Dublin, from whom any further information required can be obtained. If on examination of the specification and drawings, intending contractors should desire to obtain copies, these, together with the special printed form of tender, can be obtained on deposit of £5. Contractors are required to state whether they have constructed Scherzer rolling lift bridges, or other opening bridges, and to give full particulars of such works and the names of engineers under whom these were carried out, and to whom reference may be made. Tenders must be on the special form, and addressed to the Secretary, Port and Docks Office, Westmoreland Street, Dublin.

SANITARY ENGINEERING.

June 14. **DUNDALK.**—Providing and laying of about 1,100 yards of sewer, together with the building of manholes and other works, for the U.D.C., shown or described on the plans, sections, and specification prepared by Maurice Sellars, town surveyor, which can be seen at his office, Town Hall, Dundalk, and from whom forms of tenders, etc., can be obtained, on deposit of £2. Tenders, giving the names and addresses of two solvent sureties willing to join in a bond of £500, to be lodged at the office of Mathew Comerford, town clerk, Town Hall, Dundalk. The acceptance of any tender sent in will be contingent on the loan being granted by the Board of Works, and the accepted contractor must be prepared to await the granting of same, and to proceed with the work when called upon without any extra to the amount of the accepted tender in consequence of such delay.

June 14. **WEYMOUTH.**—Constructing and maintaining surface-water and other sewers for the diversion of surface water, Park District, Melcombe Regis, consisting of 16in. and 21in. cast-iron sewers, 21in. and 24in. steel-ribbed granite concrete sewer tubes, manufactured by John Ellis and Sons, Limited, Leicester; 6in., 9in., 12in. and 15in. glazed stoneware socket drain pipes, with outlet and flap chamber, manholes, overflows, stoneware gullies, and other works incidental thereto, for the B.C. Plans and specifications may be seen, and form of tender obtained at the office of the Engineer, W. Barlow Morgan, 4, York Buildings, Weymouth. The contractor must deposit with his tender Bank of England notes to the value of £10, also state on his tender the name and address of a properly-registered Guarantee Association willing to be jointly and severally bound with him in the sum of £1,000 for the due performance of his contract. Tenders, addressed H. A. Huxtable, Clerk to the Council, to be delivered at the Municipal Offices, Clarence Buildings, Weymouth.

June 15. **WORKINGTON.**—Provision and laying of about 2,900 lineal yards of 18in. diameter stoneware pipe sewer, with sea outfall, consisting of about 714 lineal yards of 18in. diameter cast-iron pipes supported on timber piling, together with manholes, lampholes, storm water overflow chambers, and other works in connection therewith, for the Corporation. Drawings may be seen at the office of H. Bowman Williams, Borough Engineer and Surveyor, Town Hall, Workington, from whom copy of the specification, bill of quantities, and form of tender, can be obtained on deposit of £3 3s. Tenders to be delivered to the Town Hall, addressed to John Warwick, Town Clerk, Workington.

June 20. **CHELMSFORD.**—Extending the sewer in Trinity Road, for the T.C. Forms of tender, and full particulars may be obtained, and the plans and specification may be inspected, at the office of the Borough Surveyor, Cuthbert Brown, 16, London Road. Tenders must be delivered at the office of W. Smith, Town Clerk, Municipal Offices, Chelmsford.

June 20. **YSTRADGYNLAIS.**—Schemes and estimated cost for sewering the Parish of Ystradgynlais Lower, for the R.D.C., who will pay a sum of £20 for the scheme which they consider most suitable, and the decision of the Council must be accepted as final. Competitors to state their terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars of the area to be drained and any other information may be obtained from T. Watkins, Surveyor to the Council, Ystradgynlais. Schemes to be sent in to D. L. Moses Evans, Clerk to the Council, Commercial Street, Ystalyfera.

June 21. **RICHMOND (Yorks.).**—(See "Buildings.")

June 21. **SOUTHWELL.**—Alteration and additions to sewage disposal works, for the R.D.C. The contract will comprise alterations to present tanks, new storm-water tanks, pumping tank, engine house, percolating filters, cottage, effluent outfall, and other appurtenant works. Plans may be seen at the office of the engineers (Sands and Walker, Milton Chambers, Nottingham), and copies of conditions, specification and quantities can be obtained on deposit of £3 3s. The successful contractor will be required to enter into a bond in the sum of £500, through an approved Guarantee Society, or with approved sureties for the due performance of his contract. Tenders to be sent to John Ellis, Clerk to the Council, Southwell, Notts.

IRON AND STEEL.

June 13. **YORK.**—(See "Engineering.")

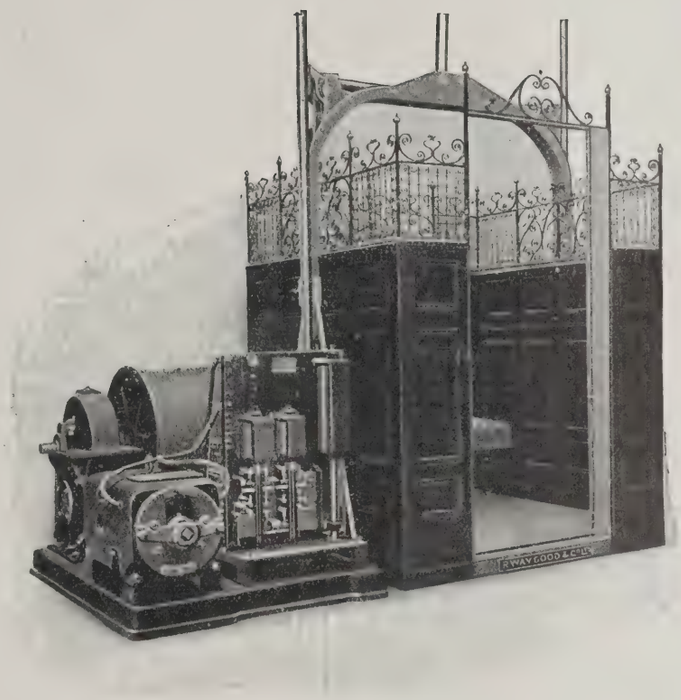
July 4. **DUBLIN.**—(See "Engineering.")

PAINTING.

June 13. **BARROW-IN-FURNESS.**—Cleaning, painting, and decorating at the technical schools, Abbey Road, for the Corporation. Form of tender and bill of quantities may now be obtained upon application at the Borough Engineer's Office, Town Hall. Tenders to be delivered, in the envelope provided for the purpose, at the Town Clerk's Office.

June 13. **ROCHDALE.**—Painting and other work required at the cemetery, for the Cemetery Committee. Further particulars may be had on application to the Borough Surveyor. Tenders to be sent to the office of W. H. Hickson, town clerk, Town Hall, Rochdale.

June 13. **DEWSBURY AND HECKMONDWIKE.**—Painting of two steel bridges over the river Calder and the Calder canal. Specification and forms of tender to be obtained from the general conditions seen on application at the Engineer's Office, Town Hall, Dewsbury. Tenders to be sent to H. Ellis, Clerk to the Board, Town Hall, Dewsbury.



June 14. **CHORLEY.**—Painting and decorating of the secondary school, Union Street, for the Education Committee according to specification and conditions, which may be seen at the Borough Surveyor's Office, Town Hall. Tenders to be sent to Jno. Mills, Town Clerk, Town Hall, Chorley.

June 14. **WEST SUFFOLK.**—Painting, etc., at the following Council schools:—Brockley, Fornham All Saints, Glemsford, Mildenhall Beck Row, Mildenhall Fen, Mildenhall infants', Mildenhall West Row, Newmarket Exning, Semer, Whepstead, for the Education Committee. Specifications and forms of tender may be obtained on application to the building inspector, A. Ainsworth Hunt, Shire Hall, Bury St. Edmund's. Tenders, addressed to Fred. R. Hughes, Secretary to the Committee, are to be delivered at the County Education Offices, endorsed with the name of the school. The work is to be carried out during the summer holidays.

(Contracts continued on page xvi.)

WAYGOOD

BRITISH BUILT.

THE RESULT OF FIFTY YEARS' PRACTICAL EXPERIENCE.

LIFTS.

R. WAYGOOD & CO., Ltd.
ESTABLISHED 1833.

FALMOUTH ROAD, LONDON, S.E.
TELEPHONE: 4,000 HOP (5 Lines).

June 14. **LONDON, S.E.**—Painting, etc., at the Lambeth Children's Infirmary, and "Ivy Bank," Crown Hill, Upper Norwood, S.E., for the Lambeth Guardians. Tenders, which will be received only on the printed form, must be sent to James L. Goldspink, Clerk to the Guardians, Guardians' Offices and Board Room, Brook Street, Kennington Road, S.E., or placed in a box provided for their reception in the office of the Clerk to the Guardians by the contractors or their representatives, should they so desire, and will be opened at the Board Room at noon on the following day, when all persons tendering, or their authorised agents, must be in attendance. Forms of tender may be obtained at the above offices. Specification will be supplied on personal application on deposit of £2.

June 15. **HALIFAX.**—Painting and colouring of sundry schools, and for maple flooring at Portland Road Council school, for the Education Committee. Plans and specification may be seen, and forms of tender obtained, on application to James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax, upon deposit of £5 for painting, and £1 for maple flooring. Tenders must be sent to W. H. Ostler, Secretary. The person whose tender is accepted will be required to observe the fair contracts clauses adopted by the Corporation.

June 16. **LONDON, E.**—Painting at the Scattered Homes, or elsewhere, for the Mile End Guardians. Forms of tender, with specifications, may be obtained upon application to Benjamin Catmur, Clerk to the Guardians, Guardians' Offices, Bancroft Road, Mile End, E., by letter, enclosing stamped directed foolscap envelope. Persons tendering will be required to state in their tender that they pay such rates of wages and observe such hours of labour as are generally accepted as fair in the trade to which the work refers. Tenders to be sent to the Clerk to the Guardians.

June 18. **GUILDFORD.**—Decorative work and repairs to the elementary schools, under their administration, for the T.C. A plan and specification may be seen, and a form of tender obtained on application to the Borough Surveyor, C. G. Mason, Assoc.M.Inst.C.E., Tuns Gate. Tenders should be sent to F. S. Tosswill, Secretary to the Education Committee, Onslow Bridge Chambers, Guildford.

June 20. **GOODMAYES (Essex).**—Painting the exterior of the Asylum, Goodmayes, for the West Ham B.C. Specification, form of tender, and further particulars may be obtained at the office of John G. Morley, Borough Engineer, Town Hall, West Ham, E., upon deposit of £1. Tenders to be delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post. The contractor will be required to enter into a bond, with one surety, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay the whole of his workmen such rate of wages, and observe such hours of labour, as are recognised by the Workmen's Trade Unions, and in force at the time of signing the contract, and shall not assign, nor under-let, or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

June 22. **LONDON, S.W.**—Cleaning and painting works and repairs at the South Western Fever Hospital, Landor Road, Stockwell, S.W., for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., Engineer-in-Chief. Conditions of contract, bills of quantities, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board.

June 23. **LONDON, W.**—(See Buildings.)

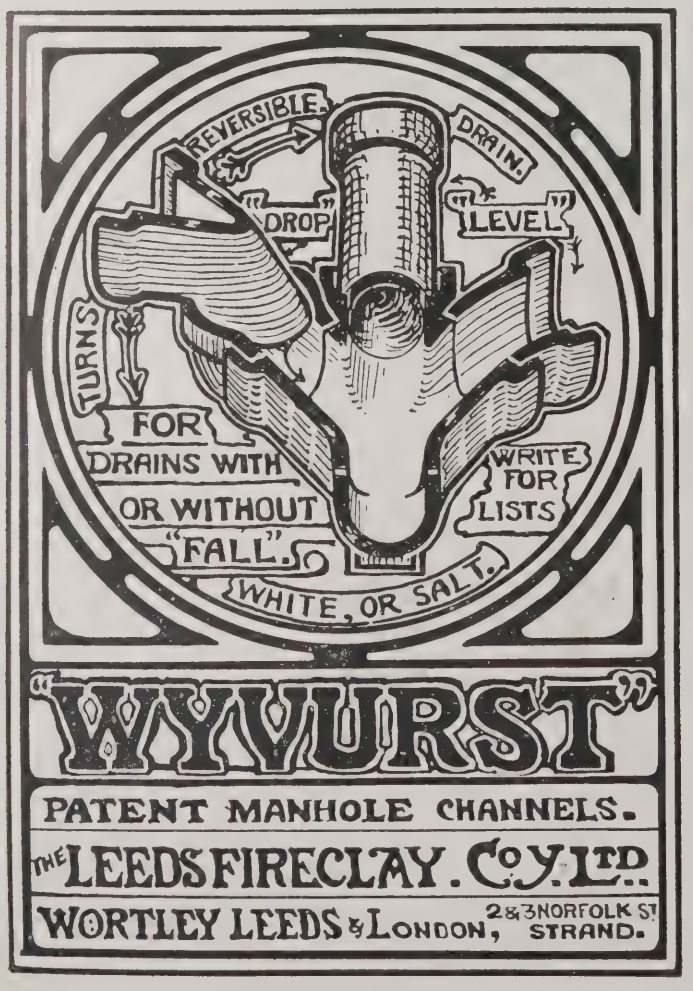
June 23. **LONDON, S.E.**—External painting and internal decorating (part of) the Workhouse at Ladywell Road, Lewisham, S.E., for the Bermondsey Guardians, according to the specification of A. H. Newman, F.R.I.B.A., etc., and quantities by W. T. Farthing and Son, of 46, Strand, W.C. (a) Forms of tender (which can only be received), (c) bills of quantities, and (d) specification, containing full particulars and conditions of contract, can be obtained at the office of E. Pitts Fenton, Clerk, No. 283, Tooley Street, S.E., between the hours of 10 a.m. and 12 noon daily, by depositing a £10 Bank of England note (cheques or cash will not be received). The amount deposited will be returned to persons sending in. Tenders, and other documents above referred to, must be delivered to the Clerk.

June 24. **EAST RIDING (Yorks).**—Painting and cleaning of certain schools in the Riding, such work to be carried out during the time the schools are closed for the summer holidays. A list of the schools intended to be painted or cleaned may be obtained on application to John Bickersteth, Clerk to the East Riding Education Authority, County Hall, Beverley. Specifications of the work may be seen and forms of tender obtained at each of the schools mentioned on the list, after June 9, and all tenders must be delivered at the same address.

ROADS AND CARTAGE.

June 13. **SOUTHAMPTON.**—Construction and maintenance of tar macadamized roads, for the Corporation. Conditions of contract and drawings may be inspected, and specification, schedule of prices and form of tender obtained at the Borough Engineer's Office upon production of the Borough Treasurer's receipt for a deposit of £1 1s. Tenders must be delivered at the Town Clerk's Office, Municipal Offices, Sauthampton.

June 13. **Church (Lancs.)**—Excavating, concreting, asphalting with Limmer rock asphalt, kerbing and flagging of Commercial Street, Maden Street, and Bank Street, for the U.D.C. Plans and sections may be seen and forms of tender and specifications obtained on application to W. E. Wood, surveyor, District Council Offices, Church. Tenders must be sent to John R. Reddish, Clerk.



June 14. **BILLINGE (Lancs).**—Supply of about 1,000 tons slag during ensuing twelve months, for the U.D.C. Also for carting road material from the several stations during ensuing twelve months. Particulars obtainable on application from the Surveyor, at the Council Offices, Billinge.

June 14. **CASTLEFORD.**—Works of street improvements in Glebe Street, Hugh Street, and Pretoria Street, for the U.D.C., in accordance with plans and specifications prepared by W. Green, surveyor to the Council, and which may be seen on application by arrangement. Tenders to be sent to H. H. Broadbent, clerk, Council Offices, Sagar Street, Castleford.

June 14. **RISHTON (Lancs.).**—Labour, and part materials, in sewering, paving, etc., parts of the following streets:—Back Harwood Road East, back Brook Street North, back Cliff Street West, back Commercial Street East, back Spring Street West, back Clifton Street North, and back Danvers Street South, for the U.D.C. Plans may be seen and specifications and forms of tender obtained on application to the Surveyor, Council Offices, Brook Street, Rishton. Tenders must be sent to J. J. Adams, clerk.

June 14. **NORTHFLEET.**—The following items from July 1, 1910, to June 30, 1911, for the U.D.C.:—700 tons (more or less) Guernsey granite, 1½in.; 500 tons (more or less) Guernsey granite, 2in.; Thames ballast; 800 tons (more or less) broken Kentish rag stone; crushed Kentish rag stone, 1½in. gauge; 295 tons granite setts; castings; 18,000 gallons (more or less) coal tar; 315 yards granite kerb, and 11 3ft. radius corners and 26 4ft. radius corners; steam rolling and scarifying. Full particulars and form of contract may be seen at the Offices of the District Council, The Hill, Northfleet, to which address tenders must be sent. N.B.—No forms of tender or contract will be supplied. So far as practicable local labour shall be employed and trade union rate of wages paid.

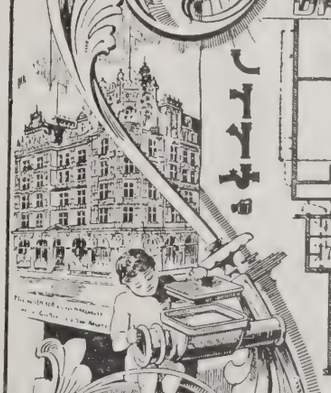
Crown8vo. cloth, Price 7/6 net (postage 4d.)

REINFORCED CONCRETE

THEORY AND PRACTICE.

By FREDERICK RINGS, M.S.A.
Architect and Consulting Engineer.

The Author has had wide experience in designing and supervising Reinforced Concrete work, and his book, which embodies the most approved modern practice,



CONTAINS ALL THE FORMULÆ AND DATA NECESSARY IN DESIGNING AND CHECKING REINFORCED CONCRETE STRUCTURES.

The recommendations of the R.I.B.A. are adopted in the work; and the symbols used are those recently arranged by the Concrete Institute.

The Celluloid Calculator forms a valuable complement to the book, enabling the amount of metal, together with the thickness of slab required for all usual spans, to be mechanically obtained without any calculation whatever.

CATALOGUES AND PRICES ON APPLICATION

June 14. **LONDON. E.**—1, private street works, Falcon Street, and Third Avenue (part of); 2, wood paving Upper Road and Helena Road; 3, attendants' quarters, Convalescent Home, The Grange, Harold Wood, for the West Ham B.C. Plans may be seen, and specifications, forms of tender, and further particulars obtained, at the office of the Borough Engineer, Town Hall, West Ham, E., upon deposit of £1 in respect of each form of tender. Note.—No tender will be considered unless the same is delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post, not later than 4 o'clock on June 14. The contractor will be required to enter into a bond with two sureties for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trade unions and in force at the time of signing the contract, and shall not assign, nor under-let or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

June 15. **LANCHESTER.**—Draining, levelling, orming, kerbing, paving, and flagging Pine Street Back Bridge Street, Wood View, etc., etc., Langley Park, for the R.D.C. Drawings and specifications may be seen and bills of quantities obtained at the Surveyor's Office, The Grove, Lanchester. Tenders to be sent to W. H. Ritson, Clerk to the R.D. Council, Lanchester.

June 15. **ENFIELD (Middlesex).**—Supply of 2,300 tons (more or less) of hand-broken Clee Hill Dhu or best blue Guernsey granite, and 1,400 tons (more or less) of broken Leicestershire or other approved granite, to be delivered free in such quantities and at such times prior to March 31, 1911, as may be ordered by the Surveyor, at the several railway stations in the district, for the U.D.C. Tenders, on forms to be obtained only of Richard Collins, surveyor, together with samples as to size and quality of the granite proposed to be supplied (no tender will be considered unless accompanied by samples), to be sent to T. W. Scott, Clerk, Public Offices, Enfield.

June 16. **BEDDINGTON (Croydon).**—Making-up Milton Road, Beddington, for the Croydon R.D.C. Plans and specifications may be seen and form of tender obtained on application to R. M. Chart, F.S.I., surveyor to the Council, Katherine Street, Croydon. Tenders to be delivered to E. J. Gowen, clerk, Council Offices, Croydon.

June 17. **MANCHESTER.**—Supply of special (permanent way) track work, for the Tramways Committee of the Corporation. Specifications and forms of tender may be obtained on application to J. M. M'Elroy, general manager, Corporation Tramways, 55, Piccadilly, Manchester, on deposit of £2 2s. Tenders to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester.

June 17. **BEXHILL.**—Making-up Marina Court Avenue (part), 50ft. in length, Pier Road West, 225ft. in length, and Pier Road East, 215ft. in length, for the Corporation. Plans may be seen, and bills of quantities, specification and form of tender obtained upon application to the borough surveyor, G. Ball, A.M.I.C.E., Town Hall, upon deposit of £1 1s. Tenders to be sent to the office of T. E. Rodgers, town clerk, Town Hall, Bexhill.

June 17. **TOTTENHAM.**—Repair of the tar and asphalte paving throughout their district, for the U.D.C. Specifications and forms of tender can be obtained on application to W. H. Prescott, A.M.I.C.E., Engineer to the Council, at the Council Buildings, The Green, Tottenham. Persons tendering will be required to deposit with the Treasurer, when handing in their tenders, in a Bank of England note or cash, the sum of £5 in respect of each tender, which will be forfeited by the person whose tender is accepted if the contract be not executed within seven days from the date he is informed it is ready for signature, otherwise it will be repaid. This deposit will be repaid to the parties tendering who are unsuccessful. The contractor will be required to pay all workmen on the Council's work the recognised trade union rate of wages. A schedule of such wages will be inserted in the contract, and a copy of the schedule must be exhibited on the pay office at the works. Tenders to be delivered to Edward Crowne, Clerk of the Council, Tottenham.

June 23. **DORCHESTER.**—Supply of tar-macadam and broken granite, for the T.C. Further particulars and form of tender may be obtained from Percival T. Harrison, A.M.I.C.E., Borough Engineer, Dorchester. Tenders must be delivered at the office of A. G. Symonds, Town Clerk, Town Clerk's Office, Dorchester.

June 25. **LEWES.**—Supply of 600 tons of 2in. broken granite, 150 tons of coarse granite screenings, and 500 tons of broken surface picked flints, for the T.C. Forms of tender, etc., may be had, and further information obtained, at the Borough Surveyor's Office, Town Hall, Lewes.

MISCELLANEOUS.

June 13. **BIRKENHEAD.**—Plastering three wards at the Union Infirmary, Church Road, Tranmere, for the Guardians of Birkenhead Union. The premises may be inspected any day between 9 a.m. and 12 noon. Forms of tender with specification, may be obtained at the office of John Carter, clerk, Poor Law Offices, Birkenhead, and must be delivered to him. Rate of wages and hours of labour clause to be observed.

June 14. **SOUTHAMPTON.**—Supply of deals and matched boarding, for the Director General, Ordnance Survey. Application for forms of tender and specification should be made to the Officer in Charge of Stores, Ordnance Survey Office, Southampton.

LATE CONTRACTS.

BUILDING.

June 9-21. **WARLEY (Essex).**—Alterations and additions to Christ Church School. Send name and address to Frank Whitmore, architect, Chelmsford, not later than June 9, enclosing cheque for £2 2s. as deposit, when bills of quantities will be sent as soon as possible. Plans and specification, and form of contract can be seen at the School, Warley, and at the Office of the architect. Tenders to be sent to A. H. Tredennick, The Vicarage, Warley, Brentwood.

June 16. **MARDY.**—Erection of new conservative working men's club at Mardy, for the Trustees and Committee. Plans may be seen and bill of quantities obtained at the Conservative Working Men's Club, Mardy, upon deposit of £1 1s. Tenders to be sent to T. R. Leyshon, secretary, Conservative W.M. Club, Mardy.

June 17. **RHONDDA.**—(1) Building of river wall at Hafod School; (2) building of boundary walls and alterations to windows at Cwmclydach School, for the U.D.C. Plans and specifications may be seen and bills of quantities and tender forms obtained at the office of the architect, Jacob Rees, Hillside Cottage, Pentre, upon the production of a receipt from the accountant of the Council for the required deposit of £1 1s. in respect of each of the Works tendered for. Separate tenders must be submitted for each of the works. Tenders and priced quantities, enclosed in the printed envelopes provided for the purpose, addressed to the "Chairman of the Building Committee," must be delivered at the Council Offices, Pentre.

"SPECIFICATION."

No. 12. 1909-10.

With which is incorporated The "MUNICIPAL ENGINEERS' SPECIFICATION."

An Annual Encyclopædia of Construction for ARCHITECTS, SURVEYORS & ENGINEERS when Specifying.

The following Letters (specimens of many received) speak as to the value of "SPECIFICATION."

"SPECIFICATION" is splendid, and to any architect or anyone engaged in the building trades invaluable. I constantly use it as a reference, and am always glad to have it by me.

(Signed) C. E. MALLOWS, F.R.I.B.A.

I consider "SPECIFICATION" to be a compilation of most valuable information, and it is not only an excellent work of reference for the architect, but also of considerable use to the engineer and surveyor. It should be upon the office table of every architect, and I shall have pleasure in recommending it whenever opportunity occurs.

(Signed) A. C. NORMAN, F.R.I.B.A., M.R.San.I.

I have found "SPECIFICATION" from its first edition very useful, and through its various editions continually improving, so much so, that it has become an essential companion for reference in office work. Its information is reliable, well arranged, and up-to-date, and it is a book that should be in the possession of every professional man.

(Signed) JAMES N. MONRO, F.R.I.B.A., I.A.

The previous issues of "SPECIFICATION" have proved of considerable value in my office, and I regard it as an excellent reference book for all classes of building work. The comprehensive character and its detail give it a special value to architects. I think the profession owes you some gratitude for bringing out such an excellent and useful volume.

(Signed) HENRY HARTLEY, F.R.I.B.A., F.S.I.

TECHNICAL JOURNALS Ltd., Caxton House, WESTMINSTER, S.W.

June 13-22. **LEEDS.**—Beckett's Park, Headingley.—Demolition of the old buildings, levelling, and excavating the site, and the formation of main roads and main drains, at the City of Leeds Training College, Beckett's Park, Headingley, in accordance with plans prepared by G. W. Atkinson, architect, of 1, Mark Lane, Leeds, and with special contract conditions of the Leeds Corporation. Send in names to James Graham, Secretary for Education, Education Department, Calverley Street, Leeds, on or before June 13, together with a deposit of £2 2s. Tenders must be forwarded to the Secretary.

June 14. **CAERPHILLY.**—Erection of two public urinals, each with four stalls, with brick work, sanitary fittings, drainage, etc., at Abertridwr, for the U.D.C. To Painters.—Tenders are also invited for painting various structures and appliances throughout the Council's District. Plans, specifications, and forms of tender, together with further information, may be obtained from Alfred O. Harpur, Engineer and Surveyor, Council Offices, Caerphilly, upon deposit of £1 1s. Tenders must be addressed to the chairman of the Council, and delivered at the Council Offices, Caerphilly.

June 16. **BARNSTAPLE.**—Re-building a portion of No. 94, Boutport Street, in the occupation of S. Trott, for the Barnstaple Municipal Charities. Plans and quantities may be obtained from J. C. Southcombe, architect, Barnstaple, and tenders to be sent to G. Mills, Secretary, Barnstaple.

June 16. **ROMSEY.**—Building of a concrete wall surmounted by an iron fence, and for other work at The Abbey Water, Romsey. Full particulars can be obtained and drawings and specification can be seen at the office of the Borough Surveyor, Market Place, Romsey. Tenders must be delivered at the office of B. W. Attlee, Town Clerk, 2, Porters Bridge Street, Romsey.

June 16. **LONDON, N.**—Erection of money order department building, Holloway, second contract (consisting of the brick and stone work, etc., of the front elevation, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to John Rutherford, H.M. Office of Works, 22, Carlisle Place, S.W. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered addressed to the secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

June 18. **GREENSIDE, near Ryton-on-Tyne.**—Several works required to be done in the erection of new club premises. Drawings and specifications may be seen at the Workmen's Club, Greenside, or at the office of Thomas E. Taylor, Architect and Surveyor, Lanchester (also Anfield Plain). Tenders to be sent to W. Harris, Secretary, Workmen's Club, Greenside, Ryton-on-Tyne.

June 23. **DALTON PARVA (Rotherham).**—New buildings and alterations and additions to existing buildings in connection with adaptation of farm buildings at Dalton Parva (near Rotherham), builder, joiner, slater, plumber, plasterer, painter (whole or separate tenders), for the West Riding Small Holdings Committee. Plans may be seen, and specifications with quantities obtained on application to the West Riding Architect, County Hall, Wakefield. A deposit of £1 must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

June 24. **WORCESTER.**—Re-building in brickwork of Kenswick Bridge, situate on the main road between Worcester and Martley, 3 miles from Henwick Station, for the Highways and Bridges Committee of the County Council. Drawings and specification may be obtained on deposit of £1 1s., of J. H. Garrett, Surveyor of County Bridges, Shirehall, Worcester (to whom tenders must be sent).

July 2. **TREVISCOE (near St. Stephens, Cornwall).**—Erection and completion of proposed Wesleyan Methodist Church, Grampound Road, according to plans and specifications, which may be seen by appointment at the residence of Capt L. H. Dyer, Treviscoe, to whom tenders are to be sent. Plans and specifications may be seen and particulars relating to the work may be obtained at the office of Sampson Hill, architect, Green Lane, Redruth.

ENGINEERING.

June 15. **LIVERPOOL.**—Provision and erection of stanchions and girders to carry on overhead travelling crane in North Docks Cotton Shed, Liverpool, for the Directors of the Lancashire and Yorkshire Railway. Plans can be seen and copies of the tender, quantities and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders to be sent to R. C. Irwin, Secretary, Hunt's Bank, Manchester.

June 16. **ROMSEY.**—(See "Buildings.")

July 16. **BURNLEY.**—Construction of an impounding reservoir, with catchwaters, aqueducts, meter-houses, etc., at Hurstwood, near Burnley, for the Corporation. Plans may be seen, and specification, schedule of prices, form of tender, and all other particulars obtained, on application to James Diggle and Son, Engineers, 14, Victoria Street, Westminster, S.W., and Hind Hill Street, Heywood, Lancashire, on and after June 13, on deposit of £5. Tenders to be sent to Peregrine Thomas, Town Clerk, Town Hall, Burnley.

SANITARY ENGINEERING.

June 14. **CAERPHILLY.**—See "Buildings.")

July 17. **RHONDDA.**—Painting and colouring the undermentioned schools during the mid-summer vacation (July 29 to August 26), viz.:—Gelli, boys', girls', and infants'; Bodringallt, boys'; Bleanclydach, boys', girls', and infants'; Penygraig, girls'; Dinas, boys'; Trealaw, boys'; and Tylorstown, boys', girls', and infants, for the U.D.C. Specifications and bills of quantities may be seen and forms of tender obtained at the office of the architect, Jacob Rees, Hillside Cottage, Pentre. Separate tenders must be submitted for each school. Tenders addressed to the chairman of the Building Committee, must be delivered at the Council Offices, Pentre.

PAINTING.

June 13. **MANCHESTER.**—Tenders for painting at the Monmouth Street (Rusholme), Pollard Street (Ancoats), Little Lever Street (Ancoats), and Knowsley Street (Cheetham) Paving Yards, for the Corporation. Specifications may be obtained at the office of the City Architect, Town Hall, upon deposit of 10s. 6d. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope, to be delivered at the City Architect's Office.

June 13. **MANCHESTER.**—Painting at the East Gorton, Chorlton, and Ardwick and Chester Road Branch Libraries, for the Libraries Committee of the Corporation. Specifications may be obtained at the office of the City Architect, Town Hall, upon deposit of 10s. 6d. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope, to be delivered at the City Architect's Office.

June 14. **CAERPHILLY.**—See "Buildings.")

June 14. **GOOLE.**—Internal and external painting, etc., of the Goole Boothferry Road Council School and the Old Goole Council School, for the Education Committee. Specifications may be obtained from E. L. Harrap, W.R. Education Offices, Goole, to whom separate tenders should be forwarded.

June 14. **CARLISLE.**—Painting and other works required to be done at five of the elementary schools, such works to be commenced on June 25, and completed not later than July 16. Specification and full particulars may now be obtained from Henry C. Marks, M.Inst.C.E., Surveyor, 36, Fisher Street, Carlisle, on deposit of 10s. 6d., and to whom tenders must be sent.

[We regret that owing to pressure on our space, we are obliged to hold over our list of tenders till next week.]

MODERN GLASSHOUSES

replete with the latest improvements in construction, ventilation, heating, &c.

Architects' Designs carefully carried out.

ESTIMATES FREE.

American Lights on Competitions.

THE latest "Annuary," as it is called, of the American Institute of Architects, contains a new Code of regulations for the conduct of architectural competitions, which came into operation on the 30th March last. It deals with the subject in a very full and very incisive manner, and a comparison of the document with that issued by our own Institute of Architects ought to be of some interest to those concerned in competitions in this country, more especially as a revised code of regulations for competitions is at present under the consideration of the Institute.

Approval of Conditions.

The first thing that strikes one in the American Code is the decided attitude which is taken in regard to the approval of competition conditions by the American Institute, and the conduct of members of the Institute in case of their disapproval. It is expected that the conditions of every competition should receive the approval of the Institute, or of an authorised sub-committee, and "it is the duty of every member to advise the said sub-committee of any contemplated competition which may come to his attention." If the conditions are such as the Institute or its sub-committee do not approve, there is no question of "advising" or "requesting" members not to compete; it is roundly declared to be "unprofessional" for any member of the American Institute of Architects to take part in a competition, whether as competitor or juror, unless the programme shall first have been approved by the Institute, or an authorised Sub-Committee. This gives the American Institute a positive standing as official approver of competition schemes, instead of the merely negative standpoint taken by the British Institute, of merely disapproving of conditions that are brought to their notice and advising members not to compete. The American Institute takes the strong ground of ruling members guilty of unprofessional conduct who enter into a competition which has not been formally approved at headquarters. We recommend this precedent to the notice of the British Institute Council, and also to those of its members who persist in competing where the conditions have been disapproved by the Council.

Interests of the Owner.

The next point that specially strikes one is the plain and uncompromising statement that "competitions are instituted with the sole purpose of advancing the interests of the owner." That is plain speaking and plain truth. In the proposed revised scheme of competition conditions suggested by the Institute Committee, and already partially discussed, there was a sentence assuming that competitions were no doubt partially instituted for the procuring of the best design for the purpose in view, "together with the promotion of the best interests of the art of architecture," an assumption which was sharply and rightly criticised at the discussion on January 3rd, and which seems to us to amount to the kind of thing that is vulgarly called "humbug." As a rule it may be safely averred that the promoters of a competition (formally labelled "the owner" in the American Code) care nothing whatever about "the best interests of the art of architecture"; they are thinking about their own interests, or at best about the advantage to their own town and neighbourhood of securing an attractive building; and as far as the competitors are concerned their object is to get the most they can out of the profession at the least expenditure of money. The American Institute recognises the fact and states it in plain language; and it is right in doing so.

Are Competitions Desirable?

Having stated this, however, the American Code proceeds to express the opinion, in the very next clause, that "competitions are in the main of no advantage to the owner"; so that the promoters (as we call them here) are taxed with being in the first place self-interested, and in the second of not understanding their own interests. The American Institute are, in fact, obviously entirely opposed to the whole principle of competition. At the conclusion of the clause last quoted, they add: "It [the Institute] therefore recommends that, except in cases in which competition is unavoidable, an architect be employed upon the sole basis of his fitness for the work." The cases referred to are, we presume, such as those in which funds have been left for a building on the condition of its being open to competition, as has occasionally happened. But the American Institute Code practically sets out with the sentiment: "Do not have any competitions if you can help it." All the rest of the provisions are to minimise the evils of competition if it is unavoidable.

This is rather too strongly put. It would be easy to name instances in which the promoters of a competition have had the advantage of getting a better building for a special purpose than they would probably have obtained without a competition. When an architect is selected without a competition, he is always selected because he has carried out other buildings of the same class in a satisfactory manner. But it is always possible that there is another architect somewhere who could do it still better, but who has not, through circumstances, had a previous chance at that class of building. Instances of this will probably occur to our readers without our naming any particular ones; and moreover it is quite possible that the architect selected for his known ability in a particular class of building obtained his first commission of the kind, which founded his reputation, as the result of a competition. Therefore we consider that the attitude of the American Institute, which obviously regards competitions as an avoidable or an occasionally unavoidable evil, is somewhat too uncompromising. Although we quite agree that competitions are promoted for purely self-interested motives, there is something to be said for them on behalf both of architects and architecture. Some architectural reputations of the present day would never have been made but for the chance afforded by competition, and not only the architect but the public would have been the losers.

Limited Competitions.

The American Institute recommends limited competitions of men selected for their reputation, and is of opinion that, unless cogent reasons prevent it, all competitions should be of that type. We should be inclined to take the opposite view, and to say that those are just the occasions when competitions are of no real service, except to spend money, and (if the drawings are exhibited) to amuse the public. When six architects, say, are selected to compete for a special building because each of them has a reputation for that class of building, the presumption is that any one of them would produce a good building if commissioned directly, and therefore the trouble and expense of the competition is wasted.

And to reduce all competitions to "limited" ones would do away with what is really the strongest point in favour of competition—the chance it affords to talented men whom circumstances have kept in obscurity. The American Institute is practically contemptuous in regard to such competitions. A passing paragraph merely mentions the fact that such open competitions "have sometimes to be employed in consequence of legislative enactment," and does not condescend even to suggest any special regulations for their conduct. This will be understood if the clause is read in connection with Clause 3 of the Code, "On the Qualifications of Competitors," which commences with the remark—

> It is prejudicial to the interests of the owner that an architect should be admitted who cannot in advance establish his competence to design and execute the work.

Mandatory Conditions.

At the close of the document is a general clause stating that as competition practice must vary in different parts of the United States, considerable latitude of interpretation is given to Sub-Committees on Competitions, but there follow certain instructions which are "mandatory," and, which lay down conditions without which the approval of the Institute must be withheld; and the second of these reads—

> "(*b*) Unless the programme excludes from the competition all persons who cannot in advance establish to the satisfaction of the owner their competence to design and execute the work."

This condition is illogical to begin with, as the Code has already recognised the fact (Clause 4*b*) that open competitions may be unavoidable on account of legal requirements, and in that case the mandate quoted could not be carried out; so that the Code in this respect stultifies itself. Moreover, while the Code started with assuming (rightly) that all competitions are instituted with the object of advancing the interests of the owner, it now turns round to take the owner under its wing and assist him in his self-interested action. The defence for this attitude, which would practically render open competitions impossible, is found under Clause 3, before quoted ("Qualifications of Competitors"), in which it is urged that sketches give no evidence that the author has the matured artistic ability to fulfil their promise, or that he has the technical knowledge necessary to control the design of the highly complex structure and equipment of a modern building. Certainly mere showy sketches of elevations or perspective views do not give such evidence. But sketch designs for a complex building would be judged in the first place (if the assessor or jury knew their business) on the merits of the plan; and our experience is that a man who can produce a really good and practically workable plan for a public building will be likely to have practical knowledge enough to carry out that plan. It is the man who produces picturesque elevations on an ill-constructed plan who is generally found wanting when practical knowledge is called for. Moreover, even in an open sketch competition every competitor is, or should be, called upon to accompany his design with a report stating the methods of construction, heating, lighting, and ventilation proposed; and such a report, read in conjunction with the plan and section of his design, ought to give sufficient evidence as to whether the author knows his business or not—provided always, as aforesaid, that the assessor or jury know theirs.

A Binding Contract.

One of the most important points in the American Code, which finds no analogy in the English one, is the provision that the Programme issued to competitors "should constitute a definite and binding contract between the owner and competitors," guaranteeing that the award and the commission will be made in favour of one of the competitors. This is a suggestion which ought not to be lost sight of in England. We have often seen the question raised by disappointed competitors, whether the promoters were not really under a contract to award in accordance with the assessor's decision; and, as far as we understand, that position cannot, in most cases, at all events, be legally sustained. The point should not be lost sight of by our Institute Committee. Another point worth attention in the American Code is the very wise one that "the programme should not require or permit competitors to furnish their own or builders' estimates of the cost of executing the work in accordance with their designs. Such estimates are singularly unreliable"; a conclusion which will apply as much to the English as to the American side of the water. It is suggested that, if required, "they should be made for all designs by one unprejudiced person employed by the owner"; a suggestion which promises, at all events, a new harvest for the Quantity Surveyor.

Appointment of Assessors.

The provisions for the appointment and the duties of assessors, and for other details in the carrying on of a competition, are in spirit much the same as ours. The Americans seem to prefer plural jurors to single assessors. Nothing is said as to the payment of either, so that we presume their services are to be honorary; that they are so in France would be quite sufficient, since among American architects whatever is French is right.

The Important Points.

The important points for English architects to note in the American Code are the decisive manner in which compliance with the ruling of the Institute as to black-listed competitions is demanded from its members, under pain of their conduct being banned as "unprofessional"; and the view that the programme of a competition should be so drawn up as to constitute a contract between the promoters and the competitors. The first-mentioned course has more than once been urged, but the R.I.B.A. Council has so far been rather tamely rejected. These are two precedents which ought to be seriously considered at Conduit Street.

As to the general view taken of the good or evil of competitions, we hold that the American view is the wrong one, and that in almost ignoring open competitions they are, so to speak, dismissing with costs the form of competition which, from the point of view of the architectural profession, has (if the drawings required are reduced to a minimum) a better *raison d'être* than any other.

Architectural Use of Concrete.

THE subject of our last week's leading article is rather unfortunately brought back to us by the illustrations in concrete and constructional engineering which accompany an account of the visit of the Concrete Institute to Paris. The visitors were taken to see, among other things, M. Hennebique's country house at Bourg-la-Reine, which is illustrated as "a marvellous instance of what can be done with reinforced concrete." It is certainly marvellous, from an architect's point of view. The house exactly illustrates the kind of thing we deprecated last week; the pursuit of tricks of design in a kind of distorted imitation of mediæval masonry. The design, in our opinion, would tend to act as a warning rather than as an encouragement to the use of reinforced concrete in architecture. A far more interesting illustration is that of the great cantilevers which have recently been put up some little way out of St. Lazare Station, to support a roadway above the enlarged width of the railway. The railway formerly ran at the foot of a retaining wall rising to the

street level above. The retaining wall has been removed and the railway widened, while the roadway above remains *in statu quo*, carried by the vast cantilevers which overhang the new portion of the railway. That is, of course, the engineering rather than the architectural treatment of reinforced concrete; but it is a perfectly satisfactory and rather striking use of the material, which it is a pleasure to see. On the other hand, nothing worse or more unsuitable can be done with reinforced concrete than to make it the medium for architectural gewgaws. A broad and simple treatment is what is required to express the quality and character of the material, any detailed ornament being supplied by surface treatment or the addition of coloured materials applied to the wall surface, as already suggested.

A "Very Practical Suggestion."

IT is natural that all sorts of suggestions for a memorial to King Edward should find their way into print. Some —like that of erecting a new façade to Buckingham Palace—we regard as being wholly admirable; others, like that which was put forward last week by a correspondent of the "Morning Post," excite our wonder. "Long before the memorial to Queen Victoria is nearly finished," writes the correspondent just mentioned, "the question of a memorial to her successor is before the country. May I be permitted to make a very practical suggestion? Nine years ago it struck me that the best and most appropriate memorial to an English Sovereign would surely be a new chapel added to Westminster Abbey. Why not build it now? It is so badly wanted for the burial of our great dead. Some may carelessly think that a new chapel would spoil the ancient abbey. Henry VII. did not think so when he built *his* new chapel. It would not long remain glaringly white. Any amount of money could be spent over it. It would be the most national memorial possible." That this is indeed "a very practical suggestion" cannot be denied. That is its defect. It so completely ignores the strength of the sentiment in favour of maintaining the Abbey in its integrity, that it need not be further discussed. It is here cited as a curious instance of the absolute futility of many ideas that are nevertheless, in a sense, "very practical."

"In Restraint of Trade."

A DECISION given by Mr. Justice Coleridge in the King's Bench Division last week puts the trade unionist in a rather curious position with regard to his union's obligations towards him. The case was that of Mudd v. the General Union of Operative Carpenters and Joiners. The plaintiff sought to recover damages for the loss of his tools in a fire, and the jury awarded him £5. There arose, however, the question of whether he was entitled to judgment. The point at issue was whether the defendant society, being mainly in restraint of trade, was an illegal association at common law. The Trades Unions Act of 1871 provides that a trade union shall not, by reason of its being in restraint of trade, be considered unlawful in the sense that membership involves liability to criminal prosecution, nor so as to render void any agreement or trust, but it leaves untouched the inability to enforce agreements for the application of its funds to provide benefits to its members. If, therefore, defendants were an illegal association at common law, plaintiff could not enforce his claim. The question whether defendants were an illegal association depended upon its rules. Since the foundation of the society about 25 per cent. of the amount paid out for benefits had been paid in respect of strikes. There was nothing illegal in a strike, and if defendants' rules in that respect had been limited to assisting strikes or supporting strikers his lordship would be disposed to hold that not to disclose an illegal purpose. But the rules went further than that. Three of them were practically the same as a rule which, in the case of Russell v. the Amalgamated Society of Carpenters and Joiners, was held to contemplate such a restraint of trade as made all the other rules, generally, harmless or otherwise, unenforceable at law. He thought that where all parties had agreed to be bound by, and had acted on, certain rules, it must be very clearly shown that the rules having an illegal tendency were a main feature of the trade union before they could render unenforceable the harmless rules. If he could have found that the rules having an illegal purpose were not a main feature of the rules in general, he should have been disposed to hold that he was not bound, but, as it was, he considered that he was bound by the decision in the case he had referred to. He therefore gave judgment for defendants, with costs. It would seem to follow therefore that the member of a trade union cannot compel it to confer upon him any of the benefits to which he assumes that he is entitled. The interest for employers seems to reside in the inference that since, apparently, a member cannot legally enforce his claims upon any of the various funds, those funds might with impunity be applied purely in restraint of trade—that, for instance, a trade union might replenish its war chest at the expense of its sick or accident or superannuation fund. Such at least seems to be the bearing of this particular judgment.

The German Building Trade Dispute.

IT was announced in a telegram from Berlin dated June 7th that both sides in the building trades dispute had accepted the draft agreement submitted to them by the arbitrators on June 1st, and that local negotiations in the various cities would begin forthwith, and it was expected that the lock-out would be withdrawn in the course of the week. Thus it appears that an unexpectedly tame and swift conclusion may now fortunately be anticipated for what was held out to be the most bitter, and what was prophesied to be the most protracted labour struggle of modern times. There was no doubt a good deal of bluster and tall talk on both sides. This is quite natural and customary; but what cannot be quite so easily understood is the persistency with which the aims and objects of the employers have been misrepresented in the British newspapers. Suspecting that (for some reason that is still unfathomable to us) the employers were being treated with scant justice in this country, we took some trouble to ascertain the employers' views, and these, when placed before our readers in our issue of May 25th, at p. 537, put, we think, a very different complexion on the employers' case from that which it had been made to assume in the daily press, and in particular showed pretty conclusively that the employers had been unjustly credited with an implacable determination to crush the unions as the chief object of the lock-out. It was insinuated that the German employers had deliberately conspired to crush the unions at all costs—that the sole object of the lockout was to reduce the men to a state of demoralised disorganisation. This appears to have been a grotesque exaggeration. The employers, indeed, expressly and explicitly repudiated the charge that their action was directed against the organisation of the workmen. Their main object was more freedom from the tyranny of the workmen's organisations; and although the thesis which Thomas Henry Buckle elaborated with superabundance of ingenuity — that those who hold the preponderance of power will certainly abuse it—has in it doubtless some germ of truth, this is an additional reason why the employers should feel anxious for a readjustment which should give them greater liberty of action in the conduct of their business. Unhappily the struggle has been marked by several scenes of violence, in which there has been bloodshed and loss of life; and these regrettable incidents, as well as the whole tenour of the dispute, emphasise the truth of the contention that the more highly organised are the forces on both sides, the greater is the assurance of industrial peace. In this country, it is hardly necessary to remind our readers, the National Federation of Building Trades Employers has succeeded in establishing a system of conciliation boards that has been hitherto found to be wholly efficient and effectual for the settlement of disputes. Whether the same machinery could be adapted to the German environment and the Teutonic temperament can be best ascertained by actual experiment—a course that can be heartily commended to our German neighbours.

FOUNDATIONS IN UNSTABLE SOIL.

By W. NOBLE TWELVETREES.

[*This gives an interesting account of the Compressol system of forming foundations in unstable soil. Briefly, this consists of perforating holes in the ground, by means of heavy dies, until a hard stratum is reached, and filling up the perforation with concrete well rammed down.*]

The foundations of important buildings and structures of engineering character present little difficulty in places where the soil is reasonably firm, but cases often arise where very heavy loads must be transmitted to and spread over comparatively limited areas. Sometimes the ground may be such that it would be capable of supporting a moderate pressure per unit area, and alternatively it may be so unstable as to call for very special types of foundation work.

One of the most familiar methods of consolidating soil of low bearing power is to drive timber or reinforced concrete piles, and upon these to build footings or a general foundation platform.

Another method of dealing with unstable soil is to construct a general foundation raft of steel beams embedded in concrete, or preferably of reinforced concrete, over the entire site of the building or structure to be supported. This solution of the problem really involves consolidation of the soil, which is compressed more or less uniformly, the surface gradually sinking until further movement comes to an end.

Foundations in Chicago and other American cities were very largely designed on this principle in former years, but to-day the tendency is rather in favour of foundation wells by which the weight of heavy buildings is transmitted down to solid rock or some firm stratum below the compressible soil near the surface.

A Compression Method.

Yet another method, practically unknown in this country, but which has been adopted with perfect success and considerable economy on the Continent, is to compress the soil mechanically in such manner as to form holes of predetermined depth at selected points, and then to fill the holes with concrete. This method, which is known as the Compressol system, can be adopted even in water-bearing strata, and as the soil is compressed laterally as well as vertically its resistance is enormously increased. Moreover, the irregular outline of the hole, due to variable resistance of the soil, has the effect of distributing the load transmitted to each concrete pier over a relatively large surface area, instead of concentrating the greater part of it at the base, as happens where ordinary foundation piers are sunk.

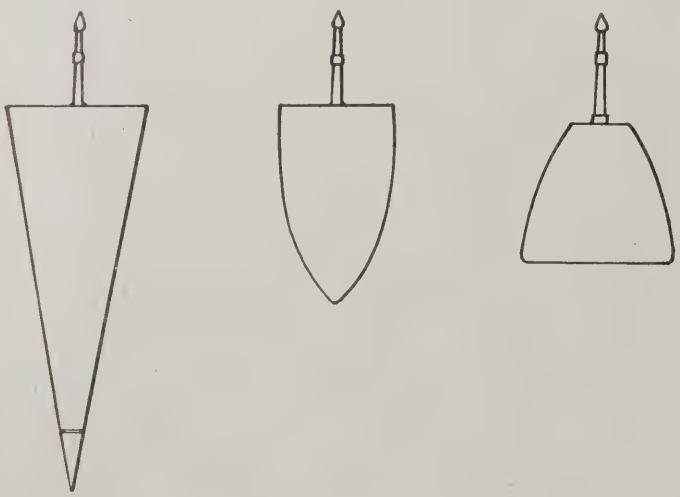

Fig. 1. *Fig. 2.* *Fig. 3.*

Fig. 1 shows the form of the perforating die first used; Fig. 2 the second perforating and compressing die; Fig. 3 is the third die for testing the bearing power of completed pier.

Fig. 4 shows the driving machine, using the first die.

As the process to which we refer is applicable to buildings of every class, and constructed of any standard materials, the particulars given below will probably interest most of our readers.

Method of Construction.

The construction of a foundation pier by the method in question comprises two operations, the first being the perforation and compression of the soil, and the second the deposition and ramming of concrete in the hole formed, with additional lateral compression of the soil.

The first operation is performed by means of a conical die of the form illustrated in Fig. 1, the body being of cast-iron and the point of steel. The die is of 33½in. diameter at the top, and weighs nearly two tons. It is raised to the required height by the aid of a machine similar to a pile-driver, and allowed to fall as many times as may be necessary to punch a hole of the requisite depth at any predetermined point.

The second operation is performed, so far as ramming is concerned, by means of another die of the shape represented in Fig. 2, the diameter of this being 29½in. at the top, and its weight about 1¾ tons.

A third die, employed for testing the bearing power of completed piers, measures 31½in. across the bottom and weighs about 1½ tons (see Fig. 3).

The driving machine illustrated in Fig. 4 has a revolving platform from which a steel tower rises to the height of

55ft. 9in., and whereon are installed a portable engine and boiler of from 35 to 40 horse-power, and a winch for hoisting purposes. The machine is fitted with an automatic clutch for engaging and releasing the various dies as required.

Fig. 5 is another view, showing three machines in operation on the foundations for the new Law Courts, Paris. It will be noticed that the perforating die is being used by two machines and the ramming die by the third.

The height of fall above normal ground level is usually from 26ft. to 32ft., the drop gradually increasing with the depth of the hole perforated. It should be noted that the fall can readily be fixed in accordance with the nature of the soil by adjusting the height of a collar attached to a bracket fitting around the vertical post of the tower, this collar serving the purpose of opening the clutch when the latter is drawn up so as to come in contact with its lower surface.

Calculating Soil Resistance.

During the perforation of a hole observations are taken of the depth penetrated at each fall of the die. Then the resistance of the soil is calculated by the following simple formula:—

$$R = \frac{Wh}{h_1}$$

Where W = the weight of the die, h = the fall of the die, and h_1 = the depth penetrated at each fall of the die.

In practical work a reduction of 50 per cent. is usually made to allow for air resistance, accidental friction against the sides of the hole, and other losses of force that cannot be precisely estimated. Then for any given load and factor for safety it is easy to determine the point where perforation may be stopped.

Fig. 6 is a section showing the nature of a well sunk in the manner described. The wall being consolidated by the action of the conical die, possesses considerable resistance to exterior lateral pressure, but when waterlogged soil has to be dealt with, or in cases where springs are likely to be encountered, clay is dropped into the boring before each fall of the die, so that a plastic water-tight lining may be formed. If preferred, the lining can be formed in the same way by depositing concrete instead of clay.

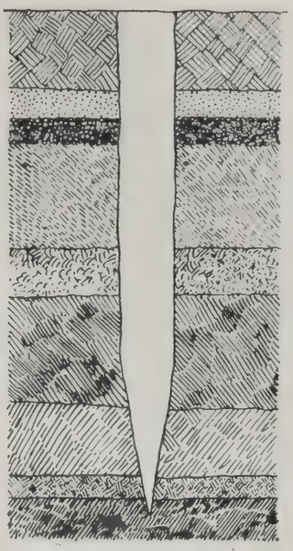

Fig. 6 is a section showing the nature of the well hole sunk by this system.

Filling the Perforations.

When perforation has been carried to the necessary depth, the bottom of the well is enlarged by dropping in concrete or pieces of hard stone, and then employing the ramming die to force the material laterally into the soil, the result being an extended base which naturally increases the bearing capacity of the foundation pier. The uppe rpart of the latter is formed by depositing and ramming concrete, in layers of about 12in. thick.

Owing to the powerful effect of the falling die, and to the variable consistency of the soil, the foundation pier

Fig. 5 shows three of the driving machines in operation on the foundations of the New Law Courts, Paris. The machine in the foreground is using the second die; the other two the first die.

shows the irregular outline of a pier constructed, the irregularity being due to the varying consistency of the soil.

assumes a very irregular outline, as illustrated by Fig. 7, which is an important feature from the standpoint of load-bearing capacity, the projections being more accentuated in places where the soil is of yielding character, than in places where it is moderately firm.

If desired, steel bars can be incorporated in the upper part of the foundation piers for connection with beams or arches between the piers and converting the whole series into a rigid structure beneath the building to be erected.

In cases where it is considered desirable to test the actual resistance of the piers, the testing die is brought into use when the piers have been completed nearly up to the level of the ground.

After several blows for the purpose of ascertaining the mean depression for each fall of the die, the effective resistance of the pier is calculated by the formula:

$$R = \frac{Wh}{2h_1A}$$

Where A = the surface area of the test die, 2 = a coefficient to allow for various indeterminate losses of force, and the other symbols have the significations previously stated.

Tests for Resistance.

Tests so conducted on the foundation piers of a bridge built across the Sambre at Louvroil, in Belgium, showed the mean depression of about 0.6in. for each drop of the test die from the average height of 15ft., the corresponding resistance of the pier calculated by the foregoing formula being 36 tons per square foot.

As the diameter of the piers was rather more than 40in., the safe load works out at about 320 tons per pier, or 160 tons per pier even if we double the factor of 2 stated above.

A more satisfactory method of ascertaining the safe bearing capacity of foundation piers constructed in the manner here under consideration, is that applied in October, 1907, by the Building Department of Vienna.

Several piers had already been constructed for the support of a large seven-storey building, when the Department intervened and prohibited further operations until tests had been made. The soil consisted of made ground to the depth of nearly 18ft., below which were beds of gravel and clay permeated by water. The average diameter of the pier selected for testing was 40in., and its length 24ft. 3in.

In order to impose a direct load on the pier a large box was constructed and placed as shown in Fig. 8, with screw jacks for supporting the loading before the first and between the remaining tests.

Operations commenced on October 10th, and ended on October 29th, being under the direction of an inspector attached to the Building Department, assisted by Dr. Ing. Fritz von Emperger as expert witness.

Test No. 1, involving the total load of 60 tons, caused no movement of the pier.

Test No. 2 brought into play the load of 108 tons, the effect of which was almost inappreciable.

Test No. 3, where the load of 152 tons remained in position for 72 hours, revealed no change of level.

Test No. 4 was made by imposing the load of 166½ tons on Oct. 17th, and taking several readings, the last being made on Oct. 29th, when the pier showed settlement to the extent of a few millimetres.

Further tests were considered superfluous, and the construction was officially authorised for the load of 110 tons per pier.

As the ground in its natural state was not capable of supporting more than 1 ton per square foot, or about 9 tons upon an area equal to that of one pier, the efficacy of this system of foundation work was convincingly demonstrated.

In addition to their advantage from the structural standpoint, Compressol foundations possess the advantages of simplicity and economy; they can be rapidly executed, and the workmen employed are never called upon to undergo the risks inseparable from the sinking of foundation wells in the ordinary manner.

Although the system was applied to the foundations of some two dozen buildings for the last Paris Exhibition, and has been employed in connection with numerous public and other important buildings in France, Belgium, Germany, Austria, Egypt, and even Siam, it is practically unknown in the United Kingdom, where local conditions frequently render the execution of foundation work by ordinary methods both difficult and costly.

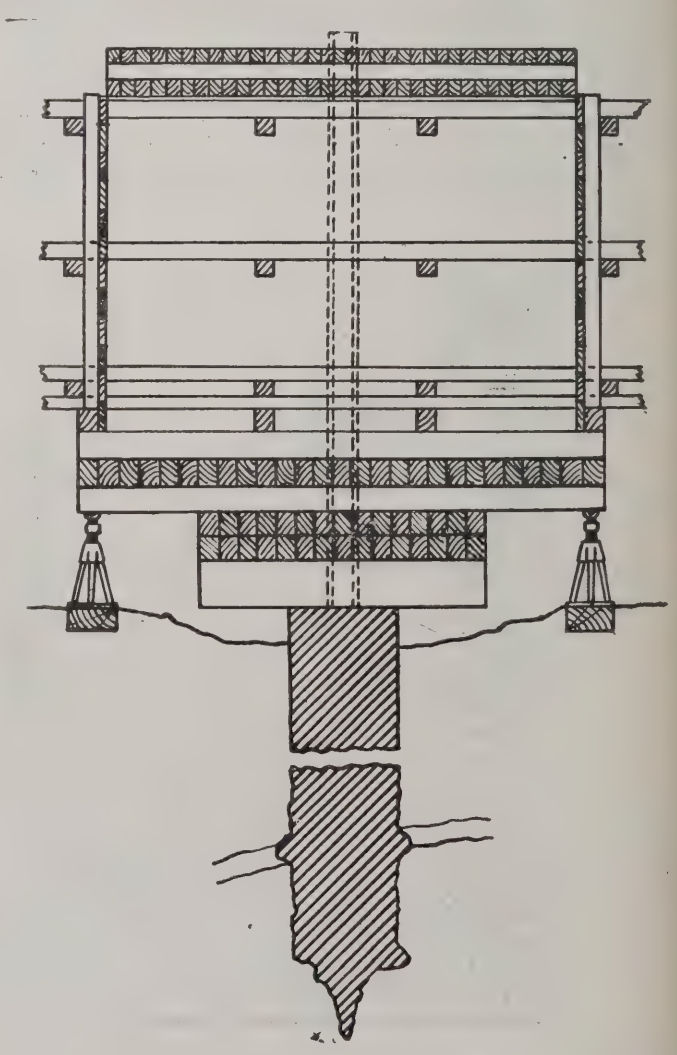

Fig. 8 shows the box arrangement constructed for the testing of foundation piers at Vienna in 1907.

This is in the old portion of the building, but the walls and ceiling are entirely remodelled. The chimneypiece is the old one refixed. The walls and ceiling are finished dead white. (See notes on page 609.)

NEWTON GREEN HALL, LEEDS: THE DINING-ROOM. ADKIN AND HILL, ARCHITECTS.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

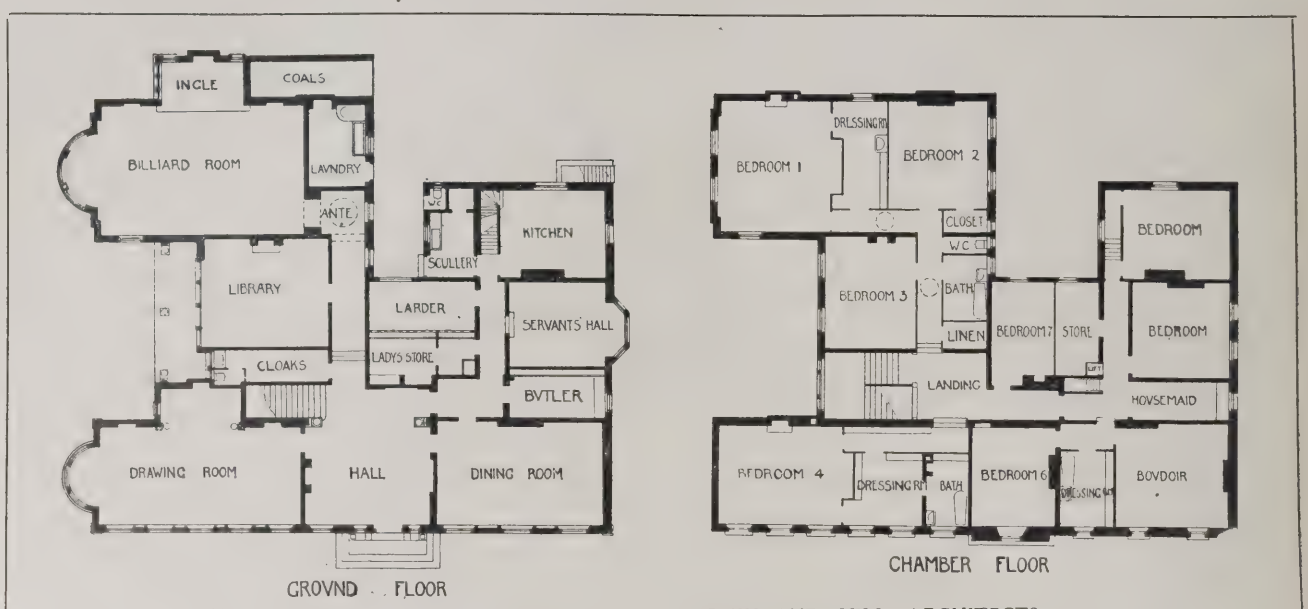
NEWTON GREEN HALL, LEEDS.

We give in this issue several illustrations of Newton Green Hall, Leeds, which has been extensively altered and added to under the direction of Messrs. Adkin and Hill, architects, of Bradford. The Hall is the property of Sir Wilfred Hepton, and is situated at Chapeltown, a suburb of Leeds, almost abutting on a tram route, within twenty minutes of the city, and hemmed in by property of the usual suburban type.

When once the entrance gates are passed the park and grounds come as a revelation to the visitor, a fertile oasis in a desert of bricks and mortar. The drive is through an avenue of fine old timber; and the house, on a slight eminence with a background of foliage, overlooks the gently undulating park, characteristically dotted with forest trees. The old building was of brick, floated on the main frontages with cement, and roofed with grey Yorkshire flags.

Built in the middle of the last century, the south elevation is of an Italian type, crude in detail, but of a good general proportion, so that aided by time and creepers a really pleasing result has been attained.

The west side and back of the building ran very much to seed, and fortunately had to be almost entirely removed on account of the large size of the new rooms. Briefly the east end and front from the kitchen to one half the drawing-room are old, with some minor alterations. The drawing-room and hall were enlarged, and all the remainder is new work.



The billiard-room was designed in a different style from the remainder of the house, it being thought a more fitting setting for the trophies of big game shot by Sir Wilfred in various parts of the world. The grounds are charmingly wooded, and would lend themselves easily to the formation of a terraced garden of a formal type, a consummation which it is hoped will eventually be arrived at. The whole of the work, including alterations to the stabling, lodge, and new entrance gates, was completed ready for occupation within four months, whilst the owner was travelling in Canada.

In one of the largest rooms, the music and billiard room, the floor is laid for dancing with narrow oak boards. No springs are used, but the necessary elasticity is obtained by the joists, etc., being fixed so that there is no direct bearing on the solid. The chimneypiece is in local stone with red Mansfield strings and green-slate dowels in the lintel. The panelling is in mahogany, and the plasterwork is left white. The dining-room is in the old portion of the building, but the walls and ceiling have been entirely remodelled. The chimneypiece is old. Walls and ceiling are finished dead white. The woodwork on the staircase is in mahogany, and the walls are panelled in Parian cement. The panelling in the morning-room is in fumed oak, with mahogany inlay. The ceiling has a band of modelled plaster. The hall is panelled in oak, finished dull brown. The builder was Paul Rhodes, of Leeds, and he executed the carved stonework. The fireproofing was done by the Bradford Fireproof Wall Plate Co. The special woodwork and modelled plasterwork were executed by Marsh, Jones, and Cribb, of Leeds, and they also supplied the grates and electric light fixtures. Henry Lindley, Leeds, carried out the plumbing work, and the sanitary fittings were supplied by Hepton and Sons, Leeds. Dixon and Son, Leeds, executed the electric wiring, and Rawlinson and Co., Leeds, supplied the lift and heating apparatus.

The panelling is in fumed oak with mahogany inlay, and the ceiling is relieved with modelled plaster.

SOCIETY OF ARCHITECTS' TRAVELLING STUDENTSHIP.

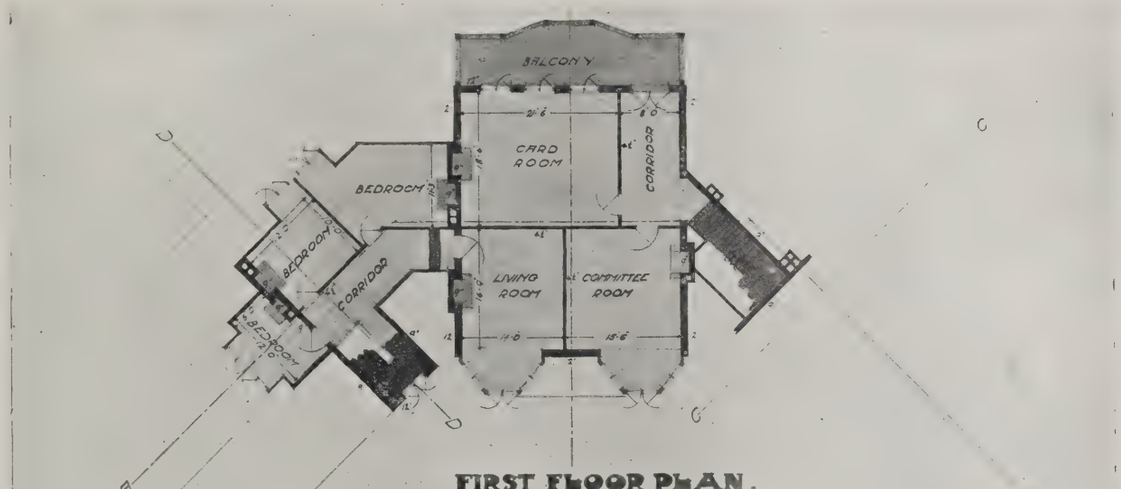
As announced in our issue last week, the travelling studentship of the Society of Architects this year was awarded to Mr. D. W. Coombs, of Bournemouth. Mr. Coombs, who is 23 years of age, received his architectural training under Mr. J. J. Shepherd, of Bournemouth, to whom he was articled in 1906, and in whose office he is now acting as assistant.

The subject set for the design competition this year was a Golf Club to accommodate 175 members, of whom 140 would be men and 35 women. The site was a level one, with no restrictions as to available area, and the cost was not to exceed £4,000. A lounge hall, luncheon room, and bar, secretary's office, kitchen, scullery, waiters' room, stores, and larder, etc., had to be provided on the ground floor, together with ladies' and gentlemen's dressing and drying rooms, and bath and lavatory accommodation, etc., while on the first floor provision was to be made for a committee room, card-room, and caretaker's residence, etc. A room for professionals, a workshop, caddies' room, wash-house, and tool-house, also a covered shelter for six motor cars, were to be provided as outbuildings. A veranda to overlook the course and a clock turret were also asked for.

The official criticism of the winning design is as follows:—

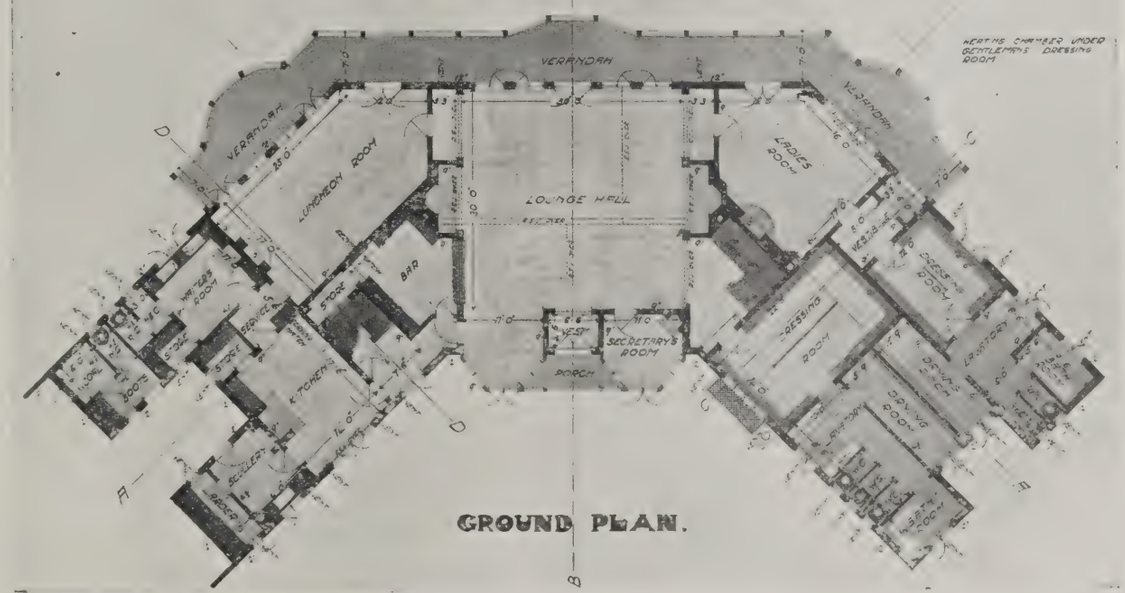
No. 9, to the author of which the Studentship has been awarded, shows an excellent general arrangement, the separation of the garage and accessories from the pavilion being particularly good, as also is the idea of locating the putting green close and handy. The general scheme of the plan is that of two wings at right angles to one another connected by a lounge hall which cuts off the corner and passes through from front to back. The method of separating the women from the men, the planning of dressing and drying rooms is very ingenious. So also is the service from kitchen to luncheon room, bar, and hall. The ladies' room is so contrived as to overlook the golf course. The only objection that can seriously be taken is to the drainage, where some practical considerations have been neglected, and theory has been carried to the extent of faddism. The positions of tee No. 1 and hole No. 18 suggest that the designer has studied the intricacies of the game. The elevation is quiet and picturesque, and the drawings well prepared and workmanlike; although they are only in pencil and colour they are quite sufficient for the purpose of the competition.

LONDON GUILDHALL RESTORATION AND DISCOVERIES.



[*At the Royal Society of Arts, Mr. Sydney Perks, F.R.I.B.A., F.S.A., the City Surveyor, gave an interesting lecture, illustrated with a series of lantern views, on recent restoration and discoveries at the Guildhall. Below is a brief digest of the paper.*]

Little is known of any Guildhall erected before the present building; there was a previous structure apparently with a frontage to Aldermanbury, and I have heard it suggested that the west portion of the crypt was part of that Guildhall. It is well to note that the present Guildhall was considered a remarkably big building at the time it was erected, and the cost crippled the finances of the Corporation for several years. Old views of the exterior show that the appearance was roughly similar to what it is to-day. After the fire, Wren added a storey and provided the hall with a flat ceiling, and there are many views both of the interior and exterior, showing the appearance of the building until the present open roof was built by Sir Horace Jones in 1864. He followed, as far as possible, old traditions, but in place of two small ventilators he fixed one large flèche. Although this is very effective from a distance, it is open to criticism in that it has the effect of somewhat dwarfing the appearance of the front to the Guildhall Yard.



I have prepared plans of the crypt and Guildhall above, showing them, as far as I can judge, as they were when first built in the early part of the fifteenth century. With regard to the crypt, the eastern half, by far the most elaborate portion, is very little different to-day from what it was nearly 500 years ago. The crypt has been restored quite recently. Until then, the walls and vaulting were covered with dirt and grease, the shafts supporting the vaulting were quite black, and it was only after the removal of the grease and dirt that the colour of the blue Purbeck stone shafts could be seen. This eastern crypt was more expensively constructed than the Western portion. Its importance was emphasised by the fine entrance, which is quite as elaborate as the fifteenth century porch. Until about two years ago it was boarded up and completely obscured. Now a new staircase gives easy access to the crypt, and we can see the fine mouldings of the piers, the niches—that no doubt held statues—and many other interesting details. A few weeks ago brickwork that had been

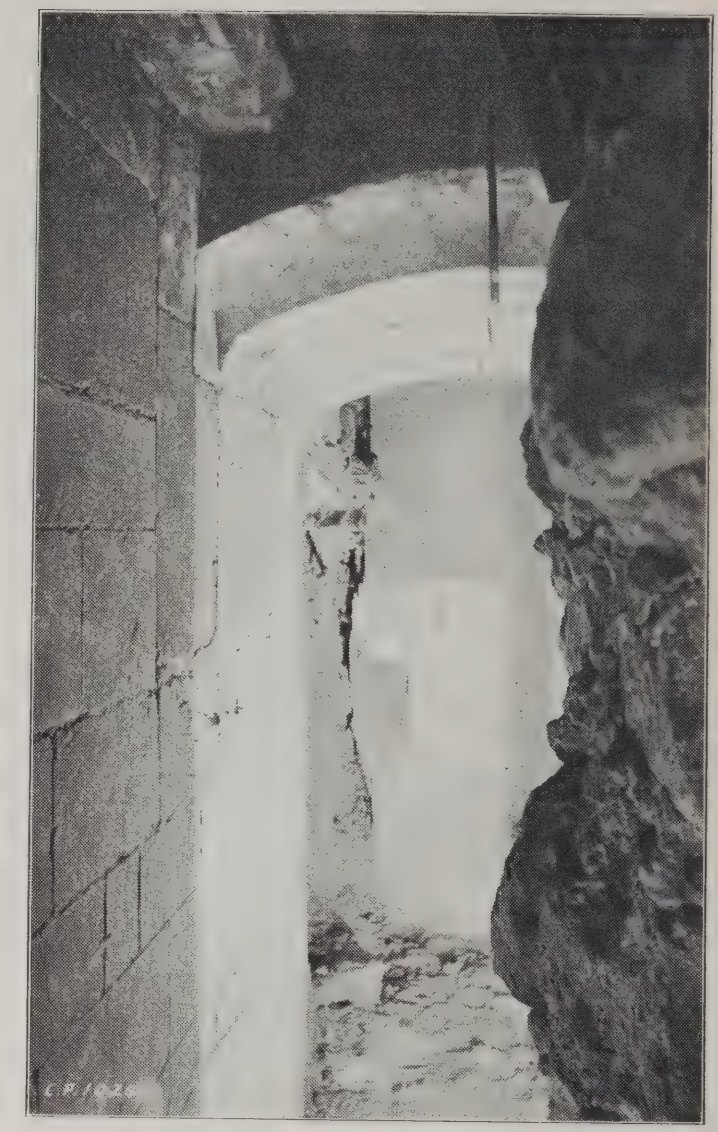
FIRST FLOOR PLAN.

GROUND PLAN.

THE SOCIETY OF ARCHITECTS' TRAVELLING STUDENTSHIP, 1910. A GOLF CLUB.
DESIGN BY D. A. COOMBS. PLACED FIRST.

built across the doorway opposite the main entrance was removed, and the steps and other details uncovered. Wren built a series of brick arches, similar to a range of railway arches. He filled up the haunches, and replaced the floor. The workmen filled the space in with any stone or brick débris handy, and hundreds of beautiful Gothic fragments exist to-day in the brick walls. While removing the brickwork to uncover the Gothic work a very large number of the fragments have been carefully removed and labelled, and are ready for depositing in the museum.



With regard to the western half of the crypt, last December I took up some paving in a direct line between two responds, and one-third of the way across the crypt I carefully cleared away the earth. Just below the surface I found the foundations of a pier that supported the vaulting. At once I opened the paving in the corresponding positions, and in every case—there are eight in all—I found the foundations I wanted. The result is that we know now exactly where the piers existed, and the number of them; and we can tell from the responds that the vaulting ribs spring direct from the shafts without any caps. Every detail is, therefore, at hand to enable the Corporation to restore the entire west end of the crypt, so that we could see it as in the fifteenth century.

Another very interesting discovery was a three-light window in the west wall of the building; this was entirely bricked up. It was, apparently, the only three-light window in the west end of the crypt. A portion of the sill remains. This is yet another link in the chain of belief that the building was an independent structure.

There is a very interesting staircase from the crypt to the side of the porch. It was partly bricked up until a few months ago.

In 1501 kitchens were erected at the north side of the building, opening off the western portion. Later on the western end of the crypt was used for stables, for we read in 1683 that two Aldermen were requested to report upon the "mischiefs arising from the keeping of a stable and a coach-house under the Guildhall." I was puzzled for a long while about the two stone staircases found in the thickness of the wall at the east end of the crypt. They start from the level of the east doorway, which was about 5ft. above the floor of the crypt, and turn outwards at a height of about 15ft. above the floor of the crypt. The plan of the hall shows a circular staircase at the north-east corner. Until a few weeks ago this was blocked at the foot by a boiler, and had not been used for very many years. On going up I found a doorway, bricked up as usual, opening outwards into space. This probably communicated with some building. There is a similar doorway in the south-east turret leading into a complete small room. There was no staircase in this angle, and consequently this room could only have been approached from a building at the east end of the Guildhall. In the circular staircase, about the level of the great hall, there is also a doorway. This was bricked up, and on removing the brickwork I came upon a passage about 23ft. long, 3ft. wide, and 8ft. 5in. high, which was also blocked with stonework. The filling in was removed with great care, and it was found that the passage led into the great hall, passing through a buttress on the way. By a little expense this ancient way can be restored, and communication opened up between the hall and crypt. Just under the great window there is a very fine stone canopy. This delicate piece of work can only be properly seen from a ladder, as the projection of the canopy of the wood screen below hides the view of it, except from a distance. At about the same level as the top of the wood panelling there is a horizontal line at the springing of the stone canopy. It is probable that tapestry was hung below.

Now we come to what we see to-day. The east end and two return sides on the hustings are panelled in oak. The woodwork has a heavy projecting canopy, and this is immediately under the stone canopy. The result is that the wood canopy prevents anyone near the east end from seeing the stonework above, and that we get two heavy horizontal lines

[*The City Press.*

A RECENTLY DISCOVERED PASSAGE AT THE GUILDHALL, LONDON.

immediately under the window, with the very unpleasant effect of dwarfing the end of the hall.

The work of restoring the porch to the Guildhall is now well in hand. The original porch, known as "the Guildhall Gate," was erected in 1425, and was very different from what we understand as an ordinary porch, for it was the full width of the Guildhall yard, about 63ft. wide. It had two doorways in it, and was in part certainly three storeys high. The upper portion of the porch suffered considerably at the Great Fire of London, and was restored by Wren in 1669. He rebuilt the destroyed portions in a severely classical manner, the central feature reminding one somewhat of Temple Bar. The original porch, with Wren's alterations, was pulled down in 1788. That fact is ever to be regretted. Dance's porch was very nearly treated in the same way, to give place to a modern porch erected by Sir Horace Jones. He pulled a third of it down, and then died. Now the missing portion is being restored. The work is well in hand, and should be finished this autumn.

Until last summer almost the entire wall surface of the Guildhall was covered with a preparation of cement about one-sixteenth of an inch thick. This had been painted and distempered, with the result that the sharpness of the mouldings had disappeared, and it was very difficult to distinguish between the original Gothic and the imitation work carried out from time to time. The plaster and paint work is said to have been started in Wren's time, the object being to paint the new stone used in restoration work after the fire, and also

the stone blackened by the flames, so that the whole should have what was considered a pleasing and uniform appearance. We can now see clearly the line of the old walls raised upon by Wren, and the clean stone of the modern windows. Two years ago the crypt was in a still worse state. It was fitted up with gas pendants, and common T pieces hung from the vaulting. These have all been removed, the gas-stoves are going, and the whole crypt has been lighted by electricity.

Considerable interest was taken in the discovery last autumn of the only original and complete window in the great hall. The recess opposite contained a like window, but this was much mutilated. I hope, however, it will be restored as soon as accommodation can be found for the occupants of the office at the back of it. With regard to the south window this has received further attention, and the brick wall on the outer side has been removed. Without doubt, this is an extremely interesting window. In the first place, we find the two window seats—one on each side of the opening. These are frequently seen in early domestic work, and fine examples exist at Stokesay and Alnwick; but no examples exist, so far as I know, in ecclesiastical work. The next thing to notice is the right-angled rebate formed for the shutters. A similar rebate exists in the windows in the crypt. At the lower portion of the window the old hooks can be seen on which the shutters were hung. The latches, although very rusty, are charming in design. The Guildhall was commenced in 1411, and consequently next year is the 500th anniversary of its foundation. What would be more fitting than to celebrate the event by restoring the western portion of the crypt? [For this report, and the illustration on p.612, we are indebted to the courtesy of the "City Press."]

THE R.I.B.A. ANNUAL ELECTIONS.

At the Business General Meeting, on Monday, June 6th, the Officers, Council, and Standing Committees for the ensuing Session were declared duly elected, in accordance with the Scrutineers' Report, as follows:—

THE COUNCIL.

President.—Leonard Stokes.

Past-Presidents.—Thomas Edward Collcutt; Ernest George.

Vice-Presidents.—*Reginald Blomfield; *Alfred William Stephens Cross; *Edward Guy Dawber; Ernest Newton.

Hon. Secretary.—*Henry Thomas Hare.

Representatives of Allied Societies.—Henry Clement Charlewood (Northern Architectural Association); John Bennie Wilson (Glasgow Institute of Architects); *Percy Scott Worthington (Manchester Society of Architects); William Morton Cowdell (Leicester and Leicestershire Society of Architects); *Arthur Stansfield Dixon (Birmingham Architectural Association); Robert Evans, jun. (Nottingham Architectural Society); Sydney Decimus Kitson (Leeds and Yorkshire Architectural Society); Arnold Thornely (Liverpool Architectural Society); *John Watson (Edinburgh Architectural Association).

Members of Council.—Maurice Bingham Adams; *John James Burnet; Walter Cave; *Max Clarke; William Flockhart; *William Adam Forsyth; James Sivewright Gibson; *John Alfred Gotch; *Edwin Thomas Hall; *George Hubbard; *Henry Vaughan Lanchester; *Edwin Landseer Lutyens; A. Beresford Pite; *Andrew Noble Prentice; *Halsey Ralph Ricardo; Henry Heathcote Statham; Sir Alfred Brumwell Thomas; *Paul Waterhouse.

Associate Members of Council.—Sidney Kyffin Greenslade; Charles Herbert Reilly; Harry Inigo Triggs; *Herbert Winkler Wills; Arthur Needham Wilson.

Representative of the Architectural Association.—Arthur Keen [F.].

Auditors.—John Hudson [F.]; William Henry Burt [A.]

THE STANDING COMMITTEES.

Art.—Fellows: Walter Cave; *Edward Guy Dawber; *William Flockhart; *Henry Thomas Hare; Gerald Callcott Horsley; *William Richard Lethaby; Robert Stodart Lorimer; *Edwin Landseer Lutyens; *Edwin Alfred Rickards; *John William Simpson.—*Associates*: *William Henry Bidlake; Thomas Davison; *Thomas Geoffry Lucas; *Walter John Tapper; *Septimus Warwick; Edgar Wood.

Literature.—Fellows: *Frank Thomas Baggallay; *John Alfred Gotch; Sir Charles Archibald Nicholson, Bart.; *George Halford Fellowes Prynne; *Halsey Ralph Ricardo; *Frederick Moore Simpson; Richard Phené Spiers; *Henry Heathcote Statham; *Charles Harrison Townsend; *Paul Waterhouse.—*Associates*: Frank Lishman; *Herbert Passmore; Charles Edward Sayer; Cyril Wontner Smith; *Arthur James Stratton; *William Henry Ward.

Practice.—Fellows: *William Henry Atkin-Berry; Howard Chatfeild Clarke; *Max Clarke; *Alfred William Stephens Cross; *George Hubbard; *Joseph Douglass Mathews; *Alfred Saxon Snell; *Henry Tanner, jun.; *Thomas Henry Watson; *William Woodward.—*Associates*: Kensington Gammell; *Edward Greenop; *Edwin Richard Hewitt; Herbert Hardwicke Langston; *Harry John Pearson; *Augustus William Tanner.

Science.—Fellows: *Harry Percy Adams; *Bernard Dicksee; *William Dunn; Frederic Richard Farrow; *Matt. Garbutt; *Francis Hooper; *George Hornblower; John Murray; *Charles Stanley Peach; *Herbert Duncan Searles-Wood.—*Associates*: *Henry William Burrows; Charles John Marshall; *Alan Edward Munby; *Digby Lewis Solomon; *Ernest William Malpas Wonnacott; *Ernest Alexander Young.

* Signifies re-election.

At the same meeting the following were elected to the Institute:

As Fellows: Ernest Robert Barrow, London; Arthur William Cooksey, London; William Bruce Dawson, London; Horace Gilbert, London.—*As Associates*: George Luard Alexander, London; Walter John Beall, Pietermaritzburg, Natal; Noel Waugh Hadwen, Kebroyd, Triangle, Yorkshire; Joseph Fearis Munnings, Government Architect, E. Bengal and Assam, Decca, India; David John Roberts, Erdington, near Birmingham; Hartley Sutcliffe, Melbourne, Australia; Edward Alexander Taylor, Wollstonecraft, North Sydney, N.S.W.; Morris Thompson, Doncaster.

THE ESSENCE OF THE HOUSING QUESTION.

The proposal to appoint a housing department for the city of Nottingham, to be managed by officials under the direction of the medical officer of health, shows a real determination to press on with the subject of housing reform. Public opinion is now, it appears, quite prepared for more effective action than has hitherto been possible, and in addition to this, the Housing and Town Planning Act has given greater powers and thrown greater responsibilities on to local authorities. Paid officials, whose sole duty it will be to attend to the subject of housing, will, in the opinion of a writer in a Nottingham paper, know a good deal more about it, and be less controlled by impulsive sentiment, than the amateur reformers, who only see one side of the subject, and that the least important side. But the question of housing reform, he continues, is both large and complex, and improvements will only be effected gradually. The people of this country have to learn much before it will be possible to make our country clean, and wholesome, and decent. Poverty is not by any means the only cause of bad housing, or even the worst cause. The difficulty arises with people who are either idle, or dirty, or vicious, and possibly all three. So far, it is possible to yield at least a modified assent to the Nottingham writer's proposition, but it is difficult to follow him when he declares that it is next thing to useless to provide such people with decent houses. He says "they do not want them—would not live in them if compelled to pay even a modest rent. They prefer their present conditions. This is where the chief difficulty comes in, and how long it will take to arouse the people of this country to a sense of its importance we do not know." This is only a specious half-truth. The writer has surely allowed his righteous indignation to blind him to the phenomena of interaction. While it is only too true that bad tenants make bad houses, the thing certainly works both ways. If it were not a well-ascertained fact that men are the creatures even more than they are the creators of their environment, the agonizing of the housing reformer were a vain exercise of the emotions. The action is reciprocal and mutual; and, in any case, you cannot reasonably expect to have clean and good people unless you provide clean and good houses.

The opposite view involves a policy of despair which is utterly foreign to the spirit on which the housing movement depends for its success. Lacking this vitalising moral force, the Housing and Town Planning Bill would have stood a poor chance of commending itself to Parliament and the country; so potent is the enthusiasm for humanity, and so general is the belief in physical means of moral betterment.

NOTES AND NEWS.

The Royal Automobile Club.

The daily papers have not yet grown tired of singing the praises of the new Royal Automobile Club. It "will be one of the seven wonders of Clubland, and the last word in commercial luxury." It will be the largest club in London, and "probably the most up-to-date in the two hemispheres." "Among the adjuncts of the club will be a magnificent swimming bath, about 100ft. long and 30ft. wide, of white marble. There are, too, in process of completion, three racket courts, a fencing-room, a gymnasium, business offices, a telephone exchange, assembly hall, photographic studio, post and telegraph offices, shooting range, Turkish baths, and a lawyer's office. There is also to be a ladies' restaurant. It it a five-floor building, and will contain about 40 rooms on the basement, 33 on the ground floors, while six will be sandwiched in a mezzanine floor, and 179 rooms will be split up in the five floors. The third and fourth floor will each take 50 of these rooms. Of the rooms, 95 will be bedrooms, and so the club will contain an hotel within its walls. The main entrance leads into a magnificent vestibule. The club dining-room and the club room will be on either side of this vestibule, and each of these will be 100ft. by 40ft. It has not yet been definitely decided whether the club journal will find a home in the new building, but if it does remove to Pall Mall, then the new R.A.C. will contain an efficient newspaper office within its walls. The kitchen will be of palatial proportions, and each department will have a room to itself, but everything has been arranged so as to be easily accessible, and on lines conducive to smart service. Two striking features of the club will be the magnificent terraces. One of these is above the assembly hall, and overlooks the Park and Carlton House Terrace. This is 132ft. by 32ft. On the ground floor level will be the main terrace, giving a promenade of over 200 feet." Of course, we cannot commit ourselves to all these superfine superlatives; but that we have nevertheless a very genuine appreciation of the merits of the club as a building will have been inferred from the fact that we long ago gave illustrated descriptions of it.

"Huddled Hospitals."

It is stated that, provided a sufficient sum can be obtained for the very advantageous site occupied by Westminster Hospital, the Governors would be very willing to put up a fine building elsewhere. For the site, though magnificent in its environment, facing as it does the Abbey and the Houses of Parliament, is not (as we have described it) "advantageous" for the purpose to which it is at present applied. The slums to whose doors it brought very necessary medical and surgical aid have now disappeared, and have been superseded by large public and commercial buildings, so that it may be said to be set in the midst of palaces. It still finds plenty of patients, its 210 beds being constantly occupied, but the removal of the hospital to a poorer and more populous district would no doubt be as "wise and right" as King Edward pronounced the removal of King's College Hospital from the vicinity of the Law Courts to the more appropriate district of Camberwell. According to the "Daily Mail," which has very usefully interested itself in the question of "Huddled Hospitals," the Committee of King Edward's Hospital Fund, who have a voice in the matter, are believed to be in favour of removing the Westminster Hospital to south-west London, somewhere between Battersea and Tooting, where the hospital accommodation is very inadequate to the needs of the vast aggregation of inhabitants. With the question of whether it is more convenient for great hospitals to be localised, or whether they are not really more accessible when centrally situated, we have for the moment nothing to do; but on architectural grounds we should certainly favour the change. Full advantage could then be taken of the opportunity for erecting at Westminster a noble building on an exceptionally fine site; and, besides, we might hope for the erection of a dignified hospital in the unutterably dismal region that stretches so drearily from Battersea to Tooting.

Torquay and its Pavilion.

It is stated that some of the ratepayers of Torquay are petitioning the Local Government Board in opposition to a scheme of the Corporation for the erection of a new Town Hall and Pavilion at an estimated cost of £45,000. This marks another stage in a somewhat uninteresting squabble. Torquay has not of recent years enjoyed the prosperity which one would expect in a seaside town with such unrivalled natural beauties, nor is its popularity among visitors anything like that of some of its neighbours—as, for instance, Paignton, about two miles away along the coast. The reason is that Torquay has done very little to deserve public patronage. In former times it was—if we may borrow a fashion-book word—a very modish town, and a considerable section of the inhabitants desire to keep it so. Royalty once patronised it; great men of art and letters forgathered in its borders. There are a large number of retired men and people of private means living in it who desire to be protected against the contamination of the "tripper," and they may be relied upon to oppose any project which would seem likely to encourage that class of visitor. The result is that Torquay provides attractions only for a fine day. On wet days there is no shelter and nowhere to go; and on such days, which, in the West of England, are neither few nor far between, even the respectable visitor and tourist must sit in his hotel or rooms and wait till the clouds roll by. It is reasonable to suppose therefore that that part of the community which must look to the visitor for a considerable part of its living is anxious to remove this reproach from the town; and that its endeavours, as crystallised in the Corporation scheme, are meeting with an opposition that is prompted quite as much by the reason given above as by the more politic plea of expense.

The L.C.C. Resumes.

At the first sitting of the London County Council after the Whitsuntide recess, Mr. Cyril Jackson, Chairman of the Education Committee, mentioned that the number of schoolchildren in London is not increasing in any large degree, but new schools had to be provided in order to accommodate those displaced owing to various causes. Mr. Lansbury complained of the non-provision of baths in elementary schools, and said that in this respect Germany was ahead of us. Miss Adler complained that the schools were not being modernised to the extent that they should be. The Education report having been disposed of, Mr. P. A. Harris moved that it be referred to the Building Acts Committee to consider and report immediately as to the steps to be taken under the Town Planning Act to preserve the essential features of Edwardes Square, Kensington; and that the President of the Local Government Board be asked to receive a deputation from the Council on the subject. He said it would be a real blot on London if any principle were set up which would permit of the closing of open spaces, such as the one under notice. Captain Swinton supported the motion, but remarked that Edwardes Square was not properly an "open space" in the accepted sense of the term, but was merely a big garden in connection with the surrounding houses. It was on those lines alone, he held, that "town planning" would succeed—it would only be by inducing landlords to lay out their property with fine open spaces on similar lines to those adopted by the first Duke of Bedford, who was the originator of town planning. Personally, he was of the opinion that the way to preserve open spaces was to refrain from taxing them, and that was the point he thought the Council should try to bring home to Mr. John Burns. This matter would be a big precedent for the whole of London, and he hoped it would be dealt with on these lines. Captain Swinton was suggesting an addition to the motion embodying his views in this respect when he was called to order by the chairman, and the motion, as proposed by Mr. Harris, was carried unanimously.

MEMORIALS TO KING EDWARD.

Proposals for memorials to King Edward are already very numerous, and it seems probable that eventually no town of importance will be without its monument to the late King. A few more or less definite proposals are enumerated below.

With regard to the proposal to build a new façade to Buckingham Palace as a memorial to King Edward, as suggested in "The Times" and as warmly approved in this journal, we gather that this project strongly commends itself to many of our leading architects and artists. Some considerable time ago, we urged that Buckingham Palace, never conspicuously beautiful or dignified, must inevitably suffer by the proximity of the stately monument to Queen Victoria, to which, probably, it will appear as a ridiculously mean and dowdy anticlimax. At the same time we admitted that there were difficulties in the way of reconstruction. There is always the question of cost; but beyond this there is to be reckoned with the natural and commendable reluctance to destroy a building that has acquired a certain sentimental sanctity from its close association with royalty. Moreover, destruction of the fabric might involve in ruin the many frescoes in which the interior is rich. On the whole, therefore, we think that the refacing of the Palace is a more feasible besides being a more easily practicable scheme, and we should be glad to learn that the authorities were giving serious attention to the proposal.

London.

At a meeting of the Corporation of the City of London at the Guildhall, at which the Lord Mayor presided, Mr. Deputy Wallace moved:—"That this court, profoundly conscious of the irreparable loss suffered by the nation and the corporation of this City by the death of their late King, Edward VII., do hereby resolve to mark in some permanent form their appreciation of his services to the country and to mankind at large." Mr. Deputy Millar Wilkinson seconded the motion, which was agreed to in silence. Mr. Deputy Wallace suggested that the further consideration of the matter should be postponed for a while, in order that they might have an opportunity of conferring with the Lord Mayor, and obtaining from him some intimation of his view and that of the corporation as to what form the memorial should take. In the course of some subsequent conversation, Mr. Kimber advocated the matter being at once referred to the special committee for consideration and report, a proposition which was seconded by Mr. Redding. Mr. W. H. Thomas, chairman of the Bridge House Estates Commitee, said it had been suggested to him that the proposed new bridge should be called King Edward's Bridge. The motion to refer the scheme to the special committee for consideration and report was agreed to.

With respect to the suggestion about the bridge, Mr. T. Lawrence Dale suggests that the new St. Paul's Bridge would offer an incomparably fine setting for a monument to our late King. The committee in charge of the bridge, he says, seem at present actuated by an unimaginative utilitarianism, but with this added incentive and the additional funds, by means of a competition open to all the architects, sculptors, and engineers of the British Dominions, might we not hope to obtain something truly worthy of the position and the purpose?

Lewisham is also moving for a memorial

Proposed Jewish Memorial.

A meeting has been held at the Jewish Working Men's Club, Whitechapel, to consider the question of a Jewish memorial to the late King Edward. Mr. Gordon presided over a large attendance. The Chief Rabbi moved the following resolution, which was carried: "That this meeting is of opinion that a suitable memorial should be raised to his late Majesty King Edward VII. by his Jewish subjects resident in East London, as a tribute to a monarch who was a peacemaker among the nations, as a King, and as the Sovereign in whose lifetime the Jews of the British Empire gained full emancipation and equality with non-Jews and enjoyed all the blessings of freedom. Further, that a 6d. fund should be established to enable all classes of the community to contribute, and this meeting pledges itself to do its utmost in carrying this proposal to the successful issue."

Cardiff.

At the opening of the annual exhibition of the South Wales Art Society at the Welsh Industries Association Buildings, Cardiff, Mr. J. M. Staniforth, who presided, referred to the desirability of having a permanent home for the society. There was a movement on foot in Cardiff just now to erect a monument in memory of the late King, and he would like to suggest to the gentlemen interesting themselves in that movement that a permanent art exhibition building in King Edward VII. Avenue in Cathays Park would be a most suitable and useful memorial.

Newcastle-on-Tyne.

A special meeting of the Council of Armstrong College, Newcastle-on-Tyne, has been held to consider the offer of a gift of £10,000 by Mr. J. B. Simpson, of Bradley Hall, Wylam-on-Tyne, for the purpose of developing the art department of the college. Sir Hugh Bell presided. For some years past the work of the art department at the college has been seriously hampered by the want of proper accommodation, and inspectors of the Board of Education have repeatedly reported that the rooms in which it is housed are insufficient for its proper progress and expansion. It is estimated that the cost of building a new school of art would be about £18,000. The council has offered a site and part of the cost of the buildings, and Principal Hadow reported that the remaining £10,000 required had just been offered by Mr. Simpson. Further contributions would, he said, be required for the maintenance and equipment of the buildings, but the main problem, that of providing the buildings themselves, might now be regarded as solved. It is Mr. Simpson's wish that the new buildings should be in some way connected with the name of the late King Edward, and the King has given his sanction to this proposal. The council expressed their gratitude to Mr. Simpson for his generous gift, and referred the matter to the Building Committee. It is understood that one of Mr. Simpson's objects is to stimulate the development of design in woodwork, metalwork, and other forms of art handicraft.

Pontypool.

The secretary of the Pontypool and District Hospital, Mr. Walter H. Hughes, has made inquiries of some of the medical men of South Wales and Monmouthshire relative to the proposal to establish a sanatorium as a memorial to the late King, and he reports a consensus of opinion in its favour. He has also communicated with several of the principal public men, and with one or two exceptions he reports they are strongly in favour of the memorial taking that form.

Liverpool.

A representative public meeting was held at Liverpool on June 7th, to inaugurate a town's memorial to King Edward. On the motion of the Lord Mayor, seconded by Sir Charles Petrie, it was decided to open a fund for the erection of a memorial to include an equestrian statue to his late Majesty. It was suggested that a sum of £25,000 might be raised. Lord Derby hoped the committee would consider no sum too small to receive in view of the universal grief of all classes at the death of King Edward. The subscriptions already promised include £250 from Lord Derby and £1,000 from Mr. L. S. Cohen, an ex-Lord Mayor of Liverpool.

Eastbourne.

The Highways Committee of the Eastbourne Corporation, on June 7th, adopted the suggestion that the Western Parades, extending from the Wish Tower towards Beachy Head, should be named King Edward's Parade. The question of erecting a statue or monument was deferred. The parades were opened by the late King.

Proposed Newmarket Statue.

At a meeting held in the Town Hall, Newmarket, to consider the provision of a memorial to King Edward, Mr. G. H. Verrall, M.P. for Newmarket, said a number of prominent patrons of racing had suggested to him that a statue of the late King should be erected at the entrance of the racecourse. Such a memorial at the metropolis of sport to the King of sportsmen would be not merely a local matter, but should receive world-wide support. A well-known baronet who had a residence at Newmarket had told him that on the first day he collected for such an object he would get £100 apiece from a number of sporting men. Lord Marcus Beresford had promised to ask King George's permission for the erection of such a statue, and the Earl of Derby, one of the most active stewards of the Jockey Club, quite approved of the idea. If the movement became a national and world-wide project, and the Jockey Club would take the lead, Newmarket must be prepared to take a back seat. He thought £5,000 or £6,000 might well be raised. A committee was appointed to decide upon a scheme.

Suggested "All India" Memorial.

Numerous suggestions are being received at Simla for the erection of a memorial to King Edward. It seems likely that contributions will be received from all over India, and that a statue will be erected at some central spot.

Montreal's Tribute.

At a mass meeting of English and French citizens held at Montreal, it was resolved, on the motion of Sir Thomas Shaughnessy, president of the Canadian Pacific Railway, and Senator Beique, that a statue "worthy of the fame of our beloved King Edward" be erected here. A General Committee was appointed, headed by Lord Strathcona, Lord Mount-Stephen, Sir Thomas Shaughnessy, and Sir Edward Clouston, to make the necessary arrangements.

Pembroke Dock.

The Executive Committee of the Victoria Nurses' Home and Meyrich Wards, Pembroke Dock, have resolved to erect an operating theatre to be known as the King Edward VII. Memorial Operating Theatre. The Secretary was instructed to send printed circulars to the chief residents.

MAGAZINES & REVIEWS.

The "Art Journal" is largely taken up, as is natural, with the Academy exhibition; but there is an article by Mr. Sketchley on the subject of "Holbein as a goldsmith's designer." If the designs engraved are all authentically Holbein's, they afford interesting proof of his talent in decorative design of this kind, and suggest the question whether some of the beautiful decorations in the costumes of his portraits may not have been designed by the painter himself, instead of being copied from the dress of his sitter. The most important of the works illustrated is a gold timepiece, with cupids supporting the dial, designed for Sir Anthony Denny as a present to Henry VIII.

In the "Burlington Magazine" Mr. G. F. Laking, who probably knows more about ancient armour than anyone else, writes an article on the Noel Paton collection of arms and armour now in the Royal Scottish Museum at Edinburgh, which appears to be very largely made up of spurious imitations—a painful truth which the writer had shrunk from telling during the lifetime of their enthusiastic collector. An article on the wall paintings in the *chaityas* at Ajantà, in India, by Mrs. Herringham, is accompanied by a photograph of one of these ancient and much-damaged Buddhist frescoes, which give a high idea of the beauty of these works, in spite of a certain naïvété of drawing.

The "Architectural Record" (New York) commences with an article on "The Architecture of American Colleges." The various stages of Columbia College buildings are curious. In 1790 it is a prim symmetrical façade with four pediments at equal distances, and an entrance door with a flight of steps under each of them; in 1857 it is a long low building with projecting eaves and rows of plain windows—the utilitarian phase, evidently. In 1879, "Hamilton Hall," one of its colleges, assumes much the aspect of English Collegiate Gothic; and at some date after 1893, when there was a special committee to consider the architectural questions, Hamilton appears with a monumental classic façade and a central portico of Ionic columns, at the hands of Messrs. McKim, Mead, and White, who also built the stately domed library with its decastyle Ionic portico. The same architects also, in the last years of the century, glorified New York University with a classic library in cross form, decorated with Corinthian columns and pilasters, so that the general progress seems to have been from simple and unpretending architecture of a more or less domestic type, to a grand display of buildings with columnar orders, which look rather Municipal than Collegiate. The same number contains an article on "Public School Architecture at Chicago," all the buildings being carried out by one architect, Mr. Dwight H. Perkins, who seems to have had a great architectural practice in this class of building, but to have ended by coming into serious differences with the scholastic authorities, apparently on a charge of extravagance in cost, and also of "insubordination," which probably means that he was an architect who liked to have his own way. There is a great deal of architectural merit in his buildings (of which the principal plans are given), but they have the same defect as the French Lycées, of looking stern and unhomelike (there should always be something of a domestic character about a school); this is especially the case with the best and most original, in a merely architectural sense, of the designs—the George W. Tilton school, which unquestionably looks more like a goal than a school.

There is an interesting variety in the contents of the "Berliner-Architekturwelt," from Herr Schulze's picturesque mediæval-looking house in the Wilhelmsdorfer Strasse, standing at the end of a street on the bank of a river or canal, to the ultra-modern Geschäfthaus in the Krausenstrasse, with its series of narrow moulded pilasters forming a series of stripes from the shop-cornice to the roof. A grim war memorial at Münster (Westphalia) comes into the scope of the magazine as being the work of a Grunewald sculptor, Herr Frydag (Grunewald is a suburb of Berlin); a ponderous circular stone erection on a spreading base, with some symbolic bas-relief sculpture around the middle portion. The thing looks barbaric, but it cannot be denied that the Germans put a certain significant power into war memorials of this kind, not out of keeping with their object.

The "Nineteenth Century" has a rather rambling article by Mr. Wedmore on "Some Tendencies in Picture-making," which represents some of the commonplaces of modern art criticism, together with a rather odd selection of some very mediocre pictures for special praise. Mr. and Mrs. Whishaw contribute a joint article on "Animate Life in Early Arabic Art." One object of the article is to show that the prohibition to represent animal forms in Mahommedan art was not so decisive or far-reaching as has been supposed, and that the Coptic artists who furnished the decoration of mosques for the Khalifs of Egypt introduced among their Arabesques, lions, griffins, human torsos, antelopes, peacocks, etc. A good many other examples are quoted of the representation of human and animal life in Arabic art.

To the "Fortnightly" Mrs. A. Tweedie contributes an interesting article of personal recollections of Orchardson. One of his remarks that is quoted is in regard to the present want of encouragement to painters and sculptors: "There is just as good talent as ever there was," he said, "if these millionaires would only encourage it and not pay vast sums for spurious old masters. You have only to call a thing *old* and it will be bought, but call the same thing *new*, and no one will even look at it." A good many of us are beginning to come to the same conclusion.

"Scribner," under "The Field of Art," has an article on "The Art of the Book-plate." The majority of the examples given, however, do not represent the true art of the book-plate, being far too pictorial in style, which is not the business of the book-plate. The style of the book-plate should be decorative and symbolical, and requires a special handling—one might almost say a special talent. Anyone can draw a small landscape in black and white and call it a book-plate. The symbolical book-plate is a more subtle affair.

In the "Antiquary" is an article by Mr. A. W. Clapham on the rather unexpected subject of "The Architecture of the Friars." So little is left of this that their part in mediæval architecture is almost forgotten. Yet there is documentary evidence that the church of the Black Friars at Endgate was a building some 300ft. long, and it is suggested in the article that it was the actual church described at length in "Pierce Ploughman's Creed," the anonymous fourteenth century satire. The article sums up a good deal of information on the subject.

COTTAGES ON THE WALKER ESTATE, NEWCASTLE-ON-TYNE.

(*See opposite and following pages.*)

These cottages were erected on the Walker Estate, and were awarded a silver medal at the recent North of England Model Cottage Exhibition. The walls are constructed of hard local bricks, 11in. thick, with a cavity in centre, faced externally with local red pressed facing, up to first floor level, and above covered with two coats of Portland cement and dashed with white spar. The roof is covered with Green's best French tiles and half-round ridge tiles. The whole of the windows are wood casements opening outwards. The total cost of the pair of cottages, including architect's commission, was £700. The contractor was Mr. James MacHarg, and the architect, Mr. Edward Cratney, of Wallsend, who also designed some other eight pairs of cottage on the same estate.

NEWS IN BRIEF.

It is expected that the Queen Victoria Memorial in London will be completed some time in May and June of next year.

* * *

With reference to the development of the site between Aldwych and the Strand, upon which work will shortly begin, a member of the syndicate has informed a representative of the "Daily News" that the greater part of the capital (a million sterling) has been guaranteed in France, and it is believed that there will be no difficulty in raising the remainder in this country. The plans, which have been passed by the L.C.C., provide for 110 shops. The building is expected to cost between £600,000 and £700,000. The site comprises 124,000 sq. ft. The theatre will seat about 800. The architect is M. Ernest Gerard, with whom is associated M. Duval. Offices have been opened at 167, Strand, overlooking the site.

* * *

The new buildings which have been erected by the National Children's Home and Orphanage Committee on a ridge of the Chilterns about a mile beyond Harpenden, as a sanatorium for children, were opened by Lady Wernher last week.

* * *

In our reference to recent appointments by the Local Government Board for Scotland, it was stated that the name of the gentleman appointed to the position of architect was "Mr. John Walker." The name of the architect is Mr. John Wilson.

* * *

A meeting of the metropolitan members of the Surveyors' Institution will be held at the Institution, at 2.30 p.m., on Wednesday, the 15th June, 1910, when Mr. Howard Martin, past-president, will open a discussion on the Finance Act. Meetings of provincial committees will be called by their respective chairmen, at convenient dates, for the same purpose.

* * *

The foundations of what is presumed to have been a Norman castle have been discovered at Castle Close, Wareham, in the course of excavating for a new house. The walls have been discovered at depths varying from one to three feet. These old foundations are composed of various local materials—Purbeck freestone and marble, Bagshot sandstone and large flints. The discovery supports the old tradition that a castle formerly stood here.

After a delay of thirty-seven years, the long-promised copy of Michelangelo's "David," the original of which was removed in 1873 from the front of the Palazzo Vecchio at Florence to the Accademia di Belle Arti, has been at last unveiled to the public on the spot where the original statue stood.

* * *

The Local Government Committee of the London County Council state that it has been brought to their notice that in recent issues of the Ordnance Survey Map the whole of Blackfriars Bridge and a part of the southern approach thereto had been shown to be within the City of London instead of only that part of the bridge to the north of the centre of the river Thames as hitherto. The committee are advised that the Acts relating to the bridge do not affect the boundary except so far as the structure of the bridge is concerned, and that the bed and foreshore of the river under the southern half of the bridge are not within the City of London. The Corporation, however, contended otherwise, and the Director-General of Ordnance Surveys decided to allow the boundary to remain as at present shown until the Corporation and the Council can arrive at an agreement. Efforts to arrive at an agreement having failed, a letter has been sent to the Director-General, objecting to the action taken in altering the marking of the boundary on the map without previously communicating with the Council, and suggesting that in future editions a note should be added that the boundary line at the bridge is in dispute.

* * *

Of the late Goldwin Smith it is recorded that his beautiful home at Toronto is "the only example of an English manor-house on the North American Continent." The political party formed through his influence was known as that of the "Grangerites," partly because his house was called "The Grange," and partly because its members were mostly grangers, or farmers; with perhaps a side-glance at the fact that, in the United States, a "grange" is a kind of trades union or secret association of farmers.

* * *

A subway has been constructed under the racecourse at Ascot, affording a passage between the five shilling stand and the grand-stand on the one side, and the carriage stand on the other.

* * *

The lofty granite obelisk at Boconnoc Park, Lostwithiel, Cornwall, has just been climbed, the first time for 171 years, by W. Larkins, the London steeplejack, who accomplished the task in three-quarters of an hour. The obelisk, which is 120ft. high, is being thoroughly overhauled, and a lightning conductor fixed, the whole of the work being executed without the aid of scaffolding.

* * *

The great thunderstorm which occurred at the beginning of last week, did a great deal of damage to property, besides causing several deaths. At the Church of the Annunciation, Chislehurst, the lightning stripped off a considerable portion of the roof. The roof of St John's Church, Aylesbury, was struck, and masonry was dislodged from the bell-tower. Chatham General Post Office was also struck. A panic was caused among the children at Napier Road School, East Ham, where a chimney-stack was struck, several chimney-pots falling into the playground. Houses at Acton, Fulham, Herne Bay, Windsor, Shipston-on-Stour, and elsewhere, were also struck. It is noteworthy that in most cases the chimneys were hit, and, even when the chimney-pots were not damaged, stoves and mantlepieces were smashed.

* * *

The severe earthquake that occurred on June 7th in the Province of Avellino was felt most severely in the towns of Calitri and Calabritto. It caused many deaths, almost all the buildings on the Rio Costella having collapsed, burying in their ruins many persons who at the time were in bed. At Vallati many buildings were ruined; and at Costel Boronia houses, churches, and business premises were damaged, some falling to pieces. It is reported from Foggia that cracks have appeared in the walls of Bovino Cathedral, a building of great architectural beauty.

* * *

An exhibition of the Home Arts and Industries, held at the Albert Hall last week, consisting mainly of women's work, included specimens of furniture and other woodwork; and it is stated that the society which organised the exhibition is anxious to receive the advice and help of professional men, especially architects, who could afford valuable guidance in other matters besides decorative treatment.

* * *

The new library of the Society for the Promotion of Hellenic Studies and the new offices of the British Schools at Athens and Rome, were open for the first time at 19, Bloomsbury Square, London, on Tuesday, June 7th.

* * *

The Local Government Board has decided to hold inquiries into proposed expenditure by public bodies as follows:—Electricity undertakings: Aldershot Urban District Council, £1,500 (June 14th); Portsmouth Borough Council, £24,000 (June 15th). Sewerage, etc.: Cheltenham Borough Council, £18,450 (June 15th); Seaford Urban District Council, £1,860 for refuse destructor (June 15th); Poole Borough Council, £1,500 for protective works at outfall (June 14th); Upton-upon-Severn, £1,900 for Powick (June 14th); Southport Borough Council, £6,000 for sludge pressing plant (June 16th); Birkdale Urban District Council, £25,000 (June 15th). Street improvements, etc.: East Barnet Valley Urban District Council, £1,130 (June 14th). Various: Teignmouth Urban District Council, for sea defences, no amount stated (June 16th); Bexhill Borough Council, £6,700 for sea defence (June 14th).

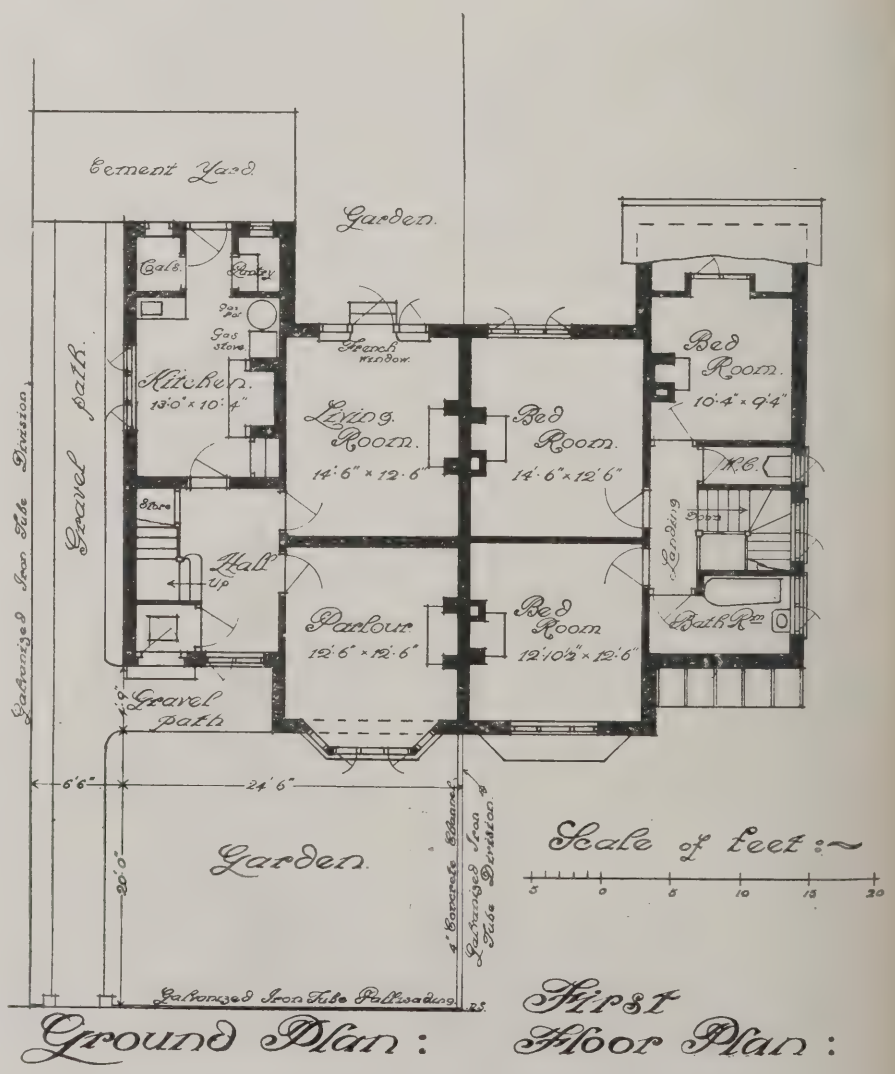
Government, is under the patronage of the King and Queen, and the president is M. Beernaezt, Minister of State and president of the Commission of the Royal Museums of Painting and Sculpture; while the organising commission of the exhibition is under the presidency of the Baron Descamps, Minister of Arts and Science. The offices of the British Committee (of which the chairman is Mr. C. H. Read, president of the Society of Antiquaries, with Mr. M. H. Spielman and Mr. A. G. Temple as honorary commissioners) are at Queen Anne's Chambers, Broadway, Westminster.

* * *

Between 30 and 40 members of the Northern Architectural Association, of which Mr. Charlewood is president and Mr. W. Milburn vice-president, paid a visit to Sunderland on June 4th. The afternoon was spent in an inspection of the New Children's Hospital, Durham Road, of which the architects are Messrs. W. and T. R. Milburn. The new hospital, which will shortly be opened for patients, is built on the pavilion principle, with every modern convenience, and has cost £15,000. The builder is Mr. John Huntley, of Sunderland.



* * *

Some 69 competitive exhibits were included among the 163 exhibits at the fourth exhibition of castings and models held by the Company of Founders last week, in the Ironmongers' Hall. The following awards have been announced:—For the best model of a medal for the Founders' Company—first prize (£20), A. Stanley Young; second prize (£5 and certificate), Agnes Kershaw Halliday; certificates of merit, Edwin G. Payne and Charles Pibworth. Class 1a, for the best casting—first prize, Arthur Huskinson; second prize, George Ellis; third prize, Samuel W. White. Class IIa., certificate of merit, E. R. Atkinson. Class Ib., first prize and silver medal, Mortimer Brown; 2nd prize, J. A. Jackson; third prize, Samuel W. White. Class IIb., first prize, George H. Ellis; second prize, Frank Theodore. Class Ic., first prize, H. E. Warren; second prize, F. W. Braddock; third prize, Thomas Benton; certificates, J. A. Jackson and A. Stanley Young. Class Id., first prize, A. F. Sysachman; second prize, J. A. Jackson; special prize, James Hanks. Class Ie., first prize, J. W. Wilkinson; certificate, Dora Bard. Class If., first prize, Dora Bard and G. Edwards Tucker; special prize, A. Stanley Young; certificate, A. E. Harford. Class IIf., first prize, G. Taylor; second prize, R. Pratchett; certificate, H. Finch.

LEGAL.

Ventilation of a Picture Gallery.

In the High Court of Justice, King's Bench Division, Mr. Justice Darling and a special jury heard the case of Power *v* Raikes and another, in which Mr. William Mailes Power, picture-dealer, of Victoria Street, Westminster, sued Mr. Robert Taunton Raikes and Mr. Charles Oury King for damages for alleged breach of contract and negligence.—Mr. Clavell Salter, K.C., who appeared for the plaintiff, stated that at the end of March,

COTTAGES ON THE WALKER ESTATE, NEWCASTLE-ON-TYNE: PLANS.
EDWARD CRATNEY, ARCHITECT.

1909, a picture-gallery was built for Mr. Power at the rear of his premises, Mr. King being the architect, and Mr. Raikes, a solicitor, acted as the contractor. Plaintiff alleged that about five weeks later it was found that some of the pictures that had been hung in the gallery had been injured by damp. There was a further claim for loss sustained through inability to let the gallery for exhibitions for about twenty-four weeks. It was alleged that ventilation between the picture screen and the wall had been omitted, contrary to specification.—Mr. Foote, K.C., who appeared for Mr. King, submitted that the claim was exaggerated. Mr. King had offered to relinquish his fees (£26 5s.) in consideration of the omission to make certain holes at the bottom of the screen, and it was contended that this sum was ample to cover Mr. Power's loss.—Mr. P. A. Robson, architect, said that for adequate ventilation a hot-water or hot-air system should have been adopted. Providing a heating system was employed, it was possible to hang pictures immediately in a new gallery.—Mr. Colefax submitted that there was no case against Mr. Raikes, as the specification did not mention any arrangement for ventilation, of whose absence complaint was made. Mr. Goddard, for Mr. King, said that it would have been impossible to dry the gallery by making holes in the screen only. It could only be dried quickly by artificial means. The inability to let the gallery for twenty-four weeks, in respect of which plaintiff claimed £252 damages, had, therefore, nothing whatever to do with the defect in ventilation. The only damage for which Mr. King was liable was the cost of effecting the necessary ventilation.—The jury found that in the building of the gallery there was negligence on the part of Mr. King, but not on the part of Mr. Raikes. They awarded plaintiff £45 damages against Mr. King.—The latter having already paid 100 guineas into court, his lordship gave judgment for both defendants.

CORRESPONDENCE.

The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

The Eighteenth Century Architecture of Bath.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—The views on Baldwin's detail expressed by Mr. Falkner in your issue of the 1st inst. touch but the fringe of the subject. It was the utter want of appreciation shown by the speakers at Mr. Mowbray A. Green's lecture for what I might style "metropolitan" architecture, which goes to prove how hopelessly insular in his conception of a city the average British architect is. The inability to grasp the essentials of civic architecture bodes ill for town planning in this country. One speaker was reported to have said: "There seemed to be a dull monotony about the streets of Bath. . . . Bath was almost Continental in appearance, and recalled some of the older parts of Paris." Apparently he started out to curse Bath, and ended by unconsciously blessing her altogether. Even his curse is unwittingly half-hearted. There is plenty of "dull monotony" in Bloomsbury: the orderly repetition of parts as is exemplified in the Royal Crescent, Bath, produces the most stately architecture the world contains. I well remember on my return from my first visit to Paris how hopelessly provincial London appeared to me. To some extent this is accounted for by the use of bricks, for the air of distinction which is common to all towns which are cities more than in name cannot be obtained in a meaner material than stone. Some fifteen years ago I was walking down the Rue Denis Pepin at Blois and it occurred to me that this little city of some 22,000 inhabitants possessed a street which would put to shame any thoroughfare in the world's greatest metropolis. If my memory does not deceive me, this street was perfectly straight—unlike the Mall, it cannot even boast of a hump in the middle! At one end the Loire is crossed by a noble bridge, and at the other the vista is terminated by terraced gardens surrounding the memorial of Pepin. I have long since forgotten its architectural details.

Our leading architects and art critics are at one in regarding Bath as the finest city in England, but I will refrain from quoting them. Let us hear what the educated layman has to say; and here I must digress for one moment to point out that the British public usually value things architectural in a city according to their size. The American who, on the occasion of his first visit to St. Paul's, exclaimed "Colossal! Mammoth!!" did not feel the least overwhelmed by its size; in fact, it is one of the last sensations that would be aroused in him. He knew what was expected of him, and his innate tact stood him in good stead! Now, Bath is not a large city as cities go in this country; suburbs included, her population is well under 100,000—about the size of Athens and her buildings are proportionate to her size. Hence, the testimony I here quote is all the more remarkable:—

"That beautiful city which charms even eyes familiar with the masterpieces of Bramante and Palladio." *Macaulay.*

"A superb city of noble and picturesque aspect . . . it is the most beautiful town in the kingdom." —*Madame Le Brun.*

"Few excel it for situation and none for magnificence of buildings."—*Waagen.*

"I am convinced that no city in the world, except Rome (when it was rebuilt by Nero) and Corinth, ever equalled the magnificence of Genoa. I am inclined to believe that Bath comes next, but immense the distance."—*Walter Savage Landor.*

And to come down to our own time:—

"It really is a splendid city. . . Then the streets, when you go into them, are as handsome and gay as London—gayer and handsomer because cleaner and in a cleaner atmosphere." *Edward Fitzgerald.*

"Bath, I am inclined to believe, is the most distinguished city to look at that we can show south of the Tweed."—*Walter Besant.*

"At once I acknowledge the superiority of the architecture to anything I had seen in Bloomsbury. At first it was Pulteney Street that captured my admiration. The facades were magnificent, but saved from being grandiose by the sincereness of their proportion and the delicacy of the ornament. . ."—*Urbanus Sylvan.*

Notice, please, that I have purposely omitted any reference that might be construed to refer to history or environment it is Bath architecture that comes in for such unstinted praise. Both Edward Fitzgerald and Walter Besant found Bath the most cheerful of cities, and should one be willing to allow that our leading architects and art critics are obsessed with a desire for gloomy grandeur in a city, can we believe that the educated laity love dull monotony? I think not.

Radlett, Herts.

Builders' Grievances.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

DEAR SIR,—In reference to the interesting article in your issue of June 1st, entitled "Builders' Grievances," I find myself almost wholly in accord with the opinions you express, with the exception of your remarks on arbitration.

On this point I fear you have to some extent misapprehended the situation. You state that "The real position of the architect is that of an arbitrator between client and builder," and whilst I now offer no objection to this definition, I would point out that disputes on building contracts very rarely arise between "client" and "builder": they are chiefly between "architect" and "builder."

With regard to disputes between client and builder, I agree that in comparatively few cases has any injustice arisen in

COTTAGES ON THE WALKER ESTATE, NEWCASTLE-ON-TYNE: VIEW FROM THE GARDEN. EDWARD CRATNEY, ARCHITECT

consequence of the architect having acted as arbitrator, but you must not lose sight of the fact that in adopting such procedure you are traversing one of the elementary principals of equity, viz., that in the event of a dispute between two parties, any person who is in the service or employment of either party for pecuniary consideration is disqualified from acting as arbitrator. One cannot disregard such a principle with impunity, and the practice cannot be justified even though in the majority of cases no miscarriage of justice results.

With regard to disputes between architect and builder, it is obviously undesirable, if not improper, that the architect should arbitrate.

Whilst I am fully in accord with your testimony as to the high character of architects in general, yet architects themselves do not claim to be infallible or immaculate, and consequently disputes may sometimes occur through the vacillation of the architect, or through oversight, or mistake, made by the architect or by his subordinates, for which causes the contractor may be involved in considerable expense, and a genuine difference of opinion might easily arise as to the extent of this extra expense.

Or there may be a dispute as to whether certain works executed by order of the architect are, or are not, included in the terms of the original contract, or in event of delay in completion of a contract a difference of opinion may arise as to whether this delay has been caused by the negligence of the contractor in performing his contract, or by the belated issue of the necessary drawings or instructions by the architect which has rendered it impossible for the contractor to complete his contract in the specified time.

Do you suggest that in such cases the architect should arbitrate? Should he not appear as witness rather than judge?

There is another aspect of the case that I fear you may have overlooked.

Does it not occur to you that a gentleman of high principle would be glad to be excused from the invidious task of delivering judgment on a case in which his own actions were involved? (In such a case a magistrate or a judge would retire from the bench.) Would he not regard with relief a clause in the building contract which transferred this onerous duty to some independent person who was in no way involved in the dispute and who was under no obligation (either real or superficial) to either party in dispute?

Pray do your best to dispel the unwarrantable delusion that the request for an arbitration clause in a building contract arises from any suspicion or want of confidence in architects. Such a request merely indicates the desire that business should be conducted upon the elementary principles of equity.

I may explain that my knowledge of the circumstances under which disputes arise under building contracts is the result of observation rather than experience, as my personal experience in this direction has happily been very limited.

BENJAMIN I. GREENWOOD.

London.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Your article certainly opens up a very wide field for discussion, and I appreciate the opportunity afforded to those who desire to ventilate their views upon this subject in the columns of the "Architects' and Builders' Journal."

While I am in full sympathy with you on many of the points raised in your article, I cannot agree with your view on others. I will therefore confine my remarks to the latter.

I do not believe there are many architects practising to-day who have any desire to become sole arbitrator between their clients (the building owners) and the builders. On the contrary, my experience is that they refuse to take up this position, and rightly, too, because now can it be expected that a man can arbitrate fairly upon a case or fault to which he himself may have contributed? He would most certainly lean towards the view held by him which probably led to the necessity of taking the case to arbitration. No man, in my opinion, is capable, however honourable he may be in his profession, of taking up such a position without laying himself open to very grave doubts. Personally, my experience is that the majority of architects are men of very high professional honour who deal fairly with those who deal fairly with them. I am afraid it is more often than otherwise the builder who is at fault through insufficient observance of the specification which the architect rightly demands should be reasonably carried out. Most of the railway companies appoint their chief engineer sole arbitrator in the contract, but this is not so objectionable since, if any mistake is made on the part of the architect or engineer, it is generally by a responsible official employed by the company other than the chief, who, when any case is presented to him, decides it upon its merits with an unbiassed mind. I have had some experience of this, and I have every reason to be satisfied with the impartial manner which appeared to govern the arbitrator's action in every detail.

The greatest trouble often arises when architects make a practice of taking out their own quantities. They cannot be expected to be so accurate in this work as a practical quantity surveyor; hence, many mistakes are made very difficult to cover, often leading to technical disputes. In such cases it would be unreasonable to expect the architect to give an unbiassed decision were he the sole arbitrator in the case; but to obviate the possibility of any such responsibility being cast upon the architect, let him, or his client, employ a quantity surveyor to take off proper quantities and thereby put an end to any quibbling, which so frequently happens under the above system.

I am pleased, however, to say that the majority of the leading architects never attempt to take off quantities, and I hope all other architects will in the near future follow the example of those who already engage properly qualified quantity surveyors for this purpose in the best interest, not only of their profession, but of their clients and the builders also.

W. THOMAS.

Cardiff.

Percentages off Quantities.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—I am sorry to trespass further upon your space, but feel I must reply to the letter of "E. H. D." in a recent issue.

It may be that taking a percentage off the whole account will result in much the same thing as adjusting the percentage correctly, but whether this is so or not depends entirely upon whether the variations on the contract are many or few, and in any case the quantity surveyor, holding practically a fiduciary position in the settlement of accounts (and in many cases being unknown to the building owner), it is his duty to be absolutely correct even to pence in defining the amount of money which shall be paid by the owner to the building contractor in final settlement.

I can see no objection to this deduction of percentage by a contractor, and have myself never had any friction on the question. The percentage question usually arises from the fact that after the contractors' estimator has priced the quantities and made up the summary, the contractor himself upon looking through the bills decides that taking all matters into consideration the prices will bear some slight deduction or addition, as the case may be, and proceeds to effect this on the summary by percentage, and there can be no injustice to the client in this method which is all clear and above board.

To go through the quantities and deduct the percentage from each individual price would involve enormous mathematical calculations (as for instance obtaining the correct price of an article at 2d. less 10 per cent), and to ask a contractor to produce, after sending in a tender, a clean bill compels him to make alterations in the original price, upon which his tender was based, and this I consider is not in accordance with the generally accepted conditions of contract and should not be allowed under any circumstances.

W. W. D.

Inter-trading Rule.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

DEAR SIR,—At the fourth annual Conference of Midland Centre Secretaries in March last, the following resolution was passed:—"That this Conference requests the Executive Council to prepare a report on the inter-trading rule and its working in those towns which have adopted it, and to circulate same among the Associations in the Centre where the rule is not in operation."

This resolution was approved and adopted at the last meeting of my Executive Council. As I am now anxious to prepare the report referred to, I should be much obliged if some of your readers, especially secretaries of master builders' associations, would kindly supply me with information that would be useful to me for the purpose indicated. I should be extremely grateful if those who have had actual experience of the working of the rule would favour me with particulars as to the results accruing from its adoption.

FRED W. AMPHLET.

Secretary, Midland Centre of the National Federation of Building Trade Employers of Great Britain and Ireland.

58, New Street, Birmingham.

[We have no doubt that Mr. Amphlet's request will meet with a ready response from those whom it concerns. Communications should be sent direct to his address.—ED.]

Licentiate R.I.B.A.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Referring to the letter in the Notes and News of your issue for April 27th, I wish to say that I most thoroughly agree with all that "A.R.I.B.A." says. In fact, he has put into words my own thoughts on the matter.

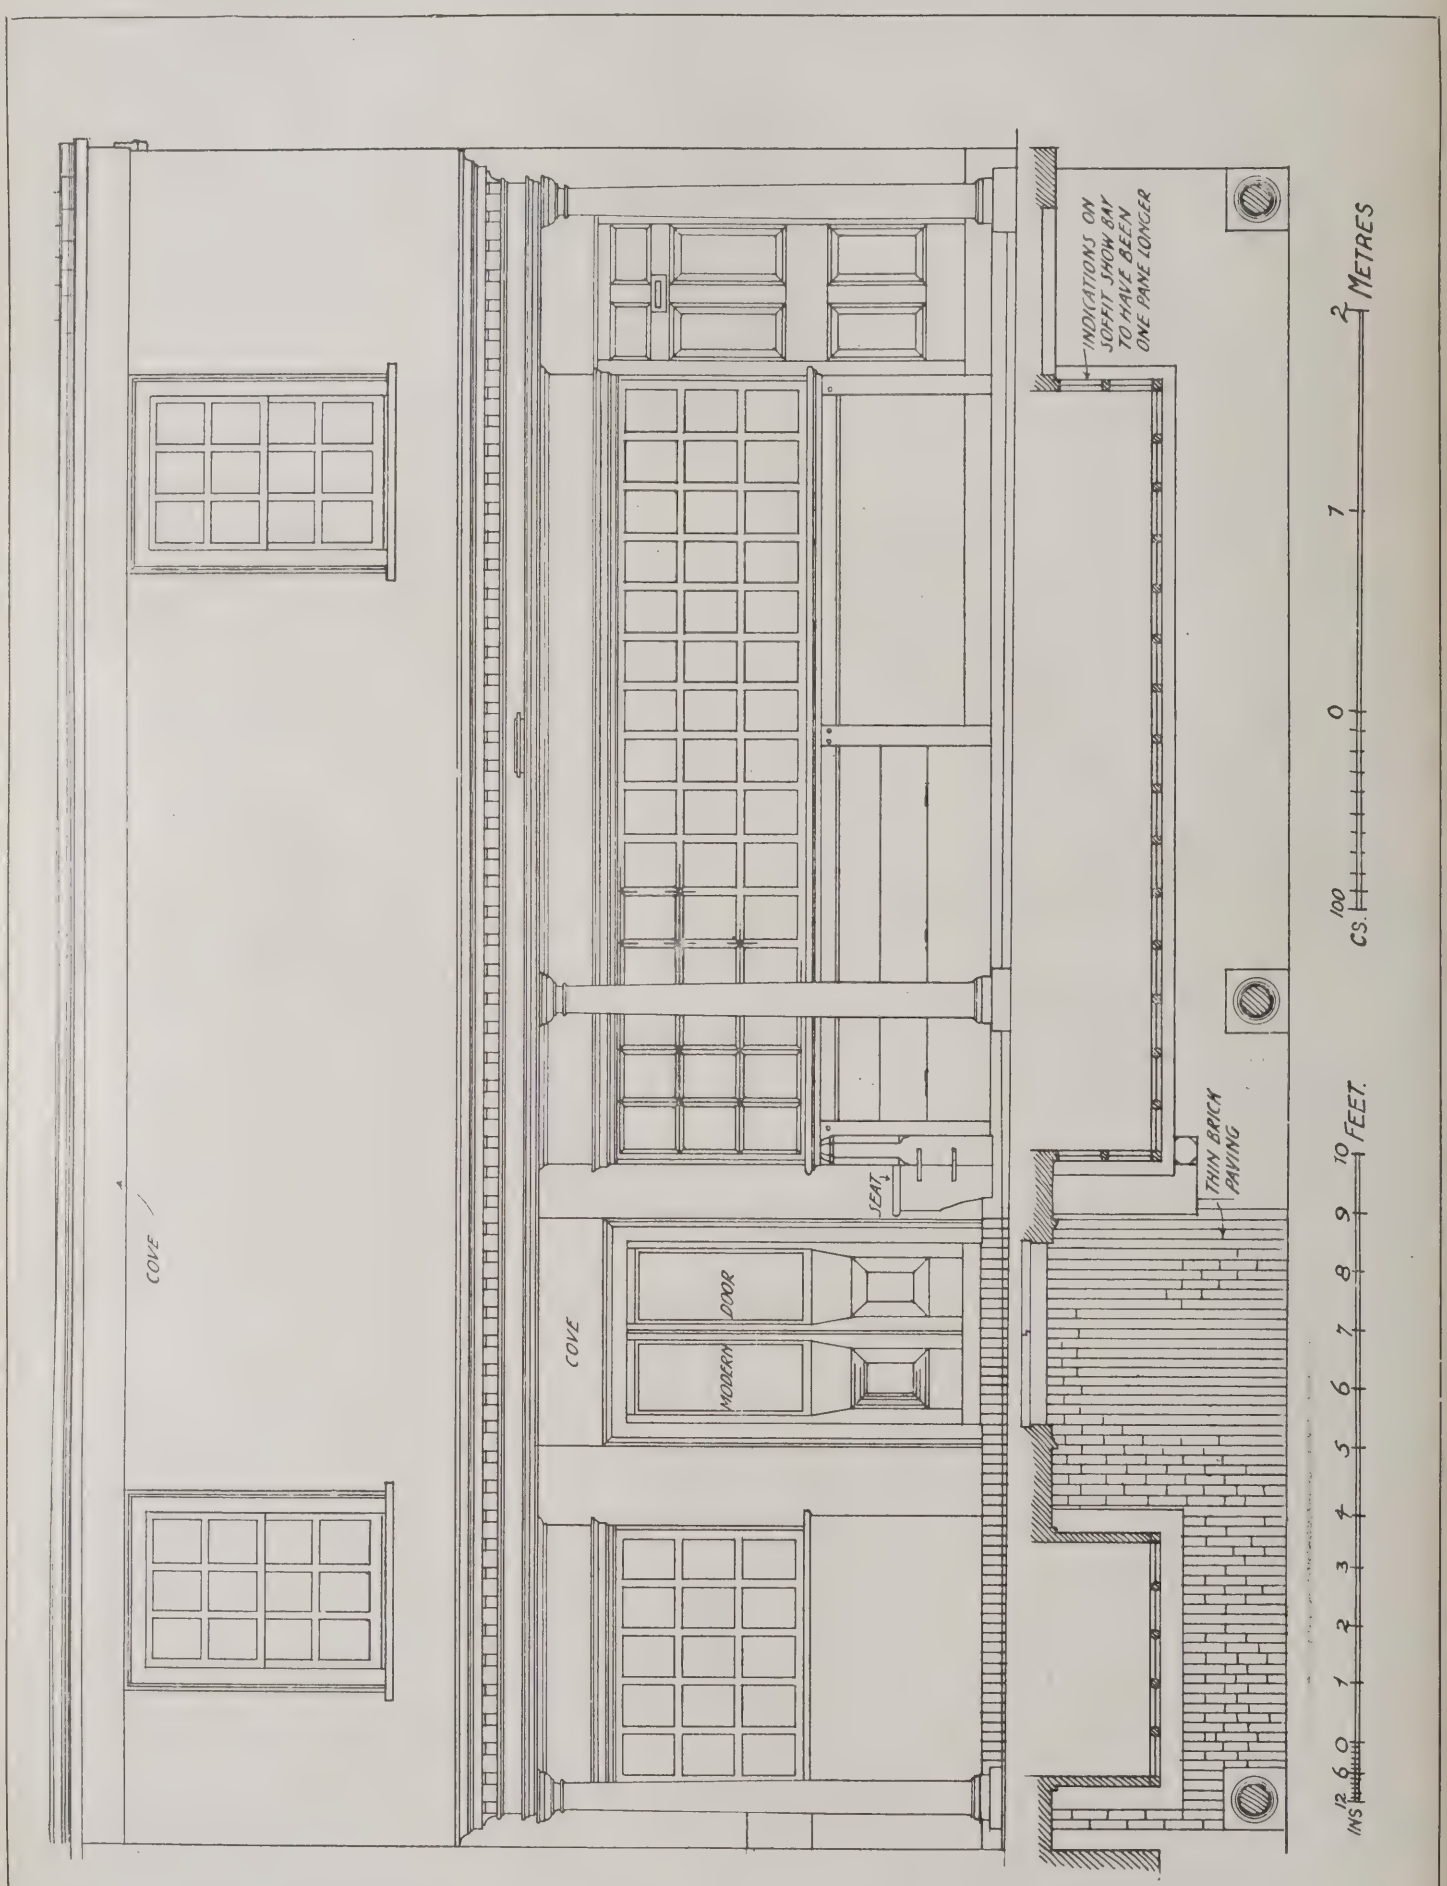
ANOTHER A.R.I.B.A.

Wolverhampton.

TOWN-PLANNING TOPICS.

Birmingham Suburbs. The General Purposes Committee, in their report presented to the Birmingham City Council on June 7th, state that they have carefully considered Part 2 of the Housing, Town Planning, etc., Act, 1909, with the view of advising the Council as to any action which should be taken thereunder. The district which appeared to first claim attention, and upon which the attention of the committee has been concentrated, was that comprising the parish of Quinton and the undeveloped portion of the parish of Harborne. It lies in the south-west corner of the city in the line of the prevailing winds, and is ripe for development. This must go forward immediately, and will either be carried out in the haphazard way of so many suburbs, which is open to grave objections of sanitation and public convenience, or development may take place on scientific lines now rendered possible by the Act of last session. The parish of Quinton has an area of 838 acres, and with the exception of the village in the north-west corner, a few houses abutting on the main road near Balden Road, and a few isolated farmhouses and cottages, is unbuilt upon. As soon as proper drainage has been provided, the committee are assured that building operations will commence in the district of Quinton. There will also before long be a great development in the neighbourhood of Harborne, where much land is ripe for building. The committee indicate in detail the requirements of the regulations in order to show that at the present stage the Council, by adopting their recommendation, would not be committed to anything more than conferences with the property owners, etc., in the proposed area. Many of the owners have already met the city surveyor, and the committee believe they will recognise that it is in their interests, as well as in that of the community at large, that the subject should be approached with a view to making a model suburb of this at present undeveloped area. The committee recommend that the Council should authorise them to serve and publish the necessary notices of their intention to apply to the Local Government Board for authority to prepare a town-planning scheme for the area comprising the parish of Quinton, and parts of the parishes of Harborne and Edgbaston, within the city, and a portion of the parish of Northfield, within the King's Norton and Northfield Urban District. Also that the committee be authorised to confer with the landowners and others interested, with a view to their reporting again at a later date, when the Council can decide upon the lines, widths, and directions of principal roads and other particulars required before an application to the Local Government Board can be definitely made.

The Recalcitrant Ratepayer. A proposal by the Enfield District Council to purchase a farm of sixty-two acres in the district for a public park is meeting with some opposition. The Council has applied to the Local Government Board for sanction to borrow £6,138 for the purpose, and the Middlesex County Council has agreed to contribute £2,038 towards the cost, which works out at £128 an acre. At a public inquiry held regarding the matter, it was stated that, whereas the rates were 6s. 8d. in the £ in 1891, they now amounted to 10s. 6d. in the £. An argument used in support of the acquisition of the land was that it should be cheaper for the district to buy it than that it should be used for the erection of cottages. The average rating of a cottage was £11, and the cost of education per house of that character was £2 17s. 7d. per annum, which meant a dead loss of £1 12s. 4d. each year to the parish.



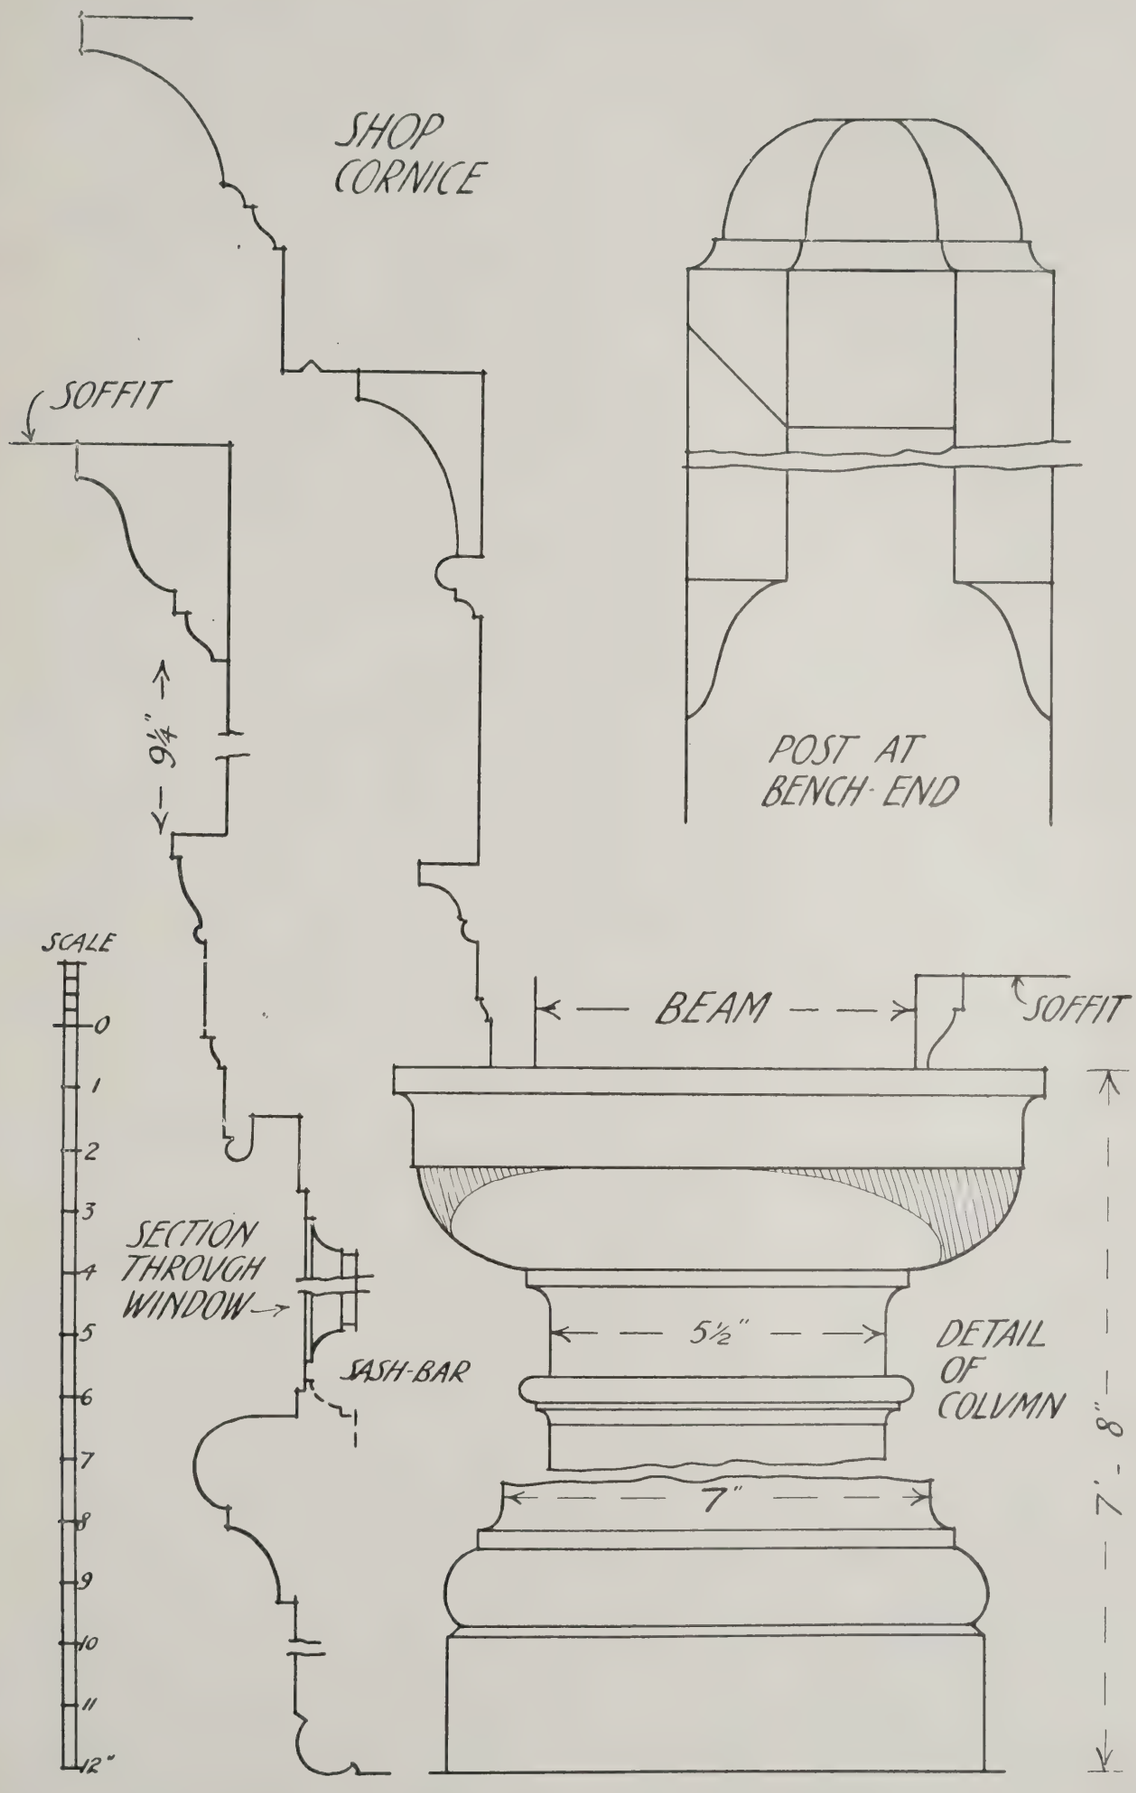
Transformation of Central Park, New York. It is proposed, almost immediately, to convert Central Park, New York, to purposes of much greater usefulness. A Special Committee has been appointed by the city to furnish playgrounds on an American plan which will not interfere with pedestrians, equestrians, and motor enthusiasts, but which will also cater on an unexampled scale for the children, who have so far, it is felt, been somewhat neglected. The playgrounds will furnish recreation in the way of swings, roundabouts, and gymnasiums for 10,000 little ones, and also wading pools, where the children can paddle without fear of being drowned. There will also be deeper pools, where children can learn to swim, nursery shelters, rests for mothers, milk depots, alfresco kindergartens, and such other devices as the benevolent and paternal Municipal Commissioners may think advisable. It is understood that all the milk sold shall be Pasteurised, and the cost will be the minimum.

A Middlesbrough Proposal. At a recent meeting of the Middlesbrough Corporation Streets Committee, the Borough Engineer (Mr. Burgess) proposed the preparation of a town-plan for land at Grove Hill. The area, about 120 acres in extent, is bounded on the south by the Asylum Farm, on the west by Martin Road, on the east by the North Eastern Railway, and on the north by Longlands Road. The resolution was carried unanimously.

Manchester Schemes. The Town Planning Committee of the Manchester Society of Architects have, during the past twelvemonth, devoted some time to further study of town planning, and the committee has now under consideration the preparation of a larger plan dealing with the main lines of extension on the northern side of the city. A scheme for the laying out of 150 acres of land at Blackley, which has engaged the attention of the city authorities, has received valuable assistance from the committee.

The Vienna Congress. The International Housing Congress at Vienna is over, and, says a leader-writer in the "Daily News," it may now be gathered how we compare with other countries in our handling of this important problem of social organisation. It is a little characteristic that though every other European State was officially represented at the Congress, this country was not, and there was an almost complete absence of any documents or illustrations of British activity. The conclusion might be drawn by a casual observer that in the matter of rational housing and town planning we are much in the rear; but that would be a good way from the truth. The proceedings, in fact, furnished very little material for the English housing reformer, which means that Englishmen have been the pioneers in this field, and still can teach more than they can learn. There are two directions in which housing reform has swept—there has been a reaction against the tenement, and there has been a growth of the conception of the ordered development of a city. To the evolution of these two fruitful ideas Great Britain has made the largest contribution. The tenement has its roots in a very ancient past. The Athenian probably lived in tenement houses, the Roman certainly did, and one has but to walk through an old city or an old quarter to know that the tenement dwelling was the mediæval type also. The tenement remains the feature of the Continental city, but it is the exception here perhaps because the chief outward burst of British cities occurred when an individualist philosophy was at its height. It would, however, be a mistake to believe that the tenement is a social institution in a sense in which the cottage dwelling is not. It is gregarious, but the flock that collects is fortuitous. It was not designed to express or cultivate any social ideal, but simply to pack as many human beings as possible into the smallest possible space. The cottage at least represents the idea of the family, which is a social unit. In the garden cities and the garden suburbs which have come into being of late years, Great Britain has made an attempt to build upon the cottage, and the family idea which it shelters, a large social institution, to make the homes of men image the harmony between the life of the family and the life of the city and the State.

The Edwardes Square Dispute. As mentioned in another part of the present issue, Mr. Harris has persuaded the London County Council to consent to his motion that it be referred to the Building Acts Committee to consider and report immediately as to the steps to be taken under the Town Planning Act to preserve the essential features of Edwardes Square, Kensington, and the President of the Local Government Board be asked to receive a deputation from the Council on the subject. At a meeting of the Kensington Borough Council the Law and General Purposes Committee reported, with reference to the closing of the carriage way of Earl's Terrace, Edwardes Square, by the Amalgamated Estates Company (the freeholders), that, "acting under the instructions given to them, the Council's solicitors, Messrs. Pontifex, Hewitt, and Pitt, have taken the opinion of counsel on the position as regards the roadway in question, and having had the opportunity of considering the opinion and other particulars before us, we have no hesitation in advising the Council to persevere in their claim that the road is a public highway vested in them, and that the public have the right of free user thereof. We have accordingly referred it to the Council's solicitors to take such legal action as they may be advised to protect the rights of the Council and maintain the public right of way over the said roadway." The Committee recommend that their action be approved by the Council, and that the conduct of the future proceedings be left in the hands of the Special Committee appointed on May 10th. This Committee, in reporting on the course they took in ordering the gates to be forced and the barricades demolished, state that after the 24th ult. they did not think it right or necessary to give instructions for the further demolition of the barricades, "it being evident that the legal question involved in the action of the company will have to be discussed in the Courts of Law."



GEORGIAN SHOP-FRONT AT BOXFORD, SUFFOLK. MEASURED AND DRAWN BY EDWIN GUNN, A.R.I.B.A.

This simple front probably dates from the middle of the eighteenth century, and its slender proportions—so suitable to the material (wood)—are rather reminiscent of "Colonial" work.

NEW BUILDINGS.

PROPOSED.

Central Ossett (Wakefield).—It is proposed to erect a new Baptist Church at a cost of about £3,000, which it is intended shall take the place of the present building. The church will be of stone and will provide seating accommodation for 750 worshippers, Messrs. John Mills and Sons, Derby, being the architects.

Dover.—New Artillery barracks, costing £16,000, are to be erected at Dover Castle.

Stourbridge.—The following plans have been approved by the Urban Council: Two houses and shops in Coventry Street; new elementary schools at the rear of the existing schools in Union Street; house in Witton Street; alterations and additions to the General Post Office in High Street; two houses in Bowling Green Lane; and a house in Ridge Street.

Stroud.—The Urban Council has approved the following plans: Sausage Factory at Union Street; dwelling-house at Stratford Road, Paganhill; dwelling-house at the Uplands; 20 dwelling-houses at Beard's Lane, Caincross Road; bay windows to the Oddfellows' Arms, Summer Street.

York.—It is proposed to demolish the old Church of Christ Church, King's Square, to carry out a necessary road widening, the surplus ground to be devoted to the purpose of an open space to be planted with shrubs and furnished with seats. It has been arranged that the Corporation are to pay the church authorities £500. There is considerable opposition to the scheme. It is also proposed to repair the tower of St. Sampson's at a cost of £1,700.

IN PROGRESS AND COMPLETED.

Elstow (Beds.).—The Bunyan Memorial Hall is in course of erection in this village, at a cost of about £1,600, and the foundation stone was recently laid. Messrs. Usher and Anthony are the architects.

Sheffield.—A new United Methodist Church is in course of erection in Stubbin Lane, near Firth Park, to accommodate 500 worshippers, at an estimated cost of £4,000, and the foundation-stones were recently laid. The building will be of brick, with stone tracings, and a Welsh green slate roof, Late Perpendicular being the style of architecture. Mr. F. W. Chapman, of Sheffield, is the architect.

Stroud.—The consecration of the new church at Uplands has taken place, the total cost being estimated at something over £7,000. Messrs. Gardner and Sons, of King Street, Stroud, were the contractors for the edifice, which was erected from the designs of Mr. Temple Moore, F.R.I.B.A.

Trent Vale.—The Trent Vale Church, the additions to which were consecrated by the Bishop of Lichfield recently, was erected in 1845 from plans by the late Sir Gilbert Scott. The additions comprise a new entrance porch, a nave, baptistery, and chancel. The old part of the church is now the south aisle, in which the altar is retained, and will be used as a chapel. The accommodation of the old building was 214, and, with the additions, will be 462. A new stone arcade divides the old part of the building from the new. The roof to the nave is open, and the chancel has a panelled wood ceiling. The nave seats are of kaurie pine, and the choir stalls are also, for the present, of the same material, but will be replaced at some future time by oak. The altar, communion rail, and pulpit are of oak, and have been executed by Messrs. Jones and Moss, of Newcastle. The windows are glazed with leaded lights with designs containing various symbols. The bosses to the whole of the arches have been carved with heads and foliage by Mr. W. Stevens. Externally the building is of local bricks and Hollington stone dressings. The builders' work has been carried out by the executors of the late Mr. J. Gallimore, under the supervision of Messrs. A. R. P. Piercy and W. F. Slater, acting as joint architects.

SOCIETIES' REPORTS.

Manchester Society of Architects.

The first of the summer visits of the Session, to Gawsworth, in Cheshire, took place on Saturday, the 28th May. Owing to the wet weather the attendance was small, and outdoor sketching was out of the question. The interior of the church, however, with its unique roof, which retains the original colouring, and the monuments of the Fyttons, was found very interesting, and the fine setting of the three old halls, the church, and the three lakes among the luxuriant spring foliage was very much appreciated. The great hall of the Rectory, with its fine timbering and roof open to the ridge, was also inspected. A passing visit was paid to Macclesfield Church, which has considerable remains of the original Perpendicular church, some fine Perpendicular and Jacobean tombs in the Savage Chapel, and a modern nave by Sir Arthur Blomfield.

On Tuesday evening, the 31st May, the visit to Bramhall was attended by over thirty members, under the leadership of Mr. Roger Oldham. The church of St. Michael and All Angels, the work of Messrs. J. Gibbons and Son, of Manchester, was first visited. The nave, chancel, and south aisle are now nearing completion, and a portion of the woodwork is in position. The drawings for the complete church, which provide for a tower, a north aisle, and an extension of the nave westward, aroused great interest. On leaving the church the party walked through the woods to Bramhall Hall, where they were met and conducted round the fine half-timbered hall by the owner, Mr. C. H. Nevill, J.P.

Edinburgh Architectural Association.

Members of the Edinburgh Architectural Association, to the number of upwards of forty, visited Broomhall, the seat of the Right Hon. the Earl of Elgin. Mr. J. P. Morton, the factor, conducted the party through the mansion, which dates from the eighteenth century, and is situated in an extensive and finely wooded demesne. One of the outstanding features of the house is the fine collection of Greek marble sculptures, about thirty in number. These include a celebrated Throne, with reliefs, from Athens; a large, richly decorated Sarcophagus, with roof-shaped cover, large sepulchral relief of Theogenes, Nikodemos, and Nikomachè, of the fourth century, B.C. One subject of great interest and beauty has no sculpture, the figures standing out (white) on a slightly coloured field. Another of small size is described in the "Journal of Hellenic Studies" as an excellent specimen of the beautiful style of the end of the fourth century. The pictures include examples of Velasquez, Teniers, Corregio, Murillo, Rembrandt, Leonardo da Vinci, Jamieson, Naysmith, and Raeburn. The attention of the visitors was specially drawn to two or three architectural pictures of Greek buildings by Lusiri, an Italian artist employed by a predecessor of the present Earl during his various journeys in Greece. On their return to Dunfermline in the evening, the members dined in the Royal Hotel. Mr. James B. Dunn, F.R.I.B.A., the president-elect, congratulated the leader of the excursion (Mr. Thomas Ross, F.S.A., Scot.) on the forthcoming honour of LL.D., which is to be conferred upon him.

The Cardiff, South Wales, and Monmouthshire Architects' Society.

The annual general meeting of members of the above society was held in their room, No. 6, High Street, Cardiff, last month, when Mr. Cecil L. Wilson, F.R.I.B.A., was elected president for the ensuing year, and other officers and members of the Council were also duly elected. The accounts of the society were shown by the hon treasurer to be in a very satisfactory condition, and a report was read by the hon. secretary (Mr. G. A. Birkenhead, M.S.A.) recording the various exhibitions of drawings held in the society's room, the various visits paid by members to works under construction, etc., and other matters of business transacted by the society during the past twelve months. Various suggestions were made as to the future work of the society, and there is a good prospect of interesting outings during the coming summer, and of instructive papers to be read at the following winter's meetings.

Institute of Metals.

Things Japanese being of particular interest at the moment, there was a large attendance at a general meeting of the Institute of Metals at Storey's Gate, St. James's Park, when Professor W. Gowland read a paper on "The Art of Working Metals in Japan." He said that the subject presented to the metallurgist and craftsman unique modes of dealing with metals and extracting and purifying them, and adapting them by simple processes to practical and ornamental uses. Gold, silver, copper, iron, and tin were the only substances recognised as metals proper by the early Chinese and Japanese writers. The Japanese were skilful washers of gold, and succeeded where modern methods could not be profitably applied. Gold on copper was used to ornament temples, and this led early travellers to imagine that there was a large quantity of gold in the country. Silver had been in use in Japan for many centuries. Copper was added to silver as an alloy. Silver was cast by being melted in earth furnaces with charcoal, and cast in linen moulds in water. Silver and copper articles were given the appearance of real silver by the outer surface having the alloy of copper removed. The art of the Japanese metal worker was best displayed in the peculiarly Japanese alloy known as Shakudo, containgold, silver, copper, lead, iron, and arsenic. It had deep rich tones of black, was capable of receiving a splendid polish, and was a perfect ground for inlaid designs of gold, silver, and copper, and for being similarly inlaid in tin. The Japanese made more numerous applications of copper than any other country. They had a simple furnace, blown by bellows, worked by eight men, who received a penny an hour. The furnace was put in the ground, and was so simple that prospectors might well use such a furnace with box bellows.

The Institution of Gas Engineers.

The annual general meeting of the Institution of Gas Engineers is to be held in the hall of the Institution of Mechanical Engineers, at Westminster, under the presidency of Mr. James W. Helps, M.Inst.C.E., engineer and general manager to the Croydon Gas Company, on Tuesday, Wednesday, and Thursday, June 14th to 16th. The president's address will be delivered at the opening of the proceedings, after which a paper on "Public Lighting from a Municipal Point of View," by Jacques Abady, of London, will be read and discussed. In the afternoon a meeting of the Joint Commercial Section of the United Kingdom will be held. After the annual general meeting of the Institution's Benevolent Fund on Wednesday morning, the report of the Gas Heating Research Committee is to be read and discussed, followed by papers and discussions on "Gas as a Universal Fuel," by Mr. H. L. Doherty, of New York, "Gas Calorimetry in the United States," by Mr. J. B. Klumpp, of Philadelphia; and "The Management of Small Gas Undertakings and Works," by Mr. F. J. Ward, of Knowle. On Thursday the report of the Institution's Carbonisation Research Committee, will be presented, after which papers on "Experiments in Carbonisation on the Birmingham Coal Test Plant," by Mr. William B. Davidson, of Birmingham; "The Latest Installation of De Brouwer Stoking Machinery and Coke Handling Plant," by Mr. S. Y. Shoubridge, of Lower Sydenham, are to be read and discussed, and the report of the Institution's Refractory Materials Committee concludes the technical programme of the meeting. A visit of inspection to the works of the Croydon Gas Company is to be paid on Friday, June 17th, the party proceeding in the afternoon to the Japan-British Exhibition.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries embodying questions which have been set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Composition to Resist Sulphur Fumes.

R. J. S. writes: "Kindly recommend a composition that will resist the fumes of sulphur. It is required for lining a bleach house, and should preferably be in sheet form with air-tight joints."

—The choice of a suitable material for lining the walls of a bleach house in order to prevent their corroding by the action of sulphur dioxide fumes depends entirely on the amount of money which can be devoted to this purpose.

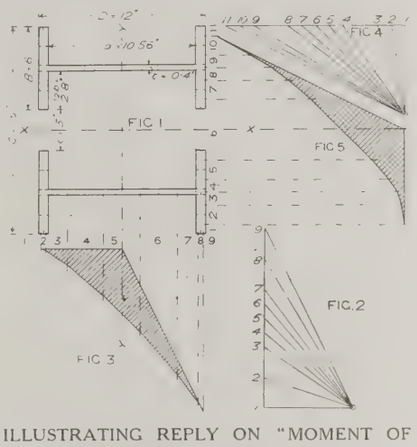
The ideal substance would be large sheets of glass with rubber strips behind and between the joints, the glass being held in position by stout pins of brass, the latter being covered with paint. A much cheaper material would be tar sprayed with moderate thickness on the present walls; but this might make the room too dark, though it is sometimes possible to spray whitewash on top of the tar.

In works where sulphur dioxide fumes are manufactured, the chambers are usually lined with lead, the joints being specially sweated and well overlapped, but this is necessarily a costly material, as very thin lead is useless.

Brickwork is usually satisfactory provided that the joints are covered with tar. Unless bricks are made of a poor material and are imperfectly burned, they are not easily attacked by the sulphur dioxide fumes, which chiefly destroys mortar.

Hence the mortar must invariably be covered by some non-resisting material such as glass, lead, or tar. S.

Overhanging Advertisement Sign.



E. H. W. (Isleworth) writes: "Please answer the following enquiry: A is detached private dwelling-house, whose frontage extends to north wall of B; B is a dairy shop; C is an advertisement plate fixed to B's wall, which forms the southern boundary of A [diagram not reproduced]. A objects to advertisement plate as being unsightly when viewed from his windows, and claims that whatever its thickness it overhangs his property and is therefore an encroachment; and on that ground he can compel its removal. Is A right? What steps should he take to enforce his right should conciliatory measures fail? "A" existed before "B" was used as a dairy, and the advertisement complained of was attached to B's wall. For what period must the advertisement exist before a right is established?"

—It is clear that to place an advertisement board in a position where it will overhang a neighbour's premises is to commit a trespass. In a case heard a year or two ago it was held to be a trespass to allow the branches of a tree to overhang, and an injunction was granted. To gain a prescriptive right the board would have to be in the same position for 12 years. An action may be brought for trespass (for which nominal damages will be awarded), and for an injunction which will be granted as a matter of course if the boundary is really overstepped. Careful enquiry should be made as to this before the action is launched. X.

Moment of Inertia of Rolled Joists.

P. L. C. (Southport) writes: "I shall be glad if you will let me know the formula for the moment of inertia of two 12in.×6in. R.S.J.'s×44lbs., as per sketch [not reproduced], on axis XX and YY."

The two rolled joists may be as shown in Fig. 1, but as querist does not give the distance apart they have been assumed 3in. apart, and the axes XX and YY are as marked by querist. The moment of inertia about the axis YY= $2\,(BD^3 - bd^3)/12 = 12\,(6\times12^3 - 5.6\times10.56^3)/12$ 630, and from the tables given in manufacturers' catalogues 2×315.3=630.6, the difference being due to the flanges being taken as rectangular by the formula, whereas in the true section they are not. The moment of inertia may also be found by the graphic method as follows: Divide the section up

ILLUSTRATING REPLY ON "MOMENT OF INERTIA OF ROLLED JOISTS."

parallel with the axis into any convenient number of parts and find the area and centre of gravity of each part. Draw lines parallel with the axis from each centre of gravity and number the spaces. Set off the areas as a load line in Fig. 2 and draw 1—0 at right angles to 1—9 and equal to half 1—9. Join 0 to the points on the load line and parallel with the vectors across their respective spaces construct the inertia area, Fig. 3. Then I=Aa where I=moment of inertia, A=area of section, and a=inertia area. For Axis YY, I=Aa=25.9×24.32=629.89, which is very near to the true resuult. The formula for the amount of inertia about the axis is $XX = (D-d)(C^3-c^3) + d(C-b^3)d - (b+c)^3/12$

$= (12-10.56)(15^3-3^3) + 10.56(15-5.6) - 10.56(5.6+3)^3/12$

$= 573$. Working graphically by means of Figs. 4 and 5, the moment of inertia I=Aa=25.9×22.1=572.39, which differs very little from the calculated result. To use a pair of rolled joists for a stanchion, it will be necessary to connect them either by lattice bars or plates. Henry Adams.

Rough-cast.

F. J. H. (Ashton-on-Mersey) writes: "(1) Can you give me a good recipe for rough cast? None of the text-books I have give a very full explanation. I have seen a lot of the usual ¾-in. Portland cement rendering, the coat of cement made with limestone chippings thrown in. Do you consider this a really good job? (3) Most of the text books give one or two coats ordinary coarse stuff, and their gravel and lime in fluid state. What do you think of this? Is lime good for external use? (4) I fancy the cement one I have mentioned is the better job, but I want to get a finish that can be whitewashed or coloured periodically, and of course one would not do that over limestone chippings; and again, does not Portland cement kill colour? (5) What I really want is a good protective and pleasing finish at a reasonable cost, and none of the text books seem to go fully into the matter. The plasterers themselves all appear to have very different ideas."

—Taking your questions categorically, (1) the best rough-cast is made by using a mixture of cement with three parts of its weight of sand, this being plastered on the wall in a layer about ¾in. thick. Gravel or pebbles may then be thrown or "dashed" on to this layer whilst it is still soft. It is not satisfactory to mix the gravel or pebbles with the cement. Instead of cement, ordinary lime mortar may be used, and is somewhat cheaper. (2) The material dashed on to the cement mixture may be of any composition. Limestone chippings, gravel, shingle, spar, pebbles, or sand all being used with equally satisfactory results in different cases. Of course, if a relatively smooth surface is required, chipping or pebbles cannot be used; the pieces are too large and must be replaced by sand or the "dashing" omitted altogether, the wall being simply plastered. (3) It is not good practice to use either the gravel or lime in a fluid state, except under special conditions. They should be wetted thoroughly, but should be distinctly "solid," the only object of the water being to make them adhere better to the plastered surface. Lime may be used if it is weather-resisting, and is employed hot, but it is mixed with the plaster and not dashed on afterwards. (4) To produce a surface which can be whitewashed or coloured periodically it is best to use a cement-sand mixture as in (1) with no dashing. If white clay is used along with the whiting used for whitewashing the surface, a coating between the colour-wash and the cement is obtained, which will usually preserve the colour. There are some colours not affected by cement. Ask your dealer about these. In any case the action of the cement is overcome after about three coats of colourwash if each is dried thoroughly before the next is applied. (5) For its low cost and effectiveness in keeping the damp out of buildings, there is nothing so good as the cement-sand mixture referred to above. The particular surface given to it will depend entirely on the material (if any) which is dashed on afterwards, or whether the walls are simply rendered in the ordinary plasterer's manner. A. B. S.

Bakers' Ovens.

X. Y. Z. (Golspie) writes: "Can you recommend any book dealing with the construction of bakers' ovens, or give particulars of any articles on the subject?"

—No book dealing with bakers' ovens has ever been published to our knowledge, and we know of no articles upon the subject. The ordinary cottage oven for baking consists of a closed chamber paved and domed in brick. There is an open flue immediately over the opening to take the smoke, which would otherwise come straight out of the door into the room. This flue connects with the main chimney flue higher up, and there are no special details necessary beyond the provision of a sufficient draught to cause the smoke to travel up the flue. The only iron fittings consist of a flat plate furnished with handles for removing it. It merely rests

against the framing, and is not hinged or fastened unless there be lugs to keep it securely in its position in the throat of the oven mouth. B. J.

Girder Fixed to Stanchion.

F. P. W. (Harlesden, N.W.) writes: "Kindly give me your opinion on the following: A 14 by 6 R.S.J. 20ft. span, carrying a distributed load of 25 tons, is cleated to a 6 by 5 stanchion, 14ft. long, fixed at both ends. It is claimed that the girder is perfectly fixed and a bending moment of $\frac{wl^2}{12}$ has been taken. Am I right in presuming that the difference of the bending moments betweeen $\frac{wl^2}{8}$ and $\frac{wl^2}{12}$ is picked by the stanchion and consequently introduces a bending moment on it? How should this be calculated graphically and mathematically?"

—This query raises a point which is rather difficult to answer definitely, and which is generally passed over. Girders with cleat connections at their ends are nearly always treated as freely supported, i.e., the additional given by fixing the ends is neglected. For the beam to be treated as fixed, its ends must be very securely fixed in direction, because the amount of play necessary to allow it to act as a simply supported beam is extremely small. Assuming for the moment that the ends are to be considered as fixed, we get B. M. diagram shown in Fig. 1.

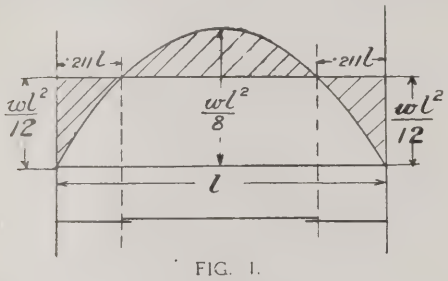


FIG. 1.

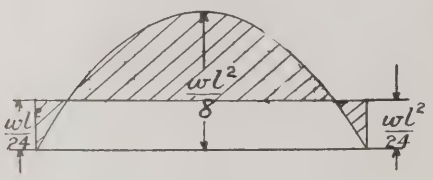

FIG. 2.
ILLUSTRATING REPLY ON "GIRDER FIXED TO STANCHION."

From this it is clear that the fixed beam is equivalent to two cantilevers of length .211l supporting a simply supported beam at the centre as indicated below the B.M. diagram. In this case the B.M. transmitted to the stanchion is $\frac{wl^2}{12}$ the case being similar to that of a stanchion with an overhanging bracket. The calculations for the stanchion are then usually carried out as follows:—First find the stress in the stanchion due to the bending moment; this we will call f_b. Next find by means of Rankine's or some other column formula the safe central load per sq. in. for the given stanchion. This we will call f_p.

Then $f_p - f_b$ = Permissible load on stanchion per sq. in. allowing for the bending moment.

In the given case $\frac{wl^2}{12} = \frac{25 \times 20 \times 12 \times 20}{20 \times 12} =$ 500 in. tons.

From the table of standard sections we see we see that for a 6″×5″ I section, A=7·35 sq. in.; Z=14·53; R=2·43, Z and R being about a central axis perpendicular to the plane of the paper.

$\therefore \int_b = \frac{500}{14 \cdot 53} = 34 \cdot 4$ tons per sq. in.

This is obviously too much.

Try a 16″×6″ section; for this A=18·23, Z=90·71, R=6·31.

$\therefore \int_b = \frac{500}{90 \cdot 71} = 5 \cdot 52$.

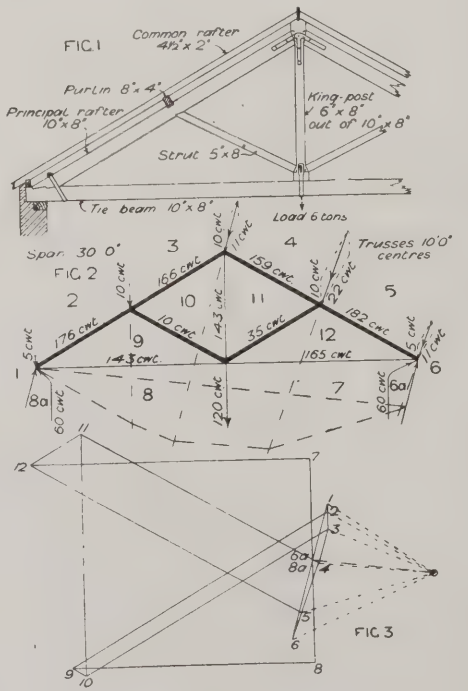
The length of the stanchion is 14ft., fixed at both ends.

$\therefore C = \frac{L}{2K} = \frac{7 \times 12}{6 \cdot 31} = 13 \cdot 3$.

$\therefore$ Taking Rankine's formula $\int_p = \frac{6}{1 + \frac{C^2}{6000}}$

$$\int_p = \frac{6}{1 + \frac{13 \cdot 3 \times 13 \cdot 3}{6000}} = \frac{6}{1 \cdot 03} = 5 \cdot 82 \text{ tons per sq. in. nearly.}$$

$\therefore f_p - f_b = 5 \cdot 82 - 5 \cdot 52 = \cdot 3$ Tons per sq. in.



$\therefore$ Safe loan on stancheon $= 18 \cdot 23 \times 3 = 5 \cdot 5$ tons nearly.

The stanchion is still a little too light by this method of calculation, but would probably be quite satisfactory. Returning to the question of the fixing of the ends of the beam, the B.M. diagram will probably in practice be somewhere between that for the freely supported beam and the fixed beam. Fig. 2 shows the B.M. diagram for a beam which we may term "half fixed." In this case the B.M. transmitted to stancheon is $\frac{wl^2}{24}$. The writer believes that this is occasionally used. A.

Roof Truss with Hanging Load.

G. P. (Rensueth) writes: "Kindly inform me if the roof as sketch [not reproduced] is in order. The roofing is 300ft. long, and has roof principals every 10ft. You will see it is compulsorily a wood roof. There is also a runner to be fixed to the centre of the tie beams to carry a load of 6 tons. I shall be glad if you will illustrate: How to calculate the weight per foot pressure, how to ascertain the various stresses, how to determine the size of the timbers."

—The sketch submitted shows a type suitable for twice the span and not convenient for the present case. Trusses of the usual types are constructed for a top load, while in this case the chief load will be hanging from below. As the truss must be constructed of wood, a king post form may be adopted as in Fig. 1. The frame diagram will be as Fig. 2, and the stress diagram as Fig. 3. For the principal rafter with a maximum stress of 182 cwt. and supported

ILLUSTRATING REPLY ON "ROOF TRUSS WITH HANGING LOAD."

length of 8ft. 6ins., try a 10-in. by 8-in. section. Then

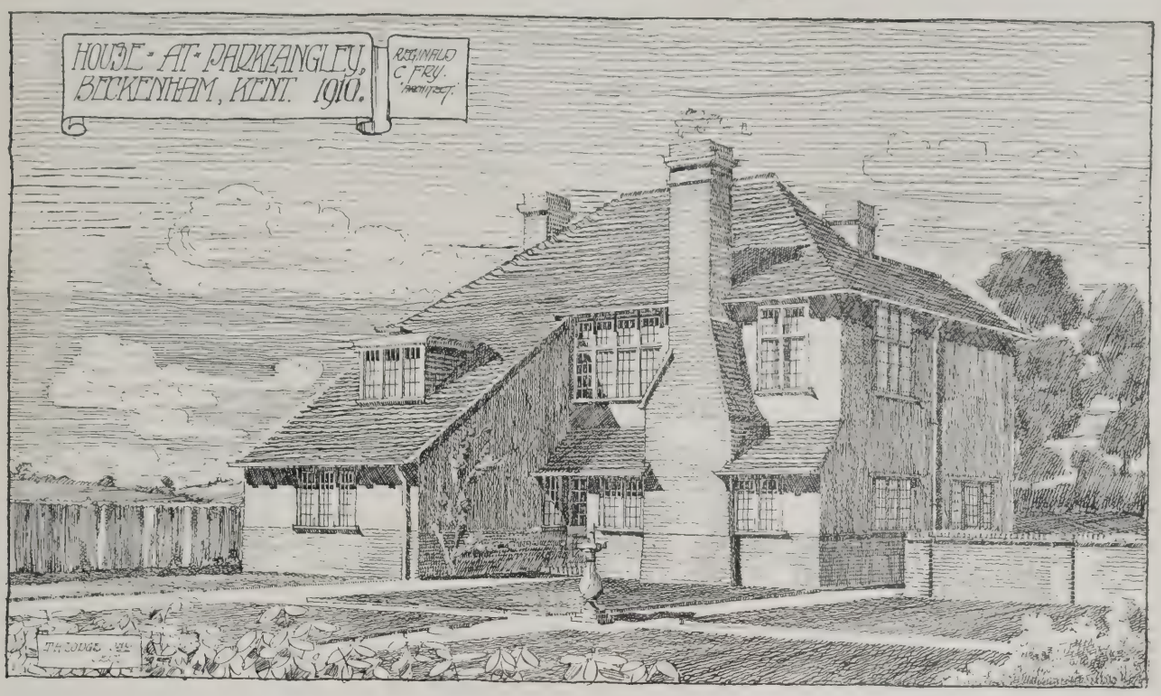
$$W = \frac{fS}{1 + \frac{m}{nq}\left(\frac{l}{d}\right)^2} = \frac{6 \times 80}{1 + \frac{2 \cdot 5}{1 \times 250}\left(\frac{102}{8}\right)^2} = 183 \text{cwt}$$

For the struts with a maximum stress of 35 cwt. and length of 8ft. 6ins., try a 5-in. by 8-in. section, then

$$W = \frac{6 \times 40}{1 + \frac{2 \cdot 5}{1 \times 250}\left(\frac{102}{5}\right)^2} = 48 \text{ cwt.}$$

Allowing 3 tons per sq. in. tension, the tie beam will require a net affective area of $\frac{165}{3} = 55$ sq. ins., which will be given by a 7-in. by 8-in. section, if there were no junctions, but this should also be made 10ins. by 8ins. The king post requires a minimum sectional area of $\frac{143}{3} = 48$ sq. in., or, say, 6ins. by 8ins. out of 10ins. by 8ins. The purlins will have to carry, say, 24 cwt. distributed, then $\frac{bd^2}{L} = 24$, or $\frac{bd^2}{10} = 24$, whence $b\,d^2 = 240$, say an 8-in. by 4-in. section. The runner must be carried by bolts through tie beam on each side of king post, not through centre.

Henry Adams.



Building Agreement.

Distracted (Thames Ditton) writes: "I have purchased a plot of ground 28ft.×15ft., and one of the stipulations in the agreement is that no house on this part of the estate is to cost less than £450. I have submitted plans to the estate surveyor in accordance with clause in the agreement, and he cubes it up and prices it at 4½d., and my design does not come to the £450 at 4½d. He therefore refuses to pass the plans, notwithstanding the fact that if built according to my specification, the house cannot be erected for much under 7d. per cubic foot. It is practically impossible to build a more convenient plan than mine on a 28ft. plot, and the elevation has a frontage of 23ft. 9in., I having designed so as to get light from both front and back. The estate surveyors suggest two methods whereby I could increase the cost, but it seems to me that to adopt plan 'A' (not reproduced) is to build a kitchen which will be so dark as to be uninhabitable should the next house be built right up to my boundary. To adopt the other suggestion 'B' (not reproduced), keeping the kitchen at the back, is to spend the extra £100 in a lot of useless dark passages. The agreement states that the costs are to be the net amount involved in materials and labour, but the estate surveyor argues that builders' profit is not labour. He also states that he alone is to estimate as to cost and he prices at 4½d. or 5d. at the most.

"What is my position if I build without getting plans passed by the estate surveyor? Can I build right up to my boundary, even though I am obliged to block out some light from the next house already erected?"

—It is not easy to answer these queries without having access to the agreement—which is apparently in the nature of a building lease. It is clear law that if a man agrees to build a house to be approved by the landlord (or vendor), or his architect, the stipulation must be complied with; the architect in such a case being appointed sole judge. So it has been decided that where there is a condition which is clearly expressed making the architect the sole and exclusive judge in all disputes which may arise in consequence of breaches of the conditions in the agreement, the lessee will be bound by his determination *Roberts v. Bury Commissioners*, L.R. 5 C.P., 310). Having this principle in view, the decision of the surveyor would seem to be final. Although the tenant may desire to build in one way, he must accept the surveyor's suggestions if he is to build in accordance with the agreement. As to the meaning of "labour," the decision of the surveyor on this point also appears to be final.

With regard to the proposal to build up to the boundary line, there is nothing (so far as one can see) to prevent this. The adjoining owner may object, but he has no legal right to prevent his neighbour from building on all his property. X.

This house is designed to occupy a site on the southern side of a road at Parklangley, the new garden suburb at Beckenham, Kent, running east and west. The house is designed to present a typical Sussex exterior. The Architect is Mr. Reginald C. Fry, of London.

VIEWS AND REVIEWS.

*Theory of Structures.**

At the end of 1903, Mr. R. J. Woods, M.E., M.Inst.C.E., Fellow and formerly Assistant Professor of Engineering at the late Royal Indian Engineering College at Cooper's Hill, wrote a book entitled "Strength and Elasticity of Structural Members." That work has obtained considerable success as a manual for students in technical institutes and engineering colleges. It certainly was very clearly and ably written, the chapters originally being compiled as a series of lectures to students at Cooper's Hill. The favourable reception given to the former work has led the author to write this present volume on "The Theory of Structures." Though self-contained and independent, it really forms a continuation of the former work, suitable for more advanced students and draughtsmen engaged in structural design. There is a good deal of duplication, for the elementary principles and formulæ of the former book are extended and utilised for the determination of the stresses in, and the design of, masonry and steel structures, and this book thus shows more their application to practical problems. The book is replete with examples from practical designs worked out in detail. The two books traverse very closely the course in theory of structures at the City and Guilds of London Central Technical College, South Kensington. The one now under notice is very suitable for such engineering colleges, and in preparing for examinations, but at the same time it will be found a useful work of reference for engineers and architects.

We can heartily commend it, though we would wish to see it incorporated in the same cover as Mr. Wood's first book.

The concluding chapter is devoted to reinforced concrete, but it practically merely follows the R.I.B.A. Report, and is of very elementary character.

*"The Theory of Structures," by R. J. Woods, M.E., M.Inst.C.E. London: Edward Arnold, 41 and 43, Maddox Street, W. Price 10s. 6d. nett.

*Books on Reinforced Concrete.**

Cheap books for the student of reinforced concrete are to be welcomed if they treat the subject fairly thoroughly, and with discernment. The publisher of this work is well-known for issuing architectural books of goodly size at a low price, and he has performed a service in issuing Mr. Rings' book at the low price of 7s. 6d. net, at which it should prove popular with architectural students. We note with interest that the author is the first book writer to use the Standard Algebraical Notation of the Concrete Institute for his calculations, and it certainly makes the text so clear that "he who runs may read." Every symbol is logical to the English reader, and there is but little need to use the key which has wisely been put both back and front of the book, the first in a fold-out sheet so that it can be by the side of the reader while studying the formulæ.

The author has not attempted any great novelty or put forward any very original suggestions in this work, but has solely been concerned with summarising the practice and best established theory of the subject. The book is intended more for students of architecture, though the author hopes to appeal to the young engineer also. After an introduction on the history and advantages of reinforced concrete, chapters are devoted to the materials employed, their proportioning and manipulation, and the execution of work. Then follows a chapter on loads, moments, and various applications of reinforced concrete to structures of many kinds. Next comes a chapter on continuity, coefficients of expansion, moduli of elasticity and safe stresses, followed by chapters explaining formulæ for slabs, beams, ribbed floors, shear stresses, columns, and arches. There is a chapter descriptive of most of the patent bars and systems on the English market, and the work is concluded by memoranda and tables (among which we notice an error on p. 149 in recording the weight of a cubic foot of steel). In a pocket at the end of the book an ingenious ready reckoner for calculating the reinforcements in slabs and rectangular beams is given, but we do not think it nearly so serviceable as graphs would be to the practical designer.

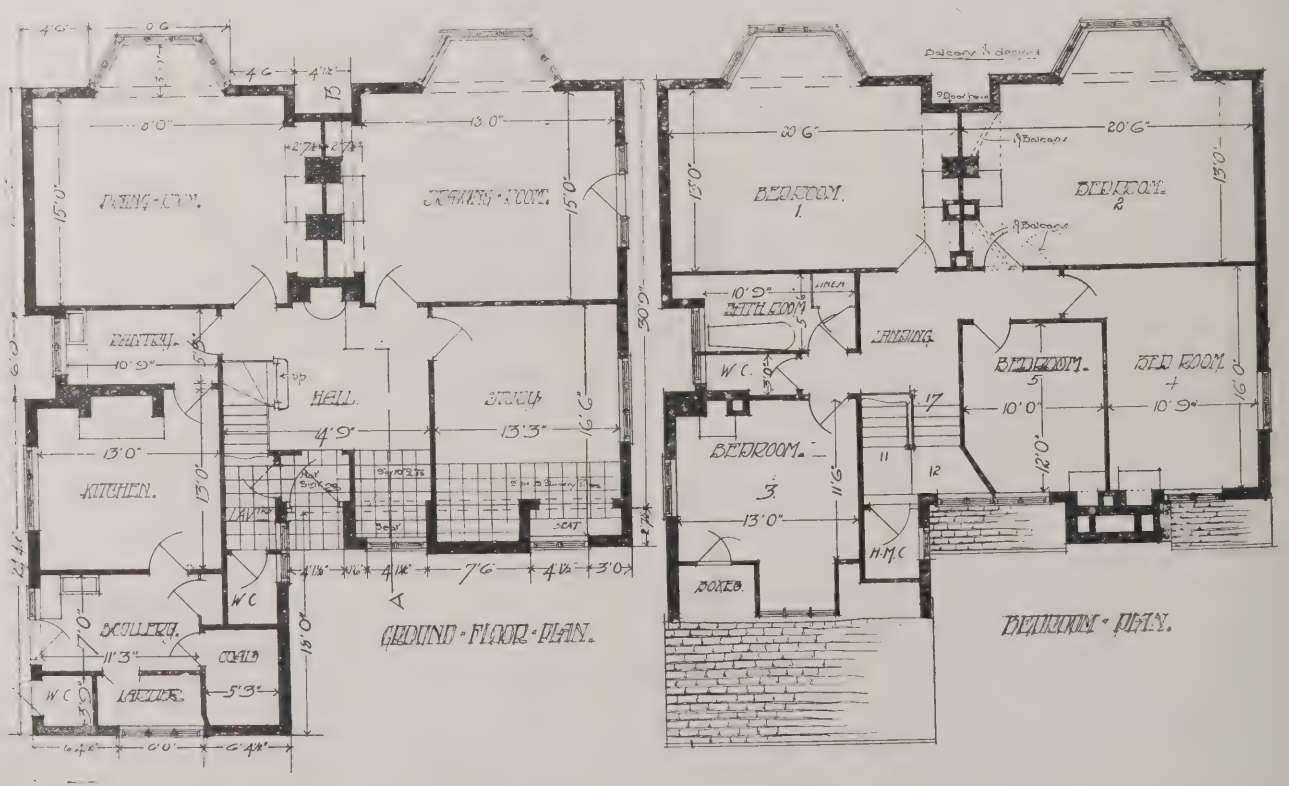
The book forms a useful summary of the practice and theory of reinforced concrete in most general acceptance in Europe, and will form a good introduction to the subject.

The second of the two books under notice is one for the advanced student of reinforced concrete, and the qualified engineer. It is the translation by an American engineer of a work originally written in German. It does not deal exhaustively with all aspects of reinforced concrete construction, but its treatment of the principles is masterly. The book is written in a real scientific way by a designer of considerable experience, and it is entirely to the point judged from a practical aspect. Indeed, it is true theory founded on experiment and practice, to the furtherance of which latter it is related in turn. This translation is of the third (1908) German edition, but the first edition of the work was issued in 1902. The manner of its publication is noteworthy. The firm of Wayss and Freytag, who, it will be remembered, were responsible for pushing the Monier system to the front for engineering and building works, being the first to take up Monier's patents for Germany and Austria, and put the practice of his system on a scientific basis, felt impelled by the absence of a uniform literature, and in view of systems based on wholly unscientific methods of calculation being pushed into recognition by systematic advertisement, to familiarise those interested in the scientific principles of reinforced concrete with all the experimental researches available at that time, and to counteract the imminent danger that reinforced concrete might forfeit a large proportion of the confidence it already enjoyed by inefficient and unscientific practice, especially if a few failures should occur. A little over a year after the publication of the first edition, the Verbands Deutschers Architekten und Ingenieur-Vereine, and the Deutscher Beton Verein published their

*"Reinforced Concrete: Theory and Practice," by Frederick Rings, M.S.A. London: B. T. Batsford, 94, High Holborn, W.C. Price 7s. 6d. nett.

"Concrete Steel Construction," by Professor Emil Mörsch, of the Zurich Polytechnic, Zurich, Switzerland. Translation from the third German edition, by E. P. Goodrich. London: Archibald Constable and Co., Ltd. New York: The Engineering News Publishing Co. Price 21s. nett.

"Leitsätze" (recommendations), and the Prussian Government issued its "Bestimmungen" (regulations), which harmonised exactly with the first edition. Indeed, the firm of Messrs. Wayss and Freytag and Prof. Mörsch, the author, had a great share in the compilation of the preliminary "Leitsätze," and manifested much interest in making them final. The "Recommendations" and "Regulations" inspired widespread confidence in the new methods of building, but even the best of directions could not altogether obviate mistakes and failures by those inadequately equipped with that knowledge of the properties of concrete and steel in combination which the regulations presupposed; for the "Leitsätze," could obviously not be made a book of instructions on the principles of the design of reinforced concrete. Prof. Mörsch, who is Director of the Technical Bureau of Messrs. Wayss and Freytag, therefore set himself the task of thoroughly revising and extending the work for the second edition (published at the end of 1905), in the light of the experimental data (in great part hitherto unpublished), the whole of which his firm placed at his disposal in the preparation of the work, together with the valuable results of tests conducted for the reinforced concrete commission of the Jubiläumstiftung der Deutschen Industrie, published in 1905, which Prof. Bach of Stuttgart gave him, especially those relating to adhesion.



The policy of Messrs. Wayss and Freytag is a broad one, for of course the material presented by Prof. Mörsch has been of considerable service to their competitors; but they believed that by a deepening of knowledge of reinforced concrete they were rendering the most service to the subject. At the end of 1907 a third edition was published, in which were included the results of new experiments conducted by Messrs. Wayss and Freytag, especially noticeable being those relating to shear in T beams, and those on continuous beams. There were also included tests on shear stresses in T beams made for the reinforced concrete commission of the Jubiläumstiftung der Deutschen Industrie, and published in 1907. References were also included to the experiments conducted by the French Government Commission on Reinforced Concrete, also issued in 1907. Various portions of the work were enlarged.

The arrangement of this third edition is that after some general or introductory remarks upon the practical reinforcement of beams, columns, and arches, under the most widely varied loading, attention is closely given to the the theory of reinforced concrete, exhaustively covering the properties of materials and applying the theory in the closest possible manner to interpret the results of tests. Prof. Mörsch does not repeat a lot of useless theories, but just shows how closely the methods of calculation given in the "Leitsätze" apply to actual tests, and that they are well founded and useful. In this portion of the book one of the most useful chapters is on shear in beams. It is the best and most detailed treatment we have seen, and no doubt it has influenced the authors of other books on the subject. The author goes into minute detail as regards the detailing of beam reinforcements, and his book will be most useful to the practical designer. A third portion of the book is devoted to a description of structures of various kinds in reinforced concrete executed by the firm of Wayss and Freytag, selected from their fifteen years' experience, for the most part under the direction of the author, with a running commentary and explanation of the designs, and theoretical data regarding the different kinds of structures. The author clearly states that he does not contemplate giving a complete presentation of all the applications of reinforced concrete, and he has limited his choice of examples to the work of his firm because he knows that it has been designed in accordance with the recommended methods of calculation, and because, he claims, the present advance in the art of reinforced concrete design is in large part due to the efforts of Messrs. Wayss and Freytag. We do not cavil at his conclusion of the work of other constructors. If the book is somewhat limited in consequence, it nevertheless contains a most valuable treatment of the general principles, and deals exhaustively with beam, slab, and column construction, which are, after all, the most important elements of design, and with the instruction contained in this book the designer will be well equipped to deal with structures of all kinds. No doubt the author would be ready to admit that there is still much room for experimental work; and the theory of the subject is not yet cleared up, though much has been done to eliminate obscure points therein by Prof. Mörsch and the experimental investigators whom he has had a great part in inspiring.

We must commend the proprietors of the "Engineering News" for having published this translation. It was badly needed. The translator has done his work well on the whole, but we think it could be greatly improved by being revised by others, for we know how difficult it is to select just the right phraseology—what appears clear to the translator who has the original in his mind and knows what he is trying to express, may by no means be clear to the reader; and it is difficult to render a work of this character immediately into the best English phraseology. The algebraical notation is awkward for the English reader to follow. In conclusion, we wish to say that we think every designer of reinforced concrete would be better for a close study of this work, which we consider the best treatment yet of the subject from the point of view of the advanced student and the practising specialist.

Historical Illustrations.

The object of this work appears to be a very praiseworthy one. In four portfolios, devoted respectively to the eleventh, twelfth, thirteenth, and fourteenth centuries, it presents drawings accompanied by short descriptions of costumes, armour, furniture, buildings, and architectural details of the periods. The majority of the illustrations have been derived from contemporary documents and manuscripts, from the Bayeux tapestry and other sources. A dozen plates are included in each portfolio. In many cases, Mr. T. C. Barfield, who is responsible for the drawings, has built up interiors from various existing portions of contemporary buildings, and to some extent, as in "the Great Hall in the Keep of the Castle," plate 13, these synthetic restorations must be taken with reservations. In plate 15, for instance we do not think that Mr. Barfield is justified in taking a wall from Southampton, a "possible gateway," the striped roof of a tower from a MS. picture, the upper part of a house from Viollet-le-Duc, and much of the Jew's house at Lincoln, as the proper ingredients for "A street in the reign of Henry II." He should not forget that there were then varying building traditions in different parts of England; and, after all, what justification has Viollet-le-Duc in this compound? Curiously enough Mr. Barfield omits any illustration of the Tower of London, or even of the famous Chapel of St.

HOUSE AT PARKLANGLEY, BECKENHAM, KENT. REGINALD C. FRY, ARCHITECT.

John in the White Tower in his eleventh century portfolio; and there is no illustration of Westminster Hall in the thirteenth century portfolio, Mr. Barfield contenting himself with a conjectural drawing of King's Hall, Winchester, based on particulars given in Hudson Turner's book. There are numerous other omissions from the architectural point of view, but doubtless the illustrations of costumes and armour will be found interesting and instructive, especially in schools, for which the portfolios are primarily intended.

Longmans' Historical Illustrations: England in the Middle Ages. Drawn and described by T. C. Barfield. 4 portfolios; 2s. 6d. each. Longmans, Green and Co.

Estate Development.

Although, owing to trade depression, the check in the rate of increase of population, and other adverse conditions, the development of building estates is not, for the moment, proceeding at the normal rate, it may be supposed that the lull is only temporary. Not long hence, activity will probably be greater than ever, as a consequence of the operations of the Town Planning Act, which may be confidently expected to cause the development of many new estates as well as the modification of many that are old. The present solstice or truce affords an admirable opportunity for taking stock of the subject, and Mr. Bright's book will be widely welcomed as an efficient aid to a full comprehension of the somewhat complex data involved.

Mr. Bright divides his book into eight chapters, which deal respectively with (i.) Building Land, its characteristics, qualifications, and mode of preparation; (ii.) Extent and nature of demand for building land; (iii.) Development schemes; (iv.) Powers and requirements of metropolitan and local authorities; (v.) Practical development procedure; (vi.) Road materials; (vii.) Methods of forming and making up of new roads; (viii.) Valuations. There are also some useful appendices, comprising forms of specification, contract, building agreement, lease, etc. There are about twenty-six illustrations, comprising plans, sections, and diagrams of almost everything that really demands graphic treatment; and a series of valuation and other tables adds considerably to the practical value of a book that, considering its handy size and moderate price, is remarkably complete. It is rather surprising to find that, in spite of the supposed "dryness" of the subject, and the compactness of the book, the matter is for the most part very interesting to read. The author has a clear style and a cheery outlook, as may be inferred from his citation of the following piece of versified proverbial philosophy:—

"The richest crop for any field
Is a crop of bricks for it to yield.
The richest crop that it can grow
Is a crop of houses in a row."

It is a weird sort of agriculture that produces a crop of such permanence; but the speculative builder who, through neglect of such information and guidance as this book affords, loses heavily by his enterprise, may develop (if he is not tired of developing) the analogy by remarking that "others reap what I have sown."

The Development of Building Estates. A practical handbook for the use of surveyors, agents, landowners, and others interested in the development, management, equipment, administration, or realisation of building estates. By Tom Bright, F.A.I., etc., With plans and illustrations by T. Spencer Bright, P.A.S.I. London: B. T. Batsford, 94, High Holborn. Price 7s. 6d. net.

LIST OF COMPETITIONS OPEN.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

JULY 20 YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to Architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

ARCHITECTURAL GARDEN FURNITURE.

The growing recognition that the planning of the garden is work that properly falls within the province of the architect, or of the specialist in architectural gardening, finds its corollary in the special attention that is being given to the design and construction of garden furniture. As an instance, we have received from Mr. John P. White, the Pyghtle Works, Bedford, a handsome catalogue containing 240 large quarto pages, nearly all of which contain several fine illustrations, which are thus classified: Garden seats, chairs, and tables (nearly a hundred examples); sundials (twenty-five); treillage (nearly a hundred); Tuscan pottery (forty-six); vases for terraces, steps, etc. (fifteen); figures in lead or stone (thirty); fountains (four); well-heads (a dozen); pigeon-cotes (ten); summer-houses (twenty-two); palmboxes (a dozen); tubs and vases for palms and shrubs (fourteen); pergolas (a dozen); bridges (eleven); horticultural buildings (twenty-eight); gates (thirty-seven). These illustrations include several excellent specimens of colour-printing.

We have been at the pains to give this rough indication of the "proportional representation" of the various objects illustrated because it may possibly afford some idea of the direction in which taste is running with regard to garden furniture. Of course this is an instance in which numerical values may or may not possess any particular significance. The fact that there are a hundred examples of garden seats, chairs, and tables, implies much less than the similar number of examples of treillage. Chairs and tables are always with us, but treillage in a hundred variations is a pretty clear indication of a current trend of taste.

The designs throughout are, almost without exception, excellent, whether they are original or whether they imitate classical, Italian, or Japanese models. The Italian seats, by the way, appear to be in some instances more handsome than comfortable. Some of the treillage really deserves the term "architectural" that is applied to it in the catalogue; and most of it would seem to be readily responsive to architectural treatment, and to require such control.

The Tuscan pottery, of which some striking examples are illustrated, consists largely of reproductions of designs by old Italian

A TREILLAGE ROSE GARDEN: INTERIOR OF THE ROSE GARDEN AT SURRENDEN, KENT.
("*Architectural Garden Furniture.*")

This design is copied from a seat in an old picture.
THE "LEAGRAVE" GARDEN SEAT.
("*Architectural Garden Furniture.*")

artists, including Michaelangelo, Donatello, and John of Bologna. Many of the figure designs—the disc-throwers, Mercurys, Bacchuses, fauns, etc.—follow classical models, and so do the fountains.

The pigeon-cotes, summer-houses, gates, and horticultural buildings savour more characteristically of rural England, which is peculiarly rich in wooden gates of multitudinous designs, many of them truly artistic in at least the essentials of dignity, simplicity, fitness for their purpose, and harmony with their surroundings.

Among the bridges, those of Japanese design are, for obvious reasons, of peculiar interest at the moment, and have, indeed, an intrinsic picturesqueness which renders them independent of the adventitious aid of the Japan-British Exhibition, which is nevertheless certain to give them a considerable vogue. In this and in many other respects the catalogue is singularly opportune, and it will be welcomed by all who are interested in the growing cult of architectural gardening.

TRADE AND CRAFT.

A New White Undercoating.

Upon the undercoat in painting the success of the finish greatly depends. The painter knows this well enough, and if he is a conscientious workman he acts accordingly. Yet, with all his care, and all his skill, he does not invariably succeed in producing a satisfactory groundwork, the materials at his command being occasionally very refractory, so that all his rather elaborate preparations are very apt to go for naught. With the object of securing more satisfaction and more certainty in the results, Messrs. Walter Carson and Sons, Grove Works, Battersea, S.W., have produced a new body white for undercoating. They have given it the name of "Coverine," and claim for it that as it is ready for use in five minutes, requiring to be thinned with turpentine only, it saves much time in the preparation of undercoats. One coat of "Coverine," it is stated, is equal to two coats of white-lead paint; while as it dries hard, and can be coated in a few hours, the finishing coat can be applied and the work completed in one day. It has such body and opacity that it can be used over existing old paint, so that in cases of urgency the labour of cleaning off is dispensed with

"Bitumastic" at the Japan-British Exhibition.

In the Transportation Section of Building No. 48, at the Japan-British Exhibition at Shepherd's Bush is the stand of Wailes, Dove and Co., Ltd., Newcastle-on-Tyne, patentees and sole manufacturers of the patent "Bitumastic" enamels, coverings, and solution, for the prevention of corrosion in iron and steel, and the protection and preservation of wood. On the stand is shown a model of the midship section of a vessel, and also a model workshop with smoke stacks, etc. These are all coated with their different "Bitumastic" specialities. There is also shown a small model of ship's steel deck plating, flushed up and levelled with patent "Bitumastic" deck covering, on which "Corticene" is laid. This material is similar to that applied successfully to the promenade, shelter, upper, main, and lower decks, etc., of the celebrated turbine liner "Mauretania." The advantages obtained by using this material in place of wood decks are as follows: No piercing of decks, more head room in 'tween-decks, steelwork efficiently protected, corticene, rubber tiling, or parquetry easily laid on, greater cheapness and durability, saving in weight, perfect sanitation, more air space, no accumulation of foreign matter as is usual under wood decks. Beyond executing very large orders on board the largest and latest liners afloat, like the "Mauretania" and "Lusitania," this firm's latest advance is the application of "Bitumastic" to valuable steel and iron structures and plant on land, the material proving invaluable for the protection of bridges, water tanks, pithead gears, refrigerating plant, roofs of buildings, etc. The firm have been awarded gold medals and first-class diplomas of merit at the following exhibitions: Genoa, 1905; Milan, 1906; Savona, 1906; Bordeaux, 1907; and Franco-British, 1908. The firm have offices and stores, with efficient staffs, at all the chief centres of shipping and industry throughout the United Kingdom, and agencies at all the principal ports in the world. Their London office is at 10 and 11, Lime Street, City.

COMING EVENTS.

Wednesday, June 15.

INSTITUTION OF GAS ENGINEERS. — Annual General Meeting: second day.

THE SURVEYORS' INSTITUTION. — Private meeting of Metropolitan members to discuss the land clauses of the Finance Bill. 2.30 p.m.

EAST LONDON COLLEGE (University of London).—Professor J. T. Morris on "The Illumination of Interiors." 8 p.m. (second lecture).

BUILDERS' FOREMEN AND CLERK OF WORKS ASSOCIATION. Ordinary meeting. 8 p.m.

Thursday, June 16.

INSTITUTION OF GAS ENGINEERS. — Annual General Meeting. Concluding day.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS. Special general and annual meetings at Plymouth.

NOTICE.

The Institution of Civil Engineers, in consequence of the death of His late Majesty King Edward VII., will not hold the Annual Conversazione this year.

FEDERATION NEWS.

We regret to record the death of Mr. Wilton A. Rycroft, the secretary of the Newcastle Association, which took place on May 23rd. Mr. Rycroft was a member of the firm of Rycroft and Glenton, chartered accountants, Newcastle-on-Tyne, and at one time held the position of secretary of the Northern Counties Federation, which he relinquished owing to ill-health, in 1900, when Mr. W. H. Hope took up the post. Mr. Rycroft leaves a wife and one child.

Cardiff.

A meeting of the committee of the Cardiff District Association was held at the Association offices on Friday, May 27th, the president (Mr. W. T. Morgan) in the chair.

Mr. C. Hoare reported that in accordance with the resolution passed at the last meeting the sub-committee had met and had requested the secretary to write to the Master Builders' Associations in various towns, making the following enquiries, viz.: —(1) Whether the builders in those towns were required to pay the Council for making connections of house drains to sewers; (2) whether the Council made a charge for fixing a meter to check the supply of water for new buildings, and, if so, what was the amount of the charge; also whether a deposit was demanded while the meter is in use, and, if so, the amount of the deposit; (3) what method obtained for the apportionment of private improvement charges for flanks of houses; and (4) where such improvement (pavement and road) constituted a public thoroughfare, are the whole of the improvements adjacent to such house payable by that house, or are they apportioned over the district, or how? The secretary reported that he had written to nine towns, and had received replies from seven, namely, Manchester, Southampton, London, Portsmouth, Carmarthen, and Barry Dock, which were read and discussed, and it was resolved that the matter be referred back to the sub-committee to go carefully through the replies, and also to communicate with other towns if they considered it necessary to do so.

Llandaff and Dinas Powis Rural District Council,—Rule 70 of by-laws requiring concrete to be placed under and around house drains.—The president reported the result of the interview with the committee of the Rural District Council, with a view of getting this objectionable by-law altered or withdrawn, and the secretary read a letter since received from the Clerk to the Council stating that the Council had resolved to take the necessary steps to revise their by-laws generally, which was considered satisfactory.

Cardiff Gas Company.—The secretary read correspondence with the secretary of the Gas Co. on the subject of the concessions applied for by this association, and the further consideration of the matter was deferred till the next meeting.—I. WATKINS, Secretary.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 18—July 4. **ST. ALBANS.**—Erection of new Carnegie public library in Victoria Street. Drawings, specification, and conditions of contract can be inspected at the offices of Guildford Dudley, architect, 2, Spencer Stret, St. Albans, on June 30, between ten a.m. and one p.m. Send names and addresses to the Town Clerk, Town Clerk's Office, on or before June 18, together with a deposit of £3 3s., when a copy of the bill of quantities and form of tender will be forwarded. Tenders must be sent to E. P. Debenham, Town Clerk, St. Albans.

June 20. **WATTSVILLE.**—Shops, houses, and bakehouse at Wattsville, near Cross Keys. Particulars at office of R. L. Roberts, M.S.A., Abercarn.

June 20. **NEWTOWNARDS (Ireland).**—Erection of business premises at Newtownards. Plans and specification may be had at the office of Thos. Houston, architect and civil engineer, King's Court, Wellington Place, Belfast, with whom tenders must be lodged.

June 20. **HUDDERSFIELD.**—Alterations and additions to the Primrose Hill Liberal Club House, for the Trustees and Committee. Copies of the quantities may be obtained on application at the office of Norman Culley, A.R.I.B.A., architect, 13, John William Street, Huddersfield, to whom tenders must be sent.

June 20. **TENDRING (Essex).**—Erection of a reception home for children at the workhouse, for the Guardians. Plans and specification may be seen and forms of tender and other information obtained at the office of the architect, G. H. Page, Trinity Chambers, Colchester, and tenders must be sent to A. J. H. Ward, clerk, 42, Church Street, Harwich.

June 20. **LEYLAND.**—Erection of nine houses in Cowling Lane, Leyland (separate tenders) to plans and specifications prepared by Wm. Forrester, Leyland, for the Leyland and Farington Co-operative Society, Ltd. Plans and specification may be seen at the Boardroom. A deposit of 5s. will be required from anyone taking out specifications.

June 20. **CWMDARE (Wales).**—Erection of 54 houses, etc., at Cwmdare, for the Aberdare Cottage Company (Limited). Drawings and specification may be seen at the office of J. Llewellin Smith, M.S.A., architect, Aberdare. Tenders, addressed to the Chairman of the Company, to be delivered to above address.

June 20. **LEEDS.**—Erection of workshops for the Gas Department in Sovereign Street. The whole of the several trades will be let in one contract. Drawings may be seen and a copy of the specification, conditions of contract, and bill of quantities obtained at the office of W. T. Lancashire, city engineer, Municipal Buildings, Leeds, on deposit of £3 3s. Tenders must be received at the Town Clerk's Office.

June 20. **NORTH BERWICK.**—Separate offers for mason, joiner, slater, plumber, and plaster work and heating apparatus for proposed additions to high school, North Berwick, for the School Board. Plans may be seen and schedules of measurement obtained at the office of James S. Richardson, architect, 14, Randolph Place, Edinburgh; or at that of A. D. Wallace, Solicitor, North Berwick, Clerk to the Board, to whom tenders must be sent.

June 20. **WATERLOO WITH SEAFORTH.**—Erection of the Crosby Road North Council school, Waterloo, near Liverpool, for the U.D.C. Bills of quantities may be obtained from John I. Thompson, Clerk to the Council, Town Hall, Waterloo, near Liverpool, upon deposit of £1 1s. Drawings and specifications may be seen at the office of Appleyard and Quiggin, architects, 67, Lord Street, Liverpool. Tenders must be delivered to the Clerk to the Council.

June 20. **LONDON, E.**—Supply and erection of certain iron buildings, and for the brickwork and concrete foundations thereof, for the Poplar B.C. Plans and specifications may be inspected, and further particulars obtained, at the office of the Borough Surveyor, Council Offices, High Street, Poplar. Contractors will be required to pay trade union rates of wages, observe trade union hours of labour, and not to sublet any part of the work without permission. Tenders to be delivered to Leonard Potts, town clerk, Council Offices, High Street, Poplar.

June 20--30. **BLACKWOOD.**—Erection of new premises at High Street, Blackwood, for the Tredegar Industrial Co-operative Society, Ltd. Plans, etc., may be seen at the office of the architect, A. E. Webb, 60, High Street, Blackwood, Mon., where bills of quantities may also be obtained upon deposit of £1 1s.

June 21. **MALLING.**—Repairs to the Mereworth parish cottages. Apply to C. Souter, Myrtle Villa, West Malling, Kent.

June 21. **BALLYCONNELL (Ireland).**—Repairs and alterations, etc., at Tomregan Church, Ballyconnell, Co. Caran. For specifications and particulars apply to the Rev. M. W. Rogers, Rector.

June 21. **TINTERN (Mon.).**—Erection of a police station, for the Standing Joint Committee. Plans and specification may be seen at the office of William Tanner, F.S.I., county surveyor, and a copy of quantities obtained on deposit of £1 1s. Tenders to be sent to the County Surveyor.

June 21. **RICHMOND (Yorks.).**—Erection of public lavatories in the Ronaldshay recreation ground, for the Corporation. Plans, specifications, and full particulars may be seen at the office of H. W. Marsden, borough surveyor, Tower Street, Richmond, to whom tenders must be sent.

June 21. **FARNHAM.**—Repairs to be executed to Tilford East Bridge, for the R.D.C. Drawings and specifications can be seen at the office of the Surveyor, Arthur J. Stedman, South Street Chambers, Farnham, and quantities can be obtained from him upon deposit of 10s. 6d. Tenders to be sent to Ernest Crundwell, Clerk, South Street, Farnham.

June 21. **WREXHAM.**—Erection of a park superintendent's house at the Parciau, Wrexham, for the T.C. Plans and specification may be seen, and bill of quantities and form of tender obtained, on application to John England, borough engineer, Willow Road. A deposit of £1 will be required. Tenders to be delivered to Lawson Taylor, town clerk, Guildhall, Wrexham.

June 21. **NEWCASTLE-UPON-TYNE.**—Erection of a single-storey shed in connection with the quay extension, for the Trade and Commerce Committee of the Council. Copies of the general conditions, etc., can be obtained, and drawings inspected, at the City Engineer's Office, Town Hall, Newcastle-upon-Tyne, on deposit of £2 2s. to the City Treasurer, at the same address.

June 21. **FARNHAM.**—To Builders and Contractors.—Erection of proposed cottages at their Ash and Hindhead Depots, for the R.D.C. Drawings and specifications can be seen at the office of the Surveyor, Arthur J. Stedman, South Street Chambers, Farnham, and quantities can be obtained from him upon deposit of 10s. 6d. each cottage. Tenders to be sent to Ernest Crundwell, Clerk, South Street, Farnham.

June 21. **WREXHAM.**—Erection of boundary wall, gate pillars, and entrance gates and railings at the Parciau, Wrexham. Plans and specifications may be seen, and bill of quantities and form of tender obtained, on application to John England, Borough Engineer, Willow Road. A deposit of £1 will be required. Tenders to be delivered to Lawson Taylor, Town Clerk, Guildhall, Wrexham.

June 21. **CRAGHEAD (Durham).**—Erection and completion of a new Church at Craghead, S.O., Durham. Plans and specifications may be seen at the Colliery Offices, Craghead. Bills of quantities and other particulars may be had from the architect, Jas W. Thompson, 63, Grey Street, Newcastle-on-Tyne, on receipt of a deposit of £1 1s. Tenders to be sent to the Rev. W. C. Chapman, Burnhope, Durham.

June 21. **EAST HAM.**—Erection of extensions to the public offices, etc., consisting of public health, education, and other offices, also public mortuary, etc., for the Corporation, all in accordance with drawings and specification which may be seen at the office of the borough engineer, A. H. Campbell, M.I.C.E., from whom bills of quantities can be obtained on deposit of £7 7s. Tenders to be addressed to his Worship the Mayor, Town Hall, East Ham. Rate of wages, etc., clause to be observed, and contractor is to enter into a contract with a bond for the performance of contract.

June 21—July 2. **MAIDENHEAD (Berks.).**—Enlargement of the County girls' school, Maidenhead, Berks, by the addition of a new wing. Send names to the Secretary to the Education Committee, Market Place, Reading, Berks, by June 21, together with a deposit of £2 2s. for bills of quantities, which will be supplied by post. Plans, specification, and form of contract may be seen at the school. Tenders must be delivered at the office of the Education Secretary

June 22. **LONDON, W.**—Alterations and additions to the lavatory accommodation at the public baths, for the Hammersmith B.C. Plans and specifications may be seen, and forms of tender obtained, on application to H. Mair, Borough Surveyor. Tenders must be delivered to H. Thompson, Town Clerk, Town Hall, Hammersmith, W.

June 22. **TIBSHELF.**—Alteration of the old Council school at Tibshelf, for the Derbyshire Education Committee. Drawings, etc., may be seen, and a copy of the bill of quantities, etc., obtained, upon payment of £1 1s. at the office of George H. Widdows, A.R.I.B.A., Architect to the Committee, County Education Office, St. Mary's Gate, Derby.

June 22. **MACCLESFIELD.**—Alterations to sanitary blocks in the main building at Parkside Asylum, Macclesfield. Plans and specifications can now be seen at the office of H. Beswick, F.R.I.B.A., County Architect, Newgate Street, Chester, or at the Asylum, and quantities obtained on deposit of £1. Tenders to be delivered to Arthur C. Procter, Clerk to the Committee of Visitors, Macclesfield.

June 22. **BRISTOL.**—Construction of stores, showroom, offices, and lavatories at Corn Exchange Buildings, Corn Street, Bristol. Copies of the specifications, bills of quantities, and forms of tenders can be obtained from H. Faraday Proctor, City Electrical Engineer, City Electrical Engineer's Office, Temple Back, Bristol, on deposit of £2 2s. Tenders must be sent sent to the Engineer.

June 22. **LONDON, N.**—Erection of a sorting office at Stoke Newington, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. Rutherford, H.M. Office of Works, Carlisle Place, S.W. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

June 23. **HALIFAX.**—Erecting eight dwelling-houses, etc., in Leamington Avenue. Plans and specifications may be inspected from June 5. Tenders must be delivered to Medley Hall and Son, Architects, 1, Harrison Road, Halifax.

June 23. **CWMBACH.**—Erection of a pair of cottage homes for children at Cwmbach, Aberdare, for the Guardians. Plans, etc., may be seen, and quantities obtained, at the office of the architect, Thomas Roderick, Clifton Street, Aberdare.

June 23. **BELFAST.**—Erection of a disinfecting station in Lagan Bank road, for the Public Health Committee. Drawings and specification may be seen at the office of the city surveyor, where bill of quantities may be obtained on deposit of £3 3s. Tenders, accompanied by bill of quantities in a separate envelope, endorsed with the contractor's name, to be lodged with R. Meyer, town clerk.

June 23. **BACUP.**—Erection of a new Post Office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster of Bacup. Bills of quantities and forms of tender may be obtained at Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, ets., Storey's Gate, London, S.W.

June 23. **LONDON, W.**—Providing and laying pitch-pine floor, plastering walls, and decorative works to Wards Nos. 8, 16, and 17 of their Infirmary, Marloes Road, Kensington, for the Guardians. Specification and form of tender can be obtained at the office of W. R. Stephens, Clerk to the Guardians, Guardians' Offices, Marloes Road, Kensington, W., or by sending a stamped directed foolscap envelope. The contractor shall on all work executed for the Guardians pay the rate of wages and observe the hours of labour agreed upon by the association of employers and the representatives of the workmen, but where no such agreement exists then the rate of wages and hours of labour must be those current in the district where the work is executed. The contractor must find two sureties in such sum as the Guardians may require, who shall enter into a bond in the form prescribed by the Local Government Board for the due performance of the contract. Tenders are to be made only on the forms provided, and are to be delivered at the above office.

(Continued on next page.)

June 23. **DALTON PARVA (Rotherham).**—New buildings and alterations and additions to existing buildings in connection with adaptation of farm buildings at Dalton Parva (near Rotherham), builder, joiner, slater, plumber, plasterer, painter (whole or separate tenders), for the West Riding Small Holdings Committee. Plans may be seen, and specifications with quantities obtained on application to the West Riding Architect, County Hall, Wakefield. A deposit of £1 must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, County Hall, Wakefield.

June 24. **MERTHYR TYDFIL.**—Construction of the necessary buildings, for the Merthyr Central Laundry Co., Ltd., Plans and specifications may be seen at the office of C. M. Davies, M.S.A., 112, High Street, Merthyr Tydfil. Tenders to be delivered to J. M. Berry and Son, auctioneers, etc., Victoria Street, Merthyr.

June 24. **WORCESTER.**—Re-building in brickwork of Kenswick Bridge, situate on the main road between Worcester and Martley, 3 miles from Henwick Station, for the Highways and Bridges Committee of the County Council. Drawings and specification may be obtained on deposit of £1 1s., of J. H. Garrett, Surveyor of County Bridges, Shirehall, Worcester (to whom tenders must be sent).

June 25. **NORTH SKELTON.**—Erection of a Working Men's Club, at North Skelton. Plans and specifications may be seen on application any day after two p.m.

June 25. **OSWALDTWISTLE.**—Erection of a new school in Union Road, Oswaldtwistle, near Church railway station, for the Higher Education Committee. The plans may be seen and bills of quantities obtained at the office of the County Architect, Henry Littler, 16, Ribblesdale Place, Preston, by deposit of £2. Tenders must be delivered to Albert Wade, Technical School, Lord Street, Oswaldtwistle.

June 27. **MERTHYR TYDFIL.**—Erection of an additional pavilion, together with other work, at the Mardy Isolation Hospital for the T.C. Plans may be inspected and specification and bills of quantities obtained on deposit of £2 2s., upon application to the Borough Engineer, Merthyr Tydfil. Tenders must be sent to T. Aneuryn Rees, town clerk, Merthyr Tydfil.

June 27. **MERTHYR TYDFIL.**—Erection of two semi-detached houses of design (A), also two semi-detached houses of design (B), near the Thomastown Park. Plans and specifications can be seen at the office of Rees Morris, architect, "Idrisville," Queen's Road, Merthyr. Tenders for houses of design (A) to be sent to C. L. Stewart, Accountant, Milbourne Chambers, Merthyr Tydfil, and tenders for design (B) to be sent to the architect.

June 27. **MERTHYR.**—Alterations and additions for the conversion of Cyfarthfa Castle into a secondary school, and the erection of science laboratories, art and lecture rooms, with latrines, playgrounds, and other works in connection therewith. Specification, quantities, and form of tender may be obtained from T. F. Harvey, M.Inst.C.E., Borough Engineer, on and after June 6, on deposit of £5 5s. Plans and drawings may be seen at Cyfarthfa Castle, and other information obtained, on and after June 6. Tenders must be sent to T. Aneuryn Rees, Town Clerk, Town Hall, Merthyr Tydfil.

June 28. **KEYNSHAM (near Bristol).**—Erection of a new goods shed at Keynsham, near Bristol, for the Directors of the G.W.R. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Bristol Station. Tenders must be addressed to G. K. Mills, Secretary, Paddington Station, London.

June 28. **DEVIZES (Wilts.).**—Erection of new waiting rooms, footbridge, and verandahs, at Devizes station, for the Directors of the G.W.R. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Bristol Station. Tenders must be addressed to G. K. Mills, Secretary, Paddington Station, London.

June 28. **LEYTON.**—Construction of underground conveniences in High Road, Leytonstone, for the U.D.C. Plans may be seen, and specification, bill of quantities, form of tender, and other particulars obtained of William Dawson, M.I.C.E., Town Hall, Leyton. Tenders (in special endorsed envelopes supplied with the forms) must be delivered at the meeting of the Council to be held on June 28, at the Town Hall, Leyton, at 7 p.m. Sureties will be required.

June 28. **KNOWLE, near Fareham (Hants).**—Erection of a work-room block and sundry alterations at the County Lunatic Asylum, Knowle, Fareham, Hants. Specifications, conditions of contract, and plans may be inspected and copies of the bill of quantities and all other necessary information obtained on application at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, on and after, June 17. Drawings may also be seen at the Asylum. A deposit of £6 6s. will be required for copy of bill of quantities. Deposits must be made by cheque payable to the Hants County Council and crossed Bank of England, or the bills will not be sent. Tenders must be on forms supplied by the County Surveyor, and must be delivered to J. Railton, Clerk to the Committee of Visitors, Knowle.

June 29. **ADWICK-LE-STREET (Doncaster).**—Erection of a mortuary chapel, caretaker's house, and board-room for the Burial Board. Plans and specification can be seen and particulars obtained at the office of John Simmons, C.E., architect, Bank Chambers, Doncaster, to whom tenders must be delivered.

June 29. **LLANTWIT FARDRE (Pontypridd).**—Erection of two cottages at their cottage homes, Church Village, Llantwit Fardre, for the Pontypridd Guardians. Plans and specifications can be seen and bill of quantities obtained from the Clerk of the Works, John Richards, The Homes, Llwynypia, on deposit to him of £1 1s. Tenders to be sent to Wm. Spickett, Clerk, Union Offices, Pontypridd.

June 30. **NEW MALDEN.**—Erection of church schools at Kingston Road. Plans and specification can be seen at the offices of Vincent Davison and Nicol, architects, Coombe Chambers, New Malden. Tenders to be sent to J. T. Thompson, Queensmead, Thetford Road, New Malden.

July 1. **LONDON, N.**—Construction of underground conveniences in Finsbury Park, by the Finsbury Gate, Seven Sisters' Road, N. Drawings, condition, and specification may be seen, and forms of tender and bills of quantities obtained, on and after the 20th inst., upon application to the Borough Engineer, J. Patten, Barber, at the Town Hall, Upper Street, N., and deposit of £2 2s. Tenders must be sent to Wm. F. Dewey, Town Clerk, Town Hall, Upper Street, N.

July 2. **TREVISCOE (near St. Stephens, Cornwall).**—Erection and completion of proposed Wesleyan Methodist Church, Grampound Road, according to plans and specifications, which may be seen by appointment at the residence of Capt L. H. Dyer, Treviscoe, to whom tenders are to be sent. Plans and specifications may be seen and particulars relating to the work may be obtained at the office of Sampson Hill, architect, Green Lane, Redruth.

July 4. **FOOTSCRAY (Kent).**—Enlargement of Longlands Council School, for the Kent Education Committee. See advertisement in this issue for further particulars.

No date. **BRECON.**—Addition of chemical laboratory and lecture-room and two class-rooms, at the County school for girls. Send names to Best and Sons, Surveyors, etc., 3, Bulwark, Brecon, accompanied by particulars of work recently executed by them and two references as to the quality of the work done.

No date. **GALWAY (Ireland).**—Erection and completion of a new college at Galway, according to drawings and specification, which may be inspected at the office of W. A. Scott, A.R.I.B.A., M.S.A., Architect, 45, Mountjoy Square, Dublin. Bills of quantities have been prepared by James Mackey, 58, Dame Street, and may be obtained from him on deposit of £5 5s.

ENGINEERING.

June 20. **BIGGLESWADE.**—Supply and laying of 12,133 yards of cast-iron water main as follows, viz.:—490 yards of 6in., 5,926 yards of 4in., and 5,717 yards of 3in., including the supply and fixing of waste water meter, sluice valves, wash-out valves hydrants, bends, branches, surface boxes, etc., required in connection therewith, for the R.D.C. Plans may be inspected and specifications obtained at the office of Henry Chaundler, clerk, Biggleswade, Beds., on deposit of £2 2s. Tenders must be sent to the Clerk.

June 21. **LONDON (for India).**—Supply of:—Steelwork for roofing for circular engine shed, about 250 tons, for the South Indian Railway Co. Specifications and forms of tender may be obtained at the Company's Offices. Tenders, addressed to the Chairman and Directors of the South Indian Railway Company, Limited, marked "Roofing for Circular Engine Shed," must be left with Neville Priestley, Managing Director, Company's Offices, 91, York Street, Westminster. A charge, which will not be returned, will be made of £1 for each copy of the specification. Copies of the drawings may be obtained at the office of Robert White, M.I.C.E., Consulting Engineer to the Company, 3, Victoria Street, Westminster, on payment of 5s. per sheet.

June 22. **BRISTOL.**—(See "Building.")

June 22. **HOLMES CHAPEL (Cheshire).**—Carting, laying, and jointing of about 7,790 yards 2in. to 4in. cast-iron spigot and socket pipes, building meter chamber, etc., for the Congleton R.D.C. Plan and specification, bill of quantities and form of tender may be obtained from the Engineer, W. W. Wyatt, Whitchurch, Salop, on deposit of £1 1s. Tenders to be delivered at the office of H. Ferrand, Clerk to the Congleton Rural District Council, Sandbach, Cheshire.

June 23. **LONDON (for India).**—Supply of girder bridges, for the Bombay, Baroda and Central India Railway Directors. Tenders must be made on forms, copies of which, with specification, can be obtained from C. Crommelin, Secretary, Offices, Gloucester House, 2, 3, and 4, Bishopsgate Street Without, London, E.C., on payment of 21s. each (which will not be returned).

June 23. **IPSWICH.**—Sinking one 18in. diameter or, in the alternative, one 24in. diameter borehole, into the upper chalk, including the provision of temporary pumping plant, and the carrying out the pumping to test the yield of the bore-hole up to 500,000 gallons, or, in the alternative, 1,000,000 gallons per 24 hours, for the Corporation Waterworks Committee. Plans may be seen and the site inspected by appointment with C. W. S. Oldham, engineer, Waterworks Offices, Ipswich, from whom copies of specification, form of tender, and schedule of prices may be obtained on deposit of £1 1s. Tenders must be delivered at the Town Hall, Ipswich, addressed to the Waterworks Committee.

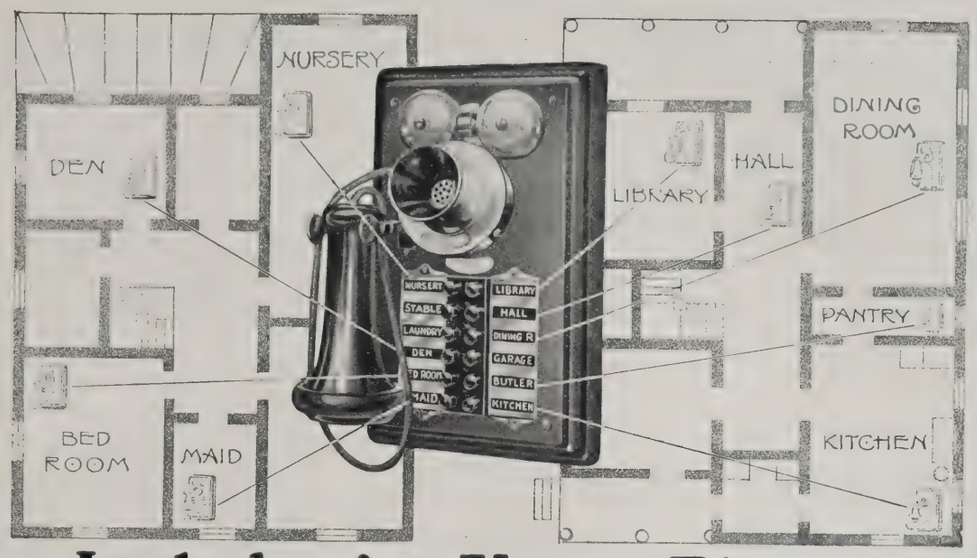
June 23. **RHONDDA (Wales).**—Works for the U.D.C.:—Construction of a supply main and intakes from the head of the Rhondda River at Gareg-Lwyd, on the rough mountain lands at the head of the Rhondda Valley, Glamorganshire, together with an armoured concrete aqueduct overhead of 24 yards long in two equal spans, a valve-house, tunnel bywash, tunnel outlet face, retaining walls, etc., in concrete or rubble masonry, a balancing tank, and other works supplementary to the existing supply of water. The pipes and ironwork are for the most part lying near the site, and further pipes, valves, and ironwork required must be supplied by the contractor. There is a tramway connecting the tunnel works with the Taff Vale Railway at Fernhill, which may be ejtended and used for the work by arrangement. The works are about two miles distant from Blaenrhondda Station, on the Rhondda and Swansea Bay Railway. Drawings may be seen, and a copy of specification and form of tender, with a schedule of quantities may be obtained at the office of Joseph Vevers, engineer, Waterworks Offices, Treherbert, Rhondda, upon production of a receipt signed by the Accountant of the Council for the required deposit of £3 3s. The contractor will be required to pay the current trade union rate of wage prevailing in the district. Tenders, addressed to the Chairman of the Waterworks Extension Committee, at the Council Offices, Pentre, Rhondda, must be delivered at the office of W. P. Nicholas, clerk, Council Offices, Pentre, Rhondda, Glam.

June 27. **PORTMADOC.**—Diverting the River Dwyryd from Aberia Point to join the River Glaslyn at a point opposite Messrs. Greaves' No. 2 wharf, between the Ballast Bank (Lewis's Island) and Trwyncae'rogo, for the Estuary Committee. Particulars may be obtained on application to Morgan Thomas, C.E., Town Hall, Portmadoc. Tenders must be sent to Jno. Jones, Secretary, Town Hall, Portmadoc.

June 27. **BOGNOR.**—New low pressure hot water heating installation, at the Bognor Council schools, for the West Sussex and Chichester Joint Education Committee. Plan and specification can be obtained on application to Haydn P. Roberts, A.R.I.B.A., County Education Architect, Horsham. The contractor whose tender is accepted may be required to enter into a contract with the West Sussex County Council, and to enter into a bond with two approved sureties, if required, for the due carrying out of the contract. Tenders to be delivered to Lionel Thompson, Secretary, Thurloe House, Worthing.

June 28. **DEVIZES (Wilts.).**—(See "Building.")

June 28. **LONDON, W.**—Reconstruction of a footbridge, etc., at Hammersmith Station, for the Joint Committee of the Great Western and Metropolitan railways. Plans and specification may be seen, and forms of tender and bills of quantities obtained, at the office of the Engineer at Paddington Station. Tenders must be addressed to H. Townsend, secretary to the Hammersmith and City Railway Joint Committee, Paddington Station, London.



June 29. **SALTASH (Cornwall).**—Construction of a steam ferry bridge, to run on chains across the river Tamar at Saltash passage, for the Saltash Corporation. Plans and specifications of the bridge may be obtained from Fred Et. Cleverton, town clerk, Saltash. The bridge is to be delivered on chains at Saltash within twelve months of the signing of the contract. Tenders to be sent to the Town Clerk.

July 1. **MAYFIELDS (Staffs.).**—Sinking a borehole of about 6in. internal diameter to such depth as may be found necessary to obtain water at Slack Lane, Mayfield, near Ashbourne, and also for making a 14-days' continuous pumping test to ascertain the yield of water, for the R.D.C. A copy of specification may be obtained on application to Luther Adams, surveyor, Stanton, near Ashbourne. Tenders must be sent addressed to the Clerk, Mayfield R.D.C., Ashbourne.

July 4. **DUBLIN.**—Construction and erection of twin Scherzer rolling lift bridges across the entrance to the Royal Canal, North Wall Quay, Dublin, for the Port and Docks Board. Specification and drawings can be seen at the office of the Engineer of the Board, John P. Griffith, M.Inst.C.E., East Wall, Dublin, from whom any further information required can be obtained. If on examination of the specification and drawings, intending contractors should desire to obtain copies, these, together with the special printed form of tender, can be obtained on deposit of £5. Contractors are required to state whether they have constructed Scherzer rolling lift bridges, or other opening bridges, and to give full particulars of such works and the names of engineers under whom these were carried out, and to whom reference may be made. Tenders must be on the special form, and addressed to the Secretary, Port and Docks Office, Westmoreland Street, Dublin.

THE RUBBER BOOM.

...se, c... ...n with marm... ...a great cur... ...ution may lie at the this Lambeth ...perience.

Yes, your mackintoshes will cost you more. This is not a Free Trade joke; it's a grimly serious consequence of the rubber boom. Waterproofs have already been put up 20 per cent., and everything of which rubber forms a part is rising proportionately. As there are generally sympathetic movements in other directions, we may perhaps expect to see umbrellas also "going up." It is rather rough on us, when other trades are dull and everyone has to economise, that we should have to pay more for our tennis boots, our hot-water bottles, our golf balls, our goloshes, our ink-erasers, our rubber heels, and our elastic stockings. It's a benevolent wind indeed that blow's nobody harm. Aye, there's the rub—in fact, there's the rubber!

...was a Simple ...treet, W. Exhibition last week in the exhibits was a

NORTON & GREGORY, LTD., CASTLE LANE, WESTMINSTER.

July 16. **BURNLEY.**—Construction of an impounding reservoir, with catch-waters, aqueducts, meter houses, etc., at Hurstwood, near Burnley, for the Burnley Corporation. Plans may be seen, and specification, schedule of prices, form of tender, and all other particulars obtained on application to J. Diggle and Son, engineers, 14, Victoria Street, Westminster, S.W., and Hind Hill Street, Heywood, Lancashire, on deposit of £5. Tenders must be sent to Peregrine Thomas, town clerk, Town Hall, Burnley.

SANITARY ENGINEERING.

June 20. **CHELMSFORD.**—Extending the sewer in Trinity Road, for the T.C. Forms of tender, and full particulars may be obtained, and the plans and specification may be inspected, at the office of the Borough Surveyor, Cuthbert Brown, 16, London Road. Tenders must be delivered at the office of W. Smith, Town Clerk, Municipal Offices, Chelmsford.

June 20. **TEDDINGTON.**—Extending Wellington Road sewer, including the provision of a cast-iron syphon under the railway, for the U.D.C. Specification, form of tender, and other particulars may be obtained from Marshall Hainsworth, the Borough, Teddington. Tenders must be received by G. H. Salmon, Clerk, Elmfield House, Teddington.

June 20. **YSTRADGYNLAIS.**—Schemes and estimated cost for sewering the Parish of Ystradgynlais Lower, for the R.D.C., who will pay a sum of £20 for the scheme which they consider most suitable, and the decision of the Council must be accepted as final. Competitors to state their terms for full detailed plans and specifications, and for carrying out the scheme they submit. Particulars of the area to be drained and any other information may be obtained from T. Watkins, Surveyor to the Council, Ystradgynlais. Schemes to be sent in to D. L. Moses Evans, Clerk to the Council, Commercial Street, Ystalyfera.

June 20. **RUDDINGTON (near Nottingham).**—Sewerage works in the parish of Ruddington, near Nottingham, for the Basford R.D.C. The contract comprises about one mile of 9in. stoneware and iron pipé sewers, with manholes, flushing chambers, and other appurtenant works. Drawings may be seen at the office of S. Maylan, engineer and surveyor to the Council, at the Public Offices, Basford, by appointment, and copies of specification, conditions, bill of quantities, and form of tender may be obtained on deposit of £2 2s. Tenders to be delivered to Henry Stone, clerk, Public Offices, Nottingham Road, Basford, Nottingham.

June 21. **RICHMOND (Yorks.).**—(See "Building.")

June 21. **URMSTON (Lancs.).**—Laying and construction of about 500 lineal yards of surface water drainage in Higher Road, Urmston, for the U.D.C. Specifications and particulars can be seen and quantities and forms of tender obtained on application to James Heath, Council Offices, Urmston, upon deposit of £1 1s. Tenders must be forwarded to T. J. Rowland, clerk, Council Offices, Croft's Bank Road, Urmston.

June 21. **SOUTHWELL.**—Alteration and additions to sewage disposal works, for the R.D.C. The contract will comprise alterations to present tanks, new storm-water tanks, pumping tank, engine house, percolating filters, cottage, effluent outfall, and other appurtenant works. Plans may be seen at the office of the engineers (Sands and Walker, Milton Chambers, Nottingham), and copies of conditions, specification and quantities can be obtained on deposit of £3 3s. The successful contractor will be required to enter into a bond in the sum of £500, through an approved Guarantee Society, or with approved sureties for the due performance of his contract. Tenders to be sent to John Ellis, Clerk to the Council, Southwell, Notts.

June 22. **ATHERTON.**—Laying and construction of a 3ft. concrete tube sewer, from the old Glass House Tanks to a point opposite the cemetery gates in Leigh Road, Atherton, with all necessary manholes, etc., for the U.D.C. Plans may be seen and bill of quantities and specification obtained on application to F. H. Grimshaw, AssocM.I.C.E., Surveyor to the Council, Town Hall, Atherton, on deposit of £1 1s. Tenders, accompanied by priced quantities, to be sent to William Garnett, Clerk to the Council, Town Hall, Atherton.

June 25. **CHESHAM (Bucks.).**—Construction of about 960 lin. yards of 9in. cast-iron pipe sewers, together with manholes, lampholes, house connections, etc., in Bellingdon Road, Sunnyside Road, Amersham Road, Pednor Road, Missenden Road, and Church Street, Chesham, for the U.D.C. Plans, sections, and specifications may be seen upon application to Percy C. Dormer, engineer and surveyor, Council Offices, Chesham. The person whose tender is accepted will be required to enter into a contract and bond in an approved guarantee society as surety for the performance of contract, a copy of which may be seen at the office of W. J. Standring, clerk, High Street, Chesham. Tenders for the whole of the work to be delivered to the Engineer.

June 28. **LEYTON.**—(See "Building.")

June 30. **CROMPTON.**—Construction of extensions to their sewage works at New Hey, for the U.D.C., comprising the following:—Contract 1.—(a) 12 precipitation tanks, with channels, valve pipes, sluices, and other appurtenant works; (b) first and second contract bateria beds, about 1¼ acres in extent, with filter area for supernatant water, and all appurtenant works; (c) detritus tanks, screening chambers, storm-water overflow chamber, with necessary channels, etc; (d) valves, screens, penstocks, lime mixer, oil engines, and machinery, etc. Contract No. 2.—(a) Dynamos and electrical equipment for lighting new and present buildings, with motors for driving machinery, standards, wiring, lamps, etc., complete; (b) alterations to present buildings, with cast-iron overhead tank, and all requisite sewer diversions, channels, etc. Drawings, specifications and general conditions of contract may be seen, and bills of quantities obtained, on application to J. P. Wilkinson and Son, Civil Engineers, 301, Cathedral Street, Manchester, and on deposit of a crossed cheque, value £5 5s. Tenders to be addressed to the Clerk to the Council, Town Hall, Shaw, Oldham.

July 1. **LONDON, N.**—(See "Building.")

IRON AND STEEL.

June 22. **CLACTON-ON-SEA.**—Supply of about 785 lineal yards of wrought-iron fencing and six entrance gates, for the U.D.C. Full particulars can be obtained upon application to D. J. Bowe, surveyor, Town Hall, Clacton-on-Sea. Tenders to be delivered to Geo. T. Lewis, Clerk, Town Hall, Clacton-on-Sea.

July 4. **DUBLIN.**—(See "Engineering.")

PAINTING.

June 20. **REIGATE.**—Painting and distempering at the childre 's homes, No. 25 and 27, Hardwick Road, Meadvale, for the Guardians, in accordance with a specification, which may be inspected upon application to the Master of the Workhouse.

June 20. **BRISTOL.**—Painting, colouring, etc., of certain schools, for the Education Committee. Specifications and conditions of contract may be obtained from Peter Addie, Exchange, Corn Street, Bristol, on deposit of £1 1s. Each tender must be sent in a separate envelope, endorsed with the name of the school to which it refers, to Wm. Avery Adams, secretary, Guildhall, Bristol.

June 20. **GOODMAYES (Essex).**—Painting the exterior of the Asylum, Goodmayes, for the West Ham B.C. Specification, form of tender, and further particulars may be obtained at the office of John G. Morley, Borough Engineer, Town Hall, West Ham, E., upon deposit of £1. Tenders to be delivered at the office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by registered post. The contractor will be required to enter into a bond, with one surety, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay the whole of his workmen such rate of wages, and observe such hours of labour, as are recognised by the Workmen's Trade Unions, and in force at the time of signing the contract, and shall not assign, nor under-let, or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

June 22. **DARTFORD (Kent).**—Cleaning and painting works and repairs at the Darenth Asylum, near Dartford, Kent, for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., Engineer-in-Chief. Conditions of contract, specification, and form of tender may be inspected at the Office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board.

June 21-28. **LEYTON.**—Cleansing, painting, repairs, and alterations at various schools, to be executed during the summer vacatio , for the U.D.C. Specifications, conditions, and forms of tender for either of the above may be obtained on written application, not later than June 21, to William Jacques, A.R.I.B.A., 2, Fen Court, Fenchurch Street, E.C. (the Committee's Architect), which must be accompanied by a deposit of £1 (cheques will not be accepted). Tenders must be delivered at the meeting of the Council to be held on June 28, at 7 o'clock p.m. The general conditions of the contract include a trades union clause, copy of which may be seen at the Architect's Office, or the Town Hall, Leyton.

June 22. **WEST HARTLEPOOL.**—Painting, etc., at certain schools, for the Education Committee. Form of tender, etc., can be obtained at the Education Office, Park Road.

June 22. **LONDON, N.E.**—Cleaning work at their infirmary, Whipps Cross Road, Leytonstone, N.E., for the West Ham Guardians. Form of tender, etc., and conditions of contract can be obtained from Thomas Smith, Clerk, Clerk's Office, Board-room, Union Road, Leytonstone, N.E.

June 22. **LONDON, S.W.**—Cleaning and painting works and repairs at the South Western Fever Hospital, Landor Road, Stockwell, S.W., for the Metropolitan Asylums Board, in accordance with conditions of contract and specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., Engineer-in-Chief. Conditions of contract, bills of quantities, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board.

June 23. **LONDON, W.**—(See Building.")

June 23. **HULL.**—Painting, colouring, whitewashing, etc., certain of their schools, for the Education Committee. Particulars and forms of tender can be obtained at the offices of J. T. Riley, Secretary of Education, Education Offices, Albion Street, Hull.

June 23. **LONDON, S.E.**—External painting and internal decorating (part of) the Workhouse at Ladywell Road, Lewisham, S.E., for the Bermondsey Guardians, according to the specification of A. H. Newman, F.R.I.B.A., etc., and quantities by W. T. Farthing and Son, of 46, Strand, W.C. (a) Forms of tender (which can only be received), (c) bills of quantities, and (d) specification, containing full particulars and conditions of contract, can be obtained at the office of E. Pitts Fenton, Clerk, No. 283, Tooley Street, S.E., between the hours of 10 a.m. and 12 noon daily, by depositing a £10 Bank of England note (cheques or cash will not be received). The amount deposited will be returned to persons sending in. Tenders, and other documents above referred to, must be delivered to the Clerk.

June 24. **EAST RIDING (Yorks).**—Painting and cleaning of certain schools in the Riding, such work to be carried out during the time the schools are closed for the summer holidays. A list of the schools intended to be painted or cleaned may be obtained on application to John Bickersteth, Clerk to the East Riding Education Authority, County Hall, Beverley. Specifications of the work may be seen and forms of tender obtained at each of the schools mentioned on the list, after June 9, and all tenders must be delivered at the same address.

No date. **LONDON, E.**—Distempering and painting works at their Children's Receiving Homes, Salmon's Lane, Ratcliff, E., for the Stepney Guardians. Specifications and forms of tender can be obtained at the office of T. G. Stacey, Clerk, Guardians' Offices, Barnes Street, Ratcliff, London, E.

ROADS AND CARTAGE.

June 20. **STOWMARKET.**—Supplying 700 tons of best hand-broken granite, size 2½in., also supply of 450 tons of broken flints, size 2½in., to be delivered at Stowmarket Station in such quantities as may from time to time be required, for the U.D.C. Tenders and samples to be sent to P. C. G. Hayward, Clerk to the Council, The Old Bank, Stowmarket. No forms of tender supplied.

June 20. **LONDON, S.W.**—Making-up and paving of Dungarvan Avenue, Putney, for the Wandsworth B.C. Specification and drawings may be seen, and forms of tender obtained, of the Borough Engineer, at the office of the New Streets Department, 56, East Hill, Wandsworth, S.W., upon deposit of £5 5s. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose. Fair wages clause. If required, the contractor must provide two sureties.

June 21. **BRENTFORD.**—Supply of 400 yards of blue Guernsey granite, hand-broken to a gauge of 2in., for the U.D.C. Forms of tender, together with specification and conditions, may be obtained on application to J. W. Croxford, the Surveyor, at Clifden House, Boston Road, Brentford. Tenders to be delivered at the Clerk's Office, Clifden House.

June 21. **BROMLEY.**—Sewering, levelling, paving, metalling, channelling, and making good Gilbert Road and Minster Road, for the B.C. Plans, sections, and specifications, may be seen, and bills of quantities obtained, at the office of the Borough Engineer, on deposit of 10s. at the office of Fred. H. Norman, Town Clerk, Municipal Offices, Bromley, Kent.

June 21. **GOSFORTH.**—Supply of carriageway and footway materials, cement, sanitary pipes, metal castings, brushes, shovels, enamelled name plates, etc., for twelve months, for the U.D.C. Particulars may be obtained on application to the engineer and surveyor, George Nelson, A.M.I.C.E., Council Chambers, High Street. Tenders to be sent to R. Sheriton Holmes, clerk, Council Offices, Gosforth.

June 21. **URMSTON (Lancs.).**—Paving, flagging, draining, and other improvement works in Westbourne Road, Grosvenor Road, and passages off Firwood Avenue, Urmston, for the U.D.C. Plans, sections, and specifications may be seen and quantities and forms of tender obtained from the surveyor, James Heath, Council Offices, Urmston, upon deposit of £1 1s. Tenders must be delivered to T. J. Rowland, clerk, Council Offices, Urmston.

June 22. **NORTHFIELD.**—Making good of Rochester Road, Northfield, for the U.D.C. Quantities and forms may be obtained, and plans, etc., may be seen, at the office of the Engineer and Surveyor to the Council, Ambrose W. Cross, A.M.I.C.E., No. 23, Valentine Road, King's Heath, on deposit of £1 1s.

June 23. **DORCHESTER.**—Supply of about 500 yards of broken flints, for the T.C. Further particulars and form of tender may be obtained upon application to the Borough Engineer. Tenders must be delivered at the office of A. G. Symonds, town clerk, Dorchester.

"SPECIFICATION."

No. 12. 1909-10.

With which is incorporated The "MUNICIPAL ENGINEERS' SPECIFICATION."

An Annual Encyclopædia of Construction for ARCHITECTS, SURVEYORS & ENGINEERS when Specifying.

The following Letters (specimens of many receivea) speak as to the value of "SPECIFICATION."

"SPECIFICATION" is splendid, and to any architect or anyone engaged in the building trades invaluable. I constantly use it as a reference, and am always glad to have it by me.

(Signed) C. E. MALLOWS, F.R.I.B.A.

I consider "SPECIFICATION" to be a compilation of most valuable information, and it is not only an excellent work of reference for the architect, but also of considerable use to the engineer and surveyor. It should be upon the office table of every architect, and I shall have pleasure in recommending it whenever opportunity occurs.

(Signed) A. C. NORMAN, F.R.I.B.A., M.R.San.I.

I have found "SPECIFICATION" from its first edition very useful, and through its various editions continually improving, so much so. that it has become an essential companion for reference in office work. Its information is reliable, well arranged, and up-to-date, and it is a book that should be in the possession of every professional man.

(Signed) JAMES N. MONRO, F.R.I.B.A., I.A.

The previous issues of "SPECIFICATION." have proved of considerable value in my office, and I regard it as an excellent reference book for all classes of building work. The comprehensive character and its detail give it a special value to architects. I think the profession owes you some gratitude for bringing out such an excellent and useful volume.

(Signed) HENRY HARTLEY, F.R.I.B.A., F.S.I.

Price 3s. 6d. nett. Postage 6d. extra. Over 500 pages, 13×9 ins., strongly bound.

JUST A WORD ABOUT WHITEWASH.

No one denies that the old method of preparing whitewash was both insanitary and wasteful. It is now rendered **obsolete.**

"CEELINKOTO"

(Registered)

does away with it.

WHY? Because just mixed with a little clean cold water it forms a **perfect sanitary whitewash** for ceilings and friezes.

When an article of sterling merit has been successfully placed on the market imitations are bound to spring up. Protect your own interests by making sure that you use

"CEELINKOTO"

(REGISTERED)

It is made in White Cream, and Ivory, and is packed in casks weighing about 1½cwt. It is sold by all Builders' Merchants and Colour Houses. If any difficulty is experienced in obtaining

"CEELINKOTO"

the Proprietors will be glad to furnish the name of their nearest local agent.

BUILDING.

June 20. **SHEFFIELD.**—Erection of rubble stone retaining and fence walls on the East and West sides of Chesterfield Road, in Smith Wood, within the City, for the Improvement Committee of the City Council. Drawings may be seen, and conditions of contract, specification, and bill of quantities, form of tender, and other particulars obtained, on application to the City Engineer, Town Hall, Sheffield, upon deposit of 10s. Tenders to be enclosed and sealed in official envelope provided, and delivered at the City Engineer's Office. Any person or firm sending in a tender will be required to add a schedule to such tender, stating the names of the various classes of labour, which he or they intends or intend to employ, together with the places where such labour will be employed, and the rates of wages, hours of labour, and conditions of employment to be paid and observed in respect to each class of labour, and of which, as shown in the schedule, shall comply with the City Council's form of clauses respecting wages, hours, and conditions of labour, and prohibition against assigning or subletting, a copy of which, in the conditions of contract, may be obtained at my office upon application.

June 21. **CLAYTON (near Bradford).**—Alteration of the approach to the female infirmary, at the Workhouse. Drawings may be seen and bills of quantities obtained on application to the Architect to the Guardians, J. Harper Bakes, M.S.A., Calverley Chambers, Victoria Sq., Leeds. Tenders must be delivered to Wm. G. Cooper, Clerk to the Guardians, 4, Town Hall Street, Bradford.

June 21. **VENTNOR (I.O.W.).**—To Builders.—Constructing a quartermaster's store in the Artillery Drill Hall, I.W., for the Territorial Force Association for the County of Southampton. Plans and specifications can be seen at the office of the architect, Percy M. Du Feu, Ventnor, from whom copies of same and form of tender can be obtained on deposit of £1 1s. Tenders to be sent to the office of the Association, 32, Queen's Terrace, Southampton.

June 24. **WOMBWELL.**—Erection and completion of two houses in Hough Lane. Plans and specifications may be seen at Jos. Mattocks, 51, Bartholomew Street, Wombwell, from June 16 to June 24.

June 27. **STONE CHAIR (Shelf).**—Carpenters and joiners', plumbers' and glaziers', slaters' and plasterers' work, and materials required in connection with the alterations and additions to the Variety Club, Stone Chair, Shelf. Plans and specifications may be inspected from June 21 to June 27, on which last-named day tenders must be delivered to G. Reginald Oddy, Architect, Northowram, Halifax.

ENGINEERING.

June 29. **OLDHAM.**—Construction of a concrete gasholder tank, 212 feet diameter by 41 feet deep, adjoining their Hollinwood gas station, for the Corporation Gas Committee. Copies of specification and drawings can be obtained on application at the Gas Offices, Greaves Street, Oldham, on deposit of £2 2s.

June 29. **HOPE (Derbyshire).**—Construction of a concrete service reservoir and the providing, laying, and jointing of about 7,560 lineal yards of 4in. and 600 lineal yards of 3in. diameter, turned and bored spigot and socket cast-iron pipes, together with all necessary valves, hydrants, intake tank, and other works connected therewith at Hope, Derbyshire, for the Chapel-en-le-Frith R.D.C. Drawings may be seen, specification, bill of quantities, form of tender, key plan of the district, and other information can be obtained on application to Brady and Partington, engineers to the Council, Town Hall, Chapel-en-le-Frith, via Stockport, on deposit of £2 2s. Tenders to be delivered to J. B. Boycott, Clerk to the Council.

July 5. **MANCHESTER.**—Manufacture, delivery, and in some cases the transport and erection of the steelwork and ironwork required for nine bridges and one subway on the Aqueduct between Walkden and Audenshaw, the weight being about 700 tons, for the Corporation Waterworks Committee. Specification and form of tender may be obtained on application to G. H. Hill and Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque for £2 2s. as deposit. Tenders, addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

SANITARY ENGINEERING.

June 29. **PATELEY BRIDGE.**—Shaw Mills sewerage scheme.—Providing and laying about 840 lineal yards of 9in. and 6in. earthenware pipe sewers, together with the necessary manholes, etc., also for the construction of sewage disposal works, consisting of detritus tank, storm water tank, open septic tank, percolating filter, and all contingent works, for the R.D.C. Plans and specification may be inspected at the offices of the Engineers, Spinks, Pilling, and Rodwell, 20, Park Row, Leeds, from whom bills of quantities and form of tender may be obtained on deposit of £1 1s. Tenders must be delivered to W. Oddie, Clerk to the Council, Pateley Bridge.

July 1. **HANDFORTH.**—Construction of about 2,280 yards of earthenware pipe sewers, of 15in., 12in., and 9in. diameter, with manholes, flushing chambers, ventilators, etc., and also for the construction of sewage tanks, the laying-out and draining of certain land, etc., for the purposes of sewage disposal. Plans may be seen and copies of the specification and quantities obtained on application to Herbert Worsley, Clerk to the Council, 36, St. Petersgate, Stockport, on the deposit of £5 5s. Tenders must be sent to the above.

IRON AND STEEL.

July 5. **MANCHESTER.**—(See "Engineering.")

PAINTING.

June 22. **LEEDS.**—Painting and cleaning of schools during the midsummer vacation. Forward names to the Education Department (Architect's Section), Calverley Street, Leeds, when a list of schools and specifications will be forwarded. Tenders to be delivered to James Graham, Secretary for Education, Education Offices, Leeds.

June 23. **SALFORD.**—Decorating ward C. 2 at Ladywell sanatorium. Specification and form of tender may be obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders must be delivered to L. C. Evans, Town Clerk, Salford.

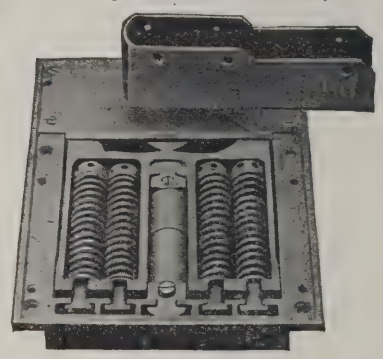
June 23. **WIGAN.**—Painting, colouring, limewashing, etc., required at the following schools:—St. Andrew's, St. Joseph's, National and Blue Coat, Presbyterian, Wesleyan, St. Paul's, Goose Green. Also limewashing, etc., at other schools. A general specification and detailed particulars of the work required to be done may be obtained on application to Geo. H. Mockler, Director of Education, Education Offices, Wigan, to whom tenders must be sent.

No date. **WEST RIDING OF YORKSHIRE.**—Division 19.—Summer renovations and cleaning at the undermentioned schools. Specifications and forms of tender may be obtained from the Education Offices, Woodhouse. Handsworth Area.—Handsworth, Woodhouse, Woodhouse West, Birley, Intake and Gleadless schools; holidays commence August 5th. Aston Area.—Aston, Swallownest Old, Fence, Treeton, Catcliffe, Brinsworth and Tinsley Schools; holidays commence 22nd July. Whiston Area.—Thrybergh and Ulley schools; holidays commence on July 22nd. Kiveton Park Area.—Dinnington, Harthill, Anston and Kiveton schools; holidays commence on July 22.

ROBERT ADAMS, ENGINEER & PATENTEE,

Architects' and Builders' Specialist.

PERFECTION IN—



DOOR SPRINGS. FANLIGHT OPENERS.

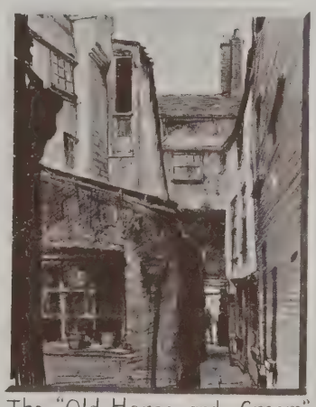
The **"QUORN"** BOILER.

A SERIES OF CHARMING ARCHITECTURAL SKETCHES.

By FRANK L. EMANUEL.



The Old Bell, Holborn

Holywell St.
from St. Clement Danes Church,
Strand. . . . .

Houses in Holborn

The "Old Horse and Groom"
back of Holborn-Above-Bars.

Booksellers Row,
Looking West.

Milford Lane,
Strand.

Davies Street.

Leather Lane, Holborn.

Fetter Lane, View from Holborn.

King St. Westminster.

The sketches are generally 9 in. by 6 in. wide. Any six pictures may be selected, and will be supplied at 5/- the set of six.

SHORT NOTES

On the Literary, Historical, and Architectural Interest of the Sketches.

1. **The Old Bell Inn, Holborn.**
   For two centuries, until 1879, a centre for coaches and carriers. It is mentioned by William Black in his "Strange Adventures of a Phaeton."

2. **Holywell Street, Strand.**
   (See also Nos. 5, 17, 18.) Holywell Street (Booksellers' Row) and Wych Street, Strand, which were swept away in carrying out the great Strand Improvement Scheme, contained, at their demolition, some fine old gabled houses. Holywell Street had then become the chief centre of the second-hand book trade, and was latterly known as Booksellers' Row.

3. **Old Houses in Holborn.**
   These quaint, half-timbered houses, which form the Holborn front of Staple Inn, are the last remaining reminiscence of Elizabethan street architecture in London.

4. **The Old Horse and Groom, Holborn.**
   This tavern was, at the time of its demolition, nearly 300 years old. One of its frequenters was the notorious thief-taker, Jonathan Wild.

5. **Booksellers' Row and Milford Lane.**
   For Booksellers' Row, see 2 above. Milford Lane gets its name from an old ford over the Thames, and a windmill that is shown in a contemporary print as standing near St. Mary's Church in the Strand, temp. James I. Sir Richard Baker, the chronicler, lived here, 1632-9.

6. **Davies Street, Oxford Street.**
   Here Lord Byron used to practise in the shooting gallery of the famous gunmaker, Joe Manton, who offended the poet by giving a blunt opinion on his marksmanship.

7. **Fetter Lane.**
   Fetter Lane was, in Stow's time, "built through on both sides with many fair houses"; those shown with gables in the sketch having probably come under his observation. "Praise God Barebones" and Mother Brownrigg have rendered the history of Fetter Lane notorious rather.

8. **Leather Lane, Holborn.**
   The date of the buildings in Leather Lane may be roughly inferred from a statement by Stow that it was "lately replenished with houses"; and Strype found in his time that "the east side of this lane is best built, having all brick houses." The chief building shown is apparently of the seventeenth century.

9. **King Street, Westminster.**
   This was, in the time of Henry VIII., the principal street of Westminster. Spenser is said to have died here "for lack of bread," and Cromwell lodged in this street when attending Parliament.

10. **Foubert's Place, Regent Street.**
    Commemorates the name of a French major who, in 1681, founded a riding school which became fashionable, and is mentioned in Evelyn's Diary.

11. **George Court, Strand.**
    One of the quaint old courts, on two levels, with steps and overbuilt passage, which were numerous in this district before clearances were made for the Law Courts.

12. **Rupert Street, W.**
    Formed in 1667, and named in compliment to the gallant Prince Rupert of the Rhine, son of King of Bohemia, and nephew to Charles I.

13. **Lincoln's Inn Fields.**
    Strongly reminiscent of the Father of the Renaissance in England, Inigo Jones, who drew the ground-plan and completed the west side. Here Lord William Russell was beheaded. Dickens, when a boy, was employed here in a solicitor's office; and his biographer, John Forster, lived here.

14. **Houses in the Strand.**
    The Strand is now almost completely modernised; and its character is so improvocative of sentiment that one marvels at the saying of Charles Lamb: "I often shed tears at the motley Strand, for fulness of joy at so much life."

15. **Archway, Portugal Street.**
    Portugal Street, Lincoln's Inn Fields, where was situated the alleged "Old Curiosity Shop," has within recent years suffered so many changes that Dickens, could he revisit it, would hardly recognise it.

16. **Exchange Court, Strand.**
    Recalls the "New Exchange" opened by James I., and a favourite scene with the dramatists of the reign of Charles II., when it had become a fashionable resort of the gallants.

17. **Booksellers' Row.**
    A later name for Holywell Street. (See 2.)

18. **Wych Street, Strand.**
    This picturesque but unsavoury narrow street (see 2) was demolished in the clearance for the Strand Improvements.

Please note that the two small sketches No. 5, are counted as one picture.

An Order Form is Printed on Page 4.

Fouberts Place, Regent St.

George Court, Strand

Rupert St. W.

Lincolns Inn Fields, South West Corner

Houses in the Strand

Archway, Portugal St, Lincolns Inn Fields

Exchange Court, Strand.

Booksellers Row, Looking East.

Wych St. Strand

The sketches are generally 9 in. by 6 in. wide. Any six pictures may be selected, and will be supplied at 5/- the set of six.
An Order Form is printed on next page.

THESE reproductions of Mr. Frank Emanuel's charming sketches comprise and preserve some of the most picturesque features of Disappearing London. The sketches have been reproduced by a special process, are printed with artistic effect in a dark brown tint, and the plates have been destroyed, so that when the present stock is exhausted no further copies can be obtained.

The series forms a quite unique and very valuable collection of records of Historic Portions of Picturesque Old London. The sketches are generally 9 inches by 6 inches wide. When framed in brown walnut and with brown mounts they make charming pictures.

A list of sketches and a short note of interest about each is given on page 2.

The Publisher offers to supply any set of

SIX PICTURES AT 5s. THE SET.

The Japan-British Exhibition.

WE have already devoted some consideration to the subject of Japanese and English art, as far as represented in the contents of the art-pavilion at the Exhibition, where, however, except as regards sculpture, Japan was much better represented than Great Britain. Other sections of the Exhibition, especially of the Japanese exhibits, merit, however, more attention than they receive. The fact is that what is called the "White City" has become a place of dining-rooms, tea-rooms, and popular amusements, with some exhibition galleries thrown in. The latter are mostly nearly empty; the crowd pay no attention to them; there are no catalogues to be had, except of the Art Section; and the "Official Guide," as it is called, is only a popular pamphlet, and gives no real information. The place is a pleasure-garden for the masses, in fact; but the Japanese Government and the Japanese exhibitors seem to have taken it seriously, and their Textile Hall, as it is called (though it represents much besides textiles) contains a good deal of fine and characteristic work.

We may notice first, however, the great Japanese pavilion built up in the entrance hall from Wood Lane Station. This is said to be an exact reproduction of the sacred gateway of Nara, the former capital of Japan; as a full-size piece of indigenous Japanese architecture it is of considerable interest. It is, of course, a timber erection, profusely decorated in colour, a brilliant red forming the main mass of colour; the large cylindrical columns are topped, not with any kind of capital, but with a flat ornament looking like a silver inlay. The roof construction, in which a lower set of rafters crops out from under the upper roof, looks very confused and unscientific, like the perfunctory carrying out of a rude traditional method of construction, and there is something almost humorous in the projection of all the loose ends, as we may call them, of the bracket-framing, and the curious turn-up of the hips of the roof, reminding one of the pictures on the Chinese willow-pattern plates. And the secondary cornice, above the columns, carries a couple of rails above it at the angles, not because rails are wanted there, but they are part of the composition. The whole thing is barbaric, unmeaning; it is not even good or scientific timber construction; but it is undeniably picturesque. Is it possible for a country so bent on taking place and power with European nations to keep up this style of architecture? Come into the Japanese Government pavilion and we shall see. There is the perspective drawing of the headquarters of the Japanese Red Cross Society; a commonplace "brick and stone dressings" building, such as we may see half a dozen of among the inferior things at the Royal Academy; and there is the large model of a Japanese "Second-class Post-Office," a square brick building with round-arched windows, stripes of different-coloured bricks, and a modillion cornice running all round it. As far as Government is concerned there is evidently an end of indigenous Japanese architecture; how could it be otherwise, alongside of those models of ultra-modern battleships, and that model of a native class of ship, which the Government fifty years ago forbade the construction of (except for small vessels), in order to encourage the building of an efficient navy?

"The old order changeth, yielding place to new."

Japanese orientalism is, officially at least, at an end; we are perhaps seeing in this very exhibition the last of it.

The history of Japanese costume and habits of life is well illustrated in the galleries to the left of the vestibule, by groups of wax figures in the costumes and avocations of successive periods, from somewhere about the eleventh century down to the final scene of "the present day," in which a good many of the figures, those of naval and military officers especially, might belong to any European country. The exhibition is an interesting one, and as, in the older periods, the heads given to the figures are distinctly national in physiognomy, one can realise how exceedingly well the native ladies' costume goes with the native face and figure; though one would not be surprised to find that the Japanese lady who has money to spend on her dress now goes to Worth, or some other famous European costumier, who will never make her look so well as in her Japan-made dress. But this series of historical tableaux, illustrative of different periods in manners and dress, is far more sensible and interesting than the absurd display which fills a long gallery on the English side of the exhibition, of wax groups of figures in the dresses appropriate to different social functions of to-day—a wedding, an "at home," a cricket match, a boating party, etc. A series of historic costumes, like that in the Japanese gallery, would have been of some value, and would have taught people something; the present show is calculated only to provoke laughter, and suggests the idea of a series of fashion-plates in the round.

The best Japanese display, after that in the Art Pavilion, is in the Textile Hall before referred to, where, however, the first thing we come to is not textiles but furniture—Takamatsu's carved furniture in dark wood; very ponderous and richly carved chairs and settees in which dragons play a great part; effective and costly work, which somehow suggests the idea of being made for the European market, for people who wish to have something that looks "Oriental" in their homes. Osawa and Co.'s simpler square-lined furniture, with some black inlay and light-coloured upholstery, a little higher up, suggests Paris rather than Japan, except in the practical way in which the feet are spread slightly to form a good base for the furniture; an incident of structure to be noticed also in some old furniture illustrated in the retrospective exhibition. A little higher up is an important exhibition with no exhibitor's name attached to it (as is the case with a good many of the Japanese exhibits); a screen with a richly carved open-work frieze enclosing a collection of magnificent gilt and lacquered cabinets, with folding doors and drawers with open-work panels, and interiors with a profusion of little shelves, columns, drawers, forming a kind of miniature architectural interior. This is very rich and splendid work, though it must be admitted that it has the stamp of modernity about

it, and is wanting in the delicacy and refinement of style and execution which characterises ancient Japanese work of the same type of object. There are other objects of great richness of effect which seem rather at variance with one's ideas of Japanese decorative art; a screen, for instance, with a heavy and effective frame of wood-carving *à jour*, and on the centre flying birds and foliage built up in high relief in thicknesses of various metals; this is undoubtedly sumptuous (that is the word) in effect, but there is a touch of Parisian taste about it that rather jars upon one. Nor can one applaud the design of an embroidered silk screen, representing the bars of a bamboo cage, with large birds behind the railing or putting their heads through it. Is it possible that these things are made with a special eye to the English market? There is, however, much really beautiful textile work scattered about, which it would be difficult to surpass either for beauty of design or thoroughness of handmade work.

The great built-up kiosk half-way up the gallery, with a raised platform in front of it, and to which we could find no exhibitor's name attached, is one of the most effective things in the exhibition. It displays great red columns, with white bases of a reversed curve, concave above and convex below, crossed at the top by two large beams covered with a greyish diaper which harmonises admirably with the prevailing red. How do they obtain that peculiarly fine red colour, brilliant and yet not garish? We seem to see no red like it in English colouring. The one false note is the heated colour of the diapered curtains, draped behind the columns, which is out of harmony with the general colour scheme. Some fine furniture and bronzes are to be seen in the interior of this erection. Another important special exhibit is that of Kyoto-Kan, enclosed in a screen decorated with a great deal of very bold and clever wood-carving of grotesque lions and other animals in high relief; whether or not they are intended to be grotesque it would be hard to say. With all its cleverness of execution, this is somewhat barbaric art, and perhaps the most thoroughly satisfactory things in this compartment are the settees, of which the seat is formed of a very fine woven basket-work, with a decorative edging formed by a narrow strip of printed silk all round. In a simple way these are excellent pieces of furniture, and thoroughly well made.

In the pavilion devoted to Japanese educational work, arts and crafts, etc., is an exceedingly fine model of a mausoleum, a building in the native Japanese style, in a large courtyard surrounded by an artistically designed open-work fence, surmounted by a penthouse top. In this department are examples of the work of students of the Tokio School of Art and the College of Engineering. The City of Tokio has its own exhibition, which includes a large relief model of the city, and similar models of the Tokio waterworks and settling tanks, which seem to differ in no respect from what we are familiar with in England, and may, in fact, have been carried out by English engineers. The exhibit of the Imperial Earthquake Investigation Committee contains two of Omori's beautiful and delicate instruments for the automatic recording of earth tremors, the construction and action of which can here be studied; it could not be intelligently described without diagrams, but they are very beautiful and delicate instruments, of Japanese design and manufacture.

The British Transportation exhibit, in a gallery adjoining the last-named, contains among other things a full-size section of the Central London Tube railway, with a carriage standing in it, which may enable those of the public who may pay any attention to it to understand the construction of the tube, but hardly anyone seems to trouble the vast solitudes of these practical departments of the exhibition. A saloon railway carriage built for Queen Adelaide in 1843 is a reminder of the days when railway carriages proclaimed their descent from the old stage-coach by being designed as if they consisted of three stage-coaches adhering together; a form of design which was carried on to a period within the memory of many persons still living; a curious instance of the difficulty there is in getting rid of a precedent and evolving a new form of design for a new type of vehicle. It took railway engineers the best part of half a century to realise that as a long railway carriage was a structure complete in itself, there was no need to divide off each section of it by a curved framing recalling the shape of a stage-coach. We are in the same confusion of mind at present with the taxi-cabs, the design of which still follows the lines of carriages built to have a horse in front of them; and the very same conservatism in regard to form is hampering our ideas as to the architectural treatment of reinforced concrete buildings. An interesting example of progress in one detail of railway construction is afforded by the placing together of a portion of the permanent way of the Liverpool and Manchester railway of 1830 with a permanent way as now constructed. The 1830 rail is what seems now a very light cast-iron section with no bottom flange, the object being that the thin web should fit close into the jaws of the iron chair; the device of making the chair wide enough to receive the lower flange, and tightening up the rail with a hardwood wedge, not having then occurred to anyone. Each chair rests on the centre of a square block of stone, the packing consisting merely of waste cinder refuse. Even with the moderate speeds of that day, it must have been a noisy and shaky railway to travel on, the stone blocks not having the elasticity of the wooden sleeper.

The British Mechanical and Engineering Pavilion contains a quantity of splendid exhibits in the way of models of ships, great and small guns, etc.; matters which hardly come within our province. The idea of a specially representative exhibition of English sanitary engineering, talked of last year, seems to have fallen through; possibly the firms who were invited foresaw that the White City was too much of a playground to promise much attention to exhibits of this class. Among the few exhibits of the kind we noticed Maignen's Germ Proof Filter, the principle of which is not explained, but which has received excellent testimony from analysts; and Prior's adjustable barless grate, which can be canted at three different angles, so as to ensure either a large fire, a moderate fire, or (when the grate is canted upward and backward as far as it will go), a smouldering fire which will keep alight for a long time without wasting much heat. In summer the whole fire-box can be easily lifted out and leave the grate-opening as a flower-stand. The same exhibitor shows another type of grate, the "Venetian," in which the same adjustability as to the size and the slow or quick burning of the fire is provided for in another manner. Both grates seem worth attention.

The Japanese garden, which has been constructed at the back of their Textiles Hall, under the poetic title, "The Garden of Peace," is a very pretty and successful bit of scenic effect, though it is a pity that something was not done to conceal or decorate the unsightly back wall of the Hall which forms one boundary of the garden. In this garden is a small example of the ordinary Japanese dwelling-house, with its beautifully made light sliding screens by which rooms are separated or united at pleasure. It is a type of house that would be impossible either for European climates or European habits of life; but from the Japanese point of view one can imagine that it is just about the perfection of dwelling-house construction.

The Artist's "Liberty to Lie."

AN exhibition of photographs in the oil process by M. Robert Demachy, of Paris, was opened at the house of the Royal Photographic Society last week, and in a lecture before the society M. Demachy pleaded that fidelity to artistic truth did not compel the photographer to render a literal transcript of what he saw before him. It was only necessary that in his exercise of "control" he should be consistent. "An artist was quite at liberty to lie, but he must not contradict himself." M. Demachy's dictum must not revolt us because it is so bluntly put; nor must we allow ourselves to fall into the error of supposing that, in art as in ethics, a lie which is only half a lie is the worst form of untruth. The use of the ugly word lie in such a connection is rather

unfortunate. If "beauty is truth, truth beauty," then conversely a lie is ugliness, and ugliness is a lie. The artist does not lie; he merely selects his facts; and if he is sometimes guilty of a *suppressio veri*, he is not therefore necessarily guilty of falsehood. He brings into prominence that which is most worthy of attention, and suppresses or reduces what is trivial or unessential. M. Demachy's system of making his photographic picture visible by the addition of a specially prepared oil pigment, thus affording great scope for personal interpretation of the subject, is in effect a revolt and a protest against the embarrassing and crude fidelity of the camera lens, as well as a correction of its aberrations. Mechanical accuracy has no place in the domain of art, art being mainly, if not exclusively, a matter of temperament and the emotions. That the intellect, however, is by no means ruled out seems to be recognised in M. Demachy's observation that the artist "must not contradict himself." Because he is human, and because art is a human thing, he may be occasionally inconsistent, but he must not be altogether wayward and capricious. It is demanded of him that he shall have ideals and remain faithful to them; principles, and remain demonstrably loyal to them; but within these limitations he may, and must, be allowed considerable latitude and control; otherwise he is less an artist than a craftsman, and, in the case of the architect, less a designer than a copyist. M. Demachy's emphasis of this point in his mitigation of the literalness of photography is the more welcome for its character as a sort of flank movement or indirect approach to the main issue—that art is a human emanation.

Bradford Corporation Contracts.

BRADFORD Master Builders' Association have made certain representations to Bradford Corporation with respect to the conditions of the corporation building contracts. The questions raised are not set forth in the source from which our information is derived, but their tenor may be inferred from the recorded decisions. It has been decided "that an arbitration clause be inserted in all corporation building contracts." That is possibly a point gained. Its value, however, remains to be seen; for it is added that the clause shall be "in such form as the town clerk shall determine." Upon the town clerk, therefore, devolves a delicate responsibility, and it would perhaps be impertinent to intrude upon his heart-searchings with an insinuation that the R.I.B.A. contract form is ready to his hand, and would possibly save him much furious thinking. This simple solution of the difficulty has probably been already suggested by the Master Builders' Association; for, generally speaking, the adoption of that form is bound to be sufficiently satisfactory to restore confidence if not to secure absolute contentment on both sides. The next decision is, "That the application of the Association for payment of one-half of the retention money at the end of three months, and the balance at the end of six months after completion of the contract be not entertained." That frigid and calculated, curt and uncompromising clause, "be not entertained," seems to suggest that the builders had hazarded a very daring departure from custom and precedent. So much the worse for custom; and, indeed, it is notorious how much too far in the opposite direction corporations are in the habit of letting themselves go. Between the two extremes there is only too much room for equitable reform. In the next item the corporation dally with the same seductive phrase, but mitigate its severity with a rider: "That the application of the Association for 'a fixed sum of, say, 5 per cent. on all prime cost sums to cover builders' liability' be not entertained, but that the present clause in the contract conditions as to prime cost sums be altered so as to give the contractor an opportunity to include in his tender a sum to cover him in respect of his liabilities for prime cost items." This concession is not very gratifying to the builder, who, it has been alleged, is usually afraid to take advantage of it, because the items are then made competitive. If the Bradford builders, however, have taken little or nothing by their action, they have at least got the corporation to move, if only in a circle; and that in itself represents some sort of a moral gain, if it does no more than demonstrate that corporations are not wholly inert bodies, nor builders' associations at all somnolent ones.

The Shakespeare Memorial Theatre.

IN order to obtain subscriptions to the fund for a Shakespeare Memorial Theatre, district committees are being formed. Such a committee was inaugurated recently, when Mr. and Mrs. Godfrey Baring kindly placed their drawing-room at Queen's Gate at the disposal of the movement. Sir John Hare, who presided, reminded his hearers that we possess the finest dramatic literature in the world, and have produced the greatest dramatist, to whose genius and immortal fame, however, we had as a nation paid no homage. "France had her house of Molière. Where was our house of Shakespeare? All the great cities of Europe possessed national theatres, and was it not a scandal that London, the richest city in the world, should be conspicuous—he would almost say, ridiculous—in being without one?" Mr. Forbes Robertson, fresh from artistic triumphs in America, pointed to the example of that country in building the New Theatre, which, he said, was the most beautiful theatre he had ever seen. He desired to see in London a national theatre which should be a fitting monument to Shakespeare as well. "It was," he said, "a question of art, and we must see to it that the drama is as well protected as are music and painting by their respective academies." Mr. Forbes Robertson was here referring more directly to the dramatic art, of which he is perhaps our most accomplished living exponent; but, as the son of a painter, and as being himself, if we are not mistaken, a deft wielder of the brush, and most certainly the possessor of a super dainty artistic temperament, may be supposed to have a sym pathetic regard for the interests of architecture. It is therefore reassuring to find him taking so active a share in the movement, and imparting to it the right artistic touch and tone. If this spirit is sustained, the right kind of fabric may yet be reared.

The Proposed India Museum.

THE proposal to build an India Museum on a site near the new London County Hall, as a memorial to the late King, is a very spirited one, and we wish that it might be carried out on public grounds, apart from any question of regarding it as a memorial. As we have already said, the best and most suitable memorial to King Edward VII. would be the erection of a new façade to Buckingham Palace, thus making a worthy climax to the Victoria Memorial; and we believe the funds for that scheme could be raised by public subscription without difficulty. It would be otherwise with the proposed India Museum, the cost of which would be very great, and would probably have to be provided mainly by the English Government, though the Indian Government might contribute a portion. It would undoubtedly be a most fitting thing to have an adequate India Museum in London, embodying full illustration of the history and the arts of India; but it is a question whether a building of the size of the design which Mr. Chisholm is working out, 370ft. in length by 210 in width, would be large enough for the purpose. The general feeling at the meeting of the East India Association seems to have been that the question of cost would be prohibitive, as in this country we fear it would be; though we feel no doubt that if France had the interests in India that we have, an India Museum would certainly be established in Paris. We believe there is something of the kind already in Berlin. We are desirous, however, to see Mr. Chisholm's design for the proposed building, which will at all events be of interest.

NOTES AND NEWS.

Garden Cities, Suburbs, and Villages.

Mr. Ebenezer Howard writes to us to say that the terms given above are often loosely used by our public press, thus confusing some vital issues. A "Garden City," he explains, is a self-contained town, industrial, agricultural, residential, planned as a whole, and occupying land sufficient to provide garden-surrounded homes for at least 30,000 persons, as well as a wide belt of open fields. It combines the advantages of town and country, and prepares the way for a national movement, stemming the tide of the population now leaving the countryside and sweeping into our overcrowded cities. A "Garden Suburb" provides that the normal growth of existing cities shall be on healthy lines; and, when such cities are not already too large, such suburbs are most useful, and even in the case of overgrown London they may be, though on the other hand they tend to drive the country yet further afield, and do not deal with the root evil—rural depopulation. "Garden Villages," such as Bournville and Port Sunlight, are Garden Cities in miniature, but depend upon some neighbouring city for water, light, and drainage; have not the valuable provision of a protective belt, and are usually the centre of one great industry only. He asks us "in the interest of accuracy and of social progress to assist in keeping these distinctions clear."

Mr. Aldridge on German Cities.

Mr. H. R. Aldridge, Secretary of the Housing Reform Council, has given a summing up of his impressions during his Council's recent Continental tour to the Berlin correspondent of the "Daily News." He says:—

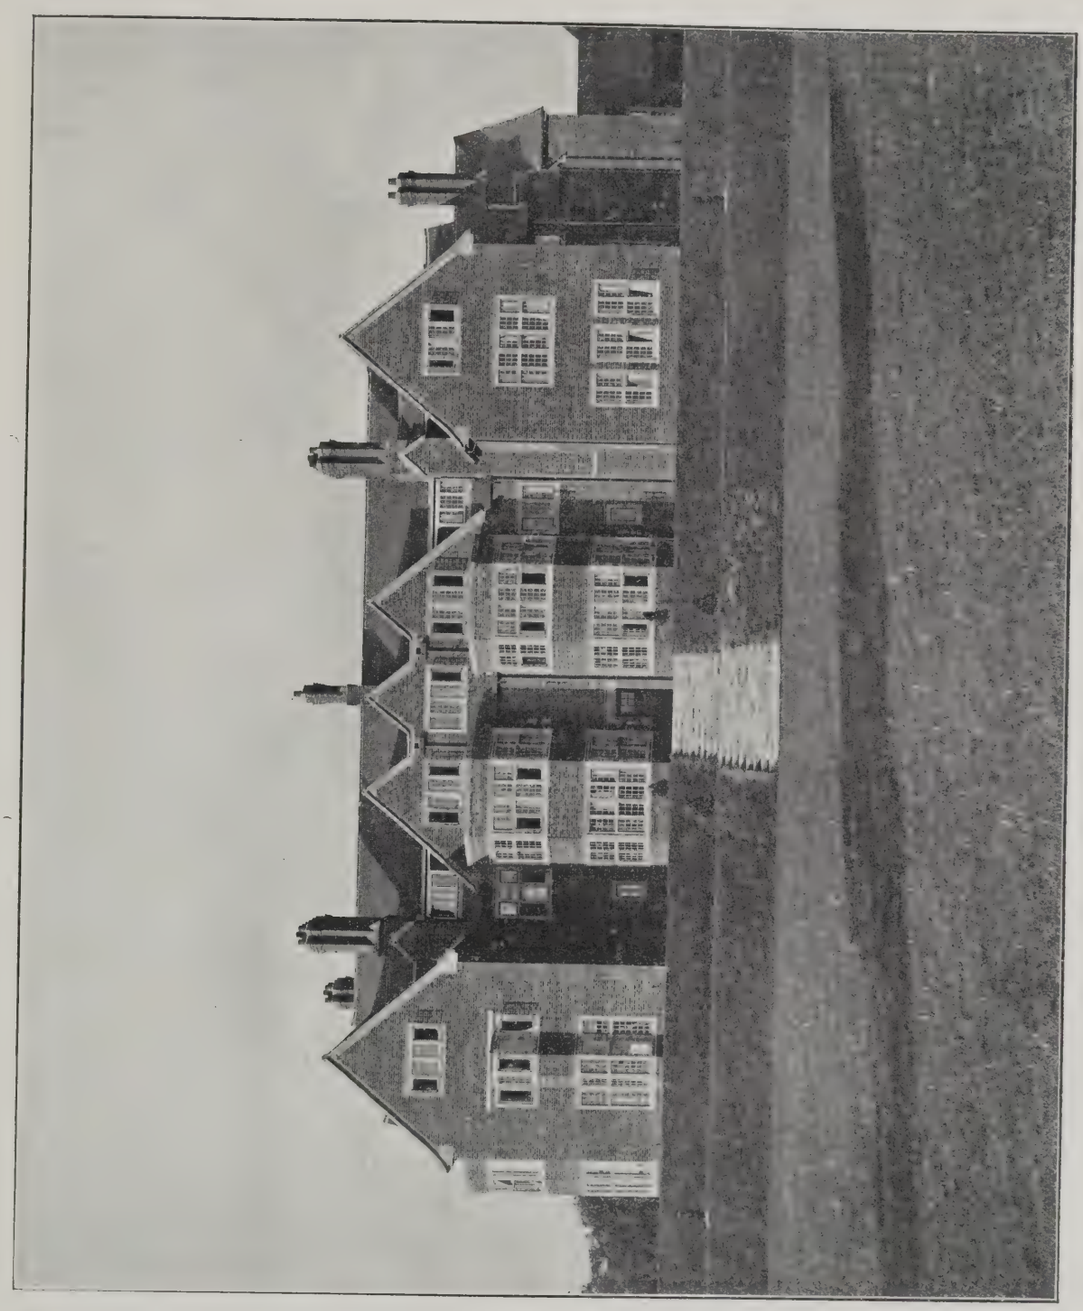
"England has nothing to learn from Germany about housing, but she has everything to learn about town-planning. Germans determine to make their towns beautiful. They have a sense of civic patriotism which we have yet to learn. They make great mistakes, however. After seeing what we have seen, nine-tenths of our party would probably be against the flat system. The Germans have also adopted the system of block buildings, which is by far the most expensive, and is raising the value of sites for workmen's buildings to £16,000 an acre. English town-planners must take the cottage as the basis of their schemes. If you like to put it drastically, you can say that in England we try to house the people; in Germany they warehouse them. But international criticisms are always risky, and I do not want to be dragged into politics. The wisest thing that I have ever heard said was a remark by a Swiss in Paris, who said that 'there is no hundred-per-cent. nation under the sun.'"

Croydon Palace.

The former palace of the Archbishops of Canterbury at Croydon, which is being carefully restored—or, perhaps, since that word seems to have acquired a sinister significance, it would be less provocative to say repaired—under the superintendence of Mr. Banister Fletcher, was, it appears, built of soft Godstone or Merstham stone, which, under the advice of Sir Arthur Church, is being treated with his favourite preparation of baryta water. In many instances, however, especially with respect to the window mouldings, it has been found necessary to employ new stone, but wherever possible the old work has been retained. The buttresses, and much of the stonework generally, were found to be covered with plaster; and in removing the plaster a window was discovered in the room over the north porch. In front of this porch, which is one of the oldest parts of the building, a retaining wall has been built under ground. The banqueting hall has a fine old oak roof. Its east wall, along which ran a music gallery, fell into the street about 1830. On the south side a beautiful doorway was found under some inches of plaster, and it is believed that if the funds allowed of extended investigations further interesting discoveries would be made. About £1,000 is immediately required for urgent works of preservation. Mr. D. Waller is the contractor.

The Life of Metallic Filament Lamps.

Some interesting figures regarding the life of tungsten lamps have been given by Mr. J. P. Jones, of the Citizens' Gas and Electric Company, to the Iowa Electrical Association. The results were adduced from the behaviour of 282 lamps which were under observation from July, 1908, to April, 1910. The average life of lamps burned out in use was 843 hours; 40 per cent. burned for less than 500 hours; 21 per cent. burned from 500 to 1,000 hours; 25 per cent. from 1,000 to 2,000 hours; 11 per cent. from 2,000 to 3,000 hours, and 1½ per cent. burned over 3,000 hours. At the conclusion of the investigation in April, 1910, there were 223 lamps in use, and the average burning was 991 hours; 12 per cent. had burned over 3,000 hours; 30 per cent. from 1,000 to 2,000 hours; 19 per cent. from 500 to 1,000 hours; and 14 per cent. had not been 500 hours in actual use.



Employers' Parliamentary Council.

The Employers' Parliamentary Council, upon which the Federated Master Builders are very ably represented, exists for the purpose of taking action "with respect to any Bills, introduced into either House of Parliament, affecting the interests of trade, of free contract, and of labour, or with respect to the action of Imperial or local authorities affecting in any way the said interests." Among the Bills to which the Council has recently given attention are the following: Railways (Eight Hours), to which the objection was that such legislation would interfere with the liberty of adult males to work for such period as they choose. The Bill has been dropped. Road Traffic, to prevent a driver having charge of more than one cart. The Bill is down for second reading on Friday, July 29th. Engines and Boilers (Persons in Charge), to prevent any person from taking charge of an engine or boiler of five-horse power unless he possesses a certificate under the Act. It was objected that this Bill was wholly unnecessary, and that, as a Select Committee reported in 1901, great care was exercised in the selection of capable, trustworthy, and qualified persons to take charge of engines and boilers, and any interference on the part of the State would tend to induce carelessness in employers. The Bill was dropped. Shop Clubs, to make it an offence on the part of an employer who made it a condition of employment that any workman should discontinue his membership or not become a member of any trade union or of any industrial and provident society. The Bill was dropped. Trade Union Law Amendment (No. 2), to override the judgment of the House of Lords in the Osborne case by allowing trade unions to pay the election expenses and the cost of maintenance of members of Parliament. The second reading was down for June 14th. Character Note, to make the giving of character notes compulsory. The second reading was dropped. Highways, to compel employers to provide an additional driver if a driver is employed for more than twelve hours, and to be responsible for penalties incurred for offences brought about by overwork. The second reading is set down for July 29th. From this list it is evident that the Council is doing excellent and very necessary work in protecting the interests of their class from the constant aggression of the militant members of the Labour Party, who, in their enforced obligation to keep moving, might become infinitely more mischievous than they actually are if it were not for such wholesome checks as those that are promptly applied by the Council, who realise that "eternal vigilance is the price of liberty."

Knappe Cross, Exmouth, Devon.

(*See also pages 633, 634.*)

This house has been built from the designs of Mr. W. H. Ansell, A.R.I.B.A., of London, on a site with a south-west aspect, and has fine views over the estuary of the River Exe, and over the English Channel, two miles away. As the situation is somewhat exposed, the walls were built hollow, being bonded with Jennings's stoneware cranked ties. The architectural motive was kept extremely simple, projecting mouldings being avoided, and good material and proportions relied

The situation being somewhat exposed, the house is built with a hollow space in the walls and bonded with stoneware cranked bricks. Ham Hill stone was used for the window mullions and dressings. (*See also pp.* 633, 634.)

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

on for effect. The garden front is symmetrical, and when the two terrace walls are built will form a complete and well-balanced whole. In planning, the large hall was taken as the central point of the daily life of the house. The principal rooms open from it, and can be reached without passing through any corridors. The central rooms on the first floor were planned as day and night nurseries for the children, with their bathroom attached. All these rooms communicate, so that access by the nurse is easy. The house contains four bathrooms. All the principal chimneypieces were designed by the architect. An entrance-lodge, stables, and electric engine-house and accumulator-rooms are also included in the work. The general contractors were Dart and Francis, of Crediton, Devon. The bricks from Basingstoke and the hand-made roofing-tiles were supplied by Ames and Hunter, and the fireproof floors were all constructed on the "Kleine" system. Polyphant stone and other Devonshire marbles were used for the chimneypieces. The grates were supplied by the Well Fire Co., the Carron Co., Thos. Elsley, Ltd., and the Teale Co. The casements, fittings, stained-glass and leaded lights, were made by Henry Hope and Sons; the special art metal-work came from Thos. Elsley, Ltd., while the door furniture, etc., was made by James Gibbons. The special English oak doors and staircases were made by the general contractors, and they also laid the oak and pitch-pine flooring. Morrison and Ingram supplied all the sanitary ware and fittings, and Miller and Co. the electric-light fittings. The modelled plaster-work in the hall and dining-room was executed by G. P. Bankart, and that in the drawing-room by Aumonier and Son. Wippell Bros. and Row carried out the heating and ventilating work. Paripan was used for the drawing-room decorations. A tube well, 300ft. deep, was sunk on the estate by Alfred Williams, of Bow, London.

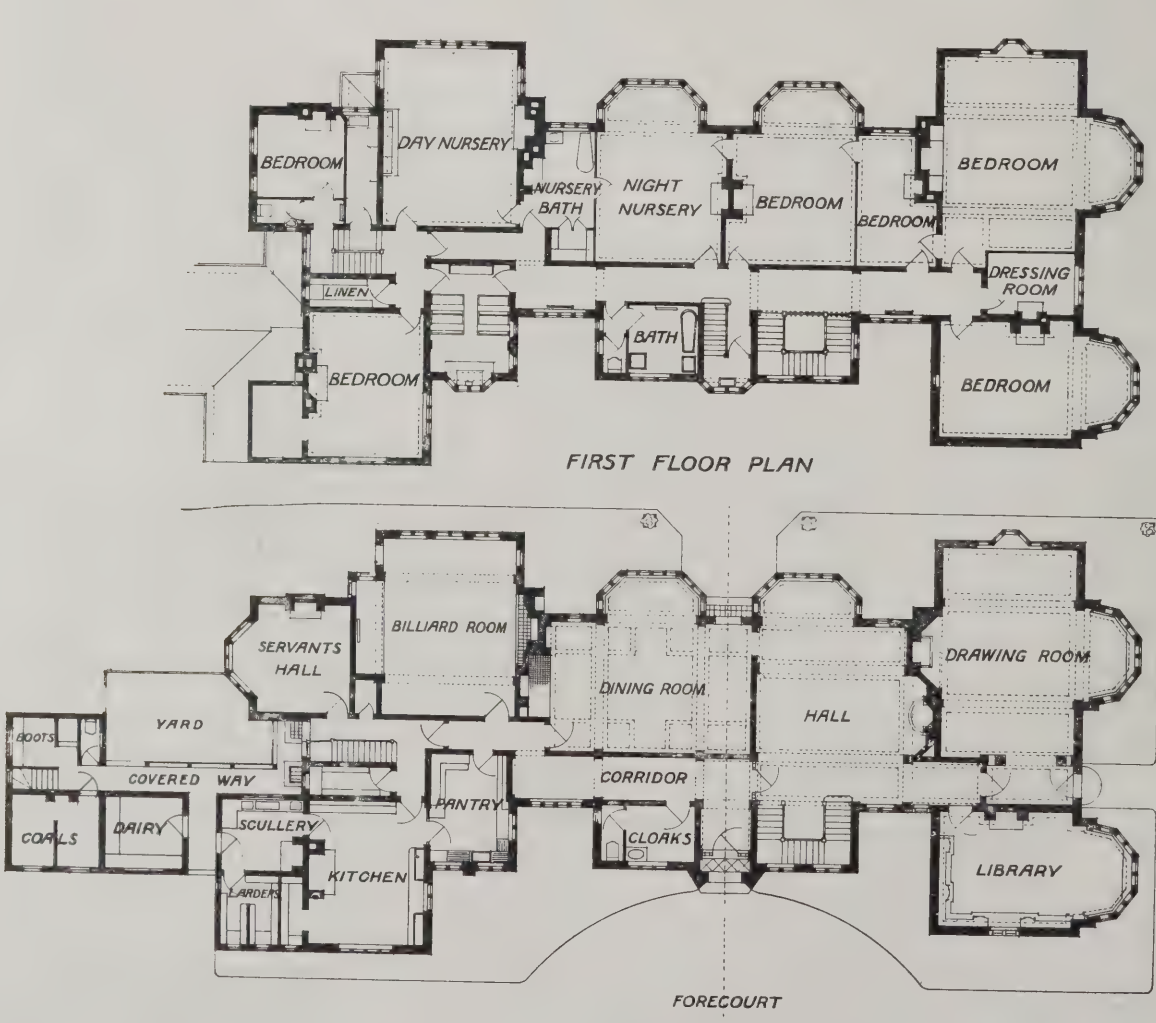
L.C.C. Housing and Street Improvement Policy.

At the meeting of the London County Council last week, Major Boscawen brought up the annual estimates of the Housing of the Working Classes Committee, which showed that £125,000 was required on the capital account, the bulk of which is apportioned for the provision of new dwellings, and the sum of £78,395 is included in the revenue account, chiefly for maintenance and management. He pointed out that his committee was largely composed of new members of the Council, who, before putting forward anything in the nature of a new policy, thought it their duty to get thoroughly into touch with the Council's business. The work of his committee, he said, fell under three heads: (1) Management of the Council's large estates; (2) development of estates not yet fully built upon; and (3) treatment of slum areas. He was convinced that the Council had done a good work in setting up a standard of excellence in their housing policy. It was sometimes said that the Council's housing schemes did not pay, but he thought it fairer to state that the losses were due to the undeveloped portion of the Council's estates, for the buildings completed showed a surplus of £3,484. He thought that the one estate which the Council could not make a paying

KNAPPE CROSS, EXMOUTH, DEVON: DETAIL OF CENTRE PORTION OF GARDEN FRONT. W. H. ANSELL, A.R.I.B.A., ARCHITECT.

property was the White Hart property at Tottenham, consisting of 825 acres, and he was afraid that it would be disastrous to develop the whole of that land as the residences wholly of the poor. Mr. Evan Spicer moved, and Mr. J. D. Gilbert seconded, that there should be a supplementary estimate of £10,000 for the clearance of the Tabard Street area, Southwark. Mr. Harold Cox remarked that, private enterprise being unable to cope with slum areas, public authorities must necessarily do the work. Mr. Evan Spicer's motion was accepted. The estimates amounted to £800,710, of which £250,000 was for street improvements under general powers, whilst the remainder was for specified tramway schemes, which necessitated road widenings.

The Late Mr. T. J. Bailey, F.R.I.B.A.



The death of Mr. T. J. Bailey is announced. Mr. Bailey as architect to the late London School Board, and more recently as Education Architect to the London County Council, had charge of the design and erection of the Elementary Schools of London for a long period. His work became so well known that he was regarded as one of the foremost English authorities on this class of building. His connection with the London County Council was severed at the end of last year, when he retired on a pension, and when the architectural and educational work he had done was referred to in terms of high praise by those who were best able to appreciate its value. At the meeting of the Education Committee last week the chairman referred in sympathetic terms to the death of Mr. T. J. Bailey. They all knew, he said, how hard Mr. Bailey had worked, and the great personal interest he had taken in all that related to his department, and it was to be feared that devotion to duty had tended to prevent him from enjoying his retirement.

Greenock's Grievance.

The disdain of the Woolwich workmen for the housing conditions at Greenock has naturally provoked indignation on the part of the authorities and inhabitants of that town. Greenock has a lady assistant whose special duty it is to visit the houses in the lower localities and report upon their condition. During February of this year Miss Anderson—the official referred to—visited 211 houses. Of these 7 were found in a dirty state, and were placed in charge of the sanitary authorities for immediate cleansing. In March the houses visited were 186, and the dirty numbered 4. In April the figures were 82, and 4 were found dirty, and in May no fewer than 466 houses were under visitation and only 12 were in a dirty condition, and these were put right without delay.

In the view of Greenock people, the allegations issuing from Woolwich are all the more regrettable as well as painful to the community in view of the special efforts made by the Corporation in the interests of public health during the past three or four decades. Through the agency of the Improvement Trust the worst portions of the central lower town were almost entirely razed to the ground, and commodious tenements suited to the working classes erected. At the present moment the Corporation is proprietor of about 500 houses in this very neighbourhood, and these houses are under the strict surveillance not only of the factor but of officials of the Sanitary and Public Health Departments.

There has been a curious sequel to the Woolwich protest. A poll has been taken of the employees in the torpedo factory of the Royal Arsenal at Woolwich on the proposal as to whether or not, if the Admiralty did not agree that their transfers to the new torpedo factory at Greenock should never exceed the housing accommodation reported by the men's local committee to be available, the men should *en masse* refuse to

KNAPPE CROSS, EXMOUTH, DEVON: PLANS. W. H. ANSELL, A.R.I.B.A., ARCHITECT.

The large hall is the central feature of the house, the principal rooms opening from it.

be transferred. The voting resulted as follows:—For the proposal, 69; against, 155. Some 300 men refused to vote at all.

Mr. Lowe, the men's secretary, interviewed by a press representative, said he could not account for the apathy of many of the workers unless it was that they feared dismissal from Government service by defiance, for it was being stated that if any workers refused to go north the Admiralty would engage other hands in Scotland at a lower rate of wages than those to be paid to the mechanics who will be transferred. Another factor which probably told against a solid vote against transference was the refusal of the various men's societies to support them in their agitation, because they were being paid above the standard rate of wages.

Aberdeen Statuary.

The argumentativeness of the Scots has found fresh fuel to feed its undying flame. A discussion as to the most suitable site for the Usher Hall went on for years, and for aught we know is still going on. It gave Edinburgh an interminable topic. It is now the turn of Aberdeen. Already there has been a considerable amount of correspondence with reference to the proposed statue to King Edward. All are agreed as to the desirability of the statue, but a dispute has already arisen as to where it should be put. One correspondent suggests that, Aberdeen being badly in need of a quiet street, such a street should be formed in order to accommodate the statue; which is irresistibly reminiscent of the alleged Scottish feat of building a barrel to fit a bung. The same correspondent, further, and perhaps more feasibly, advises that it would be a pity to spend £1,500 to £2,000 on a statue placed so high that nobody could see it without an effort that few would care to make. "The statue of Wallace," he writes, "presents itself against the sky, and people do look at it; but as for the other statues in Aberdeen, not one in a thousand looks at them, because the heads are so far above the ordinary human eye. If the statue is to be seen and admired," he contends, "it must not exceed 8ft. in height above the ground." Another correspondent would like to see all the statues put together in one spot—Union Terrace. A third correspondent suggests four suitable sites for the one statue; which seems to complicate the controversy. If this discussion is to be protracted as long as that referring to Usher Hall, the Aberdeen editors would be wise to insist on the rule of one man one site. The contention that the statue is to be of local granite will probably meet with inconsiderable opposition.

Art and Building.

Mr. C. B. Barber, Chairman of the West Yorkshire Branch of the Association of Teachers in Technical Institutes, speaking at the Batley Technical School, expressed the view that in the various building courses arranged at the different technical schools in the country, art for recent years had been sadly neglected. The result was that building students of all kinds received a good training in the constructive and mathematical sides of the subject, but acquired little or no knowledge of the artistic side. He urged that this was a serious defect in the courses of instruction, and one that ought to be remedied. In the discussion which followed, Messrs. T. Leadley (Bradford), H. Hodgson, A.R.I.B.A. (Bradford), H. Rogers (Leeds), F. E. Drury (Halifax), J. Horsman, and R. B. Hall (Batley) took part, and the opinions generally expressed were favourable to the idea that art should have a more prominent place in building studies than at present. So say we, also. It is one of the drawbacks of the technical college building education that art has little or no place in its curriculum. Architecture is not "decorated construction," but is a fundamental art underlying the whole planning and conception of a building.

The Illumination of Interiors.

Some striking statistics were given by Professor J. T. Morris in his first lecture on the "Illumination of Interiors," at the East London College (University of London). Advancing as an axiom that it was desirable that a light should

be so placed that, while invisible itself, it illuminated the object to be seen, he passed to the question of fluctuations in daylight, and by means of figures and curves showed how the intensity of illumination varied during the afternoon and evening of an average bright day, June 7th being taken as an example. While the intensity was 3,500 candle ft. at 1.30 p.m., and after fluctuating was still 3,000 candle ft. at 4.30, yet the passing of a cloud at this time reduced it to 1,100. After sunset figures dropped as low as 0.02 candle ft., but the lighting of the arc lamps only brought the illumination up to 0.10 candle ft. As to the question how much of the light entered a room, an average figure was 0.002 of the external intensity. Figures ascertained by Mr. P. J. Waldram were quoted giving the ratio for several well-known buildings. It varied from about 0.002 to 0.008 on the desks of an elementary school down to 0.0001 in the booking hall of Charing Cross Station. The figures of course depended on the ratio of window area to floor area, and on such points as wall decoration, etc. The first of these was fixed by the London Building Act of 1904 at a minimum of one-tenth of the floor area, while the Board of Education considered one-fifth as the minimum for a class room. The failure of the eye to note the wide variations was due in part to the contraction and expansion of the area of the pupil of the eye. This point was explained and illustrated by experiments which had been carried out at the East London College.

CRITICS AND PROFESSOR LETHABY.

A correspondent has kindly forwarded a comment received by him concerning Professor Lethaby's recent paper at the R.I.B.A. on "The Architecture of Adventure," which has also attracted attention in America. This runs as follows:—

I think Lethaby is sound throughout, and as much so for all the Arts as for Architecture. I am sure, at any rate, that "the pursuit of flavours" accounts for the prevalence of second-rate poetry, and for the failure of poets apparently once first rate. I believe, too, that most poetry-lovers never get beyond an appreciation of flavours. I think, though, that Lethaby is too one-sided in his argument, and that Pite's and Statham's speeches were needed to keep things right, otherwise the doctrine would be hard and unfruitful. Anyhow, it is too rigid a doctrine to trust anyone with, save a poet at least. In the course of time it will be accepted, and used fruitfully; that will produce a generation of pedants and mathematicians who will tabulate all inspirations in formulæ and rules. I know it must be so; an age of ardour must always be succeeded by an age of law, to keep the foundations sure. We are declining through an age of small things, like the Stuart era after the Elizabethan, until we shall eventually be in for another eighteenth century again. All kinds of things show the tendency—even so admirable and adorable a book as Moore's "Art and Life," laying down doctrines often akin to Lethaby's, will in the end become the pedant's authority for imposing mechanical standards of perfection on all kinds of writing; they will construe Moore's standards of reason into a need for universal common sense.

It is hard to see the great Romantic time slipping away from us, and to foresee the man of the world coming to his own again. But these things must be: they are the oscillations that make for the stability of the eternal balance. One can endure even the thought of another eighteenth century, when one thinks of the heavenly "bust-up" that will follow it. . . My only grief is that I shall not be there, when that time comes, to play all the big drums and the cymbals.

Our correspondent adds that "the broad outlook which this extract suggests may be taken as an illustration of the value of the continuance, which you recently advocated, of the Essay Prize, as such, by the Royal Institute of British Architects."

Professor Lethaby (says the "American Architect") expresses the opinion that the greatest need of the present generation of architects is a thoroughly scientific frame of mind. It is only by the repeated application of scientific knowledge, he contends, in experimenting with their current problems that real architecture can be created and form and structure reunited as of old. Progress in architecture, he further maintains, is the result of experiment, as in the experimental sciences — an interesting way of regarding the art of building, though one with which architects, we surmise, would fail generally to agree unless the qualification were made that the experiments be always made with the ultimate end in view, namely, to create a work of art. There is, of course, always this essential difference between experimenting as a scientist understands the term, that is seeking for truth, and the meaning which the artist would gather therefrom, a seeking for expression, unity, beauty. In science there is but one solution for a given set of conditions, the correct solution, while in art there are many, and it is in the choice of that one which offers the most advantages and presents the fewest drawbacks that we recognise the great artist. No doubt Professor Lethaby assumes the habit of experimenting which he advises architects to cultivate in their work to be from the standpoint of the artist and not from that of the seeker after exact knowledge. That being so, we can see a peculiar significance in his attitude for much current architectural endeavour. Writers in the English press have of late remarked the effect on their architecture of the wave of French influence from the Paris Ecole des Beaux-Arts. This influence has unquestionably produced in England a number of architects whose supposedly logical view of architecture has a very insecure foundation in fact. The work of these men may be logical draughtsmanship, but it is not architecture. Such a conclusion, of course, in no way affects the world-renowned French school of art, to which even America owes much. Imitation is the sincerest form of flattery, but imitation is often blind, mistaking the shadow for the substance, the external aspect for the essence. As a counterbalancing influence to such an extreme view of the art of building usefully and beautifully, Professor Lethaby's views should be of the greatest value to the profession.

The celebrated French authority on matters architectural, Auguste Choisy, who recently died, gives us a clue in the conclusion of his history of architecture. He presents therein an idea very closely related to the suggestions of the English professor referred to above. M. Choisy, in concluding his text, which he carries to the beginning of the nineteenth century, mentions very prominently the introduction of cast and wrought iron into the art of building, and goes on to remark that he conceives his work as an historian to end at that point where the introduction of new materials has called into use æsthetic elements of the art hitherto unknown. Here we have an example of experimenting in architecture, and doubtless M. Choisy took the stand that the work of adventure in the new materials was yet so unformed that he had no just basis on which to form an estimate of its accomplishments.

Current architectural practice is teeming with new problems for experimentation of the right sort, but it is so much easier to take inspiration from some work on which time has placed the seal of approval that these experiments are unfortunately too seldom made. In adopting such an attitude towards their problems designers are neglecting the opportunity to achieve that artistic success for which the prototype is admired. Architecture cannot be made so; if our architecture is to be vital and enduring we must learn from the past all we can, but the problems of the present must be approached in a free, and, if one chooses so to call it, an experimental frame of mind.

It is only by a well-considered compromise between structure and form, with the fullest understanding of the conditions of their problems and a thorough knowledge of the characteristics and constitution of the materials used as a vehicle of artistic expression, that modern architects will achieve meritorious results. It is of little use to argue whether form should follow structure or structure form; the effect is the paramount issue in every art.

NEWS IN BRIEF.

The Old Bell Inn, in Pall Mall, which is about to be demolished, is old enough to be associated, more or less apocryphally, no doubt, with legends of Nell Gwynn.

* * *

Garrick's Villa, Hampton-on-Thames, was put up for auction last week, but bought in at £10,000. The island, called Garrick's Eyot, facing the riverside lawn of the house, forms part of the property, which extends to 11 acres. Garrick bought the property in 1754, and the house was altered and improved by Robert Adam. Among the treasures are marble mantelpieces, and classical medallions by Bentley and Wedgwood have often been described.

* * *

Mr. M. H. Holding, A.R.I.B.A., died at Northampton recently in his 63rd year. Mr. Holding was articled to Mr. Buckridge, and on that gentleman's death, to the late John L. Pearson. It is not surprising therefore that the bulk of his practice, commenced at Northampton in 1877, was in ecclesiastical work. Among the large number of churches designed by him may be mentioned St. Crispin's, St. Mary's (Far Cotton), St. Paul's, St. Matthew's, Christ Church, and Holy Trinity. In addition, he restored or enlarged, amongst others, the following churches:—Great Brington, for Lord Spencer; Wicken, for Lord Penrhyn; Ecton, for General Sotheby; Weston Favel, Harpole, Marston Trussell, the chantry of Blisworth Church, Gayton Church and tower, Bugbrooke, Boughton, Farnborough (Hants), Quinton, Helidon, Mears Ashby, Kingsthorpe, Shutlanger, Christ Church (Lichfield), St. Edmund's (Northampton), Upton, Abington, Brixworth, St. James's (Northampton), and Olney. Mr. Holding was architect for the addition to the Northampton Town Hall, the older portion of which is a fine treatment of French Gothic.

* * *

At the annual meeting of the governors of the Royal National Sanatorium, held at the Westminster Palace Hotel last week, the most important business before the meeting was the consideration of a proposal by the committee to remove the institution to a new and larger site. It was estimated that the erection of a new sanatorium on a sufficiently commodious site would cost at least £30,000. This would include land on which patients could be set to agricultural labour, as well as workshops for indoor employment.

* * *

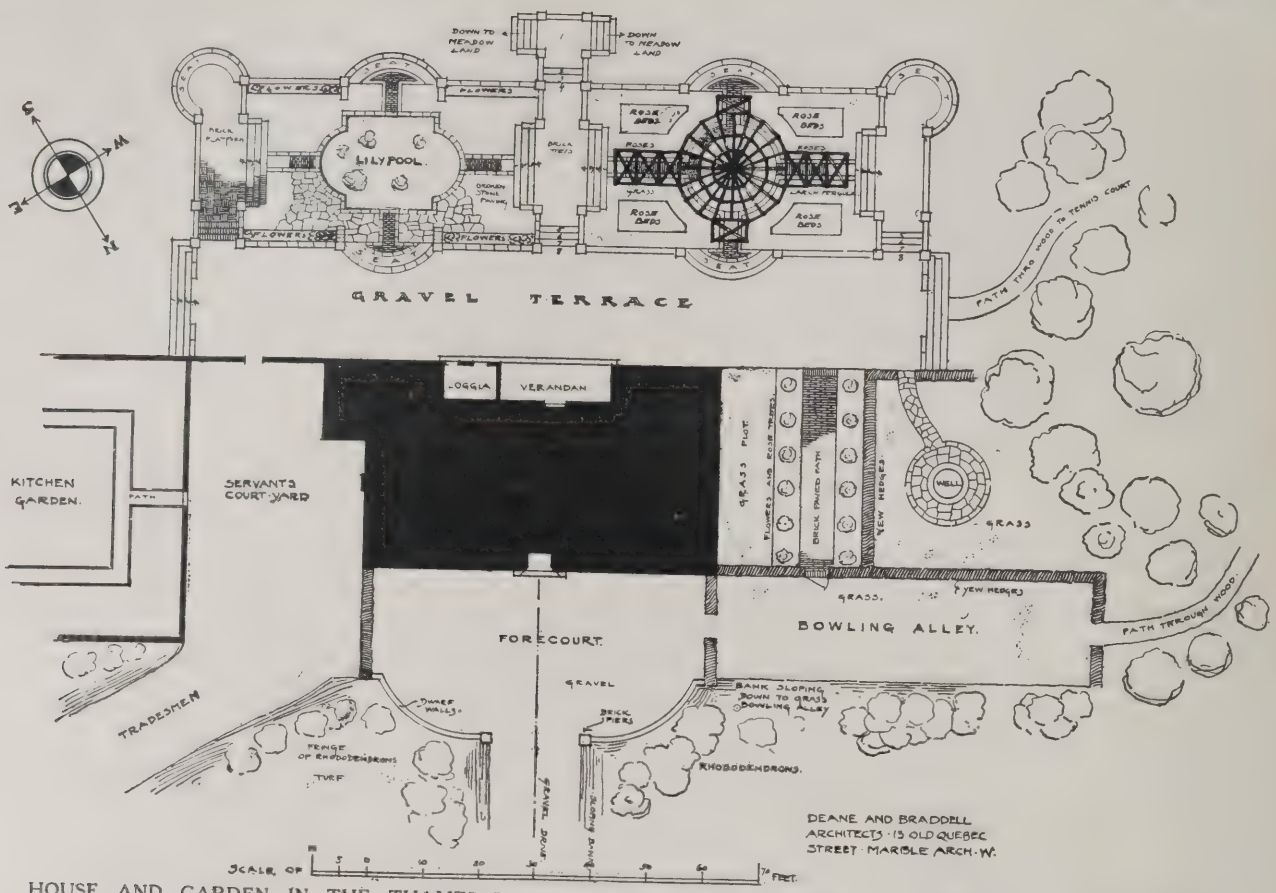
The current issue of the "Journal of the Royal Institute of British Architects" publishes the names of the first batch of "Licentiates R.I.B.A." elected under the new charter and by-laws. There are 67 altogether, and they include such names as Felix Clay, architect to the Board of Education; J.D. Coleridge; Allan George, son of the President R.I.B.A.; C. H. and E. G. Heathcote, of Manchester; and G. B. Robertson, President of the New South Wales Institute of Architects, etc.

* * *

The twenty-ninth annual meeting of the Sanitary Assurance Association was held on June 10th, when the annual report was adopted, and Mr. Walter Butler, M.Inst. C.E., re-elected President. Reference was made to the late Professor George Aitchison, a member of the original Executive Council of the Association, whose death was recorded with regret. Up to his death Professor Aitchison remained a member of the Honorary Council. The Association has accepted an invitation to be represented at the International Congress of Social Insurances, to be held at the Hague in September next.

* * *

The municipal authorities at Savona, Italy, have decided to expend £312,000 in improving the port. The improvements will consist chiefly of a new breakwater 1,575ft. long and a new quay for the landing of general merchandise.



* * *

The L.G.B. has just held or is about to hold enquiries into proposed expenditure by public bodies as follows:—Water Supply: Accrington District Gas and Water Board, £8,226 (June 21st). Electricity Undertaking: Norwich City Council, £17,783 (June 21st). Street Improvements, etc.: Runcorn Urban District Council, £3,500 (June 23rd); Southgate Urban District Council, £2,530 (June 27th); Hendon Urban District Council, £2,003 (June 24th); Ipswich Borough Council, £1,500 (June 21st). Sewerage, etc.: Kempton Urban District Council, £16,200 (June 21st); Epping Rural District Council, for North Weald Bassett sewerage and sewage disposal, no amount stated (June 23rd); Hendon Urban District Council, £9,443 (June 24th); Basingstoke Borough Council, £2,200 for refuse destructor (June 30th); Deptford Borough Council, £2,803 (June 23rd); Accrington and Church Outfall Sewerage Board, £28,000 (June 23rd); Wakefield City Council, £1,772 (June 21st). Various: Berkshire

HOUSE AND GARDEN IN THE THAMES VALLEY. DEANE AND BRADDELL, ARCHITECTS.

This house is designed for a retired civil servant, and two rooms on the first floor are set aside for the use of his sister. The house is to be situated on the summit of a hill which gently slopes away from the south front. The roof is to be covered with hand-made sand-faced tiles of a dark brown tone. The bricks used are to be 9 in. by 2 in. Dutch bricks.

HOUSE AND GARDEN IN THE THAMES VALLEY; BLOCK PLAN. DEANE AND BRADDELL, ARCHITECTS.

The billiard-room is panelled in oak, and has a painted wood ceiling, and a large red brick fireplace in the ingle. In addition to the accommodation shown, there are three bedrooms and a studio in the attics. The garden was also designed by the architects.

County Council, £19,276 for Council offices (June 21st); Halifax Borough Council, £2,045 for police station (June 21st); Leyton Urban District Council, for underground convenience, £1,725 (June 21st).

* * *

The designs of Mr. J. W. Winter, architect, of St. Peter's Close, Sheffield, for the erection of a new church and schools for the trustees of the Primitive Methodist Church at South Elmsall, near Doncaster, have been accepted. His designs for a school church at Kinsley were also adopted.

* * *

The Church of St. Nicholas, Deptford, has been condemned as unsafe, and an effort is to be made to raise £5,000 to carry out the needful repairs to the fabric. The church dates back to 1180, but the present structure was built about 1697. The tower has been restored within recent years. Sir Francis Drake was a worshipper at St. Nicholas.

* * *

At the recent meeting of the Palestine Exploration Fund it was announced by Mr. J. D. Crace, the hon. secretary, that the Turkish Government had issued the official permit to excavate at Ain-es-Shems, the site of "Beth-Shemesh" of the Bible. Beth-Shemesh occupied an important strategical position, commanding the valley—the Vale of Sorek—which formed the highway then, as it did now the railway route, from the coast to Jerusalem. The work of excavation had been entrusted to Dr. Duncan Mackenzie, who regarded the site as a very promising one for examination.

* * *

The Corporation of Torquay has accepted the tender of Messrs. R. Wilkins and Sons, of Bristol, at £28,869, for the erection of a new Town Hall and Municipal offices, subject to a loan being sanctioned.

An enquiry has been held by the Local Government Board into an application of the Normanton U.D. Council for a loan of £8,250, to build houses for the working classes.

* * *

A preliminary circular has been sent out by Bishop Ellis with a view to elicit support to a proposal to build a cathedral church at Aberdeen, for the diocese of Aberdeen and Orkney. When Liverpool Cathedral is opened, the Aberdeen and Orkney diocese will be the only one in the British Isles without a cathedral.

* * *

Recently work has been going on at Balmerino Abbey for the preservation of the existing ruins. The work has been carried out by the Earl of Moray, on the advice and under the superintendence of Mr. F. W. Deas, architect, Edinburgh.

* * *

Messrs. Hayward and Maynard, the architects of the Little Theatre, have written to a daily paper complaining that the published details of this new venture have given no credit to them, as architects, for the design and decoration, or to their client, Mr. G. J. Drummond, who is the freeholder of the premises, and is paying for the work. Messrs. Hayward and Maynard also correct the report that there were any Adam chimneypieces or other antiques in the old building. Any that will be found there when the building is opened will form part of the architects' scheme of decoration. To which we might add that it is by no means unusual, however, for the daily Press to ignore entirely the architects of buildings to which they devote lengthy and appreciative criticisms.

* * *

At a special meeting of the Worcestershire County Council it was unanimously decided to oppose the Bill for carrying into effect the scheme sanctioned by the Local Government Board for the extension of the boundaries of Birmingham by including large areas in Worcestershire.

* * *

In the House of Commons last week, Mr. Gibbs asked the Prime Minister whether it was the intention of the Government to include the Unemployed Workmen Act, 1905, in the Expiring Laws Continuance Act this Session. Mr. Asquith replied: I am not as yet in a position to say whether the Bill referred to in the question will or will not be included in the Expiring Laws Continuance Act.

* * *

The crooked spire of St. John's Church, Gloucester, has been examined by Mr. W. Larkins, a London steeplejack, and found to be unsafe. Accordingly it is to be repaired, about 20ft. being removed and the spire left truncated.

* * *

The growth of Montreal during the past few years has been most remarkable, and "The Daily Star" of that city publishes an article prophesying a population of a million people within a period of ten years. Naturally this has led to a great building and real estate boom, which is the occasion of much rejoicing by our Canadian contemporary.

* * *

A considerable number of Temperance Billiard Halls have been and are to be started in the London suburbs. These are very popular. In some cases existing buildings are being acquired, but halls are to be built at Lewisham and Battersea on a scale not hitherto attempted, both as regards size and accommodation.

* * *

The arrangements for utilising the famous "island site" of the Strand for a French Palace of Arts and Industries are now complete, and building operations will be commenced shortly. The contract for the upholstering and furnishing has

been given to an English firm, Messrs. A. R. Dean and Sons, of Birmingham. Mme. Réjane will probably be the first tenant of the French theatre which will be a feature of the plan.

* * *

The restoration of the tower of St. Philip's, the cathedral church of Birmingham, has raised the question whether the edifice is not altogether inadequate to the needs of the diocese. "The Guardian" refers to the want of accommodation on numerous occasions of corporate worship.

* * *

The Edinburgh School Management Committee has come to the conclusion that schoolrooms for more than sixty children are too large, and have decided to make that figure the maximum in future; and they have also agreed that the sewing-room and the sewing mistress are no longer to be continued in the accommodation and staffing of the schools. A census of accommodation shows that there are 286 class-rooms for over 60, and 488 of 60 and under. It is proposed to expend about £6,000 in partitioning off or otherwise altering the large rooms to bring the accommodation within the new limit.

* * *

The Austrian Government has voted £250,000 a year for 10 years to create a fund for aiding local authorities and building associations to erect cheap and sanitary dwellings for wage earners, as a first step towards reducing the high rents payable by poor people for inadequate accommodation.

* * *

Mr. A. A. Hudson, acting as Board of Trade arbitrator in the dispute between the Nottingham Master Builders' Association and the Builders' Labourers' Society as to certain alterations in working conditions which had been demanded by the latter, issued his award on June 13th, in which it is determined that the rate of wages shall be 6½d. per hour; that the working hours shall be 51½ hours from March to October, 41½ from October to January, and 44 from January to March. It is provided that "labourers shall carry 9 common bricks, 8 facings, and 8 blues all round until the walls of any building are 30ft. from the ground level, and one brick less above that height. The labourer, when working on chimney shafts when they exceed 50ft. from the ground level, repairs to boiler seatings and flues, and to bakehouse ovens and bridge foundations and culverts when working on water, shall receive ½d. per hour extra." Doubtless this is all quite clear to the parties concerned, but the wording, especially that of the first sentence (which could be easily perverted to a rather ludicrous meaning) is somewhat turbid, probably as the result of being disturbed by several hands.

* * *

At the annual dinner of the International Society of Sculptors, Painters, and Gravers on Wednesday last, which was held at the Grafton Galleries, a portfolio of the members' work was presented to Mr. William Webb, the hon. solicitor and treasurer, as a mark of esteem for his counsel and help for many years.

* * *

In preaching at St. Margaret's, Lothbury, to business men on behalf of the building fund of St. Jude-on-the-Hill at the Hampstead Garden Suburb, Canon Scott-Holland said that the suburbs of London had been built up with ugly, shapeless, and meaningless blocks of buildings, and all because we never conceived the idea that society should be organic in thought and association. There was a sickening blight on the repetition of houses, alike in form and on a gridiron plan, which rose up in London suburbs with never a thought of drawing the people together. Monotony, instead of variety, was all round. Contrast it with a little town in the Cotswolds. There each house was of separate form, and in it were separate lives, but all the varied activities of the rich and poor contributed to the common stock of the community's life.

* * *

A petroleum syndicate are proposing to erect petrol tanks by the riverside in Townmead Road, Sands End. The syndicate previously proposed to erect tanks for 250,000 gallons in the neighbourhood of the Bishops Park, but the ground landlords —the Ecclesiastical Commissioners—refused to grant a lease. The Borough Council are not opposed to the second proposal, owing to the neighbourhood not being densely populated, and the scheme bringing another industry into the district.

* * *

It is proposed to commemorate the battle of Largs in 1267 by the erection of a suitable monument on the site of the battlefield. A local commitee has been formed under the presidency of the Earl of Glasgow to obtain funds for the purpose.

* * *

With regard to the proposed memorial at Birmingham, Mr. James A. Swan, architect, 56, Newhall Street, Birmingham, writes to the "Daily Post" to the effect that it would be hard to imagine a worse site than the balcony of the Council House, which has been suggested as a suitable site. The statue, he says, would require to be of colossal size in order to be seen, and the weight, if placed centrally, would be thrown on the weakest parts of the structure, which was never intended. A better proposal, he suggests, would be to remodel Victoria Square and find more suitable positions and setting for the present statues, now so badly placed, and also provide for future additions. The Victorian memorial should be the central feature of the square so named. The approach to the square, Mr. Swan thinks, should be the King Edward Memorial in the form of a triumphal arch entered from Colmore Row; it might form part of a general scheme for the improvement of the centre of the city. "The want of a far-sighted policy in these matters is the cause of such unsatisfactory results being attained. Future generations may have cause to thank the promoters of town planning, whose duty it should be to foster the artistic as well as the utilitarian spirit. Why is it that these committees do not appoint more men to advise them who have made a study of the subjects involved?"

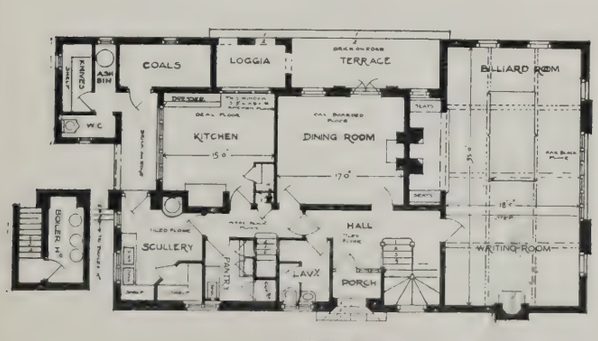
* * *

At the meeting of the Concrete Institute at the Royal United Service Institute, Whitehall, on May 26th, when Mr. H. Kempton Dyson read the paper which is summarised in another portion of the present issue, the following were elected members: J. P. Nicoll (New Zealand), J. Landreth Smith (British West Indies), and W. E. R. Randall, jun. (Chatham).

* * *

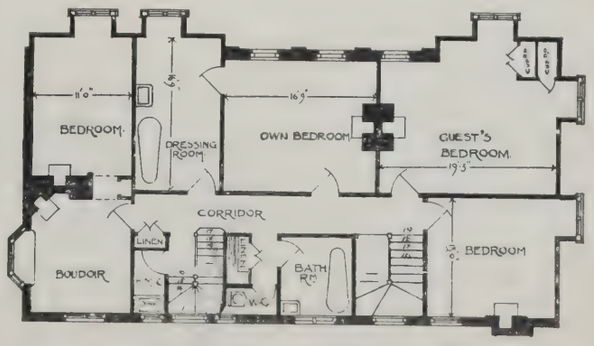
The Institution of Gas Engineers has concluded its annual meeting (in London). The election of officers and members of the Council resulted as follows: President, Mr. Alexander Wilson, Glasgow; vice-president, Mr. J. Ferguson, Derby; members of the Council, Messrs. F. J. Bywater (Birmingham), F. W. Goodenough (Westminster), W. R. Herring (Edinburgh), and H. Lees (Hexham).

* * *



A bust of the late King, the gift of the English colony in Berlin, is to be placed in the vestibule of the Rathhaus, Prof. O. A. Young being the sculptor.—At Bombay a committee has been appointed to collect subscriptions and consider what form the memorial shall take.

* * *



The Mayoress of Bournemouth has formally opened the new promenade constructed by the Corporation on the west side of the pier at Bournemouth, at a cost of over £6,000. Alderman H. Robson (chairman of the Beach Committee) stated that in recent years the Corporation had spent nearly £47,000 on improving the sea front.

* * *

The Chamber of Deputies has passed, with one slight modification, the proposal of the Parliamentary Commission for the

GROUND-PLAN

BEDROOM-PLAN

HOUSE IN THE THAMES VALLEY. DEANE AND BRADDELL, ARCHITECTS.

excavation of the area comprised within the Zona Monumentale. The Bill will be forthwith submitted to the Senate, and may be expected to become law next month. Thus archæologists will no longer have to fear the permanent burial of the important remains in that district.

* * *

The Committee of the House of Commons which deals with unopposed measures considered last Thursday the London County Council Money Bill, which Mr. Haward, comptroller to the Council, stated would give further borrowing powers totalling £2,378,398, the corresponding figure for last year being £3,473,000. One of the items of expenditure was £500,000 for the provision of schools under the Education Act. The Bill was allowed to proceed.

* * *

The members of the London County Council who will in August visit Stockholm as the guests of the Municipality, have been invited by the President of the Gothenberg Town Council to visit that city also. The Chairman of the Council has accepted the invitation.

* * *

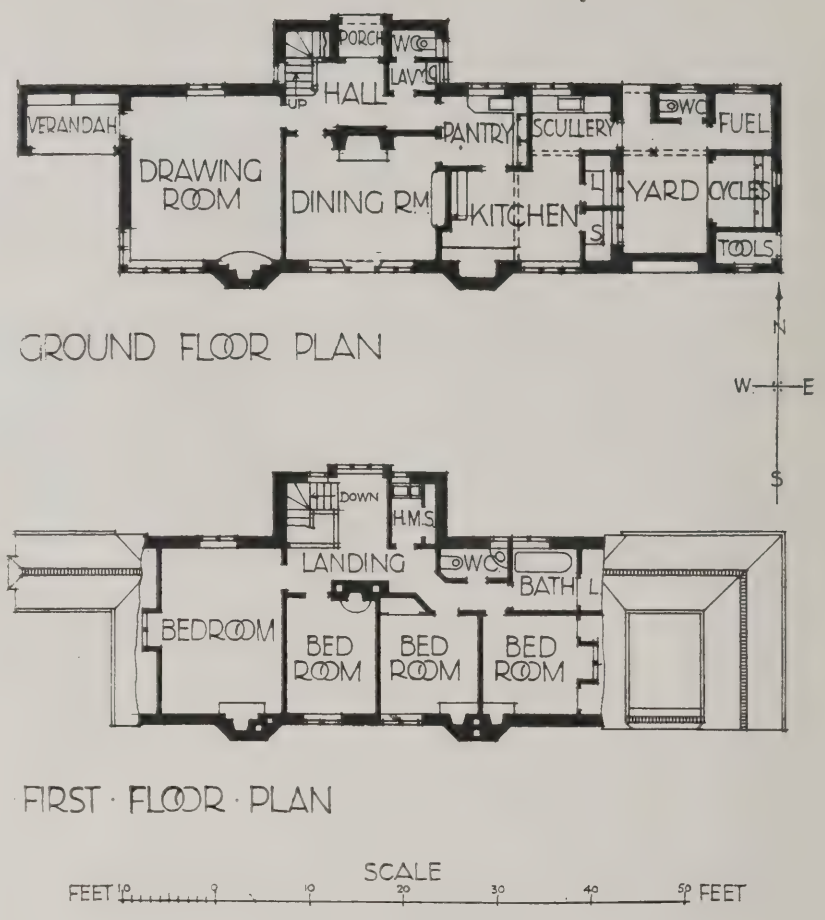
Messrs. Dargue, Griffiths, and Co., Limited, have removed their London office to larger premises at 34, Queen Anne's Chambers, Westminster, and have appointed Mr. Wilson Aldwinckle their London representative.

OBITER DICTA.

Hard or Soft ?

The latest boom is in timber. A scarcity of wood is predicted, and many foolish persons, it is said, will shortly be losing their heads in this new form of speculation.—"*Punch.*"

"Savage Ruskin."



Ruskin was a great critic; he was looked upon in his day as a sort of—he was going to say a sort of god almighty—and alluding to this a writer in "Punch" once said:—

"We paint and paint, and no complaint,
And sell before it's dry.
Then savage Ruskin sticks his tusk in
And nobody will buy."

Great critics were scarce in those days, but now they read criticisms in every local paper, sometimes severe, sometimes complimentary, and all he hoped was that the artists would struggle against all the adverse criticisms of their works.—*Lord Tredegar at the opening of the annual exhibition of the South Wales Art Society, Cardiff.*

"Stains of Incense."

I would point out that a Japanese Uffizi is now on view at the White City, whose treasures are being shown in relays, the space being too small for a single comprehensive show. The name of Kanaoka has been added to the series of great names; to his master of the ninth century is ascribed an influence as great in his country as that of Giotto in Italy. Two lovely kakemonos of his school show the descent of a heavenly host bearing flowers and musical instruments, painted in gold, upon a background of the same rich intricacy of design. Let us forget for a moment the dimpled forms, the strange wreathed smiles of these exotic figures, and note the sinuous charm of the contours, the profound delicacy of thought and workmanship which characterise these paintings, now dim with age and the stains of incense.—*C. Ricketts in the "Morning Post."*

This house has been designed for a small square site of about half an acre, with the main road on the north running east and west. The grounds are level except for a slight fall to the south, the main rooms overlooking a small tennis lawn and formal garden, with pergola in front of the dining-room windows. Externally the house is to be built of white-washed brick with old hand-made tiles on the roof with half-round ridge tiling and bonnet-shaped hips. The upper part of the two chimney-stacks on south front to be of 2 in. dark-red hand-made bricks with ½ in. mortar joints. The exterior timber work is all to be in oak with construction pegs left projecting ⅜ in. The casements are to have plain stout wood bars filled in with crown glass.

PROPOSED SMALL HOUSE AT FARNHAM. B. W. BILLINGE, ARCHITECT.

A Vanishing Varnish.

"To cure damp walls, make a varnish of one part of shellac to two parts of naphtha, and cover the damp part thoroughly with it. This varnish has a disagreeable smell, but it soon wears off."—"*Leek Times.*" So that it comes rather expensive in the end.—"*Punch.*"

The Plague of Chaos.

The modern haphazard city is an eruption of brick and stone rather than the abiding place of a commonwealth. The plague of chaos is as strong abroad as here. The streets of a German or French suburb may possess a greater outward show of decency; but mechanical depression is stamped upon them, and behind the plaster and the paint there are too often overcrowding and insanitary conditions such as we in this country could not easily parallel. If one may judge from the movement of things in the cities and from the deliberations of the Congress, Continental opinion is following with regard to both the cottage dwelling and town planning along the lines which this country was the first to sketch. Indeed, they may very possibly outstrip us very soon, for Britain is a prolific exporter of ideas, the value of which other peoples appreciate more justly. It is a rivalry, of course, which can bring only good to the world. Wholesome houses and sanely built cities mean so much misery blotted out of the diary of humanity. But we should take care that it is a rivalry in which we maintain our place as pioneers and teachers.—"*Daily News*" *Leading Article.*

Popularization of Art.

The days are gone by when art was regarded as the luxury of the few. It has become a factor in democratic culture, and the democratisation of art has advanced by long strides in recent years. Time was when public art galleries were regarded merely as a means of giving the ordinary person the casual pleasure of gazing upon fine pictures, with the limited and uncertain hope that the process of gazing would tend to refinement and elevation. But we have gone beyond that stage. Education and business enterprise have made fine art ubiquitous; one cannot, if he would, escape it. It is true that the business enterprise which with one hand tries to popularise fine art, with the other hand palms off upon the public the base currency of the false and the tawdry, but with the gradual elevation of popular taste it may be hoped that these will in time lose their vogue. Art is part of the daily curriculum in the schools, and infants are taught to use the brush before they can handle the pen.—"*Western Mail.*"

Hiding Poor Architecture.

Badly designed houses can always be improved in appearance by a covering of vines. It is a matter of regret that the work of the turning lathe and fret-saw still holds its place in many American houses; but as long as we continue to decorate our dwellings with jigamarigs and porch-posts turned and carved into ugly, fantastic shapes, those who can discern their ugliness must content themselves by hiding it with the leaves and flowers of clinging vines.—"*The American Carpenter and Builder.*"

CORRESPONDENCE.

[The Editor declines responsibility for the statements made or opinions expressed by correspondents.]

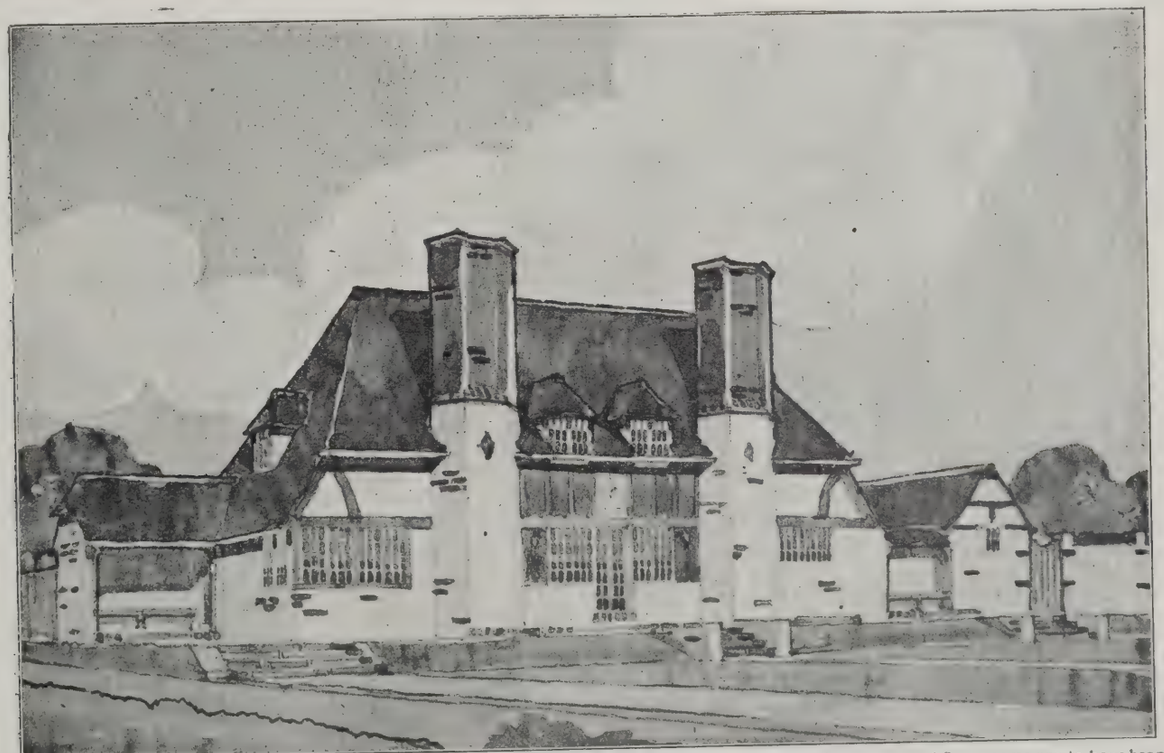
Builders' Grievances.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Your article is doubtless an honest attempt at impartial treatment of a series of knotty questions. If I do not agree that you have been entirely successful in achieving impartiality, it is not a complete answer to say that I am biassed. There are none of us capable of changing at will our accustomed point of view; or, as Chesterton puts it, the most impartial of us are biassed. It must be so.

The "possible rather than the probable" grievances are, or have been, to every contractor real and actual. Not that they (all of them or, in fact, any of them) are suffered at the hands of all architects. There are architects against whom no reasonable contractor has ever been able to allege a grievance; but that fact makes it the more desirable to eliminate as far as possible the opportunity for their occurrence. When a builder is suffering from a manifest case of injustice at the hands of an architect who has not the courage to admit that he has made a mistake, it is small satisfaction to him to read in the (late) "Builders' Journal" that some of his grievances are "possible rather than probable." A grievance which has taken shape and is causing loss, perhaps ruin, may come upon a builder suddenly; it is almost always one that is "possible rather than probable." If it had been probable he would have been able to keep clear of it.

The question of the self-appointed architect arbitrator is just such a grievance. Differences or disputes between employer and contractor are more mythical than real. Under almost every building contract, in practice, the whole of the dealings are between contractor and architect; and a dispute or difference, though technically with the employer, is, as a matter of fact, in nine cases out of ten with the architect. It may be as to insufficient description in the quantities or specification, and consequent inadequate pricing—a very easy pitfall. How can the architect arbitrate on such a question where his own work is concerned, and his opinion formed before hearing the builder's argument? (See judgment of Justice Buckley.) But it seems to be hopeless to think of convincing even a reasonable opponent when we find you saying that an architect of the best type of ability and character would be justified in considering it an insult to suggest that his own opinion of his own work might be mistaken.



Whether reference to an arbitrator, who may take your view, is likely to be satisfactory, is a question open to difference of opinion. It may be that a more satisfactory solution would be the elimination of the arbitration clause, leaving free access to his Majesty's Courts of Law within the right even of a building contractor. But that is another story.

In my own experience, on only one or two occasions have I had reason to consider the "possible rather than probable" grievance which had already become actual. Almost all the architects for whom I have carried out work have been of the high-minded and capable type to which you have referred; but if, at any time, I have reason to ask that an opinion of theirs should be reviewed by one of their fellow-architects, because of the serious nature of the question in dispute, I trust that they will not consider my action in self-defence as an undeserved insult.

There are other points in your admirable article to which I should like to refer if space permitted, but I fear I have already too far trespassed to permit of insertion of this letter in your journal.

Blundellsands. R. ARTHUR COSTAIN.

SIR,—It is always interesting to read an independent criticism of our grievances, complaints, foibles, and fancies, if only because it enables us to "see ourselves as others see us," whether the poet's conclusion follows or not. I was therefore pleased to read your article of the 10th inst. on the above subject. Your remarks on the scarcity of good workmen in consequence of the decline of apprenticeship are no doubt generally true. But isn't it a satire on our political system to reflect that the same force which is used for limiting apprentices in the building trade is applied for exacting money from the ratepayers to support technical schools for the purpose of teaching youths a trade at which they may not be allowed to work? As to by-laws, you say builders are interested parties; therefore, their opinions, if taken, would not have the same weight as with those who are acting solely in the public interest. But I would remind you that by-laws are framed chiefly by officials, and while it is true that builders, by reason of their trade, are interested parties, it does not follow that they are less keenly alive to the public welfare than public officials. Builders contribute largely to the development and extension of our towns and cities. It is in consequence of this development and extension that by-laws require reconsideration and amendment from time to time, and it seems to me that representatives of the Building Trades Employers' Federation, not only on account of their trade, but for their experience and general knowledge of the requirements of the town in which they carry on their business—a business which is peculiarly adapted for affording such knowledge and experience

Internally the decoration is to be extremely simple. All the joinery being oak left the natural colour. The ceilings to ground-floor rooms are to have beams and 5 in. by 4 in. joists, all left rough and showing but plaster between. The floors are to be of narrow oak boards. All the rooms are to be white throughout (except the dining-room and hall) with picture rails level with the top of architraves of doors. The dining-room and hall are to be panelled up to height of doors, and all above left white. The fireplaces are to have "Heaped" fire interiors with specially designed brick tile surrounds to the architect's drawings. The outbuildings and larder, &c., are to have paving of 9 in. by 9 in. red quarries while the pergola and paths generally are to be York stone paving slabs. The eaves are to have plastered soffits, whitened. The guttering is to be painted green and all down pipes white.

PROPOSED SMALL HOUSE AT FARNHAM. B. W. BILLINGE, ARCHITECT.

—might with advantage be consulted by public bodies when reconsidering their by-laws. If the Government were proposing new Press laws, I presume you would not consider a committee, say of builders, could give them better assistance in framing such laws in the public interest than the same number of representatives of the Press. Your remarks on contract conditions are very plausibly written, but they scarcely confirm your claim to impartiality. The conclusion I draw from them is that you consider, apart from public officials, the "high-minded" architect may safely be trusted by both the builder and building owner to act justly and impartially in all matters that may arise between them and himself, and that, therefore, he would object to, and would resent, the introduction of an arbitration clause in his contracts—the Institute form notwithstanding. Why should he object, and resent? Would it offend his dignity? It surely would cast no suspicion on his integrity, *i.e.*, if by "high-minded" you mean "nobility of character," and not "haughty, arrogant in disposition." I should have thought the high-minded—in the best sense—architect would not resent an equitable agreement, but that he would rather welcome it. Laws for enforcing righteous dealing have no terrors for the just and upright man. "Against such there is no law." This subject ought not to be argued on personal considerations, but as a business transaction, and on that ground I fail to see a reasonable argument against the insertion of an arbitration clause in all contracts. Suppose you went to Tokenhouse Yard for the purpose of buying a property you were anxious to secure adjoining your business premises, and the auctioneer announced that the vendor's solicitor would interpret and determine all rights, easements, and every other question that might arise in connection with the transfer of the property, and that his decision would be final and without appeal, would you consider that a fair and businesslike condition? I think not. Yet you would be in a position similar to that in which many builders have found themselves under their contracts. Perhaps the most acute grievance touched upon in your article is that of builders' locked-up capital. You have previously done the trade some service under this heading. It is no uncommon experience to have a 15 per cent. or 20 per cent. balance left for twelve or eighteen months, or even longer in some cases. Exceptional circumstances may occasionally arise to delay settlements; but the practice is far too common to be thus accounted for. Surely it is only a reasonable business proposition to ask that after, say six months, all such balances should carry 5 per cent. interest. Competition in the building trade is exceedingly keen, and profits consequently so small that where large balances are outstanding so long, all the profits are swallowed in interest. It would be no injustice to the building owner, for he has the use of the money. It is a real injustice to the builder to keep him out of his money so long, and not infrequently results—as you have previously pointed out—in ruin to his business. In agitating for the removal of these grievances, the Federation are seeking no specially advantageous conditions. They are asking for no privileges. All they require are such fair and businesslike conditions and agreements from architects and engineers as they have reason to believe would be required of them if their positions were reversed.

JAS. WRIGHT.

Nottingham.

Swansea Cottage Exhibition.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In your issue of the 8th inst. there is a paragraph referring to an article in "The Cambrian" on the Swansea Cottage Exhibition, and as I have built cottages for the Exhibition I should be much obliged if you would grant me the opportunity to reply. It is suggested that considering the Corporation have spent £600 to £700 on preliminary expenses, and £4,000 in laying out roads, an exhibition of 27 cottages will be a very poor return. In the first place, this expenditure is not merely for the 27 cottages, but opens up land for a far greater number. In the second place, if £225 be taken as a low average of cost per cottage, the outlay represented by exhibitors is £6,075. There is no reason to suppose that 27 cottages will be the total extent of the exhibition, but it requires encouragement, and not the cold water of your informant.

GEORGE L. PEPLER.

Pall Mall East,
London, S.W.

Licentiate R.I.B.A.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—I have read with surprise and regret the several letters by Associates of the R.I.B.A. in connection with the Institute's action in creating Licentiate members. I think I am right in believing that a very great proportion of the men the Council will admit will be architects of proved ability, and whose one object in becoming Licentiates will be to further the public interest in supporting the Institute and the profession in a way they are unable to do at present. At a time when reform in the architectural profession is so badly needed, it is surprising to find members who see fit to put stumbling-blocks in the way of the Council's action. The discussion as to whether Licentiates will place "Licentiate R.I.B.A." after their names is unworthy of Associates of the Royal Institute of British Architects. If the Council make a judicious selection (which I fully believe they will), they will secure men who do honour to an honourable profession, and secure also able coadjutors in their pre-eminent desire that architecture should convey its message to the minds of the people, and be a concrete monument to our day and generation, and be the educational factor which it ought to be. All ideas of personal advertisement and private gain, or petty jealousy, ought by Associates and members of the Institute to be subordinated to the greatest good.

A. N. W. HODGSON.

Windermere.

The Society of Architects' Travelling Studentship Design.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—In the current issue of your paper you give a reproduction of the design for a golf club house which has been placed first in the competition promoted by the Society of Architects.

Any architect who plays golf will naturally take a great interest in the design and will study it critically with a view of seeing if it meets all the requirements of present-day golfers. As one who professes to golf a little, I should like to offer my opinion on the plan.

The lounge hall is ridiculously large for a club of this size, also badly lighted; it would be draughty and cold in winter, and golf is largely a winter game. The ladies' room should not connect directly with the gentlemen's lounge. The bar opening into a lounge is objectionable, and no first-class modern club should have this arrangement. The lavatory accommodation is poor: there are no urinals, nor is there a shower bath. The drying room should be separately heated by a stove, as the room is often wanted in summer to dry clothes, when the heating apparatus is not working. These are points which might be remedied in carrying out the work; but the worst feature is the dressing-room, which is far too small; at most 65 to 70 lockers could be arranged, unless placed in two tiers, which is most inconvenient. The one thing necessary in a good golf club house is a commodious dressing-room.

The plan looks very well on paper, but I fear that it would be found when erected to be a very inconvenient building.

I trust that my comments will be accepted in the spirit in which they are given.

T. TALIESIN REES.

Bath Street, Bath.

To the Editor of THE ARCHITECTS' AND BUILDERS' JOURNAL.

SIR,—Admirers of old Bath will be glad to hear that so far the colonnades in Bath Street have not been touched. Whether they are to be allowed to remain permanently as they are we cannot tell; but as the contract is in Messrs. Waring's hands, it does not seem likely, judging from their buildings in Oxford Street, that, for no reason so far adduced, they will destroy so interesting or picturesque a feature of Bath. I am writing from Bath in the second half of June.

W. J. L.

LEGAL MATTERS.

Responsibility for Dry Rot.

The Court of Appeal, composed of Lords Justices Vaughan Williams, Fletcher Moulton, and Buckley, have had before them the case of the Guardians of the Poor for the parish of Leicester v. Trollope. The plaintiffs appealed from an order of Mr. Justice Bucknill in chambers directing that the action be referred to an official referee, and refusing to order that the question of the liability of the defendant in the action be heard first, and all other questions be reserved. There was also a cross notice of appeal by the defendants asking, in the event of the appeal succeeding, that the venue should be changed from Leicester Assizes to London.—Mr. Hugo Young, K.C., and Mr. A. Neilson appeared for the plaintiffs, and Mr. Ernest Pollock, K.C., and Mr. Ricketts for the defendant.—Mr. Hugo Young said that the question on appeal was the mode of trial, and also as to the place of trial. His submission was that the question of liability should be decided first, inasmuch as it was a case in which the question of damages (which might never have to be tried) could easily be separated from the question of liability. He submitted that the plaintiffs had the right to have the question of liability determined before a judge and jury first.—The nature of the action was this: On November 20th, 1900, a contract was entered into by the Leicester Guardians with a firm of architects, Messrs. Giles, Gough, and Trollope (of which the defendant is the only surviving partner), for the purpose of preparing plans for and supervising the erection of an infirmary at North Evington, and giving certificates in the ordinary way. In 1902 another contract was entered into with a firm of builders to carry out the work. The building was completed in 1905, and the architect gave the builders his final certificate. In 1908 it was discovered that dry

rot had developed in the flooring and skirting boards, and the consequence had been that the whole of the floors had to be taken up and a large amount of work done. The defendant did not dispute that dry rot had set in, but he said that the cause of it was that the builders, instead of laying concrete under the floors in the manner provided, had departed from the specification, and for their own convenience had put in wood pegs, struck down through the concrete, which pegs had been the means of bringing up damp, and causing dry rot to set in.—Mr. Pollock said he did not think the architect went as far as that.—Mr. Hugo Young referred to a letter written by the defendant, in which he declared his willingness to "join forces with the Board and its expert for the benefit of the Institution," and alleged that the damage had arisen in consequence of certain departures from the specification, in the method of laying the floors.—Lord Justice Vaughan Williams said that, judging from that letter, the dry rot was due to the action of the builders in not following out the specification, and prima facie the architect was responsible for not having seen that the builders did follow the specifications.—Mr. Hugo Young said that the position which the architect took up was this: He said that for the action of the clerk of the works he was not responsible. On the other hand, the plaintiffs said that the clerk of the works had no power to give any orders, and that the architect was responsible for supervising the work and seeing that the clerk of the works did his duty, and, further, for giving a final certificate without satisfying himself that the work was properly completed. What happened (said Mr. Young) was this: After the defects were discovered, the architect started to replace the flooring at his own cost; but he found it was an expensive matter, and he gave it up. Then he wanted the plaintiffs to bring an action against the builders, but this the plaintiffs declined to do, having regard to the fact that so long a time had elapsed, and that the builders were in possession of the architect's final certificate. It was in these circumstances that the plaintiffs brought the present action against the architect. Continuing, Mr. Hugo Young said that the defendant, when the matter was before Mr. Justice Bucknill, did not appear to oppose the question of liability being decided first. All he was anxious about was that the venue should be changed to London. He thought that he would be prejudiced by a trial at the Leicester Assizes, because the matter had been talked about a great deal locally, and had been the subject of comment in the newspapers. Lord Justice Vaughan Williams said it appeared to him that the architect might have a remedy over against the builders. If the question of liability was tried first, probably none of those details would be gone into which would give an answer or a probable answer to the question as to the architect's remedy over against the builder.—Mr. Hugo Young said he did not think that question arose in this case. There had been no third party notice given, and the pleadings had gone on.—Lord Justice Vaughan Williams observed that third party notice was only an alternative method.—Mr. Hugo Young submitted that the question of liability and the question of damages were two separate things, and that the plaintiffs, in order to try the first, ought not to be put to the expense of preparing evidence in the second. Furthermore, the work was not yet finished at the infirmary, but the action had to be brought owing to the Statute of Limitations.—Mr. Pollock, in reply to Lord Justice Moulton, said that he was there to support the order of the judge referring the whole case to the official referee. The defendant was counter-claiming against the Guardians in respect of the position of the clerk of the works, who was their servant.—Mr. Hugo Young said he was not disputing that there was a serious question to be tried—whether the architect or the clerk of the works was responsible—but he submitted that the question of liability ought to be decided first.—Lord Justice Vaughan Williams said that the question of liability might depend on what took place in the course of the contract.—Mr. Hugo Young said that he did not want to shut anything out from consideration that was necessary to decide the question of liability.—Lord Justice Moulton suggested that the parties should come to some arrangement, and after consultation between counsel, Mr. Hugo Young announced that they had agreed to the following order: "By consent the case to be tried before a judge alone in London; no question of amount to be tried in the first instance, and that to be tried in such way as the judge may direct; the costs of the summonses and this appeal to be costs in the case."—The Lords Justices intimated that they were of opinion that the parties had adopted the proper course.

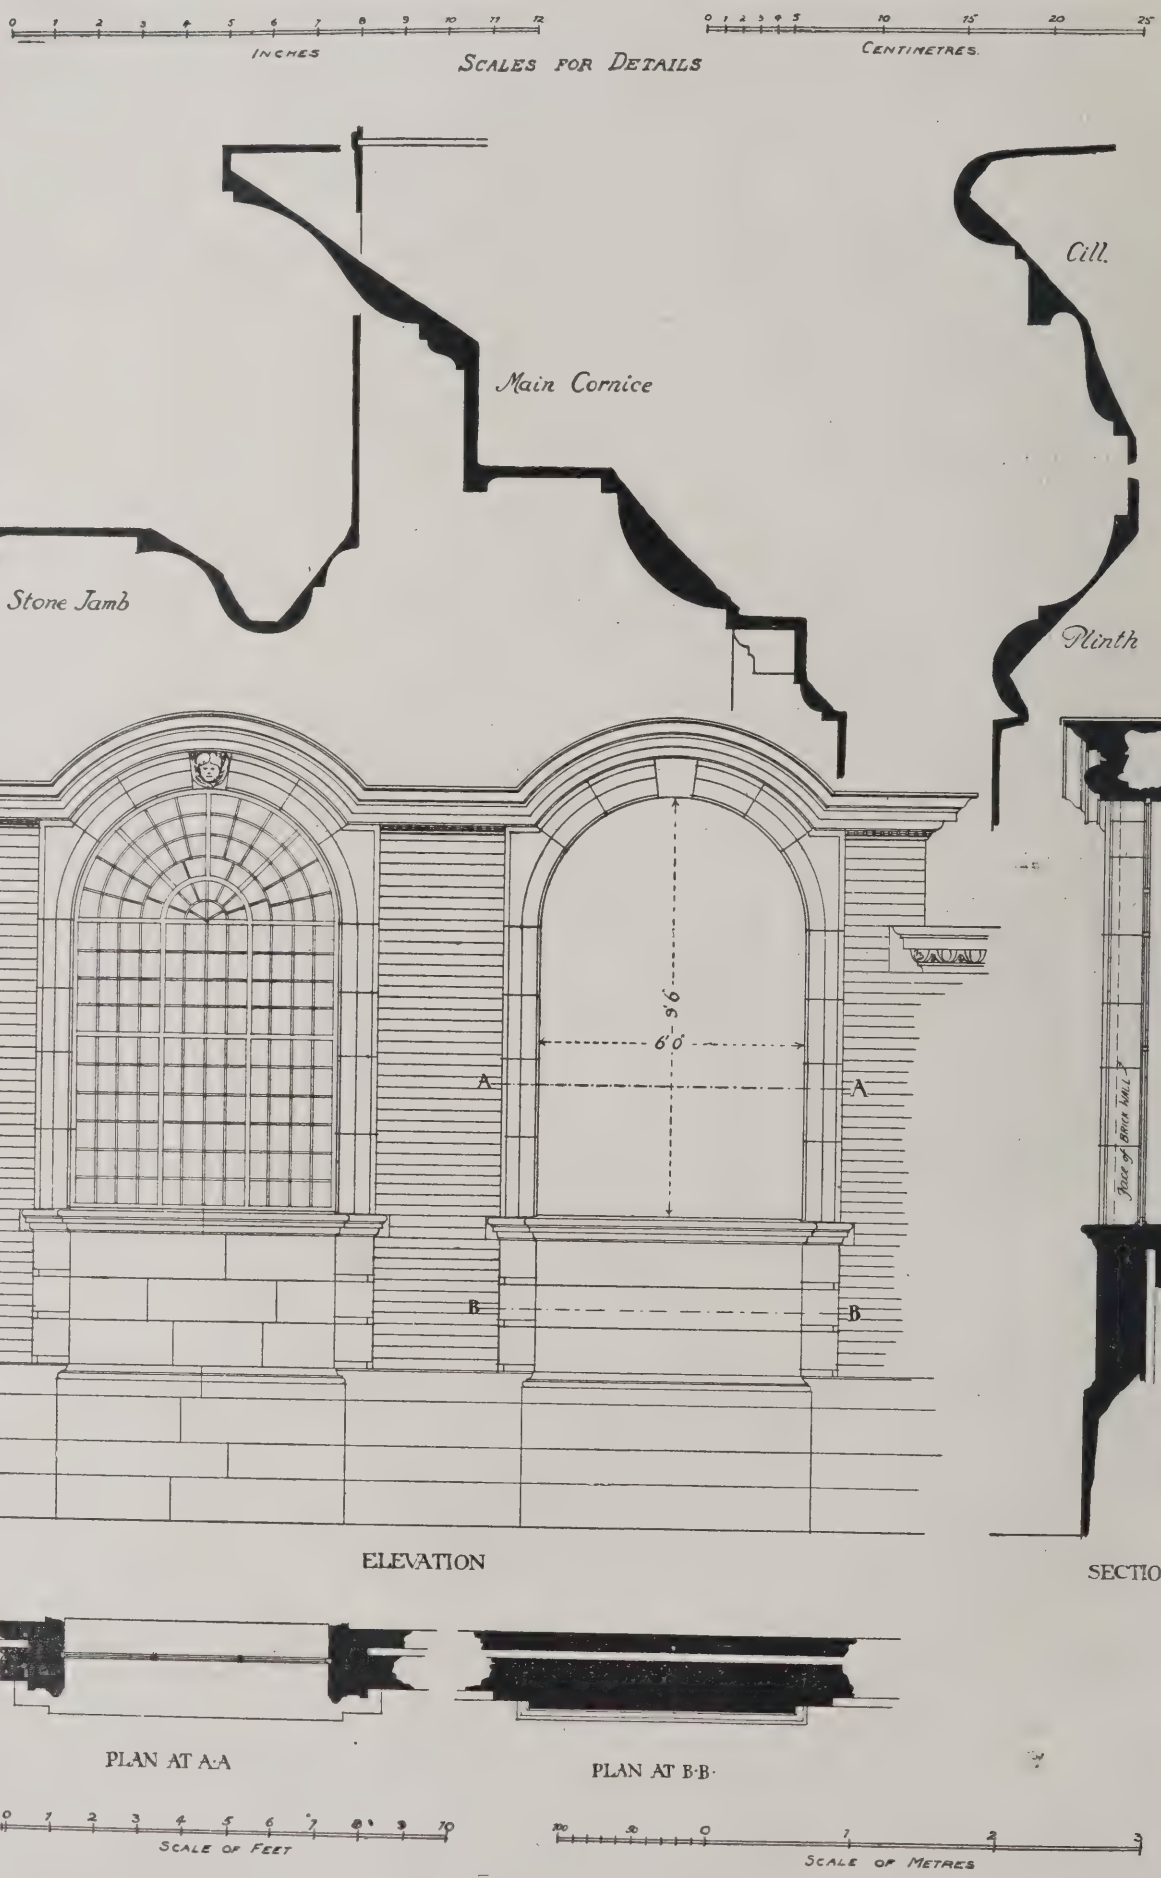
Waiting for Wages.

In Glasgow Sheriff Small Debt Court, Sheriff Glegg heard an action for damages at the instance of James Adair and Arthur Gill, bricklayers, against Messrs. Dewar and Elliott, builders. Pursuers were in the employment of defenders, and on April 14th they were told there was no work ready for them to do. They obtained work elsewhere, and returned to get their wages. Having requested payment from a member of defenders' firm, they were told to get the usual line from the foreman on the job, which they did. They were then instructed to return on Saturday for payment, which having to do they thereby lost an hour's work at their new job, which was the sum sued for, 9d. each. Pursuers averred breach of trade practice and of the implied contract of service. Defenders' agent objected to the relevancy of pursuers' averments, on the ground that these averments only disclosed a few days' delay in paying the debt, and the only damage known to law for delay in payment was interest. Sheriff Glegg sustained this contention, and dismissed both actions.

A Costly Arbitration.

The claim of Messrs. S. E. Moss and Co., of Norwood, against the Lambeth Guardians, for £3,300 in respect of alterations at the Home for Aged Poor, Norwood, has at last been settled. The arbitrator, Mr. J. W. Stevens, architect, of New Bridge Street, held seventy sittings at the Green Dragon Hotel, Fleet Street. In his award, Mr. Stevens grants Messrs. Moss £1,221 7s. 3d. with costs against the guardians, which it is anticipated will be over £3,000. The arbitrator's fees amount to £745 10s. The case has lasted over three years.

Lincoln's Inn Fields Improvements.



Before the House of Commons Committee, last week, considering the L.C.C. General Powers Bill, Sir F. Leyland-Barratt presiding, the Hon. J. G. Fitzgerald, K.C. (for the London County Council) dealt with an approved clause asking for powers to acquire certain premises in Lincoln's Inn Fields for street improvements. The Chairman of the Committee announced that it had been decided to grant the powers sought by four votes to one.

TOWN PLANNING.

R.I.B.A. Town-Planning Conference. The R.I.B.A. Town-Planning Conference which, on account of the death of his late Majesty, King Edward VII., has been postponed, will be held in October next, from the 10th to the 15th. The detailed programme will be issued as soon as possible.

The Board of Trade Watches Developments. It is understood that the Board of Trade is watching with considerable interest the development of town-planning in the provinces. Nottingham and Birmingham are believed to be the most advanced of the provincial boroughs so far as information in the possession of the Department goes. In the former town it is proposed that a new department under the supervision of the medical officer of health shall be established for dealing with town-planning. In Birmingham a scheme is already on foot, though it has not yet reached the stage at which it can be put before the Local Government Board. One of the schemes already submitted to the Board shows how desirable it is that the plans which are evolved shall deal with land under the control of one local authority. A scheme connected with the Knebworth Estate has only been dealt with because the landowner has carried through careful negotiations with the various local authorities. There are four or five of them concerned with different parts of the estate, and they never could have been satisfactorily dealt with had it not been the landowner's desire to facilitate matters. Birmingham has only been able to evolve its scheme because of recent extensions.

Workmen's Housing. A conference convened by the Workmen's National Housing Council was held on June 11th, at Essex Hall, Strand, London, to consider what benefits could be secured out of the Housing and Town Planning Act, 1909. Mr. Will Thorne, M.P., who presided, said that the housing problem, which was first tackled in 1851, was as deep-rooted as ever. One-fourth to one-fifth of the wages of the working classes went in house rent. Many were badly housed, and defective drains caused much sickness. It was estimated by sanitary authorities that if the people were properly housed something like 200,000 lives could be saved every year. Councillor Devenay (West Ham) proposed a resolution pledging the delegates to secure the formation of local committees for the purpose of putting the Housing Acts to the most effective use by (a) Securing that where the tenant of a house let after December 3rd, 1909, suffers injury owing to the house not being in a condition reasonably fit for human habitation, legal action shall be taken for damages. (b) Where unfit houses exist, compelling the landlords to put them into proper repair, or the local authority to close or demolish them at the landlord's expense. (c) Inducing the local authority, where necessary, to build additional houses (to be let at cost rents), or, where opportunity offers, to buy existing houses. (d) Watching the development of new building areas, so as to prevent the creation of new slums. One speaker complained of the way the working-classes were being turned out of districts, especially in Chelsea, where palatial buildings were being erected as the old leases of property expired. They were going to have districts for the rich and districts for the poor

DETAILS OF WINDOWS TO NEWS-ROOM, PUBLIC LIBRARY, KINGSTON-ON-THAMES, ALFRED COX, F.R.I.B.A., ARCHITECT.

These are two of the windows to the news-room. The dressings are of Portland stone, the roof over being covered with lead, the main roof with red tiles. The walls are faced with red Bracknell bricks. The window frames are of wrought iron, with leaded panes.

CONCRETE AND STEEL SECTION

(MONTHLY.)

Proportioning Concrete. There seems to be a good deal of uncertainty about the shrinkage in the bulk of the ingredients of Portland cement concrete on their being wetted, mixed, and rammed, although this is one of the first things one would think the practical constructor would investigate. There are certain rules in vogue among contractors for the determination of this shrinkage, while some go so far as to deny the existence of any in their practice. One favourite rule is to take the volume of the larger aggregate (the broken stones or gravel) and add one-sixth or one-seventh for increase in bulk due to the presence of the sand and the cement. Now, though this is somewhere near, it is not at all accurate. Those contractors who do not allow anything for shrinkage on the total volume of the aggregate are often quite right also, for their practice is with a certain aggregate, namely, Thames ballast, which has really too much sand in it to give the strongest concrete.

Shrinkage. Surprise is sometimes expressed by those who have heard of shrinkage in properly proportioned concrete at what to them seems the absurdly low figure at which London general building contractors estimate for such work, and at which they actually make profits; but if we work up the price as they do, we can quite see how it is done. Thus, for a mixture of 6 to 1 concrete we have, say :—

6 yards Thames ballast at 5s. = 30s.
1 ton Portland cement at 20s. = 20s.

Total 50s.

Dividing by 6 we obtain 8s. 4d. per yard for the concrete, add 2s. for labour and 10 per cent. for profit, we get the price out at 11s. 4d. per yard. If the aggregate is cheaper, then the price may be even less. On the other hand, better-quality concrete, in which the sand and stones are supplied separately, having been sifted, not only costs more for labour, but the materials are more expensive in first cost, and a certain proportion of their bulk is lost in the finished concrete by shrinkage.

Taylor and Thompson's Rule. We may now give the most approved rule for determining the bulk of the ingredients entering into concrete, namely, that of Messrs. Frederick W. Taylor, M.E., and Sanford E. Thompson, S.B., Assoc.M.Am.Soc. C.E., which is the result of comparing numerous tests with various admixtures and different materials. First it should be explained that the cement, sand, and stones will contain voids filled with air or water. These are variables, and must be eliminated from the formula; consequently we require to know the volume of each material exclusive of voids, which is called the absolute volume, and is obtained from dividing the total weight by the specific gravity of the material. Now, Taylor and Thompson's rule is as follows :

$$V = (1 + r)(c + s) + (1 + p)g$$

in which C, S, and G are the absolute volumes of cement, sand, and stone respectively, R the ratio of the absolute volume of the water plus the air entrained in the gauging to the absolute volume of cement plus sand, and P the ratio of the absolute volume of the stone particles plus the air voids due to imperfect mixing to the absolute volume of stone.

This rule may be again simplified for practical work by substituting average values for R and P, when we get

$$V = 1{\cdot}34\,(c+s) + 1{\cdot}08\,g.$$

Again substituting for C the number of pounds of cement divided by its specific gravity (which may be taken as 3.1) times the weight of a cubic foot of water (62.3 lbs.), we obtain the cement expressed in lbs.

Likewise we can express the sand and stone in measured volumes by substituting for the absolute volume the measured volume multiplied by the proportion of solid material contained in it. Thus, if C = the weight of the cement in lbs., SrG = volumes of loose sand and stone, per cubic yard of concrete, and V_1 V_2 = the absolute voids in the sand and stone we obtain.

Quantity of concrete made with C lbs. cement, S cubic yards of sand, and G cubic yards of stone or gravel =

$$\frac{1{\cdot}34}{3{\cdot}1 \times 62{\cdot}3}C + 13{\cdot}4\,(1 - v_1)S + 1{\cdot}08\,(1 = v_2)G$$

Again, assuming that 1 cubic foot of average loose moist sand contains 89 lbs. of dry sand, and its specific gravity dry is 2.65, we get by substitution :

$$\text{Quantity of Concrete} = {\cdot}00694C + 733S + 1{\cdot}08\,(1 - v_2)G$$

Percentage of Voids. The percentage of absolute voids for the stone can be obtained by merely taking a large pail, weighing it, pouring in 31 lbs. 2 ozs. of water, and marking the level of the surface which determines that up to this mark it contains ½ cubic foot of any material. Then (1) weigh the measure, (2) fill it to the mark with the material in the slate in which the percentage of voids is required, (3) weigh and deduct weight of measure calling nett weight of a cubic foot of the material M., (4) correct for contained moisture by taking an exact weight (about 10 lbs.), drying in an oven at 212 degs. F. at least, and calculating the percentage of moisture in terms of the weight of the original moist stone expressing the percentage as a decimal, p, (5) select the weight of a cubic foot of absolutely solid rock or stone from one of the aid-books of engineering formulæ, and call it R.

With this we can calculate the percentage of absolute voids from the formula :

$$\left(1 - \frac{M - Mp}{R}\right)100$$

We can still further simplify the formula if we like by taking the average voids in gravel as 40 per cent., and in broken stone as 45 per cent.

The foregoing affords an easy but very exact method of determining the exact amount of shrinkage, and having obtained the exact quantities of each material entering into a cubic yard of concrete we can easily estimate the cost. The labour requires to be estimated accordingly as a constant from experience, and in reference to the rates of wages in the locality and the difficulties of the work. A basis for determining this is that an average quantity of concrete mixed, wheeled 50 ft., and rammed, per man per day of 10 hours will be 2.2 cubic feet., but with a large quantity this may be increased to 3 cubic feet. For reinforced concrete allowance must be made for extra labour beyond the foregoing for difficulties, and more care required in ramming.

Alkali and Concrete. The "Proceedings of the American Society of Civil Engineers" contains a paper by Mr. George Gray Anderson on the effect of alkali on concrete. The author quotes Prof. Headden, who said : "I am convinced that the only question of alkali that we have resolves itself into one of drainage, and beyond this there is no alkali question for us," and then goes on to say that it would be too much to hope that the drainage around structures would as effectually solve the difficulty of alkali in contact with concrete, but it will aid in resisting the action of the agencies at operation. It is not possible, however, in all cases to provide such drainage as would be effective, and beyond all that—beyond the external application and the possible incorporation of an impervious coating in the mass itself—it seems to the writer that there must be added to it or in it, in some form, agencies which will counteract the effect of these apparently well-recognised chemical elements which bring destruction; and that must be left to the chemist.

The Multifarious uses of Cement. Cement is applied to a multitude of small uses nowadays; indeed, it is the small users who consume the greatest quantity of cement manufactured. All sorts of articles are now made of concrete—its uses in the country, on the farm and elsewhere, are multifarious, and it is at the same time applied to such strange uses as the construction of boats and coffins and telegraph poles. It is doubtful if we realize even now its vast possibilities. The lay user, if he may be so called, is chiefly responsible for discovering these new applications; for when he comes across any difficulty, he seems to fall back on Portland cement as a cure-all. One peculiar application in this way is the use of concrete for the repair of decayed tree trunks. The whole of the decayed wood is first removed from the cavity, then nails are driven in the sound wood to aid in getting a good bond, and concrete is poured in to fill the hole. If this hole is large, reinforcements of steel rods are introduced, so as to stiffen and support the trunk. In this way the entrance of moisture into the hole (and consequent decay) is prevented. If the hole is a small one, the bark usually grows over it in a short time, and no one would know from outward appearance that the tree had a core in part of concrete. Of course, this and other applications are merely those which follow from the first principle that Portland cement is a cheap and permanent matrix, but perhaps the most important and interesting features from our point of view are the applications in which certain properties peculiar to the material are responsible for such use. For instance, the properties of impermeability, protection of steel against corrosion, weakness in tension, and equality of

coefficients of expansion of steel and concrete, which lead to the construction of barges, punts, water pipes and sewers, tanks and watering troughs of reinforced concrete. Such may be deemed but variants on one or two fundamental principles long established, but at least they are interesting, for only of recent years have such principles been generally understood and recognised, and attention directed sufficiently to the subject by a number of people who out of their wider activities have evolved these newer applications.

A Novel Cement House. A house recently built in America has the entire exterior of cement, the mixing of the component parts being undertaken after a long study of the subject. The inside of the house was finished first. This done, the whole outside was clothed with wire screen stuff, such as is used for fencing chicken pens. This was firmly fastened. The studding was close, and when the wire was on it gave a rigid surface on sides, ends, and the slopes of the roof. Over this layer of wire was spread a first coat of cement. It was well pressed on, so that it oozed through the meshes of the wire for clinching hold. When this first coating was thoroughly set another and heavier one was spread over the surface. Shingle effects were fashioned on the gables, and on the roof the cement was shaped and lined, to give an appearance of slating. Then over the whole outside was laid a finishing veneer of cement paint. The house is impervious to heat or cold, or leak of rain; and, as its foundation is a solid ledge, it can defy the frost to wrestle with it. The cost of building is said to have been about the same as wooden construction would have been, but with cost of maintenance and repairs eliminated.

Concrete Bridges on Estate. In the matter of cost a concrete bridge stands somewhere between the wooden structure and the stone arch. The manifest advantages of concrete-steel arch bridges over other types is rapidly becoming recognised by engineers, especially on public works. Such bridges combine in a measure the strength and graceful lines of stone structure with the economy of the steel bridge. When once in place the cost of maintenance is practically nothing. There are no replacements of rusted parts and no painting. Their life is practically that of stone. They can be built to give as much water-way or head room as a steel bridge, and to stand as firm as a rock against freshets. They grow stronger with age. Home labour and home materials may be used in their construction, and withal a concrete bridge is a thing of beauty. The old way to bridge streams and gullies was with wooden structures—possibly a rustic affair of cedar or birch. High water frequently carried them away. The planting became rotten and unsafe. The whole structure needed replacement at least once in a dozen years, and for half of this time such a bridge was an unsightly blot on the landscape. The concrete-steel arch bridge is not for a decade, it is for a century. The man who builds it builds for his grandchildren as well as himself, just as he plants the oak tree.

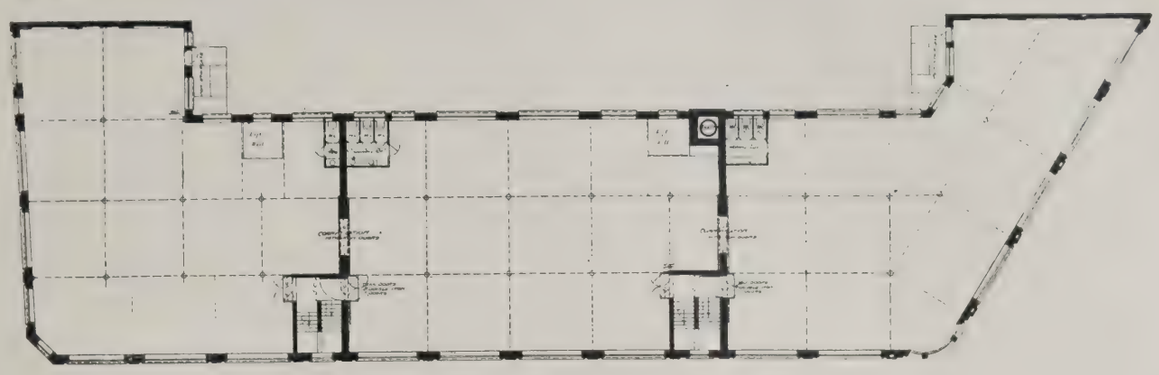
Repairing a Concrete Chimney. The foundations of a chimney at a small arms factory at New Haven, U.S.A., formed part of a power house building, and rose to a height of 80ft. above the foundation. The greater part of the intermediate length was cylindrical, with walls 4in. thick. The chimney had developed longitudinal cracks of such a size as to allow the smoke to escape, while at other times air entered in such quantities as to render the draught insufficient. To remedy this a 5in. jacket of concrete, reinforced by 32 steel rods enclosed by horizontal hoops 6in. apart, has been placed over the chimney above the foundation, and this was accomplished on the cylindrical portion of the chimney by means of a form consisting of a cylinder of 16 gauge iron braced with angle iron. This cylinder was 5ft. high with an inside diameter of 5ft. 8in., and was composed of three sections divided vertically. A platform was also provided at the top of each section. The sections were then placed round the chimney and bolted together, and the complete form was suspended by ropes and blocks from the overhang of the chimney. A length of 5ft. of the chimney was then wrapped with asbestos felt to act as an expansion joint between the old and the new work, and concrete was filled into the space between the form and the chimney and closely tamped about the reinforcement. The following day the steel and asbestos were extended, and the form was taken apart and reassembled 4ft. 10in. higher up, leaving a lap of 2in. This process was repeated until the whole chimney had been repaired.

Earthquake Shock. We have often referred to the wonderful resistance shown by reinforced concrete structures to earthquake shock. The latest recorded instance is from Mexico City. A reinforced concrete building was in course of erection when it was subjected to the earthquake shock of June 30th, 1909. The second floor was less than two days old when the shock occurred. The projecting rods at the column points and in the outside wall swayed violently, as noted by the architect and the superintendent of construction, who were on the building when the second of two rather heavy shocks occurred. Similar to a number of structures built in Mexico City during the past few years, the entire building is carried on a heavy reinforced concrete raft, which reduced the pressure on the soil to about 800lbs. per sq. ft. Examination of the building after the shocks failed to disclose any cracks even in the green concrete.

RAPID BUILDING IN REINFORCED CONCRETE.

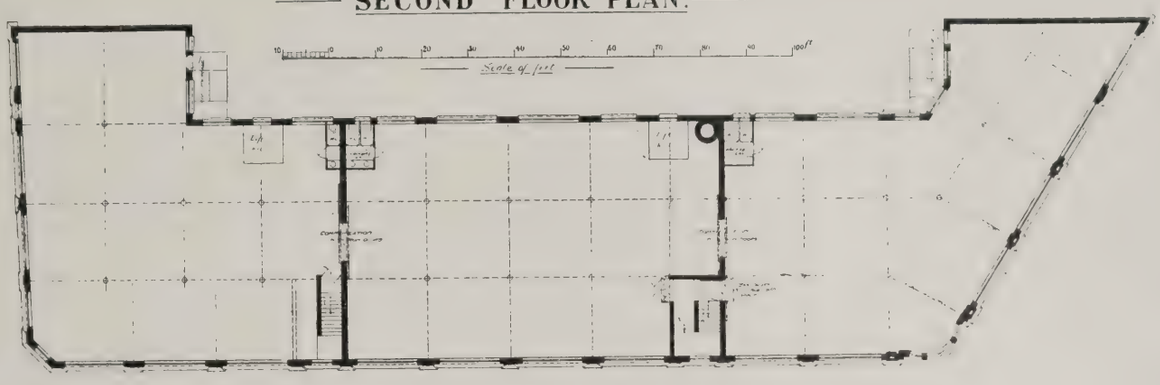
The facilities offered by reinforced concrete for expeditious and economical building construction are well illustrated by the tobacco manufactory nearing completion in City Road for the firm of Carreras and Marcianus Cigarettes, Ltd.

Although having a frontage to the main road of only about 90ft., the building extends back for the distance of from 200ft. to 250ft., being about 55ft. wide and having two wings, bringing the total width at each end up to about 70ft. The building covers an area of 11,395 sq. ft., or rather more than a quarter of an acre.



In addition to the basement, the structure includes four floors, and is covered by a flat roof protected by parapets and available for storage purposes or for use as a floor in case of future upward extensions. With the exception of the enclosing walls, the work is entirely of reinforced concrete, which has been applied to the construction of the floors and roof, all columns from basement upwards, all stairways and landings, two suspended van roads over the basement, and a flat roof over the boiler house.

After considering alternative projects, one representing ordinary steel and concrete construction, and the other reinforced concrete construction, the proprietors decided upon the latter in accordance with the recommendation of their architects, one reason being the lower cost of reinforced concrete, and another (of equal importance) the shorter time necessary for completion. Other incidental advantages carried by this decision are the superior rigidity of the building, its absolute resistance to fire, and the avoidance of frequent painting and maintenance charges inseparable from ordinary steelwork.



The party wall doors throughout the building were supplied by the Checkfire Door Co., and are their patent composite fire-resisting doors of steel and asbestos. In connection with this it is interesting to note that the fire insurance company allowed the openings in the party walls to be of greater area than usual, as these doors were to be used.

SECTION A B SECTION C D

TOBACCO FACTORY IN REINFORCED CONCRETE, CITY ROAD, LONDON. HOBDEN AND PORRI, ARCHITECTS.

A good idea of the expeditious progress made by the contractors may be gathered from the statement that the timber moulds and centering for the basement columns and ground floor were commenced on January 3rd last, and that by March 15th the roof was completely finished.

As each storey includes about 11,200 sq. ft. of reinforced concrete flooring, in addition to twenty-one interior columns, two staircases, and two lift wells, the amount of work is very considerable, and its execution at the rate of 14 days per storey deserves special notice by architects and others interested in building operations.

The architects were Messrs. Hobden and Porri, of Finsbury Square, E.C.; the general building work having been executed by Mr. H. Kent, of Lewisham; and the reinforced concrete construction by Messrs. Holloway Bros. (London), Ltd.

WALLS AND ROOFS IN REINFORCED CONCRETE.

By FREDERICK RINGS, M.S.A.

Reinforced concrete walls offer many advantages. They are fire-resisting, burglar-proof, and easily and quickly erected, besides being light and considerably thinner than brick walls. Consequently, they offer a larger floor space. Furthermore, they are strong, and can be constructed to carry any load required, and they dispense with bressummers as they are self-supporting between piers or columns as the case may be—that is, they require a deep foundation at intervals only.

Where the appearance is to be studied, the concrete can be treated in many ways, to give a smooth or rough surface; or stone, tiles, or almost any other finish may be adopted. Door and window openings can be formed with wooden frames or channel irons, and it is advisable to fix the reinforcing rods securely to these frames.

Sound-proof and Weather-proof.

Where sound-proofing, or protection against heat and cold, is particularly required, it is usual to adopt two independent walls with a space between them. This space may remain hollow, or may be filled with cork, hot sand, or, where a single wall is adopted, a lining of some special felting can be used.

Reinforcement for Walls.

The ordinary reinforcement for walls consists of round or square rods, spaced horizontally and vertically some 1ft. 6ins. to 2ft. apart. Where only one set of rods is used, they are usually placed in the centre of the wall. If special bending moments, caused by earth or wind pressure, are to be dealt with, it is advisable to arrange for two sets of rods, one of them being placed as near the outer edge of the section as possible.

As regards thickness, 3in. is usually sufficient for ordinary purposes, and if the wall is plastered both sides in addition. For hollow walling a thickness of 2ins. for the inner and 3ins. for the outer wall is recommended, with a space of 3 to 6ins. between them; care being taken to tie the rods of the two walls together at intervals in both planes.

If the concrete walling butts on to a brick wall, a good joint is effected by letting the horizontal rods run into the brickwork for a distance of about 6ins., and in this case the horizontal rods are most economically arranged so as to occur in a line with the joints of the brickwork.

If it is desirable to relieve foundations between the supports or over openings or beams, the horizontal rods are often bent up at an inclination of about one-eighth of the span, and this method considerably increases the strength of the wall.

Special moments at particular points are easily resisted by the insertion of extra rods.

Boundary and Garden Walls.

For boundary and garden walls, reinforced concrete is also highly suitable. Walls in this material last longer than brick walls. The expense of repairs, such as pointing, etc., is done away with, while, given proper construction, settlements and settling over on one side are impossible. To resist wind pressure, I irons are spaced some 10 or 12ft. apart, and securely fixed in blocks of concrete. The stanchions receive narrow concrete casings as a protection against rust. The intervening spaces are then filled in with concrete walling made between shuttering or in large slabs, some 3in. thick, the reinforcement being placed in the centre, and the panels supporting themselves on the foundations of the stanchions.

Retaining Walls

must necessarily be calculated in every instance to resist the earth, water, or whatever other pressure is to be dealt with. The panels between the piers or ribs are considered as slabs and calculated accordingly, the earth-pressure taking the place of the floor-load, as in the case of an ordinary ceiling slab.

The accompanying drawings and details illustrate some open-shed buildings designed and executed by a well-known Continental firm. The dimensions have been translated into English measurement for better understanding, and the rods selected as near to English stock sizes as possible. It is particularly interesting to note the means adopted of tying the stanchions and roof principals together.

Reinforced Concrete Roofs.

Roofs in reinforced concrete have the great advantage of being fireproof. In many Continental countries roofs of timber are not allowed over workrooms of any description—a very wise precaution, which might with advantage be adopted in this country. Quite apart from the protection against fire, timber has not a great resistance, and can easily be destroyed by fungus, dry-rot, or damp.

Existing timber roofs may be protected against fire by forming concrete ceilings below. Iron roofs are very dangerous in case of fire. The various members of the trusses bend and lose their resistance and collapse, destroying everything below them. Reinforced concrete roofs are doubtless somewhat more expensive, but they offer more roof space, requiring supports at greater intervals only, and are certainly more sanitary. Particularly desirable are hollow roofs, the hollow space ensuring uniformity of temperature.

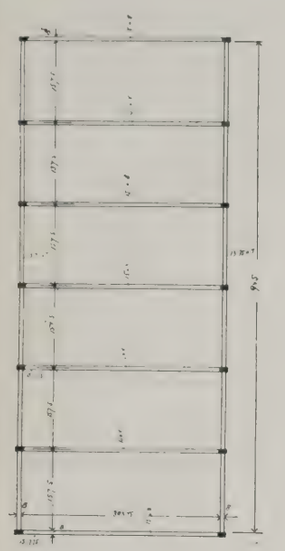
Outer Finish.

An important consideration is the outer finish. Climatic influences and constant change of temperature cause the concrete to crack; and although the material, if properly mixed, may be perfectly waterproof, this cannot be relied on, and the rooms may be very uncomfortable in consequence. To prevent surface cracks is admittedly very difficult, but as the cracks occur almost always immediately above the reinforcement, it seems advisable to choose a reinforcement of such small sectional area as to divide up the whole area to the greatest possible extent. Wire meshing or similar small pattern material should prove most satisfactory for the purpose, as the temperature cracks are likely to be so small in this case that they are barely visible, and are not large enough to let water through.

Protection Against Temperature.

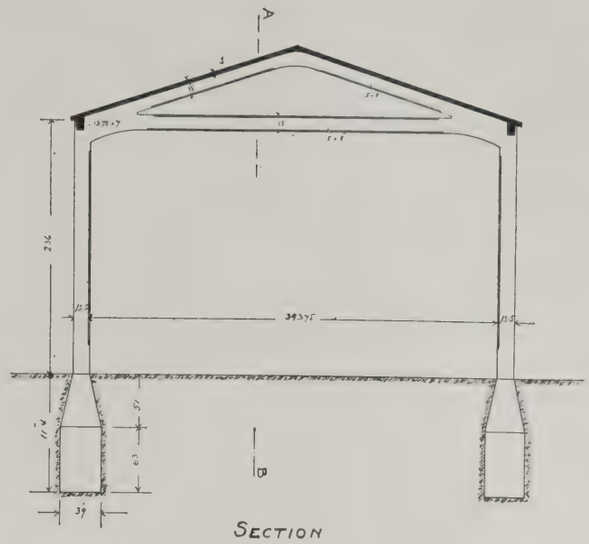
To counteract the influence of temperature, the insertion of a thin layer of cork has proved very satisfactory. The cork is placed immediately on the concrete and covered with tiles or roofing felt. As aggregate for the concrete, coke breeze recommends itself, as it prevents condensation caused by heating the rooms in the roof during cold and frosty weather. It is highly advisable to form small holes directly below the roof surface to allow of constant ventilation and change of air, and thus prevent condensation. Roofing felt saturated with tar or asphalt is suitable for steep roofs. For mansard roofs, slates are often used. They may be nailed direct to the concrete within about eight days after construction. Metal of any description is unsuitable unless some special insulating material is placed between same and the concrete. Metal is a good conductor of heat, and consequently creates temperature stresses in the concrete, and cracks follow. Copper is the least objectionable metal, while zinc must never be used directly touching concrete, as the latter will quickly destroy it. A method very much in use for flat roofs on the Continent is to cover the whole surface with three layers of paper with a flexible watertight substance in between. The layers are separated from the concrete by the insertion of roofing felt. The whole is finally covered with sand or fine gravel, 3 or 4ins. thick. If the roof is very steep the concrete itself may be mixed sufficiently rich to be waterproof.

Calculations for Roofs.



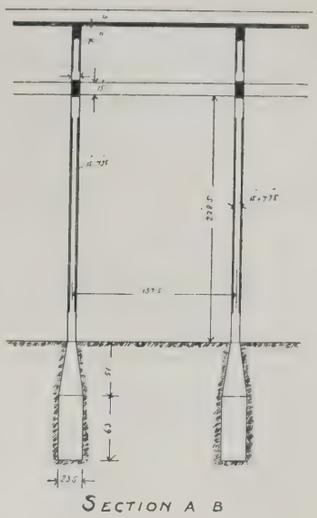
In calculating roofs it is usual to adopt the following loads: For inclinations from 0° to 15° the roof is considered as a horizontal slab exposed to a live load of 50 to 60lbs. per ft. super. For inclinations from 15° to 50° a vertical load is assumed for wind pressure, snow, etc., of 30 to 40lbs. per ft. super. For inclinations of 60° and more, the wind pressure should be taken at 20lbs. per ft. super.

CONCRETE ROOFS AS FIRE BARRIERS.



Combustible roofs are a menace to the safety of any community. Any roof that will not resist fire is about as desirable as a powder magazine. Insurance underwriters claim that the list of conflagrations annually credited to combustible roofs is almost as long as that of general fires due to unprotected window openings.

In this day of fireproof materials, the question of protecting the building and its contents by a substantial roof should not present any insurmountable difficulties. Flimsy roofs are menaces in at least three particulars: They allow a fire in the building to burst forth, giving it plenty of draught to complete the destruction of the building and contents; they present the weak spots in every city block, for they catch flying sparks and embers and ultimately burst into flame, while the original fire may have started blocks away; they offer no resistance to the falling walls of adjacent buildings.



Roofs properly constructed and covered with concrete shingles or tile offer protection from outside fire risks. Reinforced concrete roofs imprison a fire in the building so roofed, protect the building from outside fires, and offer strong resistance to falling débris.

SECTION A B

WALLS AND ROOFS IN REINFORCED CONCRETE. BY FREDERICK RINGS, M.S.A.

REINFORCED CONCRETE BINS.

By H. KEMPTON DYSON (Secretary, Concrete Institute).

[*At the tenth ordinary meeting of the Concrete Institute, which was held at the Royal United Service Institution, Whitehall, on May 26th, Prof. Henry Adams in the chair, Mr. H. Kempton Dyson, secretary of the Institute, read a paper on "Reinforced Concrete Bins," in which this adaptation of the material was usefully described; formulæ for various types of bins being stated, and a classification of the different forms being attempted. The author contended that for these uses the material is more economical than steel, the first cost being no more, while there is an important saving in the cost of upkeep.*]

The chairman said that the subject of the paper that evening was a very useful one. It was particularly interesting from the difficulty that surrounded the determination of the stresses, and, of course, upon the determination of the stresses the design must ultimately depend, so that they would all listen with considerable pleasure to the paper.

Mr. H. Kempton Dyson, Secretary of the Concrete Institute, then read his paper, of which we give a summary below:

Among the varied uses to which reinforced concrete is now put, the construction of bins for the storage of materials of various kinds, the author considered, took an important place. Reinforced bins had been constructed for holding grain, coal, cement, ore, broken stone, sand, and other materials. It seemed established now that not only did reinforced concrete possess in a supreme degree the qualities of fire-resistance and long life, in which respects it was superior to steel, which had been used largely for the construction of silos in preference to timber, but it originally cost no more and sometimes less than steel, while the cost of frequent painting and repairs was saved. Steel bins cost 50 to 100 per cent. more than timber bins of moderate size.

Classification of Bins.

Reinforced concrete bins were classified by the author into two main divisions: (1) those of large size without separate divisions and having relatively large area in respect to height; and (2) those of cellular construction, having compartments of rectangular, square, round, or hexagonal cross-section. The silos in both divisions were usually charged with materials from the top, either by direct dumping from railway wagons or carts, or by means of convoyers.

The first division chiefly became the problem of the retaining wall so far as design was concerned. The paper described some reinforced concrete bins of this type. Such bins are usually required to discharge material by gravitation, and they were most often built with bottoms sloping one way to two sides or to all sides, and delivering the material through side gates.

The second division entailed rather different mathematical analysis in the design, and the paper was chiefly concerned with the description of reinforced concrete bins of such cellular type, which likewise discharged their contents by gravitation, but generally, because of their shaft-like arrangement, were made to discharge the material directly under them from their lowest point through a centric or eccentric hole, and occasionally through side openings. These cellular silos might be again subdivided into (1) suspension bunkers; (2) circular bins; and (3) hopper bins. The first were constructed by suspending, from two side girders, the bottom, which was curved to assume the form of the equilibrium polygon, the stresses in the containing surface of a truly formed suspension bunker thus being purely tensile ones. In this connection it might be remarked that some suspension bunkers had been built of steel plates with a reinforced concrete lining. The circular bins (the second subdivision) were constructed with spherical or conical bottoms, and the stresses were circumferential tension and vertical compression in the cylindrical sides, and tangential and circumferential tension in the bottoms. The third subdivision included the square, rectangular, and hexagonal bins, in which there were bending stresses introduced as well as direct tensile and compression stresses. The square hopper bins were perhaps the more usual type of reinforced concrete bin in this country.

Calculation of Pressures.

The calculation of the pressures upon the side walls and bottoms of bins, the author stated, had been the subject of a fair amount of experiment and theorization, but in those of large size the lateral pressure was determined by the ordinary retaining wall theories, about which there has been a great deal of theorizing and very little experimentation. The theorists, however, worked upon two main lines of thought, namely, that of Coulomb's theory of the prism of maximum pressure and Rankine's theory of conjugate stresses. Though the variants on these two theories were very numerous, there were really only two mathematical processes of treating the same fundamental idea. They were only special cases of a single general equation.

The paper then gave formulæ for retaining walls, shallow and deep bins, circular bins, suspension bunkers, and special applications of reinforced concrete, together with tables containing experimental data and diagrams to save labour in designing bins.

Some tests have shown great increase of pressure when material was in motion in bins, but only in the cases where discharge openings were at the sides, which established the importance of such openings being in the centre, for the pressures in motion with side openings were in some cases four time as great as when at rest. When, however, the grain was discharged at the centre, the maximum variation did not exceed 10 per cent.

Advantages of Reinforced Concrete.

Reinforced concrete, apart from its fire-resisting qualities and long life, possessed some distinctive advantages as regards resistance to stresses in bins. It so happened that the horizontal reinforcement in the walls of cellular silos when resisting the bending induced by one cell being loaded while the adjoining one was empty, was not called upon to develop more than half the anchorage resistance that would require to be developed with all pockets filled simultaneously. Likewise when the anchorage stresses were greatest the bending was nil, because adjoining pockets were filled. Therefore the reinforcement for the walls afforded at the same time the best anchorage for them, and it served both functions in turn.

The corners of cellular bins in the interior of a collection were usually considered to be completely fixed, and therefore the moment at the centre was taken as $\frac{pl^2}{24}$ and in the corners as $\frac{pl^2}{12}$, where p = the unit pressure. In order to obtain the greater resistance moment thus required at the corners, recourse was usually had to the expedient of doubling the thickness of the walls there so as to use the same amount of horizontal reinforcement. The splaying of these corners serves other advantageous purposes in theory and practice.

Cost of Erection.

It was not easy to get exact figures of the cost of erection of various bins and silos, especially in this country. In America the reinforced concrete storage bins at the Santa Fé Elevator, Chicago, Ill., cost 20 cents per bushel of storage capacity, whereas the timber working house at the same place cost 1 dol. per bushel of storage capacity, exclusive of power plant; the machinery was, however, unusually expensive, and this made the cost high.

The working house of the Sante Fé reinforced concrete elevator at Argentine, Kas., cost 60 cents per bushel of storage capacity, exclusive of power plant, while the bins there cost 20 cents per bushel.

Regarding this country, a silo containing 449,000 cu. ft. of grain, with bins 8ft. sq., worked out at 8d. per cu. ft. of grain capacity, or 6d. per cu. ft. of total cubical extent. Bunkers standing on legs containing 10,280 cu. ft. worked out at 1s. 5d. per cu. ft. of coal capacity, and 7d. per cu. ft. on total cubical extent, while others somewhat larger cost 11¼d. per cu. ft. of coal capacity, or 5¾d. per cu. ft. on total cubical extent. Some maize silos in London for 167,400 cu. ft. of material cost 1s. per cu. ft. of grain capacity, or 6d. per cu. ft. total cubical extent. Some silos in Dublin containing 33,000 cu. ft. of grain cost 7¾d. per cu. ft. of grain capacity.

Then followed a description of various ore and stone bins, coal bunkers, sand and cement storage bins, and grain silos erected in this country and abroad, illustrated by lantern slides from photographs and working drawings.

DISCUSSION.

Mr. E. Fiander Etchells. Mr. E. Fiander Etchells, F.Phys. Soc. A.M.I.M.E. M.C.I., in opening the discussion, said they all owed a debt of gratitude to their secretary for having collected in such small compass such a wealth of information. There was no book so far as he knew printed in Great Britain or the United States which gave such details of silos. The reader mentioned early in the paper that the construction of reinforced concrete silos cost sometimes more, sometimes less, than steel. He doubted, with all the advantages, if reinforced concrete silos of the circular form could be put up so cheaply as a cylindrical steel shell, such as those seen at the Albert Bridge Flour Mills. The makers told him that they could put those up at 30 per cent. under the cost of reinforced concrete structure, but when you got to plane surfaces and rectangular bins reinforced concrete might hold its own in point of cost. There was one advantage which reinforced concrete had over woodwork, namely, it was vermin-proof. The rats caused a good deal of destruction of the grain and of the silo itself if built of woodwork. Then while there is not the same trouble from vermin with the steel structure, yet there was the rust which discoloured the wheat and depreciated its value, so that if we spoke of reinforced concrete on the point of cost alone, we ought not to forget that there was some-

thing beyond the cost of erection. There was one point which had been prominently brought out on the slides before them, and that was that reinforced concrete was subject to the laws of evolution. In the case of the wooden bins the hopper was easy enough to be carried out. When it came to steelwork it was an expensive item, while when we came to the hoppering of reinforced concrete it was very difficult indeed, and rather costly work, both to get in the centering and to get the rods of the right length and bend them to the same position, and to do it cheaply. It was possible that the tendency would be to make the abutments flatten, and to get the slope, perhaps, of mass concrete; or an alternative method would be to have a continuous V-shaped channel running right from end to end of the bin, and let the contents form the hopper at right angles to that.

With regard to the many formulæ given, suffice it to say that the nett effect of almost all was to show that with tall bins, after a certain height was reached, there was no further increase of weight on the bottom, so that the coals or grain, as the case might be, were carried by friction on the sides of the bin. The difficulty often met with in steel bins was that the plates were not stiff enough to carry this vertical pressure, and in this particular reinforced concrete had the advantage, because if it were stiff enough to carry the lateral pressure it would be quite stiff enough to carry the vertical loads due to the weight of the material on the sides of the bin.

Mr. William Gilbert. Mr. William Gilbert, M.Inst.C.E., M.C.I., said the author had given a valuable collection of formulæ which would be very useful for reference. When rectangular bins were used it appeared to him that the chief advantage of reinforced concrete was that very large panels could be used. If steel plates were used for large bins, then a complicated system of tie rods had to be used. With regard to the raw meal silos at Messrs. Kaye and Co.'s cement works, referred to by the author, the cost in reinforced concrete was about 10 per cent. less than the offer of a similar design in steel. The estimated complete cost worked out to about £2 per ton of raw meal stored, but the raw meal was rather a light material, only weighing about 63lbs. per ft cu. The three reinforced concrete silos at the same works, which were circular bins about 40ft. in diameter, had a capacity of about 4,500 tons, and the cost worked out at about 16s. per ton of cement stored, this figure not including the machinery used for filling or emptying the silos. The difference in cost between £2 and 16s. per ton of storage capacity was, of course, caused by the difference in the size of the bins. In addition to the interesting problems referred to by the author as to the design of bins, in the case of bins for storing finely ground powder an important point was the angle of slope at the bottom of the bin, in order that the bin might be self-emptying, and the extracting machinery in this case had to be carefully designed in order to get a uniform discharge from the bin when the material flushed and fell down suddenly.

Mr. Bylander. Mr. S. Bylander, M.C.I., said he was struck with the enormous labour which the author must have given in preparing the paper. It was most valuable in the very detailed information given, which was very useful to an engineer who had to design a work.

Mr. Munro. Mr. J. Munro, M.C.I., congratulated the author on the labour, research, and trouble he had taken in collecting the data contained in the paper. Mr. Etchells had mentioned about rats, but he always understood that there was a more terrible enemy to grain than rats, and that was the worm—the weevil, which came from the grain and pierced the wood in wooden silos. He had been told by persons who were largely interested in timber erection that the life of a timber silo was between 10 and 15 years.

Mr. Alban Scott. Mr. Alban A. H. Scott, M.S.A., M.C.I., gave some particulars of costs of reinforced concrete versus steel bins. For a series of bins of 4 tons capacity, the concrete cost 2s 7½d., and steel 6s. 3d. per cub. ft. of storage capacity; for a series of bins of 10 tons capacity the reinforced concrete cost 2s. 4d. as against steel 4s. 5d.; 60 tons capacity concrete 1s. 10½d., steel 3s. 1½d.; 140 tons capacity concrete 1s. 8½d., steel 2s. 7d.; 350 tons capacity concrete 10⅝d., steel 2s. 1d.; 2,000 tons capacity concrete 10⅛d., and steel 1s. 9d. per ft. cube of storage capacity. Those were actual tenders received and works actually executed in concrete, and both exactly on the same basis, and including all the necessary outlet doors and gearing, but not conveying plant. Moreover, steel required painting outside at regular intervals, and reinforced concrete could be put up very much quicker than steelwork.

Mr. Langford and Mr. Fraser. Mr. W. M. Langford, Assoc. M. Inst. C. E., M.C.I., next spoke. Mr. Percival M. Fraser, A.R.I.B.A., M.C.I., asked if any particular precautions were taken to protect the internal surface of the concrete against the continual movement of the coal or grain, or the falling of the coal or grain. In certain cases the material fell on to the concrete, owing to the quick discharge and intermittent filling. Was the surface of the concrete itself found sufficient, or must it be protected by steel plates?

Mr. Brand and the Chairman. Mr. Vernon Brand next spoke, and the chairman, Prof. Henry Adams, M.Inst.C.E., in concluding the discussion, said one would have thought that almost all the coal bunkers that had been constructed had been shown on the screen, but two he had inspected lately that were not there had some interesting points about them. The larger, of 2,000 tons capacity, was straight and level and true in every part, but the other, of 350 tons capacity, had hardly a straight line or a straight surface or a vertical column or vertical side to a column at any part, and when the concrete was broken away to expose the reinforcement, it was in a condition matching the exterior. He was quite sure that good workmanship inside must be accompanied by good workmanship outside.

In speaking of the retaining wall formulæ, it might not be generally known that a tank or water pressure followed exactly the same rule as Rankine's formula for earth, taking a natural slope of 0. It was not a common form of estimating the pressure of water, because it could be done quite easily another way, but it was interesting to note that the earth formula could be applied to water.

The Lecturer's Reply. Mr. H. Kempton Dyson, replying to the discussion, said that the interior surface of a bin was not usually specially protected, but left as rough as possible so as to hold up the material. Reference had been made to one example where ore was shot into the bin, and the angles thereof were protected by steel. In another example where coke fell into the hopper there was a special construction to prevent the coke breaking itself, and he suggested that something of the same sort might be done where there were heavy materials dropping into the bunker.

CONCRETE AND STEEL ITEMS.

Steel Frame and Reinforced Concrete in Schools. We note with interest that at last week's meeting of the London County Council the General Purposes Committee reported that during the Whitsun recess the Chairman of the Education Committee asked them to authorise, as a matter of urgency, the giving of effect to a recommendation of the Education (Buildings) Sub-Committee, which time did not admit of submitting to the Education Committee, that the architect should give evidence on the building laws in London in relation to reinforced concrete and steel skeleton construction before a departmental committee appointed by the Board of Education to consider the cost of the buildings of public elementary schools. They authorised, through their Chairman, the giving of such evidence on the distinct understanding that the Council was in no way bound by any opinions that might be expressed in such evidence, or committed as to its future policy in the matter. It is to be hoped that the Board of Education's Departmental Committee will offer some pronouncement on steel frame building and reinforced concrete for the construction of schools. There is no doubt in our mind that such construction would lead to considerable economy being effected without any loss of efficiency, but rather with gain.

Temperature of Concrete Setting. For the purpose of measuring the heat generated by the hardening of Portland cement, some tests are being made in the Panama Canal zone by embedding in the walls of the locks at Gatun six resistance thermometers. Readings will be taken of the temperature at various stages of the hardening of the concrete. From the time concrete begins to crystallise until it reaches its final set, the increase in temperature is rapid. From the settling point the increase is slow, but usually continues during the whole of the hardening process, which is indefinitely long, probably lasting for several years. We look to these experiments to give us some interesting information regarding this hardening and the heat produced by the chemical changes that accompany it, and perhaps some light may be thrown on expansion and contraction, more especially the latter, which is the *bête noir* of the concrete constructor.

Electrolysis in Reinforced Concrete. Some useful data on this subject were recently given in the "Iron and Coal Trades Review." The possibility of electrolysis occurring in connection with reinforced concrete is important as regards the durability of the form of construction in situations where such action is possible. In the experiments referred to three specimens were made by embedding 2in. tube to a depth of 8ins. in the concrete. Two of the specimens were placed in water, and a steady current of 0.1 ampere was passed through them from a

storage-battery, the current entering through the tube and leaving through the tank, while the third specimen was not subjected to a current in order that a comparison might be made. The current was maintained continuously for 30 days, and it was found that unexpected deterioration of the concrete took place, large cracks appearing in it, while a layer of rust formed on the tubes, and pitting was very noticeable with an appreciable loss in weight. Other tests made were on 1½in. tube buried to a depth of 9in. in a 1:3:5 concrete, and with a current of 0.05 ampere passed through continuously for 70 days. The electrolytic action was found to be very strong, and the softening of the concrete very marked; while the specimens not subjected to current remained clean and bright. The others developed a coating of rust the thickness of which increased with the duration of the flow of the current, and a coating of rust was developed on the walls of the cracks. It would be well to have some tests on reinforced concrete more allied to actual practice than these.

CONCRETE COLUMNS.

Tests of Concrete Columns Made Under Building Conditions.

The construction of a building near the engineering building of the University of Pennsylvania afforded an opportunity of testing reinforced concrete columns which had been built under working conditions. Nine columns 14in. square and 12ft. high were moulded.

The series consisted of triplicate tests of three types of columns; columns 1, 2, and 3 were plain concrete, columns 7, 8, and 9 had longitudinal reinforcement; and columns 4, 5, and 6 had spiral hooping in addition to the longitudinal reinforcement. The longitudinal reinforcement consisted of four ¾-in. square plain steel bars; the spiral hoop consisted of 5-16-in. round rod wound on 12-in. diameter at 1½-in. pitch. Steel for the reinforcement was furnished by the Philadelphia Steel and Wire Co., to whom acknowledgement is hereby made.

The concrete was a 1:2:4 mix; using a standard Portland cement, bar sand, and pebbles crushed to pass a ¾-in. screen. As shown in the next paragraph, the cement passed the specifications of the American Society for Testing Materials; the sand was the common yellow bar sand in use in Philadelphia; the pebbles were hard, angular, and in large part quartz. The concrete was made of a wet consistency in a batch mixer of about 1-3rd cubic yard capacity. It was wheeled in barrows and shovelled into the forms, as the runways were too low to permit dumping directly into place. The concrete was placed in layers of about 3ft. and thoroughly stirred as it was shovelled in.

The following are the results of the cement tests: Water used in mixing neat mortar, 21 per cent.; pats, O.K.; specific gravity, 3.09; fineness, 81 per cent. passed 200 sieve, 96 per cent. passed 100 sieve; strength neat cement, 648lb. per square inch at 7 days, and 687lb. at 28 days; strength of 1:3 mortar made with crushed quartz sand, 227lb. per square inch at 7 days, 284lb. at 28 days.

The tests of the ¾-in. reinforcing steel showed the following: Yield point, 44,000 lbs. per square inch; ultimate strength, 61,000lb. per square inch; elongation, 17 per cent.; reduction of area, 62 per cent.

The tests on the cubes and cylinders resulted as follows:

Specimen.	Number of specimen.	Age, days.	Load lb.	Load lb. per sq. in.
8-in. cylinders, 16 in. high.	1	55	119,600	2,400
	2	76	109,000	2,170
	3	76	136,000	2,710
Average				2,420
6-in cubes ..	1	55	99,500	2,760
	2	55	99,400	2,760
	3	76	112,000	3,110
Average				2,880

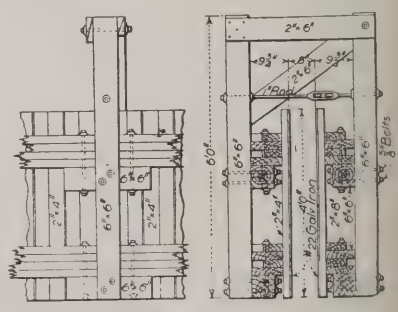
Modulus of Elasticity (by Cylinder 1.)

0-500 lb. per square inch.....3,850,000
500-1000 lb. per square inch.....3,000,000
1000-1500 lb. per square inch.....2,650,000

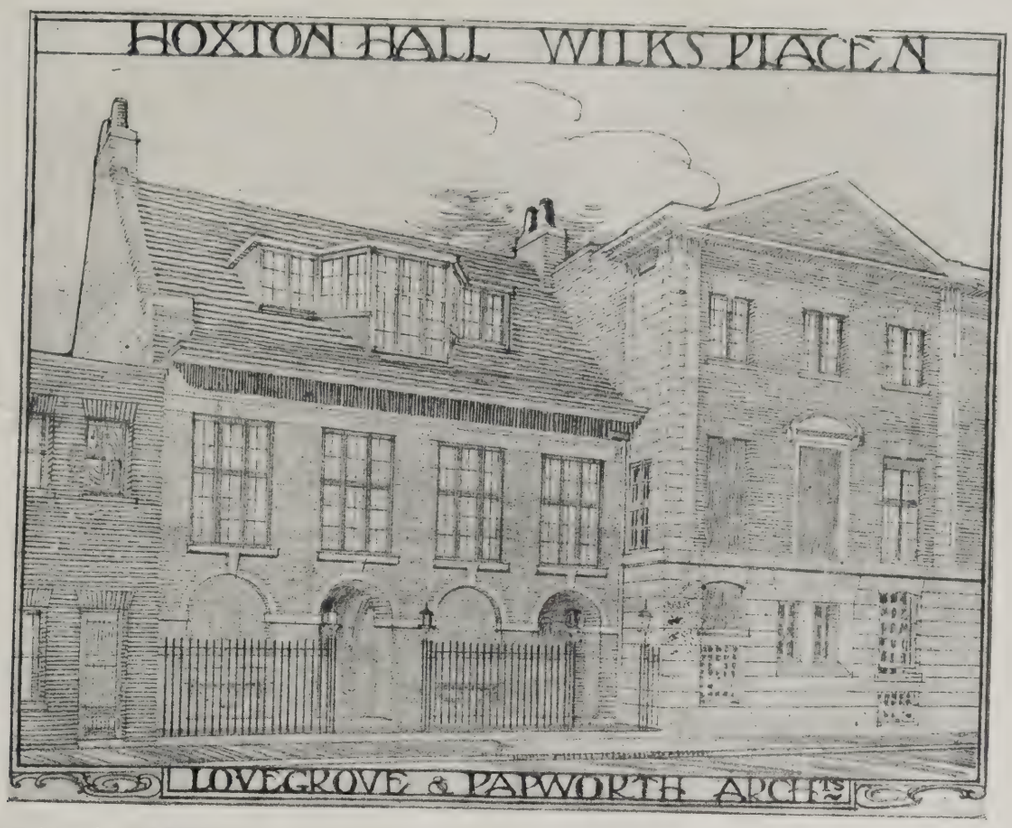
The results of the column tests are given in the following table:—

Serial number.	Age (days).	Gross	Within reinforcement.	Area of steel.	Per cent of reinforcement.	Max. load, lbs.	Max. stress, lb. per sq. in.	Modulus of elasticity 0-500 lb. per sq. in.	Modulus of elasticity 500-1000 lb. per sq. in.	Modulus of elasticity 1000-1500 lb. per sq. in.
1	71	196	..	..	..	528,000	2,690	3,700,000	2,950,000	2,950,000
2	64	196	..	..	..	440,000	2,250	3,750,000	3,200,000	2,650,000
3	58	196	..	..	..	502,000	2,560	3,850,000	3,150,000	2,150,000
						Average	2,500	3,766,000	3,100,000	2,580,000
7	53	196	64	2.25	1.15	532,000	2,710	3,300,000	2,900,000	2,450,000
8	60	196	64	2.25	1.15	488,000	2,490	4,150,000	3,550,000	3,550,000
9	66	196	64	2.25	1.15	500,000	2,550	4,700,000	3,350,000	3,350,000
						Average	2,580	4,025,000	3,266,000	3,116,000
4	62	196	113	4.64	2.40	564,000	2,870	3,550,000	3,200,000	3,000,000
5	69	196	113	4.64	2.40	564,000	2,870	3,800,000	3,500,000	3,600,000
6	56	196	113	4.64	2.40	528,000	2,690	4,200,000	3,000,000	2,200,000
						Average	2,810	3,850,000	3,230,000	2,930,000

The results of the tests impress one with the good showing made by plain concrete and the small increase in strength resulting from the use of reinforcement. The popular notion that the hooped columns are much more desirable because of their greater toughness would seem to be ill-founded, because, as can be shown also by a theoretical analysis, this toughness is not exhibited until after the maximum load is developed, which, if applied by a dead weight instead of a testing machine, would cause almost, if not quite, as sudden a collapse as would occur with either of the other types of columns. This premises axial loading, and does not consider the effect of eccentricity or earthquake.



FORMS FOR A CONCRETE WATER TANK.



A railway in the United States now has in use three reinforced concrete water tanks for locomotive supply service. They are 24 ft. in diameter, and 16 ft. high inside, built on side-hill ledges, thus requiring no stool support. The floor and circular wall are both 8 in. thick, reinforced with square "indented" bars. The reinforcement in the floor consists of two layers of ¼ in. bars on 4 in. centres, the first layer at right angles to the second. The wall reinforcing is composed of ⅜-in. vertical bars spaced 8 in. apart on centres around the entire circle, and these are surrounded by ⅜-in. hoop bars spliced with a 4-in. wire-wound lap joint, the spacing varying from 1¾-in. at the bottom to 6 in. at the top. To provide against possible bulging of the circular wall it is tied to the floor by ⅜-in. bent bars on 8 in. centres. These bars extend part way up the side wall outside of the hoops and part way under the floor just above the floor reinforcing. An 8-in. kneebrace is placed between the wall and the floor and the former is thickened to 12 in. for a distance of 2 ft. 2 in. above the bottom of the floor.

The forms were built in sections 4 ft. high, six sections of 60 deg. each making up the full circle. The true arcs for the inside and outside forms were sawed from short pieces of 2 by 8-in. nailing strips, and these were spliced together so as to complete a 60 deg. section. On the arc side of these strips 2 by 4's 4 ft. long were nailed on 8 in. centres and No. 22 galvanized iron was fastened to these so as to form the facing for the centre. The two sides were held at the proper distance apart by an adjustable yoke, the details of which are shown herewith.

The concrete was 1:2:4 Portland cement, sand and broken stone of ¾-in. maximum size. Wherever possible the concrete was spaded so as to get 1 in. of mortar at both inside and outside surfaces, no waterproofing material being used. The climatic conditions did not necessitate a roof being built over the tank, except for the purpose of keeping out sand, so only a rough plank roof was provided.

According to the chief engineer of the railway, these tanks have remained watertight and are giving entire satisfaction under the conditions obtaining in that territory. The tanks were built by the company labour and cost approximately 2,500 dols. each, although Mr. Croswell states that the cost could have been somewhat reduced had the workmen been more experienced in this class of work.

THE ARCHITECTS' STANDARD CATALOGUES.

We have pleasure in being the first to announce the forthcoming issue of the Architects' Standard Catalogues. Their object, stated broadly, is to create harmony out of chaos in an architect's office; for who can but deplore the huge expenditure involved annually in the issue of catalogues and pamphlets which, without malice, are thrown into the waste-paper basket as the only means of effectively getting rid of them. Any attempt to classify and file them would leave but little time for aught else. Before the work of issuing standard catalogues was proceeded with, the organisers wisely appealed to manufacturers for their opinion on the subject, and several meetings, largely attended by manufacturers, were held. Architects' views have since been ascertained, and these, it is stated, are in entire sympathy with the proposal. Our views on the subsubject of standardised catalogues have been repeatedly expressed; and we have only to reiterated our approval of a system that promises so much convenience for architects, while at the same time offering the manufacturer much-needed relief from the disadvantages under which he laboured when his expensively produced catalogues were destroyed offhand. There can be no doubt that the system of standardised catalogues will save much mortification to all concerned. The standard catalogues are, of course, of uniform size and style, and are bound together according to subjects, each volume including all the approved catalogues relating to the heading under which they are classified. The set is expected to comprise eight volumes, each dealing with a special line, such as sanitation, materials, steel and fireproof construction, ironmongery, wall and floor-coverings, and so on. Each volume contains nothing but purely catalogue information, arranged under thumb-indexed sections, so that reference is instantaneous, thus saving not only the lamentable waste of the architect's valuable time, but the even more considerable vexation of spirit that, under common conditions, are too frequently the only result of a consultation that is therefore as much as possible avoided. On the other hand, where the arrangement is orderly and systematic, and the required item is instantaneously found, consultation becomes a pleasure instead of a nuisance. The volumes will be issued by the Architects' Bureau Association, Ltd., Bloomsbury Hall, Hart Street, W.C.

R. Waygood and Co., Limited.

The tenth ordinary general meeting of R. Waygood and Co., Ltd., took place on Thursday, June 16th, at Cannon Street Hotel, at noon, Mr. H. C. Walker, chairman and managing director, presiding. The secretary having read the notice convening the meeting and the auditors' report, the chairman in the course of his speech said that in spite of unprecedented competition and low prices, the firm, by close attention to details, had maintained the dividend, and claims to have secured the most important contracts which have been let this year, including the new Post Office, now erected on the site of Christ's Hospital, Newgate Street. This contract is for 12 electric lifts, some of them to raise 2 tons at a speed of 200 feet per minute. These are the largest electric lifts which have hitherto been made in this country to work from three-phase current, and their installation involves very special arrangements, both in design and manufacture. They were also successful in obtaining the contract for the lifts for the Royal Liver Friendly Society building in Liverpool. This is a huge office building, and is to be equipped with 15 of Waygood's high-speed electric passenger lifts, some of them working at 400 feet per minute. The height is such that it is called the first British "skyscraper," as it has 16 floors. The equipment of lifts will be second to none in the United Kingdom. The firm have secured the order from Messrs. Harland and Wolff to fit the new mammoth White Star liners, "Olympic" and "Titanic" with 16 lifts, including 8 of their special electric passenger lifts. Mr. Walker had just been to New York on the "Lusitania" and was pleased to note that the lifts his firm fitted in this magnificent steamer are in constant demand, and highly praised by passengers and crew. They have now fitted over 50 ships with their lifts, quite apart from the special work they have done in this direction for the Admiralty, for whom they have fitted 30 electric lifts on battleships and cruisers. They have also secured the order for an electric passenger lift for the Lord-Lieutenant of Ireland, Viceregal Lodge, Dublin, many others for well-known noblemen and others of high social rank. They have completed, or have in hand, lifts for over 15 public buildings, including the Tower of London Regalia Room, Birmingham Council House extension, Royal Scottish Museum, Edinburgh, Edinburgh University, the Guildhall, the Institute of Electrical Engineers, the Imperial College of Science and Technology, the Baltic Mercantile and Shipping Exchange, and the Regent Street Polytechnic, as well as 13 hospitals.

HOXTON HALL, LONDON, N.

The foundation-stone for the new buildings at Hoxton Hall, Wilks Place, was laid by Mr. J. Allen Baker, M.P., representing the Bedford Institute Association, on June 11th. These new buildings consist of new lecture-rooms and meeting halls covering a large area fronting Wilks Place, and in rear of the present Hoxton Hall Mission buildings. The basement will be used as extensive cloakrooms, lavatories, bathrooms, and chair stores, with a large boys' club room. The ground floor will contain a meeting hall and medical mission, and the first and second floors, meeting halls and girls' clubroom and lavatories. Considerable alterations will at the same time be made in the existing large hall by the provision of two new staircases and new retiring rooms and kitchens, while the entire building will be redecorated. The only new elevation in which there will be any attempt at architectural design is that to Wilks Place, on which front the buildings have been kept as low as possible, and as this is a narrow turning the design will be kept very plain. The buildings are being erected for the Hoxton Hall Mission, which is a daughter of the Bedford Institute Association by Messrs. John Grover and Son, of New North Road, the architects being Messrs. Lovegrove and Papworth of 374-8, Old Street, E.C.

ELECTION OF LICENTIATES R.I.B.A.

At the Council Meeting of the 6th June the following candidates, having been found eligible and qualified under the Charter and By-laws, were elected Licentiates of the Institute in accordance with the provisions of By-law 12:—Aberdour, James Gordon; Allen, George Pemberton; Bailey, William Henry, (Maritzburg); Barnard, Leonard William (Cheltenham); Belsher, Bernard James; Bennett, John (Bolton); Betenson, Frederic Roger, F.S.I.; Bissell, George Ernest (Colchester); Bourne, John Charles; Briggs, George Hamilton; Brooks, Stanford Morton (Glasgow); Calldott, Charles William; Church, Arthur Harold; Clark, Charles Richmond Rowland (Basingstoke); Clay, George Felix Neville, B.A., Cantab.; Coleridge, John Duke; Colville, Hubert Leonard; Cook, Ellis Taylor (Rotherham); Cox, Bernard Joseph Farrar; Creighton, Henry Richard; Davidson, William, *Owen Jones Student* 1904 (Edinbro'); Davies, Ivor Samuel (Bangor, N. Wales); Davies, George Walesly (Darlington); Dewes, Walter; Dight, Alfred Henry (Birmingham); Duff, John (Rephad, Stranraer); Fry, Peter George (Weston-super-Mare); George, Allan; Gilbertson, Alfred (Liverpool); Griffith, Edward Henry Herbert (Ringwood); Gunson, Ernest (Manchester); Harber, William Francis; Havers, Albert Charles (Norwich); Heathcote, Charles Harold (Manchester); Heathcote, Ernest Grigg (Manchester); Hewitt, Stanley Goodison (Liverpool); Hook, John; Kempster, Fred; Laing, Henry George Malcolm; Lawrence, Joseph Thomas; Lucas, William Louis, B.A.Cantab.; Martin, Robert (Manchester); McLachlan, Herbert, Gutherie; Newman, Charles James (Rugby); Norton, Charles Harrald; Partridge, Sidney Herbert (Newton Abbot); Pullin, Charles Henry; Robertson, George Birrell, *President of the Institute of Architects of N.S.W.* (Sydney, N.S.W.); Scrivener, Harold Moore (Northampton); Shann, Frank Halliwell; Sharpe, Thomas William; Shelmerdine, Edmund John; Sidwell, Henry Thomas (Rayleigh, Essex); Sinclair, Colin, M.A., F.S.A.Scot. (Glasgow); Skipper, Charles Frederick (Cambridge); Smith, William Auger (Nottingham); Tanner, Douglas George (Eastbourne); Tatchell, Sydney Joseph; Taylor, William (Aylesbury); Toombs, Edwin Ashley; Townsend, Charles William; Waterworth, John Halstead; Webb, William Herbert; Williamson, Walter (Bradford); Winder, Thomas, Assoc.M.Inst.C.C. (Sheffield); Windsor, Frank; Wire, Wilfred Travers.

SOCIETIES' REPORTS.

The Society of Engineers.

The third vacation visit of the present session took place on Wednesday, June 15th, 1910, when, by the courtesy of Maurice Fitzmaurice, Esq., C.M.G., M.Inst.C.E., a party of members of the Society and their friends visited the site of the New County Hall of the London County Council on the south side of the Thames at Lambeth.

The river is excluded by an embankment wall similar to the Victoria Embankment on the opposite side of the river. The embankment wall is founded on the London clay formation at a depth of about 20ft. below Ordnance Datum, and the whole area behind the wall is to be covered with a raft of concrete 5ft. thick, resting on the Thames ballast at a level of 8ft. below the same datum. On this raft the building will be erected. The embankment wall is being built behind a cofferdam consisting of a single row of Oregon pine piles, 14in. square, grooved and tongued, which are driven about 12ft. into the clay. The wall is of 6 to 1 Portland cement concrete, faced with Cornish and Aberdeen granite above low-water level. In front of the central portion of the future building the wall has two flights of steps leading down to the river, and the granite is finished with a rough face. Behind the wall is a series of arches forming storage vaults, and on the top of them will be a terrace, access to which will be by a flight of steps from Westminster Bridge. Special precautions were taken in constructing the foundations of the new wall near the abutment of Westminster Bridge. The bridge is founded on cast-iron piles, and, in order to avoid any possibility of weakening this support, a length of 30ft. of the wall next the bridge was founded in a caisson, which was sunk with compressed air. The foundation of the abutment was also partly surrounded with steel sheet piling driven down to the London clay. The embankment wall has been designed and is being constructed under the supervision of Maurice Fitzmaurice, Esq., C.M.G., the Chief Engineer to the London County Council, the contractors being Messrs. Price and Reeves. The raft foundation is being laid by Messrs. F. and H. F. Higgs, under the supervision of Mr. W. E. Riley, F.R.I.B.A., the Council's Superintending Architect, who is also associated with the architect for the whole scheme, Mr. Ralph Knott, F.R.I.B.A.

TRADE AND CRAFT.

Gas Fires.

The Gas Light and Coke Co. issue a very eloquent persuasive to the use of gas fires, in which, after remarking that "In our capricious climate there is no dependence that the seasons will be true to type—that even in the height of summer we may get raw mornings, damp afternoons, and chilly evenings"—stress is laid on the very important part played by sentiment in the matter of fire-lighting. "The thought of lighting a coal or wood fire at such time conjures up a sort of curious feeling that we are contemplating something wrong, violating a household rule, or ignoring the tradition that summer is not the time for a fire. There is the inconvenience of laying a fire, which the servant often accomplishes in a half-hearted way that is enough to deter a sensitive housewife from ordering a fire at all. Possibly the grate is decorated with flowers or some other form of ornament which has to be removed. The gas fire is the solution of the whole difficulty. Turn on the tap, apply a match, and in a few minutes the room is cosy; just at the right heat which you can regulate exactly to your requirements." The moral is too obvious to need emphasis; and the great convenience of gas fires, which can be instantly set going without the slightest fuss of preparation, and are cleanly, controllable, and altogether comfortable, is indisputable and demonstrable at all seasons of the year; but in summer-time these virtues become specially conspicuous.

LONDON MASTER BUILDERS' ASSOCIATION.

The monthly Council meeting was held at 31 and 32, Bedford-street, on Thursday, 16th June, last. The President (Mr. L. Horner) occupied the chair.

The Organisation Committee reported that several firms had signified their intention of becoming members, and that the names of the recently elected Associates Members had been placed upon the telephone card.

The Council considered the Bill to amend the law relating to Trade Unions now before Parliament. As the Bill proposes that the funds of the Trade Unions, which have been subscribed solely for trade purposes, be utilised to contribute to the expenses of some Members of Parliament, the Council decided to protest against the Bill.

The question of the system of measurement of slating and roof tiling was again considered. A method agreed to be the most satisfactory was forwarded to the proper authority with a request that it might be considered by them.

The Hon. Treasurer submitted the Finance Committee's report. It was decided to carry a further sum to Deposit Account

COMPETITIONS.

Whittingham Asylum Extensions.

Mr. G. T. Hine, F.R.I.B.A., the assessor appointed to judge the competitive designs for an annexe to Whittingham Asylum, has awarded the first premium of £100 to Messrs. Sykes and Evans, Chapel Walks, Manchester. Their plans have since been examined by the Commissioners in Lunacy and at the Home Office, and already preliminary site arrangements for the building have been made. The annexe is to accommodate 700 patients of both sexes.

Rockland Workhouse Infirmary.

The Wayland Board of Guardians have selected, subject to the approval of the Local Government Board, the plans of Mr. H. J. Green, of Norwich, for the above building.

Usher Hall, Edinburgh.

The result of this competition is expected just after July 9th.

LIST OF COMPETITIONS OPEN.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

JULY 20 YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

JULY 25. NEW ELEMENTARY SCHOOL, WINCHESTER. Designs are invited from Hampshire Architects for Elementary School Buildings to accommodate 330 children. Plan of the site and full particulars may be obtained on application to Thomas Holt, Town Clerk, Town Hall, Winchester. Premiums of £50, £30, and £20 are offered for the Design selected as first, second, and third. Thomas Holt, Town Clerk.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

SEPT. 5. THE QUEEN'S UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to Architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

COMING EVENTS.

Wednesday, June 22.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Sketching Club Annual Excursion

INSTITUTION OF HEATING AND VENTILATING ENGINEERS.—Summer meeting at Bournemouth (second day).

INSTITUTION OF CIVIL ENGINEERS. — The 18th James Forrest lecture. 8 p.m.

EAST LONDON COLLEGE (University of London).—Professor C. A. M. Smith on "The Illumination of Interiors." 8 p.m. (third and concluding lecture).

Thursday, June 23.

R.I.B.A.—Final and Special Examinations for candidates as A.R.I.B.A. commence and continue to July 1st.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS.—Summer meeting at Bournemouth. Concluding day.

SOCIETY OF ARCHITECTS.—Visit to the Japan-British Exhibition.

Friday, June 24.

ROYAL SANITARY INSTITUTE.—Meeting at Dublin.

NEW BUILDINGS.

PROPOSED.

Aberdeen.—Mr. A. Marshall Mackenzie, A.R.S.A., has prepared plans showing the new additions to King's College, Old Aberdeen, which it is proposed to erect on the property for many years carried on as the Aulton Brewery, closely adjoining the College buildings, and which the University authorities acquired some time ago. The old buildings will, of course, be cleared away, and on the site there will be erected improved accommodation for the English and History classes. The buildings will be of freestone, so as to harmonise with the college, of which they will form part, and the architecture will follow the lines of the University Chapel. The extensions involve an outlay of about £20,000.

Bolton-on-Dearne.—The Urban District Council has received a letter from the Local Government Board respecting their housing scheme. The Council, it will be remembered, applied for sanction to borrow sums of £300 and £150 for the purchase of land at Highgate for the purposes of allotments and housing, respectively. The letter said: "The Board are advised that the purchase money, £450 for the entire property, would be more equitably apportioned as follows: £250 for allotments and £200 for housing purposes." Subject to this the Board had decided to comply with the application, and their formal sanction was enclosed. Regarding the Council's application to borrow £600 for the purposes of the erection of a storeyard, stables, and depot, the Local Government Board also wrote stating that an inquiry would be held in due course.

Bridlington.—At a recent special meeting of the Bridlington Town Council a resolution was submitted instructing the Council to purchase at a cost of £7,250, the People's Palace and the adjoining land, and to apply to the Local Government Board for sanction to borrow £7,400 to complete the purchase. It was stated that there was no present intention to erect a Town Hall and offices, though these were necessary, and would have to be provided in the near future. The property could be secured and held by the corporation without costing the ratepayers anything. The resolution was carried.

Coalville.—The Urban Council has approved the following plans:—House, Crescent Road, Hugglescote; four houses, Ashby Road, Hugglescote; house, Bakewell Street, Coalville; house, Bakewell Street, Coalville; house, Battleflat; two houses, Church Lane, Whitwick.

Colwyn Bay.—It has been decided to proceed immediately with the completion of St. Paul's Church, Colwyn Bay, by building the tower, as originally intended. According to the design selected by the Committee, the tower promises to form a striking feature. It will be about 85 ft. in height, of quiet and dignified character, with eight handsome belfry windows, but very little minor ornamental detail. Situated at the north-west corner of the nave, and forming the main entrance to the church, it will provide a roomy porch, over which there will be a classroom, surmounted by the ringing-room and belfry, with space for a full peal of bells. The tower is square in plan, with massive buttresses at the angles, and built like the church of local limestone, with red sandstone dressings. A Building Sub-Committee has been appointed, the plans and tenders are now under consideration, and it is hoped that the contract may be settled by the end of June. It is estimated that the total cost will amount to over £3,500, exclusive of the cost of reinstating the church grounds and other contigent expenses.

Drogheda (Ireland).—Mr. J. F. M'Cabe, L.G.B. Inspector, has held an inquiry, in the Courthouse (Drogheda), into an application of the Corporation for £15,000, in connection with a new housing scheme which they have formulated for the erection of artisans' dwellings. There was no opposition on behalf of the ratepayers.

Normanton.—An inquiry has been held at the Normanton Urban Council offices with respect to the Urban Council's application to the Local Government Board to borrow £8,250 for the erection of 38 houses for the working classes, abutting on land at Haw Hill Park.

Quarrington.—The scheme for erecting a new church for the parish of Quarrington, which shall be close to Sleaford, is being pushed forward, and it has been decided to purchase a site offered by the Marquis of Bristol, at the north-west corner of the cricket field. About £1,400 is in hand and promised to meet the cost of the scheme.

Shrewsbury.—At a recent meeting of the Shrewsbury Town Council a resolution was proposed, urging the widening of the English Bridge, which is the main and only approach to the town for vehicular traffic from London, Birmingham, and the Midlands, and that application be made for a loan of £5,000, to carry out the work. This had become urgently necessary for the safety of the public in consequence of the large increase in the traffic in recent years. The Chairman of the Improvement Committee thought that when any loan was applied for it should be to improve generally the dangerous places in Shrewsbury, and in view of that, he moved as an amendment that a committee of the whole Council be appointed to consider and report on the best design and financial arrangement for the alteration of the English Bridge. This was agreed to.

Wednesbury.—At a recent meeting of the Town Council a report was presented by the Education Committee stating that twenty tenders had been received for the erection and provision of the new public elementary school, in accordance with the plans and specifications approved by the Board of Education, and that the tenders of Messrs. J. Summerhill and J. Jellyman had been accepted conditionally upon the Town Council approving the expenditure of a sum of £15,385, the amount of such tender. The report stated that the committee would recommend the Town Council to approve the expenditure, and to obtain and provide a loan for the amount required to cover it. It was decided that the report should be discussed in committee.

IN PROGRESS AND COMPLETED.

Cheltenham.—The new chapel at St. Paul's Training College, the foundation-stone of which was laid in January of last year by the Bishop of Gloucester, has been dedicated by the Archbishop of Canterbury. The building, which is of white square-cut stone, built in the Early Perpendicular style, will provide accommodation for 600 worshippers, and has been erected on the south-east side of the College grounds, in the rear of the existing buildings. The roof is of red tiles, and the whole of the interior woodwork, including roof timbers of light oak, harmonises with the stone. The chapel is lofty, and is lighted by six traceried windows on each side and one at the east end, while at the west end over the gallery is a circular window. A narrow round tower with lights at the top, similar to one just opposite at the rear of the college, stands at the north-west corner. The floors of the ante-chapel, chancel, and aisles, are laid with marble mosaic. The chapel proper is 100ft. in length, and 39ft. in width from wall to wall, and 33ft. between the piers. Arches spring from pier to pier longitudinally, and so form an arcade above the windows on each side. The chancel is 22ft. by 14ft., and the ante-chapel, which is at the end of, and divided by an oak screen from the main chapel, is 32ft. by 15ft. The cost was £10,000, Messrs. C. Hodgson-Fowler, of Durham, and Chatters and Smithson, of Cheltenham, being the joint architects. Messrs. Collins and Godfrey were the builders, the heating apparatus being fixed by Messrs. Marshall, and the electric light installed by Steel and Co.

Eastleigh.—The Bishop of Winchester has consecrated the new church of All Saints', which has been built to meet the needs of this large and rapidly increasing community, which has recently been augmented by the removal to Eastleigh of the locomotive department of the London and South-Western Railway. The new church has cost £8,000, and is part of a scheme involving a sum of £12,000, the remainder of this amount being set apart for the building of a large parochial hall. It is built in the Perpendicular Gothic style of Swanage stone, with exterior dressings of Monk's Park (Bath) stone, and interior dressing of Beer stone, and provides seating capacity for 700 people. North and south transepts are provided, also a morning chapel, clergy vestry, and octagonal choir vestry. The choir stalls are of oak, the arcading on either side of the nave being a striking feature of the interior. Messrs. Musselwhite and Sapp, of Basingstoke, were the builders, and architect is Mr. N. C. H. Nisbett, F.R.I.B.A., of Winchester, diocesan architect and surveyor

Fairhaven (Lytham).—The new Wesleyan Church, which has been erected from the designs of Mr. A. Brocklehurst, architect, Manchester, at a cost of between £5,000 and £6,000, has been formally opened on completion. Seating accommodation is provided for 500 people, and the building is furnished in oak, with pitchpine ceiling, having an exterior of parpoints, relieved with dressed and carved stone.

London, N.—The laying of the foundation-stone at the Tollington High School for Girls, Grand Avenue, Muswell Hill, has been performed by the Hon. Mrs. Bevan. The new building will accommodate 300 girls, and is planned to meet every requirement of the education authorities. It is a three-storey structure of utilitarian design, with few decorative features, and is built of red pressed bricks, with stone and brick dressings. It contains a number of classrooms of uniform size, laboratory, cookery school, assembly hall (60ft. by 30ft.), and a gymnasium, with floor suitable for dancing and lighting arranged for drawing purposes. The corridors are of fireproof construction, the floors are sound-proof, and the heating will be by a system of hot water at low pressure from a room in the basement. Playgrounds are provided both back and front—one for the senior scholars and the other for the juniors. The cost of the building is £5,000, exclusive of the freehold site. The school has been erected from the plans of Mr. Alfred Conder, architect, by Messrs. John Grover and Son, Islington. The work is already well advanced, and the school will be opened in September.

London, S.W.—Rapid progress is being made with the erection of Messrs. Arding and Hobb's new premises at Clapham Junction, which will cover an area of nearly 30,000 square feet, the height from the basement being 68 ft. The frontage in St. John's Road will be 190 ft., in Lavender Hill 140 ft., and in Ilminster Gardens 50 ft., making with the "Island" windows, which will be 20 ft. deep, a total glass frontage of about 510 ft. The building, which is to be divided into blocks, 40 ft. by 100 ft., will include all the latest improvements for the comfort and convenience of customers, including a large restaurant, reading, writing and retiring rooms. Messrs. Gibson, Skipwith, and Gordon, of 5, Old Bond Street, W., are the architects.

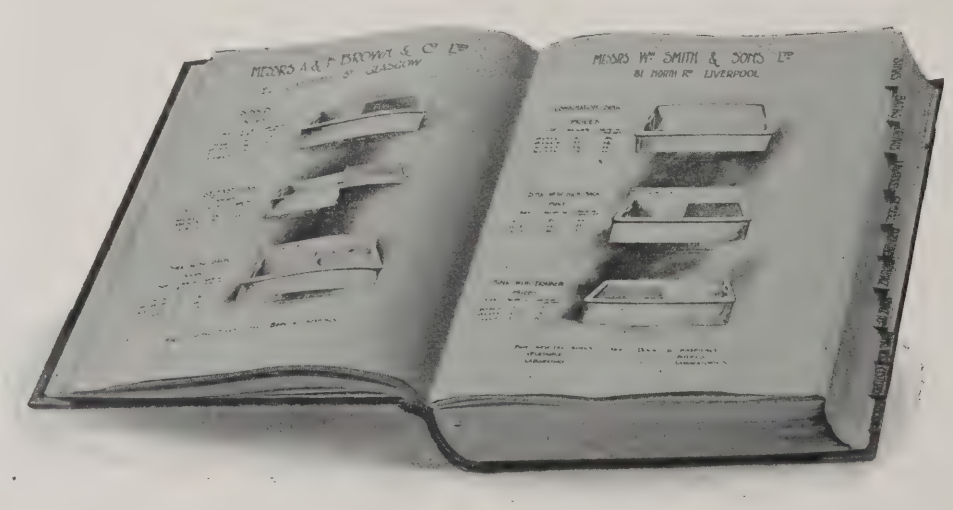
New Washington (Durham).—A large and commodious new theatre, providing seating accommodation for 1,800 persons, has been completed and opened at New Washington, Co. Durham. The site is in a central position, in close proximity to the main thoroughfare, and the building, which is of red brick, with a slate roof, is lighted throughout by electricity. Messrs. Hope and Tasker, of Newcastle-on-Tyne, were the contractors.

Rothesay.—A roller skating rink and entertainment pavilion promoted by a syndicate of Glasgow gentlemen, has been opened at Rothesay by Mr. Harry Hope, M.P. for the county of Bute. The building, which occupies the site of the old gas-works, is handsome and commodious, and provides accommodation for 4,000 persons, Mr. J. Campbell Reid being the architect.

IMPORTANT ANNOUNCEMENT.

THE

ARCHITECTS' STANDARD CATALOGUES



Issued under the auspices of

THE ARCHITECTS' TECHNICAL BUREAU.

This work has been **recommended by a Committee of Manufacturers,** appointed at public Meeting of Manufacturers to report thereon.

The set of volumes as shown above will contain Catalogue and Manufacturers' general information of service to Architects.

The details of this publication have been subjected to the revision of Committees of Architects and Manufacturers.

For preliminary application form and full particulars apply to ***THE MANAGER,***

THE STANDARD CATALOGUE PUBLISHING CO.,

Bloomsbury Hall, 24, Hart St., Holborn, LONDON, W.C.

Telephone ;—GERRARD 825 (3 lines).

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 25. **EVESHAM.**—Repairs to, and painting and decorating of, the Town Hall buildings, for the T.C. Specifications may be seen at the offices of the Borough Surveyor, H. S. Harvey, Town Hall, Evesham, and all further particulars can be obtained from the Borough Surveyor. Tenders to be sent to Thos. A. Cox, Town Clerk, Evesham. The contractor whose tender is accepted will be required to enter into usual formal contract with the Town Council.

June 27. **WITHNELL.**—Extensions and alterations to St. Paul's schools. Plans may be seen and quantities and particulars obtained from Jolly and Buckley, Architects, Chorley, to whom tenders must be delivered. Whole tenders invited.

June 27. **MERTHYR TYDFIL.**—Erection of sixteen semi-detached houses with roads, sewers, etc., for the Park Crescent Building Club, near the recreation ground. Plans and specifications can be seen at the office of the architect, Rees Morris, "Idrisville," Queen's Road, Merthyr Tydfil.

June 27. **DIPTON.**—Erection and completion of business premises at Dipton for George Maddison. Drawings, specifications, and conditions of contract may be seen at either of the offices of Thomas E. Taylor, The Grove, Lanchester, also Front Street, Annfield Plain.

June 27. **MERTHYR TYDFIL.**—Erection of an additional pavilion, together with other work, at the Mardy Isolation Hospital for the T.C. Plans may be inspected and specification and bills of quantities obtained on deposit of £2 2s., upon application to the Borough Engineer, Merthyr Tydfil. Tenders must be sent to T. Aneuryn Rees, town clerk, Merthyr Tydfil.

June 27. **STONE CHAIR (Shelf).**—Carpenters and joiners', plumbers' and glaziers', slaters' and plasterers' work, and materials required in connection with the alterations and additions to the Variety Club, Stone Chair, Shelf. Plans and specifications may be inspected from June 21 to June 27, on which last-named day tenders must be delivered to G. Reginald Oddy, Architect, Northowram, Halifax.

June 27. **MERTHYR TYDFIL.**—Erection of two semi-detached houses of design (A), also two semi-detached houses of design (B), near the Thomastown Park. Plans and specifications can be seen at the office of Rees Morris, architect, "Idrisville," Queen's Road, Merthyr. Tenders for houses of design (A) to be sent to C. L. Stewart, Accountant, Milbourne Chambers, Merthyr Tydfil, and tenders for design (B) to be sent to the architect.

June 27. **MERTHYR TYDFIL.**—Erection by one contract of eleven covered playsheds at the Council schools at Pengarnddu, Penyrheolgerrig, Caedraw, Abercanaid, Troedyrhiw, Aberfan, Edwardsville, and Woodlands, for the Education Committee. Particulars may be obtained from the deputy surveyor, Town Hall, Merthyr Tydfil. Tenders to be sent to E. Stephens, clerk to the Education Committee.

June 27. **MERTHYR.**—Alterations and additions for the conversion of Cyfarthfa Castle into a secondary school, and the erection of science laboratories, art and lecture rooms, with latrines, playgrounds, and other works in connection therewith. Specification, quantities, and form of tender may be obtained from T. F. Harvey, M.Inst.C.E., Borough Engineer, on and after June 6, on deposit of £5 5s. Plans and drawings may be seen at Cyfarthfa Castle, and other information obtained, on and after June 6. Tenders must be sent to T. Aneuryn Rees, Town Clerk, Town Hall, Merthyr Tydfil.

June 27. **BELFAST.**—Erection of chimney shaft and flue connections at the Electric Power Station, Belfast, for the Tramways and Electricity Committee. General conditions, specifications, and drawings can be seen at the office of the City Surveyor, City Hall, Belfast, and bill of quantities obtained from Acheson Ferguson, Scottish Provident Buildings, on deposit of three guineas, to be lodged with the City Chamberlain, City Hall. Tenders to be lodged at the office of R. Meyer, Town Clerk. Compliance with Standing Order No. 44 relating to payment of wages and hours of labour, etc., will be required.

June 27. **PORTSMOUTH.**—Erection, completion, and maintenance in thorough repair for six calendar months from the completion of the whole thereof, of the following works, namely, a chapel, house, offices, boundary walls, and fences in the new cemetery at Milton, within the Borough of Portsmouth, for the Council. On deposit of £3 3s. a copy of bills of quantities, with forms of tender, can be obtained on application to G. Hammond Etherton, Town Clerk, The Town Hall, Portsmouth, and the specification, general conditions, and plans can be seen, and any further particulars obtained, at the Borough Engineer's Offices, at the same address. Tenders must be sent to the Town Clerk. Fair wages clause.

(Yorks.).**—Works, for the Education Committee of the East Riding:—(a) Alterations and additions to the Council school at Atwick; (b) erection of new cloak-rooms and formation of yards, etc., at the Council school at Holmpton; (c) erection of new cloak-room and heating chambers, etc., at the Council school at Hutton, Cranswick. Plans and specifications may be seen and forms of tender obtained on application to the Building Surveyor, County Hall, Beverley. Quantities in respect of the Atwick school only can be obtained upon depositing £1 1s. A copy of the plans and specifications, together with forms of tender, will be deposited at the respective schools. Tenders to be delivered at the office of John Bickersteth, clerk to the East Riding Education Authority, County Hall, Beverley.

June 30. **NEW MALDEN.**—Erection of church schools at Kingston Road. Plans and specification can be seen at the offices of Vincent Davison and Nicol, architects, Coombe Chambers, New Malden. Tenders to be sent to J. T. Thompson, Queensmead, Thetford Road, New Malden.

June 30. **KESTEVEN.**—Alterations and additions to farm buildings and cottages at Metheringham Fen and Tanvats for the Small Holdings Committee of the Kesteven C.C., according to plans, specification, and quantities prepared by Jesse Clare, County Architect, Sleaford, of whom quantities and all particulars can be obtained. Tenders to be delivered to Thos. H. Holdich, Sleaford.

June 30. **BATH.**—Erection of mess room and office and pair of cottages at the sewage disposal site at Saltford, near Bath, for the Corporation. Plans may be seen and quantities obtained at the office of the engineer, W. H. Radford, C.E., Albion Chambers, Nottingham, on deposit of £2 2s. Plans can also be seen at the City Surveyor's Office, Guildhall, Bath. Tenders to be sent to Fredk. D. Wardle, Town Clerk, Guildhall, Bath.

June 30-July 4. **ST. ALBANS.**—Erection of a new public library in Victoria Street for the T.C. Further particulars and forms of tender may be obtained, and plans may be seen, at the office of Guilford Dudley, the architect to the Council, 2, Spencer Street, St. Albans, on June 30. Intending contractors will be required to deposit a sum of £3 3s. prior to particulars being furnished. Tenders must be sent to E. P. Debenham, town clerk.

July 1. **PRESTON (Yeovil).**—Alterations and additions to the schools at Preston, Yeovil. Particulars may be had from C. and C. B. Benson, architects, Yeovil.

(*Continued on next page.*)

July 1. **PORTH.**—Erection of two villas at Cemetery Road, for H. A. Bolton. Plans and specification may be seen at the office of James T. Jenkins, architect and surveyor, Porth and Bedwas, to whom tenders must be delivered.

July 1. **ST. AUBYN'S (Cornwall).**—Additions and alterations to the buildings at St. Aubyn's, Trevilly, Sennen. Plans and specifications can be seen by application to the Steward, Chyaneglos, Marazion, to whom tenders should be sent.—Piers S. St. Aubyn.

July 1. **LONDON, N.**—Construction of underground conveniences in Finsbury Park, by the Finsbury Gate, Seven Sisters' Road, N. Drawings, condition, and specification may be seen, and forms of tender and bills of quantities obtained, on and after the 20th inst., upon application to the Borough Engineer, J. Patten, Barber, at the Town Hall, Upper Street, N., and deposit of £2 2s. Tenders must be sent to Wm. F. Dewey, Town Clerk, Town Hall, Upper Street, N.

July 2. **FOLKESTONE.**—Erection of a temporary building at the County school for girls, for the Kent Education Committee. See advertisement page xxii. in this issue for further particulars.

July 2. **TREVISCOE (near St. Stephens, Cornwall).**—Erection and completion of proposed Wesleyan Methodist Church, Grampound Road, according to plans and specifications, which may be seen by appointment at the residence of Capt L. H. Dyer, Treviscoe, to whom tenders are to be sent. Plans and specifications may be seen and particulars relating to the work may be obtained at the office of Sampson Hill, architect, Green Lane, Redruth.

July 2. **CHIPPENHAM, ETC.**—Internal and external renovations to Chippenham Police Station, also police cottages at Highworth, Ludgershall, and Shrewton, for the Standing Joint Committee of the Wilts C.C. Specifications and forms of tender can be obtained on application to the County Surveyor, Trowbridge. Tenders addressed to the County Surveyor, must be delivered at the office of J. George Powell, county architect and surveyor, Trowbridge.

July 4. **FOOTSCRAY (Kent).**—Enlargement of Longlands Council School, for the Kent Education Committee. See advertisement in this issue for further particulars.

July 4. **SOUTHEND-ON-SEA.**—Alterations and additions to Leigh Road and Brewery Road Council Schools, for the Education Committee. Plans, specifications, and conditions may be seen, and form of tender obtained, on deposit of a cheque for £1 1s., upon application to Ernest J. Elford, C.E., borough engineer and surveyor. Tenders to be delivered at the office of J. W. Barrow, Clerk to the Committee, Education Offices, Municipal Buildings.

July 4. **FOOTSCRAY (Kent).**—Enlargement of Longlands Council School at Footscray, Kent, for the Kent Education Committee. Plans and specification, prepared by the Committee's Architect, (Wilfred H. Robinson, M.S.A.), and conditions of contract may be inspected at the office of the Committee. Send name and address, accompanied by a deposit of £1, to Fras. W. Crook, secretary, Caxton House, Westminster, S.W. The person whose tender is accepted will be required to provide two sureties who will enter into a bond to the Committee for the satisfactory completion of the contract. Tenders must be addressed to Thos. Beeton, Corner House, Church Avenue, Sidcup.

July 4. **GORAGHWOOD (Ireland).**—Erection near their Goraghwood Station of a timber-framed storage bin, etc., about 50 feet x 50 feet, and averaging about 35 feet high, with timber roof, covered with corrugated iron, for the Directors of the Great Northern Railway Company, Ireland. Also an engine and boiler house, etc., about 75 feet long by 36 feet wide. Sides and roof to be steel framed and covered with galvanised corrugated iron. Drawings and specifications may be seen at the office of F. A. Campion, chief engineer, Amiens Street terminus, Dublin, or copies of them at the office of the district engineer, Belfast, and forms of tender can be obtained. Tenders should be delivered to T. Morrison, secretary, Secretary's Office, Amiens Street terminus.

July 5. **WOKING.**—Erection of a new sorting office at Woking for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Woking. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered addressed to the Secretary, H.M. Office of Works, etc., London, S.W.

July 5. **MAIDSTONE (Kent).**—Erection of offices, workshops, stores, etc., upon the Council's wharf in St. Peter Street, Maidstone, for the Bridges and Roads Committee of the County Council, in accordance with drawings and specification, which may be seen at the office of the County Surveyor, West Borough Chambers. Bills of quantities can be obtained upon a deposit of a cheque for £3 3s. Tenders to be forwarded to W. B. Prosser, Clerk of the Council Sessions House, Maidstone. Fair wages clause.

July 5. **LONDON, E.**—Erection of proposed nurses class-room and addition to drug stores, etc., at the District Sick Asylum, Devons Road, Bromley, E., for the Managers, in accordance with plans and specification prepared by their architects, J. and W. Clarkson, 136, High Street, Poplar, E. The drawings and conditions of contract may be seen at the offices of the architects, and a copy of the specification and form of tender obtained upon payment to the architects of a deposit of £5. Tenders to be addressed to Walter R. Foskett, Clerk to the Managers, at the Asylum, Devons Road, Bromley-by-Bow, E. Parties tendering will be required to declare that they pay the rate of wages and observe the hours of labour that are generally recognised by the trade unions and considered fair in the trade, and will be required to provide two approved sureties, each bound in the amount of the contract, for the proper fulfilment thereof.

July 6. **CHIPPING ONGAR (Essex).**—Execution of (a) general painting and repairs, (b) tiling and roof repairs, and (c) alteration to kitchen in administrative block at the children's homes at Chipping Ongar, for the Hackney Guardians. Specifications, conditions of contract, and forms of tender can be obtained of Frank R. Coles, Clerk to the Guardians, and the drawing relating to the alteration to the kitchen in administrative block may be seen at the Guardians' offices, Sidney Road, Homerton, N.E. The contractor will be required to give approved security in a bond, the form of which may be seen at the Guardians' offices. Tenders must be delivered at the office of the clerk. Tenders are, so far as they relate to section (c)—i.e., alteration to kitchen in administrative block—conditional upon the sanction of the Local Government Board.

July 7. **SOUTHEND-ON-SEA.**—(See "Engineering.").

July 8. **MATLOCK.**—Alterations and additions to Smedley's Hydropathic, consisting of 32 bedrooms, etc., etc., for the Directors. Tenders are invited for work connected with the following trades:—Mason, bricklayer, concretor, excavator, and drainage, joiner, plasterer, plumber, glazier and painter. Persons desirous of tendering will please inspect the site and take their own quantities from plans and specifications, which will be on view at the Secretary's Office of the Hydro, from June 24 to July 5. Tenders to be sent addressed to the "Chairman of the Board of Directors."

No date. **ELLESMERE.**—Erection of new shop premises with store rooms, etc., at Ellesmere, for the Ellesmere and District Co-operative Society, Ltd. For plans and specifications, etc., apply to the Secretary of the Society.

No date. **ROMFORD.**—Erection of new business premises and dwelling-house, with works incidental thereto, on the site of the Old Windmill and Bells, Market Place, Romford, for L. F. Stone. Send names to the architect, E. J. Little, Hornchurch Road, Romford, or to C. E. Pease, F.S.I., Surveyor, 16, Clifford's Inn, Fleet Street, E.C. Bills of quantities can be obtained.

No date. **GRANTHAM.**—Construction and erection of a new drill hall at, and certain alterations to, the Barracks, at Grantham, for the Lincolnshire Territorial Association. Bills of quantities and specification of works required may be obtained by approved applicants at the Offices of Scorer and Gamble, Architects, Bank Street Chambers, Lincoln, on deposit of £2 2s.

No date. **EGREMONT.**—Extension of the gasworks for the U.D.C. Contract No. 1: Excavations, concrete and masonry of retort house. Full particulars and copy of the bill of quantities may be obtained from the engineers, Thomas Newbigging and Son, 5, Norfolk Street, Manchester, on deposit of £1 1s. Drawings and specification may be seen at the Engineers' office, or at the gasworks, Egremont.

ENGINEERING.

June 27. **PORTMADOC.**—Diverting the River Dwyryd from Aberia Point to join the River Glaslyn at a point opposite Messrs. Greaves' No. 2 wharf, between the Ballast Bank (Lewis's Island) and Trwyncae'rogo, for the Estuary Committee. Particulars may be obtained on application to Morgan Thomas, C.E., Town Hall, Portmadoc. Tenders must be sent to Jno. Jones, Secretary, Town Hall, Portmadoc.

June 27. **LICHFORD (Lymington).**—Designs, specifications, and tenders for a ferro concrete bridge (8ft. span), at Lichford, in the parish of Milton, for the Lymington R.D.C. Also for a concrete surface water channel near the Milton Schools. Particulars to be obtained of S. Crittall, surveyor, Sway. Tenders must be sent to J. Davis Rawlings, Clerk, 38, High Street, Lymington.

June 27. **SEATON.**—Laying 280 yards of 3in. cast-iron socket pipes, with appendages, including sluice valve and hydrants, for the U.D.C. Specifications and conditions may be seen at the office of the Council's surveyor, E. W. Skinner, by appointment. Tenders must be addressed to A. P. Cann Evans, Clerk to the Seaton Urban District Council, Town Hall, Seaton.

June 27. **BOGNOR.**—New low pressure hot water heating installation, at the Bognor Council schools, for the West Sussex and Chichester Joint Education Committee. Plan and specification can be obtained on application to Haydn P. Roberts, A.R.I.B.A., County Education Architect, Horsham. The contractor whose tender is accepted may be required to enter into a contract with the West Sussex County Council, and to enter into a bond with two approved sureties, if required, for the due carrying out of the contract. Tenders to be delivered to Lionel Thompson, Secretary, Thurloe House, Worthing.

June 28. **DEVIZES (Wilts.).**—(See "Building.")

June 28. **LONDON, W.**—Reconstruction of a footbridge, etc., at Hammersmith Station, for the Joint Committee of the Great Western and Metropolitan railways. Plans and specification may be seen, and forms of tender and bills of quantities obtained, at the office of the Engineer at Paddington Station. Tenders must be addressed to H. Townsend, secretary to the Hammersmith and City Railway Joint Committee, Paddington Station, London.

June 29. **OLDHAM.**—Construction of a concrete gasholder tank, 212 feet diameter by 41 feet deep, adjoining their Hollinwood gas station, for the Corporation Gas Committee. Copies of specification and drawings can be obtained on application at the Gas Offices, Greaves Street, Oldham, on deposit of £2 2s.

June 29. **SALTASH (Cornwall).**—Construction of a steam ferry bridge, to run on chains across the river Tamar at Saltash passage, for the Saltash Corporation. Plans and specifications of the bridge may be obtained from Fred Et. Cleverton, town clerk, Saltash. The bridge is to be delivered on chains at Saltash within twelve months of the signing of the contract. Tenders to be sent to the Town Clerk.

June 29. **HOPE (Derbyshire).**—Construction of a concrete service reservoir and the providing, laying, and jointing of about 7,560 lineal yards of 4in. and 600 lineal yards of 3in. diameter, turned and bored spigot and socket cast-iron pipes, together with all necessary valves, hydrants, intake tank, and other works connected therewith at Hope, Derbyshire, for the Chapel-en-le-Frith R.D.C. Drawings may be seen, specification, bill of quantities, form of tender, key plan of the district, and other information can be obtained on application to Brady and Partington, engineers to the Council, Town Hall, Chapel-en-le-Frith, via Stockport, on deposit of £2 2s. Tenders to be delivered to J. B. Boycott, Clerk to the Council.

July 1. **MAYFIELDS (Staffs.).**—Sinking a borehole of about 6in. internal diameter to such depth as may be found necessary to obtain water at Slack Lane, Mayfield, near Ashbourne, and also for making a 14-days' continuous pumping test to ascertain the yield of water, for the R.D.C. A copy of specification may be obtained on application to Luther Adams, surveyor, Stanton, near Ashbourne. Tenders must be sent addressed to the Clerk, Mayfield R.D.C., Ashbourne.

July 4. **DUBLIN.**—Construction and erection of twin Scherzer rolling lift bridges across the entrance to the Royal Canal, North Wall Quay, Dublin, for the Port and Docks Board. Specification and drawings can be seen at the office of the Engineer of the Board, John P. Griffith, M.Inst.C.E., East Wall, Dublin, from whom any further information required can be obtained. If on examination of the specification and drawings, intending contractors should desire to obtain copies, these, together with the special printed form of tender, can be obtained on deposit of £5. Contractors are required to state whether they have constructed Scherzer rolling lift bridges, or other opening bridges, and to give full particulars of such works and the names of engineers under whom these were carried out, and to whom reference may be made. Tenders must be on the special form, and addressed to the Secretary, Port and Docks Office, Westmoreland Street, Dublin.

July 5. **MANCHESTER.**—Manufacture, delivery, and in some cases the transport and erection of the steelwork and ironwork required for nine bridges and one subway on the Aqueduct between Walkden and Audenshaw, the weight being about 700 tons, for the Corporation Waterworks Committee. Specification and form of tender may be obtained on application to G. H. Hill and Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque for £2 2s. as deposit. Tenders, addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

July 7. **SOUTHEND-ON-SEA.**—Extension of Southchurch Esplanade, for the Corporation. The esplanade will be approximately 1,260 feet in length, 69 feet in width, and will be protected by an apron wall. Copy of the general conditions, specification, and duplicate copies of the bill of quantities and form of tender may be obtained and plans inspected on application to Ernest J. Elford, M.Inst.M.E., borough engineer, Municipal Buildings, Southend-on-Sea, on deposit of £5 5s. Tenders to be delivered to H. J. Worwood, town clerk, Town Clerk's Office, Southend-on-Sea.

July 16. **BURNLEY.**—Construction of an impounding reservoir, with catch-waters, aqueducts, meter houses, etc., at Hurstwood, near Burnley, for the Burnley Corporation. Plans may be seen, and specification, schedule of prices, form of tender, and all other particulars obtained on application to J. Diggle and Son, engineers, 14, Victoria Street, Westminster, S.W., and Hind Hill Street, Heywood, Lancashire, on deposit of £5. Tenders must be sent to Peregrine Thomas, town clerk, Town Hall, Burnley.

(*Contracts continued on page xvi.*)

Reinforced Concrete

Leslie's Patent System

FOR

PUBLIC BUILDINGS, FACTORIES, SILOS
FOUNDATIONS, BRIDGES RESERVOIRS,
AQUEDUCTS, SEWERS, PILES, WHARVES.

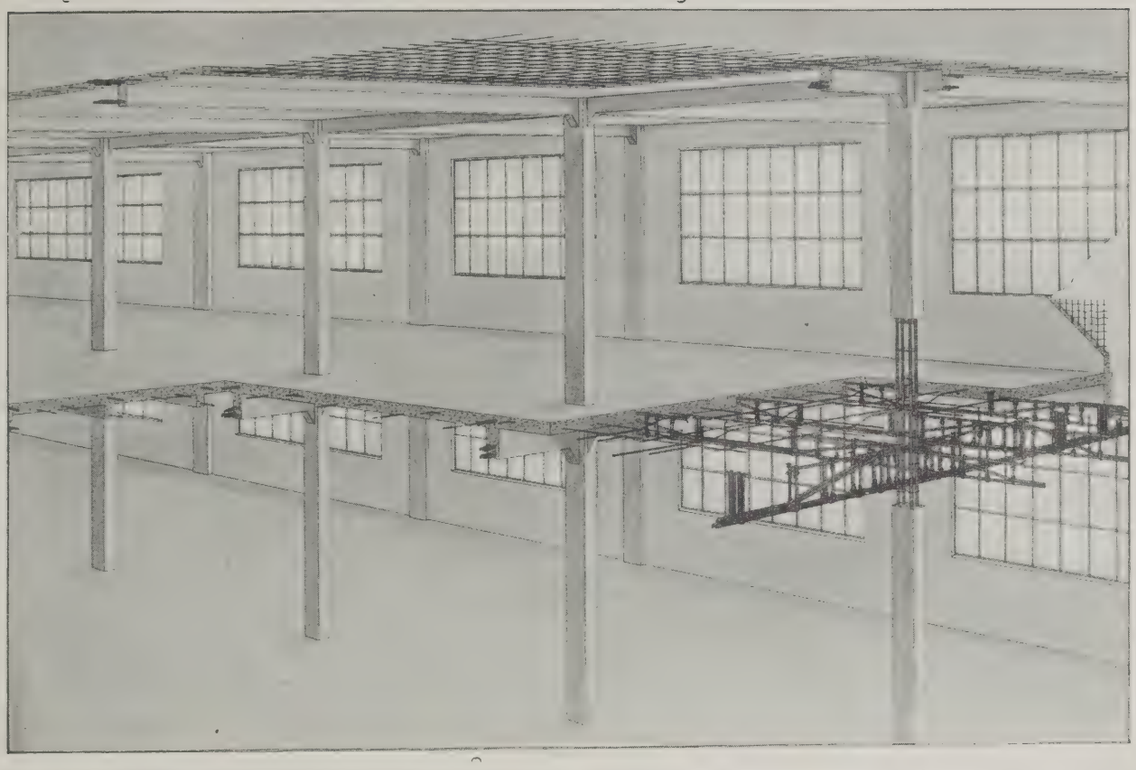

Diagram showing the application of the Leslie System to a building now in course of construction.

Leslie's Patent System

possesses the following advantages :—

1. Rigid Stirrups.
2. Stirrups any length and varied spacing.
3. Complete truss action in Beams.
4. No loose members.
5. Al members completely framed as Units.
6. Exactitude of disposition.
7. No risk of members being displaced.
8. Elimination of Errors in workmanship
9. Formed from ordinary standard sections of steel.
10. Fire-resistance.
11. Economy of material and labour.

Special Treatise on Reinforced Concrete

will be sent to Architects and Contractors FREE on application.

EFFICIENT CONSTRUCTION GUARANTEED.

LESLIE & COMPANY, Ltd.,

General and Specialist Contractors to Government Departments, Public Authorities, Railway and Dock Companies, etc.

KENSINGTON SQUARE, LONDON, W.

Telephones : 1257 and 1258 KENSINGTON.

SANITARY ENGINEERING.

June 28. **LEYTON.**—(See "Building.")

June 28. **WINTERTON.**—Construction of a new sewer for Earlsgate in the U.D. of Winterton, together with the manholes, vent shafts, and other works, for the U.D.C. Tenders to be addressed to Norman Gibson, Clerk to the Council, South Street, Winterton. Plans and specifications may be seen and tender forms obtained at the office of Alexander M. Cobban, 12. Home Street, Scunthorpe.

June 29. **SOUTH NORMANTON.**—Laying about 260 yards of 6in. and 9in. stoneware pipe sewers, together with manholes; also the construction of small sewage tanks, percolating beds, and incidental works at Berristow Row, South Normanton, for the Blackwell R.D.C. Drawings, etc., may be seen, and full particulars obtained, at the office of the district surveyor, Henry Silcock, 67, Westgate, Mansfield, on deposit of £1.

June 29. **PATELEY BRIDGE.**—Shaw Mills sewerage scheme.—Providing and laying about 840 lineal yards of 9in. and 6in. earthenware pipe sewers, together with the necessary manholes, etc., also for the construction of sewage disposal works, consisting of detritus tank, storm water tank, open septic tank, percolating filter, and all contingent works, for the R.D.C. Plans and specification may be inspected at the offices of the Engineers, Spinks, Pilling, and Rodwell, 20, Park Row, Leeds, from whom bills of quantities and form of tender may be obtained on deposit of £1 1s. Tenders must be delivered to W. Oddie, Clerk to the Council, Pateley Bridge.

June 30. **CROMPTON.**—Construction of extensions to their sewage works at New Hey, for the U.D.C., comprising the following:—Contract 1.—(a) 12 precipitation tanks, with channels, valve pipes, sluices, and other appurtenant works; (b) first and second contract bateria beds, about 1½ acres in extent, with filter area for supernatant water, and all appurtenant works; (c) detritus tanks, screening chambers, storm-water overflow chamber, with necessary channels, etc; (d) valves, screens, penstocks, lime mixer, oil engines, and machinery, etc. Contract No. 2.—(a) Dynamos and electrical equipment for lighting new and present buildings, with motors for driving machinery, standards, wiring, lamps, etc., complete; (b) alterations to present buildings, with cast-iron overhead tank, and all requisite sewer diversions, channels, etc. Drawings, specifications and general conditions of contract may be seen, and bills of quantities obtained, on application to J. P. Wilkinson and Son, Civil Engineers, 301, Cathedral Street, Manchester, and on deposit of a crossed cheque, value £5 5s. Tenders to be addressed to the Clerk to the Council, Town Hall, Shaw, Oldham.

July 1. **LONDON, N.**—(See "Building.")

July 1. **HANDFORTH.**—Construction of about 2,280 yards of earthenware pipe sewers, of 15in., 12in., and 9in. diameter, with manholes, flushing chambers, ventilators, etc., and also for the construction of sewage tanks, the laying-out and draining of certain land, etc., for the purposes of sewage disposal. Plans may be seen and copies of the specification and quantities obtained on application to Herbert Worsley, Clerk to the Council, 36, St. Petersgate, Stockport, on the deposit of £5 5s. Tenders must be sent to the above.

July 7. **LYMINGTON.**—Cleansing of the outfall sewer on the Mudlands outside Lymington for the T.C. Specifications may be seen at the office of J. Davis Rawlins, Town Clerk, 38, High Street, Lymington, and it will be desirable for persons tendering to inspect the outfall. Tenders should be sent to the above.

IRON AND STEEL.

June 28. **LONDON.**—Supply of about 120 tons of steel bridge girders and other iron and steel work of British manufacture, for the Directors of the G.W.R. Plans and specification may be seen and forms of tender and bills of quantities obtained at the Office of the Engineer, at Paddington Station. Tenders must be addressed to G. K. Mills, Secretary, Paddington Station, London.

July 4. **DUBLIN.**—(See "Engineering.")

July 4. **NOTTINGHAM.**—Supply and delivery at Nottingham of 400 tons of steel rails of the British Standard Section No. 4, for the Tramways Committee of the Corporation. Drawings may be seen, and copies of the specification and form of tender obtained, on applying to Arthur Brown, M.InstC.E., City Engineer, Nottingham, on deposit of £1 1s. Tenders to be delivered to J. A. H. Green, Town Clerk, Guildhall, Nottingham. Fair wages clause.

PAINTING.

June 25. **EVESHAM.**—(See "Building.")

June 27. **STOCKTON-ON-TEES.**—Painting at the Borough Hall and Town Hall. For particulars apply at the Borough Engineer's Office, Town Hall. Tenders to be sent to Arthur B. Crosby, Town Clerk, Borough Hall, Stockton-on-Tees.

June 27. **CROOKSTON (Govan).**—External painter work to be done at Hawkhead Asylum, Crookston, for the Govan Lunacy Board. Schedules of quantities, etc., may be obtained on application to John Mitchell, Clerk, 7-8, Carlton Place, Glasgow, with whom offers are to be lodged.

June 27. **LIVERPOOL.**—Painting required at their Cottage Homes Institution, at Olive Mount, Wavertree, for the Select Vestry of the Parish, according to a specification which may be seen at the office of H. J. Hagger, Vestry Clerk, Parish Offices, Brownlow Hill, Liverpool, to whom tenders must be sent.

June 27. **CLECKHEATON.**—Painter's and decorators' work required to be done at the town hall, for the L.D.C., in accordance with specification prepared by their surveyor, which may be inspected at his office, Town Hall, and where form of tender and any further particulars may be obtained. Tenders must be sent to John H. Linfield, clerk, Town Hall, Cleckheaton.

June 28. **EDINBURGH.**—Painter work at various schools for the School Board. Specifications may be obtained at the Board offices, Castle Terrace. Tenders must be lodged with J. W. Peck, Clerk to the Board, School Board offices, Castle Terrace, Edinburgh.

June 28. **LONDON, W.C.**—Cleaning and painting their offices, 15, Henrietta Street, and 29, Maiden Lane, Covent Garden, for the Guardians of the Strand Union. A copy of the specification and form of tender can be obtained of the Guardians' architect, A. A. Kekwick, 12, Norfolk Street, Strand, on depositing £2 2s. in cash. Tenders are to be delivered at 15, Henrietta Street, Covent Garden. The party whose tender is accepted will be required to enter into a bond with two approved sureties for the due performance of the contract.

June 29. **WEST HARTLEPOOL.**—Painting, etc., at the public library, in accordance with the specification to be seen at the office of Nelson F. Dennis, M.Inst.C.E., Borough Engineer and Surveyor, Municipal Buildings. Tenders are to be addressed to the Chairman of the Public Library Committee, and delivered at the Town Clerk's Office, 78, Church Street.

June 29. **WOOLWICH.**—Painting and certain repairs at the Town Hall, Wellington Street, for the B.C. Copies of the specification and form of tender may be obtained at the office of J. Rush Dixon, M.Inst.C.E., borough engineer, Town Hall, Woolwich. Tenders must be sent to Arthur B. Bryceson, Town Clerk, Town Hall, Woolwich. Fair wages clause.

June 30. **LLANFYLLAN (Wales).**—Whitewashing and colouring the Union Workhouse. Specification may be inspected at the clerk's office at Llanfyllin. Tenders should be sent to T. Edwards, Clerk to the Guardians.

June 30. **CLARACH (Wales).**—Repairs, painting, and colouring of the Congregational Chapel, for the Trustees. Tenders can be sent in separately if desired, and should be forwarded to Griffith Jones, Nantllan, Clarach, Aberystwyth. The specifications may be seen at the Chapel House.

June 30. **LONDON,** S.W.—(a) Painting works, etc., at the Infirmary; (b) painting works, etc., at the Intermediate School, for the Guardians of the Wandsworth Union. Forms of specification and tender can be obtained upon application at the office of F. W. Piper, clerk, Union Offices, St. John's Hill, S.W., to whom the respective tenders must be sent.

June 30. **SHREWSBURY.**—Paint, colour, etc., the interior of the Board Room, offices, etc., and the exterior wood and iron work of the cemetery buildings, for the Cemetery Committee. Specification may be seen and printed form of tender obtained at the office of W. Chappel Eddowes, borough surveyor, Borough Surveyor's Office, The Square. Tenders to be sent to the Town Clerk, Guildhall.

July 1. **BIRSTALL (Yorks.).**—Painting Prospect Mill—ironwork with red oxide, woodwork with white lead and oil. Apply to Taylor Yeilding, Birstall.

July 6. **CHIPPING ONGAR (Essex).**—(See "Building.").

July 6. **LONDON N.E.**—Cleansing various wards, etc., at their Infirmary, High Street, Homerton, N.E., for the Hackney Guardians. Specifications, conditions of contract, and forms of tender can be obtained at the Guardians' offices, Sidney Road, Homerton. The contractor will be required to give approved security in a bond, the form of which may be seen at the Guardians' offices. Tenders must be delivered to Frank R. Coles, Clerk to the Guardians.

No date. **HOWDENDYKE.**—Painting the outside woodwork of the Steam Packet Inn, Howdendyke.—Apply to J. Wilson, Proprietor.

No date. **ASPULL.**—Cleaning, painting, etc., as follows, viz:—1st, iron fencing on road side near Springs Bridge; 2nd, the iron work underneath Springs Bridge; 3rd, tramway shelter near Finger Post; 4th, the wood finger post. Particulars can be obtained on application to L. Athron, Clerk, Council Offices, Aspull.

ROADS AND CARTAGE.

June 25. **LEWES.**—Supply of 600 tons of 2in. broken granite, 150 tons of coarse granite screenings, and 500 tons of broken surface picked flints, for the T.C. Forms of tender, etc., may be had, and further information obtained, at the Borough Surveyor's Office, Town Hall, Lewes.

June 27. **WHITSTABLE.**—Supply of 835 yards broken pit flints that will pass through a 2½ ring; 120 yards hoggin; 130 yards Thames ballast; 110 tons of ⅜in. granite chippings and dust; 60 tons of best Portland cement for the Tankerton Estate, Limited. Tenders to be addressed to the Tankerton Estate Office, Whitstable.

June 27. **STRATFORD-UPON-AVON.**—Supply of broken and unbroken road macadam required for the maintenance of the borough roads during ensuing year, for the T.C., according to specification to be obtained, together with form of tender, on application to Roden Dixon, C.E., borough surveyor, Municipal Offices, Stratford-upon-Avon. Tenders to be lodged with the Borough Surveyor.

June 28. **SOYLAND (Yorks.).**—Supply of about 635 tons of granite macadam, 2in. gauge, delivered at Ripponden or Rishworth Railway Station (L. and Y. Railway) in such quantities and at such times as required, for the Soyland U.D.C. Tenders to be sent to L. H. Longbotham, clerk, Council Offices, 4, Carlton Street, Halifax

June 28. **LONDON, N.W.**—Relaying of 3,336 yards super. or thereabouts of wood paving in Cambridge Road and Cambridge Gardens, Kilburn, for the Willesden District Council. Plan and specification may be seen, and all further particulars obtained, upon application to O. Claude Robson, M.Inst.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W. Tenders to be delivered at the offices of the Council. A £10 Bank of England note to be deposited with each Tender under separate cover.

June 28. **LONDON, S.E.**—Kerbing, channelling, and metalling the roadways and paving the footpaths with artificial stone (in separate contracts) of Springrice Road, Lewisham, for the B.C. Plan and specification may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). Copies of the specification may also be had on payment of 5s. in each case, which will not be returned. Tenders must be delivered at the Town Hall, Catford, and placed in the box there provided for the purpose. The works are to be proceeded with immediately on acceptance of tender and execution of contract, and the contractor must employ local labour as far as practicable in carrying out the work. Rate of wages and hours of labour clause to be observed.

June 29. **BOLLINGTON.**—Supply of about 300 tons of Welsh granite macadam for the U.D.C. Particulars may be obtained from Samuel Knight, clerk, Council Offices, Bollington, near Macclesfield.

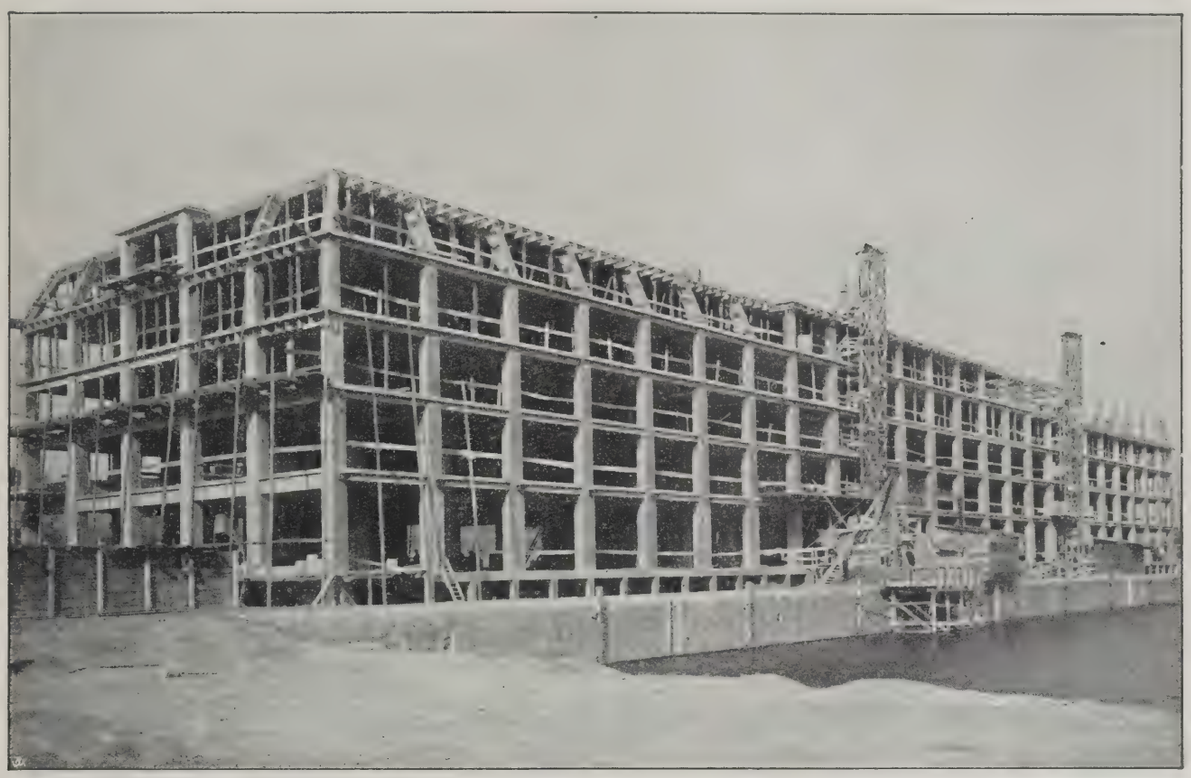
June 29. **LLANTRISANT.**—Construction of a new road, from Penygarreg to Gwernleuci, in the parish of Llantrisant, for the R.D.C. Plans, etc., may be seen, and quantities and forms obtained, from Thomas Saunders, Surveyor, School Street, Pontyclun, Glam., upon deposit of £5

June 29. **BRAINTREE.**—Supply and delivery at Braintree Railway Station of 600 tons (more or less) of 2in. granite; and for the use of a steam roller and scarifier, for the U.D.C. Forms of tender may be obtained on application to H. H. Nankivell, Surveyor, Vestry Hall, Braintree. Tenders to be delivered to Herbert J. Cunnington, Clerk.

June 29. **BEDFORD.**—New paving works required in St. Paul's Square, Bedford. Drawings and specifications can be seen, and copies of bills of quantities, forms of tender, and all information obtained upon application to N. Greenshields, A.M.I.C.E., Borough Engineer and Surveyor, Town Hall, Bedford. Tenders must be addressed to Harry Smith, Deputy Town Clerk, Town Hall, Bedford.

June 30. **SURBITON.**—Street improvement works at Tolworth Road, for the U.D.C. Drawings, etc., can be seen at the office of Henry T. Mather, engineer and surveyor, Council Offices, Ewell Road, Surbiton, and a copy of the specification obtained between 10 a.m. and 1 p.m. Tenders must be delivered at the Council Offices. A deposit of £1 1s. must be made.

July 4. **EAST DEREHAM.**—Supply of 350 tons (more or less) of 2½in. broken granite, and 350 tons (more or less) of 1½in. broken granite, to be delivered free at the East Dereham Station of the Great Eastern Railway Company before the end of November, 1910, for the U.D.C. Forms of tender may be obtained on forwarding a stamped addressed foolscap envelope to the surveyor, H. G. Himson, Theatre Street, East Dereham. Tenders to be sent to B. H. Vores, clerk to the Council.



July 5. **FEATHERSTONE (Yorks.).**—Street works in Albert Street, Post Office Road (part of), Newport Terrace, Wilson Street, and Whiteley Street, within their district, which include kerbing, flagging, channelling, macadamizing, etc., for the U.D.C. The plans may be inspected, and copies of the specification, bill of quantities, form of tender, and general conditions obtained, on application to Samuel Chesney, engineer and surveyor, Council Offices, Featherstone. Applications must be accompanied by a deposit of £1. A fair wages clause will be inserted in the contract. Tenders, together with the priced quantities, must be received by J. A. Haigh, clerk, Council Offices, Featherstone.

The QUALITY
of the
'KOH-I-NOOR.'

If there is one thing that the 'Koh-I-Noor' Pencil is inseparably associated with, it is QUALITY. At first men thought that 4d. was too much to pay for a black-lead pencil—until they tried the 'Koh-I-Noor' Quality. After that they needed no further persuasion to buy, in fact, it sometimes proved difficult to cope with their demands for the 'Koh-I-Noor.' Nothing but 'Koh-I-Noor' would suffice.

If you are one of those who still think that 4d. is a stiff price to pay for a pencil, an experiment will only cost you 4d. It won't be a costly experiment either, seeing that one 'Koh-I-Noor' outlasts SIX ordinary pencils. And then—the luxury of writing with such a magnificently-made pencil! You cannot know what it means until you try 'Koh-I-Noor' Quality. And you will never go back when you do know.

Made in 17 degrees from the hardness of a stylo to the softness of a crayon. One to suit every pencil purpose.

'Koh-I-Noor' Pencils are 4d. each or 3s. 6d. per dozen. Of Stationers, &c. Illustrated particulars free for the asking from L. & C. Hardtmuth, 12, Golden Lane, London, E.C. (Paris, Vienna, Dresden, Milan, Brussels, New York).

What Can Examination Do?

THE Institute of Architects last week was in the somewhat singular position of presenting its gold medal to an English architect who was not a member of that body, and who disapproved of an important part of its policy, and took the opportunity of saying so. While he was touched, he said, by receiving the highest distinction of a Society of which he was not a member, he still remained a hardened unbeliever in the possibility of discovering an artist by the process of examination; an expression which, of course, was intended as a condemnation of the Institute's "Preliminary," "Intermediate," and "Final" Examinations, and its admission of Associates to its ranks as a result of these examinations.

Now, what are the reasonable objects of examinations in architecture, and the advantages to be gained by them? The first of all, perhaps, is that the process of working up for an examination marks out for a student a special course of study—a very important point with a subject so diverse and complicated as architecture. A young man entering, without any special guidance, on the study of architecture, is liable to be almost bewildered by the number of subjects which are more or less closely connected with it; the history of the art, the mastery of planning, the various practical subjects which are connected with modern building, etc. A programme for examination, drawn up by men of experience, furnishes him with a lead, classifies the studies to be undertaken, and gives something definite to work up to. At the time when the question of examinations was being much canvassed and argued about, for and against, we remember seeing a letter from a young student, testifying that the programme of the Institute examination, a new thing at that time, was really the first assistance he had ever had towards the pursuance of a distinctly marked line of study, and it had been of incalculable advantage to him, as we have no doubt it has been to many others. That is one point.

The first step towards acquiring the power of designing modern architecture is a knowledge of the art as it already exists, of its various forms and traditions, acquired by a study of the principal architectural styles of the past. This, we know, is denied by some, who argue that this study of past styles is what leads to archæological architecture, and that it would be better for a beginner in the practice of modern architecture to be left to evolve his own design based on the practical requirements of each building. It might almost as well be said that a modern poet should be unacquainted with the poetic literature of the past, in order to ensure his originality. How is he then to test and train his own perception of style? It is the same with architecture. Architecture is a traditional art; every great building in the world has been influenced by buildings which have preceded it; and no one mind has the originating power to evolve a style of architecture with no basis of precedent to go upon. Then there is the training of the eye and the taste to be considered, an end which can only be acquired by the study of the finest examples of architectural style and proportion. The Intermediate examination of the Institute demands, as the first requirements in its programme, the production of two sheets of careful drawings of any two out of three Orders of classic architecture mentioned, and a sheet of details of classic ornament from the round. While mentioning the subject, we may add that in mentioning "Doric" it should specify whether Greek or Roman Doric, or give the preference to the former, which affords the far finer training to the eye and mind. But to return: Is it intended by this that the student should necessarily contemplate introducing these Orders or this classic ornament into his own work as a practising architect? Surely not; the Classic Orders are put down for study because they (the Greek ones especially) are the best examples of refinement in detail, profile, and proportion of parts, and therefore the best studies for fostering a refined perception in such matters; to borrow Steele's expression, "to know them is a liberal education." We know how painfully architects are often struck by the coarseness of the details which engineers put into their masonry when they begin to get "architectural"; but why is this? It is not because engineers want to do coarse architectural detail; it is that they do not *know* that it is coarse, because their eye has never been trained by the study and the drawing of classic models. If engineers who design bridges and railway stations had all been compelled to go through a study of the Greek Orders (only) as a portion of their education, we should soon see a difference in their architectural details. And besides this, the history of architecture in general, of the changes and developments out of which the leading styles grew into being, is a history of the greatest interest, of which even well-educated people in general know far too little; and who is to be expected to know it, if the architect does not?

As to examination in a practical knowledge of construction, and of the provisions necessary for the scientific heating and ventilation of buildings, we do not gather that the utility of that is contested even by those who object to examination in architecture in a general way. From the Institute point of view, that is a means of ensuring that architects who are admitted to its membership do know that which the public expect them to know, and which at all events can be acquired by anyone who makes up his mind to acquire it, apart from all questions of artistic power in design. And a programme of requirements of this kind in an examination is not only useful as a guide to study, but also as an inducement to young men who are disposed to look too exclusively to the æsthetic side of architecture (as a good many are at present) not to neglect points which are necessary to the safety or comfort of a building, however beautiful its design may be. If some of those who object to examinations in architecture had been compelled to go through an examination in construction, we should not, perhaps, have seen such curious results as the covering of a museum floor with iron columns, because the architect had not realised that a floor some forty-five feet wide could be carried by girders in one span.

A good deal of criticism has been expended on the introduction of an apparently very general examination in history

and geography, and in one foreign language, in the Institute Preliminary examination; and it is complained that these subjects have nothing to do with architecture. We are not so sure of that; but at all events they have to do with securing that an architect who is a member of the Institute should be a fairly well-educated man, a matter which has some bearing on the respect with which the profession will be regarded by the public. The history of architecture is very intimately connected, too, with the history of nations, and cannot be fully understood apart from it. And the knowledge of both French and German is of value to an architect nowadays —many valuable books, both on architectural history and construction are published in Germany, many of which are not translated; and M. Choisy's French books (very little known among English architects) are most valuable additions to an architectural library. And at any rate it is as well that an architect should have more notion of the idiom of our nearest neighbours than to translate "il vient de sortir"—"that comes of going out." Languages, history, etc., are omitted in the Final examination of the Institute, but we are not sure that it would not be well to have an "Honours" examination for such subjects of general education.

Lastly, there comes the great *crux*, the idea of examination in design, which commands a large proportion of the marks in the Final examination, where a design is required to be made on the spot, in two days' work, of a building of moderate dimensions, or a portion of a more important edifice, from particulars given. This is the only point at which examination in design comes in, and the difficulty is that there is no absolute standard of good and bad design. Nor, indeed, is there any absolute test as to which of two plans is the best; and plan is a part of design. As far as convenience of planning is concerned, however, it is pretty easy to decide positively that a plan is a bad one, from the point of view of convenience. It is not so easy to decide which of two plans is the best in regard to architectural effect, or to bring such a question to any decisive test. But we take it that the function of the examiner in this case is mainly a negative one. Examination cannot evolve architectural genius; that may be agreed on all hands. It cannot decide positively which of two designs shows the better artistic character. But it can say, in regard either to plan or design, or both—"We must have something better than this, at all events." And to that length it may have a wholesome preventive and corrective influence. We have seen plans, produced by architects who object to examination on principle, which would infallibly have led to their author being "ploughed" at the Final examination; a result which might have revealed to them some of their own deficiencies.

Corporation Competition.

MR. JUSTICE NEVILLE, in his judgment, given last week in the Chancery Division of the High Court of Justice, in the case of the Attorney-General v. The Corporation of Leicester, decided that the corporation had exceeded its statutory powers with regard to the supply of electricity. The corporation, not content with supplying electric energy, had opened a shop, in one of the principal streets of Leicester, for the supply of electric fittings, and an unnamed ratepayer of the borough set the law in motion with the very laudable object of determining whether or not this enterprise had legal sanction. Mr. Justice Neville made it very clear that in his opinion "the installation of electricity and provision of fittings is a separate business incidental to the use but not to the supply of energy." He therefore granted the declaration and injunction for which the plaintiff applied. Whether the corporation will think it worth while to carry the case further remains to be seen. So far, at all events, they have done the State some service in demonstrating the lengths to which municipal powers can be stretched, and hence the unwisdom of the ratepayers in placing in the hands of a corporation a weapon which may be turned against themselves in a way that possibly was not generally foreseen.

The necessity is now apparent of discriminating between monopoly and competition in municipal undertakings. It may be justifiable, and may even be necessary, to entrust a corporation with certain large undertakings of public and common service—such, for instance, as that of water supply —in which virtually there is, and can be, no competition. Even if it is perhaps best, on the whole, that a monopoly of such a great public service should be entrusted to a corporation rather than be left to private enterprise, over which the public may have no effective control, it is a very different matter to allow a corporation to come into direct competition with the established trades of its ratepayers, as it certainly does when it opens a shop for the sale of small goods, or sends round workmen to do odd jobs. Even when, as must often happen, the corporation is unable to supply the goods, or to do the work so cheaply as can the private tradesman, the latter is nevertheless at a manifest disadvantage.

The Proposed India Museum.

SINCE writing a note on this subject last week, we have had the opportunity of seeing Mr. Chisholm's sketch design for the proposed museum. This is in the quasi-Oriental style which the architect applied very successfully for Government buildings during his professional career in India, and which we thought very well suited to the country, as designs which represented Eastern forms modified by European influence, and designed with reference to the Indian climate. Whether such a style would be equally in place in London may be a question. It has not in this case the justification of climate. Still, if an India Museum is built, it would be fitting that its exterior should suggest India to some extent; but it should not appear too exotic. There is another point in regard to this special building; the proposed site is a parallelogram, with the shorter side to the river, but the principal elevation of the building is on the long side. It would seem, under these conditions of site, that the elevation towards the river should be the most important, as it will be much more seen than the side. The architectural composition includes large and small cupolas of somewhat Oriental character, and a lofty central tower. If the river front were modified so as to give it more importance, the design ought to make an effective group.

Truro Cathedral.

IT is a satisfaction to know that Truro Cathedral is at last completed by the erection of its two western towers. At one time, after the choir had been opened for service, there was some fear lest the completion of the nave, with its western towers, should be adjourned *sine die*, as it was said that all the subscriptions available from the county had been exhausted. The funds, however, have been somehow found, and Truro thus becomes the first Anglican cathedral entirely planned and carried out in this country in modern times. The building of the nave of Bristol, from Street's design, was a remarkable and unprecedented event at the time, furnishing proof that a modern architect could complete a mediæval cathedral in a style entirely worthy of the ancient portion of the building; and as this was not the "restoration" of any ancient work, but the addition of a necessary portion of the building which was not in existence, we do not see how the most determined anti-restorationist could have grounds for criticising it. The nave formed part of an incomplete design, and to have built in a modern style to give testimony to its date would have been an architectural absurdity. In the case of Truro Cathedral the architect was to erect an entirely new church, and the question might well then be raised, and, we think, was raised at the time, whether a cathedral commenced in the nineteenth century should adopt the style of the thirteenth or fourteenth. We should have been inclined to think that it ought not to do so; that

it should be frankly a modern church in a modern style; but it is certain that this would not have met the sentiment of those who promoted the work and collected the money for it. They associate a certain style of architecture with the idea of an English cathedral, and association must count for something. One thing is certain, that if the object was to revive the style of the mediæval cathedral, this could not have been better done than in the interior of Truro; it is almost, one may say, more mediæval than an actual mediæval building, in all the treatment of its detail, even to spacing the corbels under the floor of the central tower at unequal distances, which a mediæval builder would not necessarily have done. There are special points in the building, too, which are original; notably, the two lofty windows, one on each side of the chancel, which throw a flood of light across this part of the building. Externally there is a little more modernity in the building; it is mediæval on Pearsonesque lines. The architect judged rightly in adopting the composition of a centre tower with two western towers, a form of cathedral design peculiarly English; the French suggested the twin towers, but the dominant central tower is a peculiarly English feature, and one the typical French cathedral loses very much by wanting.

The R.I.B.A. Gold Medal.

MR. THOMAS GRAHAM JACKSON, R.A., received on Monday week, at the Royal Institute of British Architects, Conduit Street, the Royal Gold Medal. Among the company present were: Sir Lawrence Alma-Tadema, O.M., R.A., Sir Henry Tanner, Sir Charles Lawes-Wittewronge, Sir Brumwell Thomas, Sir Aston Webb, R.A., the Provost of Eton (Dr. Warre), the Warden of Wadham College, Mr. Thomas Brock, R.A., Mr. John S. Sargent, R.A., Mr. Reginald Blomfield, A.R.A., Professor Waldstein, Mr. Basil H. Jackson, and Mr. Ian MacAlister (Secretary).

Mr. Ernest George, A.R.A., President, in making the presentation, spoke of Mr. Jackson as an accomplished architect and man of letters. Upon finishing his University course Mr. Jackson became a pupil of Sir Gilbert Scott. Beginning his career in the heat of the Gothic revival, he had acquired a knowledge of the mediæval methods of building which had served him well, for the Gothic inspiration is felt in most of his works, though they may be clothed with forms or detail of other origin. He was an artist of strong individuality, with an intimate and practical knowledge of material, and he had helped much to bring together the several arts, and was some time Master of the Art Workers' Guild. His name will always be associated with Oxford, where the modern growth of the city has been generally under wise direction, the spirit of the old being preserved, while there is freshness, originality, and beauty, in the new. To him they owed modern buildings for Brasenose, Lincoln, Corpus, Trinity, Balliol, and Hertford; the new Radcliffe Library, Somerville Hall, the City High School, and the High School for Girls; also the restorations of the Bodleian Library, St. Mary's and All Saints' Churches. At Cambridge they owed to him the new Law Library and Law School, as well as the Sedgwick Memorial Museum and other buildings. To the same hands they owed the restoration of many precious relics—Eltham Palace, Great Malvern Priory, Bath Abbey, Christchurch Priory, and the anxious work of maintaining Winchester Cathedral against the threatening of underground forces. He had studied Romanesque in its home, and the Dalmatians sought his help in the building of the campanile of their cathedral at Zara. He had been a valued member of the Board of Architectural Education, and he had a grand record of scholastic work, which at the same time was scholarly work, and would always be honourably associated with the name of Thomas Graham Jackson.

Mr. Jackson, having been invested with the blue riband, replied that he was deeply sensible of the honour conferred upon him. To an artist no appreciation could be so welcome as that of his brother artists. They lived, indeed, by the patronage of the public, who on the whole were able to form a right estimate of the merits of those whom they employed, but who were perhaps too liable to be influenced by fashion and blind obedience to be always right at the moment. But it was to the judgment of those who followed the same craft as himself that the artist looked for due appreciation of his work. He was deeply touched by the fact that they had bestowed their highest distinction on one who was not a member of their society, but one who at times had been even an opponent of their policy—an opposition that had never caused interruption of friendly relations between them.

On the motion of Mr. John Slater, seconded by Sir Aston Webb, R.A., the president was thanked for his services during the past two years.

House of Lords Decision Under the Compensation Act.

A POINT of considerable importance to employers, with respect to the Workmen's Compensation Act, was determined in the House of Lords, recently, in the appeal of Vickers, Sons, and Maxim, Ltd., v. Evans, in which the application of Section 16 of the First Schedule of the Act of 1906 was tested. In that section, power is given to the arbitrator, in the event of a review taking place more than twelve months after the accident, the applicant for compensation having by that time ceased to be a minor, to increase the compensation to any amount not exceeding fifty per cent. of the weekly sum which the workman would probably have been earning at the date of the review, but for the accident, but not in any case exceeding £1. The appellant, while still a minor, in July, 1907, obtained employment with the defendants as a labourer, as he was short of work in his own trade of stove-grate fitter. While working for Messrs. Vickers, Sons, and Maxim, he met with an accident to his right arm, and was awarded 11s. 4d. a week compensation. In February, 1909, he was able to do light work found for him by the company at the same rate of wages as he had received before the accident, and the compensation was thereupon reduced to one penny per week. In August of the same year, the applicant, having attained his majority, applied for a review of the award, claiming that but for the accident he would have been earning more than the old rate of wages. The county court judge at Sheffield then found that as a stove-fitter the applicant would have been able to earn 30s. a week. He therefore increased the 1d. per week to 7s. 6d. until further review. This judgment was upheld by a majority of the Court of Appeal, in which Lord Justice Buckley dissented from the Master of the Rolls, and Lord Justice Moulton. In the House of Lords, the Lord Chancellor, Lord Macnaghten, Lord James of Hereford, and Lord Collins agreed that the appeal should be dismissed; Lord Macnaghten expressing approval of the method adopted in the Act in trusting to the discretion and good sense of the county court judge to fix a proper amount with relation to the probable earnings of the applicant after he had come of age, supposing he had not been prevented by the accident. This decision of the House of Lords will be regarded by builders as adding yet another to the already too heavy burden of risks under the Compensation Act. The boy whose accident affects his earning capacity after he has become a man may demand increased compensation when he attains his majority. Apparently, in the case of the building trades, the amount of the revised compensation will be based on the easily ascertained rates of wages agreed upon between the respective organisations of the masters and the men; and the knowledge of this extended liability will not tend to the increased employment of boys, while it rather seems to add to the complexity and vexatiousness of the apprenticeship question.

NOTES AND NEWS.

A Twelfth Century Triptych.

A valuable and interesting work of art has recently been placed on exhibition in the Mediæval Room of the British Museum by the kindness of Mr. J. Pierpont Morgan, who has lent it to the Museum. It consists of a triptych made about 1180 A.D., and containing relics of the true Cross mounted on enamelled adjuncts by Godefroi de Claire. This triptych was made for Wibald, a famous Abbot of Stavelot, a great monastery in the Ardennes. During the Napoleonic wars the triptych was carried by the then Abbot into Germany, where it lay until its acquisition a few months ago by a London dealer, who sold it to Mr. Morgan. There are represented upon it two series of subjects—on the one side the conversion of the Emperor Constantine, and on the other the story of the "invention of the Cross" by the Empress Helena. Wibald, who died in 1185, was counsellor of the German Emperors of his time. The enamel upon the triptych comprises probably the finest pieces known of the kind of enamel made on the Meuse in the twelfth century.

Artesian Wells in the City of London.

The revised charges for water instituted by the Metropolitan Water Board have led to the sinking of a large number of artesian wells within the city boundaries. Between 1836 and 1907 fourteen wells were sunk, but since 1907 as many as 22 have been put down, making 36 in all. The Public Analyst reported that the waters were highly pure and soft, but somewhat saline, and are better for domestic purposes than those of the Water Board. As an example of the saving effected by well-sinking, the case of an hotel is mentioned paying £900 a year in water-rate. An artesian well was installed at a cost of £800, and running expenses amount to £200 a year. Thus a saving has been effected of £700 a year. As, however, the supply is largely tapped by the Water Board before it reaches the City, it is possible that the supply will ultimately be affected, and there is thus an element of speculation in well sinking.

The Land of the Incas.

Sir Clements Markham, lecturing on the above subject before the Royal Geographical Society, dealt with a map covering Southern Peru, and part of the north of Bolivia, including the vast forest region to the east, most of which has recently been explored. This land was formerly the country of the Incas. Near the southern shores of Lake Titicaca, there were the ruins of a great city. In the time of the Incas it was the same ruin as now. Its origin and history were absolutely unknown, and myths were invented to account for the numerous stone statues. The ruins showed very advanced proficiency in the masonic art, and there were monoliths which had been conveyed from great distances. The size of those cut and carved stones was unequalled in any other part of the world except Egypt. To archæologists the map would be very serviceable, as it included the sites of 18 ancient ruins of Incarial or pre-Incarial times.

Quarry-Dressed Stone.

The question of quarry-dressed stone is a source of frequent trouble, but does not always assume such complexity as a case that is reported from the North. A builder had tendered for a certain building contract, at a price that admitted of the stone being dressed on the job. The "building owners," however, who happened to be a church council, had ascertained that the stone would be cheaper if dressed at the quarry, and they demanded a consequent reduction. The stone was then brought to the job ready dressed. This the workmen refused to stand, as it is a breach of the working rules that have been agreed upon between their and the employers' respective organisations. The bricklayers, stonemasons, and joiners have threatened to strike unless the rule is observed, and they are supported by a decision arrived at by the local Conciliation Board. It is stated that the church council have refused to compensate the builder for the increased expenditure which he must now incur; so that, between the building owners and the workmen he is placed in an unenviable position.

The Newest Model Town.

"The model town of the world" is—yet to be built. But "wealthy and philanthropic New York women" are going to build it. In order to make the "grafting" of public officials, and corrupt politics generally, impossible, there will be neither public officials nor politics. "Once a week the residents will meet in the Coliseum and decide on public measures and bring to trial all persons charged with crime, the guilt or innocence of the prisoners to be decided by the vote of the meeting. There will be no public-houses." All this is to happen in Kentucky. The architecture should be of corresponding simplicity, and the design of that Coliseum should be splendidly null in character, considering the miscellaneous uses to which it is likely to be put. But the model moral town should be model (and moral) in its buildings; and if it materialises on these lines, it will be worth a long journey to see.

A Pre-Reformation School of English Sculpture.

An exhibition which has been held during the present month in the rooms of the Society of Antiquaries illustrated a curious phase of English art—that of mediæval alabaster work, an industry that, according to the catalogue, "flourished in England, principally at Nottingham and in Derbyshire, throughout the fourteenth and fifteenth centuries and the earlier half of the sixteenth century." The exhibition reminds a writer in the "Morning Post" that prior to the Reformation there was a living school of English sculpture; and he alleges that some of the finest examples were shipped over to the Continent at the spoliation of the churches in the reign of Edward VI., and now masquerade as the work of French carvers, while many of those that remained were hacked to pieces by the supporters of Cromwell. He adds that "hardly less disastrous must have been the well-intentioned ravages of the Gothic Revival in the nineteenth century, against which Ruskin and Morris inveighed." The compositions vary considerably in artistic merit, some being merely mechanical reproductions of a set pattern or motive, while others are invested with the charm of genuine art. The subjects consist largely of passions, martyrdoms, resurrections, crucifixions, and like subjects. Alabaster continued in use for memorials long after the Reformation, and there are references to it in the Elizabethan dramatists. Webster anticipating the modern dislike of violent and theatrical sculpture.

House Near Farnham, Surrey.

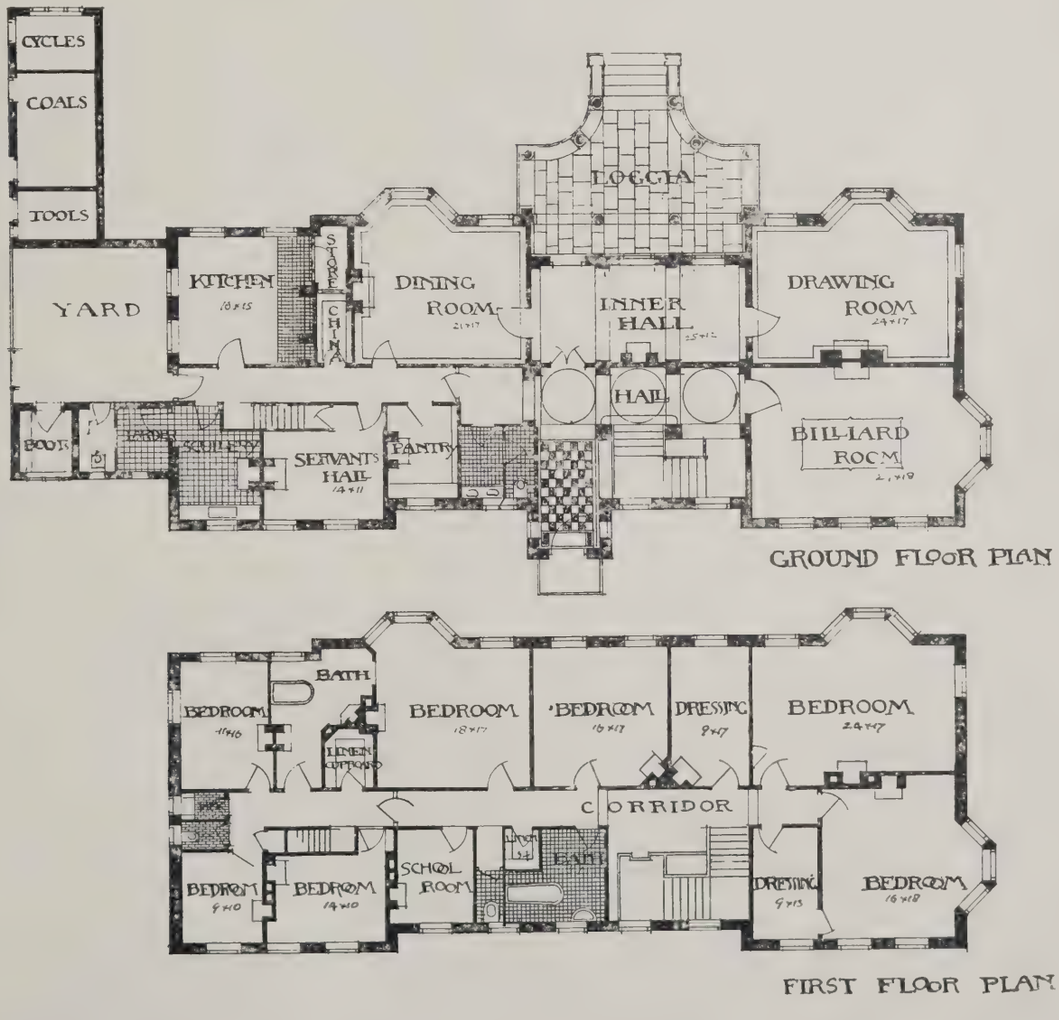
(See pp. 666, 671, 673.)

This house, an example in the modern Georgian manner, is built in red brick, with stone dressings to the porch, brick quoins relieving the surface at the corners of the bay, etc. The windows are of wood painted white. The bricks are 2in., most carefully selected for colour. The result is most subdued; an effect of great quietness was aimed at, and, it is believed, has been attained. The entrance hall and vaulted corridor are simply finished in white, the latter being paved with dark red hexagonal tiles, and the entrance hall has a floor of black and white marble squares. The hall has walls panelled with oak. The inner hall is panelled with basswood stained black, but not sufficiently dark to hide the grain. The ceiling has modelled plaster beams. The fireplaces have a Teale grate with a surround of Medmenham tiles. The drawing-room, to which this forms the lobby, is panelled in pine, painted white, and the dark panelling of the hall acts as a foil. The general contractor was A. G. Marden, of Farnham. The bricks for the south front were supplied by T. B. Lawrence and Sons, of Bracknell. The general contractor carried out all the work, including the panelling, to the satisfaction of the architects. The grates were supplied by the Teale Fireplace Co., of London; G. P. Bankart, of London, executed the modelled plasterwork and the lead rainwater heads. The marble paving was supplied by Art

The entrance hall and vaulted corridor are finished simply in white, the latter being paved with dark red hexagonal tiles, and the entrance hall has a floor of black and white marble squares. The hall has walls panelled in oak.

HOUSE NEAR FARNHAM, SURREY: ENTRANCE HALL AND CORRIDOR.
NIVEN, WIGGLESWORTH, AND FALKNER, ARCHITECTS.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS



Pavements and Decorations, Ltd., London. The sanitary fittings are by Shanks and Co., Ltd.; Messrs Niven, Wigglesworth, and Falkner were the architects.

Brick Court, Temple.

To Sir Aston Webb's several happy adventures in restoration is now added the sympathetic and altogether seemly rebuilding of No. 1, Brick Court, Middle Temple Lane. The old house had to come down because its foundations had suffered in indirect consequence of the borings and tunnellings and artificial earthquakes that have robbed the earth of its natural stability, and the new building has been designed in the true spirit of the old—a simple thing to do, but not every eminent architect would have done it with such unassuming fidelity. Simplicity, however, is the dominant note of the Temple. It is seen not only in its buildings, many of which are plain to ugliness, but in their names, of which the same terms may be used—e.g., Paper Buildings, Pump Court, and Brick Court; blunt and honest names, baldly descriptive, deduced directly from the evidence, and devoid of every vestige of imagination, the Benchers habitually restraining the exuberance of that wayward and unforensic faculty. The Goldsmith house next door was built in 1704, so that it was sixty years old when Oliver Goldsmith, having received five-hundred pounds for "The Good Natured Man," got an unwonted feeling of unlimited wealth, and on the strength of it left his dingy rooms in Garden Court, and took chambers —three rooms on the second floor—in No. 2, Brick Court. He bought the lease for four hundred pounds, and furnished the rooms in sumptuous style, the better to entertain his many friends, not all of whom were of the grave sobriety of Johnson and Reynolds; for Blackstone, in chambers immediately below, complained that the racket made by "his revelling neighbour" did not assist him in the compilation of his commentaries. Ten years—the happiest of his life—were spent by Goldsmith in No. 2, Brick Court, where he died on April 4th, 1774. On the day of his funeral — April 9th — "his staircase in Brick Court was crowded with mourners of all ranks and conditions of life, conspicuous among them being the outcasts of both sexes, who loved and wept for him because of the goodness he had done."

Honours to a Landscape Painter.

It is so common to find art entirely overlooked in the distribution of "birthday honours," that it is a surprise, as well as a pleasure, to find that for once the name of an artist figures in the list, and we may congratulate Sir Alfred East on a distinction that has been well earned, although one may think that there are other painters who have claims to recognition of this kind. It is to be presumed that this is an honour entirely due to the artist's distinction as one of our finest landscape painters. The majority of the honours conferred are obviously—somewhat too obviously—recognitions of political services or leanings; but we are not aware that Sir Alfred East's landscapes have so far exhibited any tendencies towards a symbolical support of Liberal principles.

HOUSE NEAR FARNHAM, SURREY: PLANS. NIVEN, WIGGLESWORTH, AND FALKNER, ARCHITECTS.

NEWS IN BRIEF.

At an Executive meeting of the York Master Builders' and Contractors' Association, held recently, it was carried unanimously: "That the best congratulations of this Association be offered to our President (the Right Hon. the Lord Mayor of York, Alderman James Birch) on his attaining the honour of the Freedom of the City of London successively to his recent reception of the Freedom of the Worshipful Company of Plumbers."

* * *

Mr. Bertram MacKennal, A.R.A., has been appointed to design and model the Coronation medal and the coinage of the new reign. Mr. MacKennal, who is an Australian sculptor, born in Melbourne in 1863, designed and modelled the medals for the Olympic Games of the year before last. He was elected an Associate of the Royal Academy last year, and was the first Colonial who ever achieved that distinction. He is the first Overseas Briton ever called upon to design the English coinage.

* * *

The new electrical laboratory which, at the cost of the Drapers' Company, has been erected on the north side of the Museum of Oxford University, is of stone and red brick, in Renaissance style, and has cost about £23,000. Mr. T. G. Jackson, R.A., is the architect.

* * *

A national committee, of which his Majesty the King, when Prince of Wales, graciously acted as honorary chairman, has been formed under the auspices of the British Empire League, to secure the erection in London of a memorial to Captain Cook. The committee propose that a memorial, by a sculptor of repute, should be erected in the best available position in the centre of London. The First Commissioner of Works has promised his co-operation in the choice of a suitable site. For the purpose a fund of at least £3,000 will be needed. Nearly one-third of this amount has been subscribed by members of the committee.

* * *

The Aberdeen Byron Statue Sub-Committee having received subscriptions amounting to over £900 (£1,000 was the amount desired) have resolved to proceed with the scheme. The statue, which is to be of bronze, and to be erected in the grounds of the Aberdeen Grammar School, has been entrusted to Mr. Pittendrigh Macgillivray, R.S.A.

* * *

A conference took place in Edinburgh recently between representatives of art schools in Scotland to consider the carrying out in the various art centres in Scotland of instruction which would be of special value to those who intend to pursue an architectural career. For some time past efforts have been made in Edinburgh to obtain architectural surveys of the historic buildings of Scotland, and it is thought that by general co-operation amongst the various art schools a good deal more might be done in this direction. Aberdeen would share in any scheme which might be decided upon. The matter will be reported to the Governors of the Technical College.

* * *

We are informed by Messrs. Fredk. Jones and Co., makers of the "Hercules" partitions, etc., that the business hitherto carried on at their several addresses, viz., Perren Street, Kentish Town N.W.; Duncan Street, Salford, Manchester; Hercules Works, Burton-on-Trent; and Slag Wool Works, South Bank, Yorks, under the style of Fredk. Jones and Co., will be known as Fredk. Jones and Co., Ltd., with registered office at Perren Street, Kentish Town, N.W. The business will be carried on under the same management and proprietorship as hitherto, and outstanding liabilities will be met by the new company on the usual monthly pay-day.

* * *

Mr. Edward W. Beeson and Mr. John J. Roth, of the firm of Beeson and Roth, and Mr. Guy Study, architects (U.S.A.), announce that they have formed a partnership under the firm name of Beeson, Roth, and Study, with offices at 1008-1009, Liggett Building, St. Louis, Mo., U.S.A.

* * *

Bournemouth will celebrate its centenary in a series of fêtes lasting from July 6th to July 16th. A hundred years ago it consisted of a single house, and now has seventy-five thousand inhabitants. As a writer in a London daily paper observes, "It would be difficult to discover a town which has a more beautiful centre, or more picturesque suburbs, or better kept parks." Its tiled and gabled detached houses are a great relief to the eye as compared with the stucco terraces that make most of our southern watering-places so unspeakably depressing.

* * *

We are requested to announce that Messrs. James H. Tozer and Sons, Ltd., engineers and contractors, Birkenhead and London, have appointed Mr. Vere Sussex Hyde, M.C.I., manager of their reinforced concrete department (Lock Woven Mesh System) at their London office, York Mansion, York Street, Westminster, S.W.

* * *

His Majesty the King has been graciously pleased to become Patron of the Iron and Steel Institute. His late Majesty King Edward VII., was Patron during the whole of his reign.

* * *

The President of the Board of Agriculture and Fisheries has appointed a Departmental Committee to inquire into the pay and classification of the civil assistants, temporary civil assistants, and labourers employed on the Ordnance Survey, and to report whether, having regard to the conditions of their employment and to the rates current in analogous occupations, their remuneration is adequate. The committee will be constituted as follows: Sir Walter Foster (chairman), Mr. G. L. Barstow, a Principal Clerk in the Treasury, Colonel J. W. Greig, M.P., Mr. George D. Kelley, and Mr. F. Newman Rogers. Major W. C. Hedley, R.E., of the Ordnance Survey will act as secretary.

* * *

The Great Quebec Bridge.—The cost of the steel work in the great Quebec bridge will, it is expected, reach £2,000,000. Tenders are anticipated from seven British, German, American, French, and Canadian firms.

* * *

The designs of Mr. Burke-Downing, F.R.I.B.A., have been selected by the assessor in the architectural competition for the church and parish hall to be erected in Narbonne Avenue, Clapham Common, as a memorial to the late Canon Greene, rector of Clapham.

* * *

The building now being erected in Old Scotland Yard, Whitehall, S.W., is a new recruiting depot. Part of the building will be devoted to police purposes, one of the former houses on the site having been given up by the Police authorities to enable the ground to be cleared for the new building.

* * *

It is stated that the sum which is to be spent upon the development of Preston, midway between Torquay and Paignton, is £70,000. Mr. Paris Singer has constructed a sea wall, roads are being provided, and numerous houses and bungalows are in course of erection.

* * *

Mrs. Currie, Mrs. Merrilees, and Mrs. Percy Molteno have given £25,000 to the University of South Africa, Cape Town, for the erection of a hall and the foundation of a scholarship of £150 a year in memory of the late Sir Donald Currie.

* * *

The fund for rebuilding the Bedford College for Women at South Villa, Regent's Park, now amounts to £48,000—£100,000 is the sum required. Mr. Basil Champneys has been appointed architect.

* * *

The Standard Music Hall, opposite Victoria Station, London, has been acquired by the Alfred Butt Syndicate, and is to be rebuilt. The new hall will seat from 2,500 to 3,000 people.

* * *

Mr. Selwyn Image has been elected Slade Professor of Fine Art, Oxford University, in the room of Mr. C. J. Holmes, who resigned upon his appointment as Director of the National Portrait Gallery.

* * *

Jedburgh Abbey, one of the most interesting ruins in Scotland, has been in serious danger of collapse. Fortunately, the services of Sir Rowand Anderson were requisitioned in time to save the building from destruction, and the structure has now been secured to last for many generations.

* * *

Mr. McKenna, replying to a question by Mr. Bowerman, in the House of Commons, stated that so far as the Admiralty was aware there was sufficient tenement accommodation at Greenock to house the Torpedo Factory employees. To encourage the building of cottages on the English system for the Torpedo Factory employees, the Admiralty have agreed to guarantee, on certain conditions, the rent of 100 houses, which are to be commenced forthwith and to be completed by the end of this year.

* * *

The list of honours and promotions issued last Thursday in celebration of the birthday of his late Majesty King Edward, is less interesting from the point of view of art, architecture, and the building industry than it might have been. Among the new peers, however, is Sir Weetman D. Pearson, Bart., president of S. Pearson and Son, Ltd., the cosmopolitan contractors. Sir William Mather, who becomes a Privy Councillor, is chairman of Mather and Platt, Ltd., of the Salford Ironworks. Mr. Charles Henry Davis, who is knighted, is the solicitor to the Public Works Loan Board. Mr. Alfred East, the landscape painter and etcher, and President of the Royal Society of British Artists, also receives the honour of knighthood. Also among the new knights are Mr. Clarendon Hyde, a partner in the firm of S. Pearson and Son, and Mr. Alexander Rose Stenning, who is the retiring President of the Surveyors' Institution.

ARCHITECTURE AT THE ROYAL ACADEMY.

CONCLUDING NOTICE.

It remains for us now to say a few words as to domestic and street architecture at the Academy. In this, as in other classes of design, the frequent absence of plans is to be deplored, and there is no class of building in which plan is of more importance. How can anyone say whether a house is a good or a bad one, as a residence, unless the plan and disposition of the rooms is shown? It may be an agreeable object in a perspective view, and be a very uncomfortable house to live in. And there are cases in which not only is there no plan, but the exterior of the house has no more character or individuality than the lithographs of "desirable residences" in an estate agent's window. Such things have no rightful place in an Academy of Arts.

Schools of the smaller kind come under the heading of domestic architecture. They should at least have that character, so we may include Messrs. Swarbrick's "Elementary School, Didsbury" (1410), of which plans are given. The building is picturesque, and the three large mullioned windows mark effectively the position of the large hall. But there is nothing in the plan to explain the tower-like erection in the centre, and there is a range of class-rooms all facing south! Will architects of schools never learn that a class-room facing south means, in bright sunshiny weather, constant discomfort? You might just as well plan an architect's drawing-office with a south aspect.

Mr. T. P. Figgis's designs are never commonplace, and his "Radium Institute, Riding-House Street" (1426) is a good piece of masonry design, with distinct style of its own in the treatment of the detail of windows and cornice. This is really street architecture, and not mere "frontage." Mr. Hack's little elevation drawing, "Design for Offices" (1439), is also good in a quiet way. Mr. Richter's "Recess in Hall" (1448) does not demand a plan—it is merely a good water-colour drawing of an interior with classic decorative features, and one doubts whether its proper place should not rather be in the water-colour room. And the same remark would perhaps apply to Mr. Leslie Cook's "A Renaissance Dining Hall" (1658), not equal, however, as a water-colour, to Mr. Richter's drawing. Mr. J. H. Somerset shows a very pretty little foreign roadside house at "Hardelot, France" (1456), and has added a plan in the corner, the greater part of which is carefully obliterated by the catalogue number being inserted over it. It would have been as easy to insert it in the opposite corner, which is nearly blank; but it is the rule that the number is put in the left-hand corner, and that it hides the plan no one cares. "House at Church Stretton" (1452), by Mr. Ernest Newton, is another of these little water-colour drawings, this time without a plan, in which, however, we can realise a picturesque garden front, with a double flight of steps from the garden to the terrace, and an arched recess and seat devised beneath the steps.

Mr. Tapper's "Bicton Hall" (1463), which is hung very high, badly wants a plan to explain it. The centre block of the house projects far in front of the wings (a bad arrangement architecturally), with a semicircular bay in the centre and a loggia with coupled columns. There is a formal garden laid out on each side of the centre block, but what one wants to know is, how the internal plan works out into this unusual disposition of masses? Mr. Barrow's "'Olantigh,' Kent" (1464), is on old eighteenth century lines; a square brick house with a great stone portico of Ionic columns, the house and the offices arranged *en echelon*. The plan is too high up to be properly seen, but there appears to be some rather stately garden arrangement in the rear, on the axis line of the portico. "Sutton Valence School" (1471; no plan), by Messrs. H. P. Adams and C. Holden, is an artistic and effective monochrome drawing of a building surrounding three sides of a quadrangle, with a very good school character about it. The lower building at the end of the wings is badly connected with the rest, and makes awkward-looking lines; but in other respects the building seems so suitable to a school that one regrets the more not to see a plan of it.

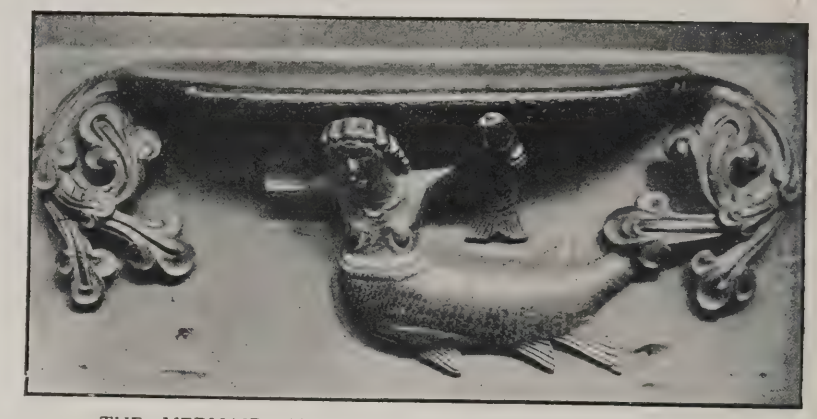
Mr. Lionel Crane's "Highfields, Marlow" (1468, 1476; no plan), has a pretty garden front, with its curved columned porches abutting against the sides of the gabled projections. "The Common Room at Rounton Grange" (1478) is an interior which looks as if it were intended as an illustration of plaster-work. It is a wainscoted room with a plaster barrel vault with enriched ribs, and Welsh vaults over the windows; but the detail, as far as shown, is rather commonplace. "The Croft, Woodchurch" (1480), by Messrs. Fair and Val Myer, is original. It is a house round a central courtyard, which is seen from under a cloister of Tudor arches in the foreground. The general style is rather too much like a pretence of being a mediæval building. Messrs. Seth-Smith and Monro's "Proposed Hotel and Motor-Boat Club, Shoreham Beach" (1482; no plan) is a pretty and piquant little drawing of a very marine-looking group of buildings. A little drawing of "House in Teesdale" (1483), by Mr. Leonard F. Wood, deserves attention for the treatment of the plan, and especially for the summer "tea-room" with open arches, divided from the courtyard and the kitchen wing by a circular porch. There appears to be a swing door into the porch from the kitchen. It is something to come on a little device in house planning which seems quite new. Another small drawing that deserves mention is Messrs. Castle and Warren's "The Doone, Byfleet" (1563), an L-shaped small thatched house, with a circular court fitted into the internal angle, and a drive up to it at an angle of 45 degrees. Mr. Ashbee's "Reconstruction and Additions, Woolstaplers' Hall, Campden" (1568), is a large sheet entirely of plans and elevations, in which the treatment of the grass courts and yards is very fully shown. The architecture of what appear to be the new portions is not interesting, but is perhaps controlled by the style of the existing buildings. But this is much more the right sort of drawing for the architectural room than many of the mere pictorial views exhibited.

Messrs. Forsyth and Maule's "'Beechlaw,' Puttenham" (1517), is a good house shown in a neat line drawing and plans, a feature in which is a low wing added for a laundry. Three houses designed for the Hampstead Garden Suburb (1582) show in the plan the preposterous arrangement of having all the kitchens facing south and all the drawing-rooms facing north! But in these æsthetically conceived garden suburbs one can be surprised at nothing unpractical. Mr. Mawson's "Pond Garden, Pittencrieff House" (1583), is an effective pencil drawing of a garden scene. Mr. Arthur T. Bolton's "Villa in the Warren, Ewhurst" (1591), is such an interesting and unusual bit of (apparently) brick architecture that one regrets the more to find no plan. Next we may notice a rather fine scheme for a "Proposed London House" (1599), by Mr. MacDonald Gill. This has a symmetrically arranged square plan with a central *cortile*. The angles of the plan are emphasised, the centre portions of the wall slightly recessed; the principal sitting-rooms being arranged at the angles. In the upper portion the windows are grouped under arched recesses running up through the second and third storeys, and the walls illustrated by a structural polychromy of white and blue bands, probably glazed bricks. This is a really fine and dignified town house, and we hope it may rise from the state of being "proposed."

Mr. Schwabe's "Design for a Frontage" (1612), as such, does not perhaps call for a plan, and is a really interesting attempt at a stone street front with some novelty of detail, and sculpture (bas relief) well introduced in suitable positions. This is a front which would be quite worth carrying out. Mr. Walter Cave's "Ewelme Down" (1618), is a good example of what may be called the rambling type of large country house, with an irregular plan and grouping dominated by a large square tower-like mass at one point of the composition. It is a style of country mansion design for which there is much to be said, combining as it does picturesqueness with a suggestion of dignity; only we like to see the tower in such a case respond to something of importance in the plan. In this case the tower, on the ground plan, only marks the position of the pantry—a useful element in a house plan, but hardly one to distinguish by raising a tower above it. Mr. Ernest Wilmott's "Sketch of a Garden" (1621) is, we presume, only a design *en l'air*, but it is a fine one. It shows a large formal garden on a high level, with lofty retaining walls connecting it with a wooded park on the lower level. At one point the high garden and retaining walls project forward in a kind of bastion, at the foot of which is a monumental doorway leading to a stair to the upper level.

Mr. Mallows exhibits a fine drawing of "The West Front of Hampton Court Palace: showing proposed restoration of moat, bridge, and great gatehouse" (1633). The architecture is, of course, mainly a representation of what exists; the drawing is interesting as showing what may have been the original appearance of the approach to Wolsey's palace. Mr. Tapper's "Eastham Grange" (1643) looks very like an old country house with low walls and high roofs. Whether it is actually a new house or a treatment of an old one there is nothing to show. If it is entirely a modern house it is a great deal too archaic-looking, but the drawing is an effective one. Mr. Jell's illustration of the rebuilding of some houses in Bury Street and Ryder Street (1646) is a poor drawing, but the design seems better than the drawing. Mr. Prentice's "Manor House, Motgrove" (1651; no plan), is a good monochrome water-colour of a domestic Gothic house of the rambling type, shown from that point of sight which is called a bird's-eye view.

It will be gathered that there are few things very remarkable in the domestic architecture designs, and there are far too many drawings which are merely more or less pretty pictures of houses, conveying no adequate information as to their merits, either in plan or in detail.



BOOKS.

Misericords.

The subject of carved misericords in English churches, treated of by Mr. Francis Bond, is of social and historical, as well as artistic interest; indeed, it may be said that the former is the principal interest in this class of carvings, which are mostly very rude in their representations of human and animal figures, and are more humorous than beautiful. But, as Mr. Bond points out in his preface, these carvings tell us much more than what people thought about birds, beasts, and fishes. They constitute a kind of history of English social life in the fourteenth, fifteenth, and sixteenth centuries, as it was lived by the common folk. Many of them are very satirical in intent, and the odd thing is that the satire is not infrequently directed against the church and the monks themselves.

Mr. Bond has classed his descriptions and illustrations according to subjects depicted. We begin with Eastern mythology, which comprises St. George and the Dragon and the Phœnix, the last-named being represented in a carving at Westminster. Classical mythology includes the peacock, siren, mermaid, dolphin, centaur, and two or three other legends; and of these the mermaid is the most frequent and the most popular. The author does not suggest any reason for this beyond the fact that the mermaid's tail lends itself very well to effect in carving. We imagine, however, that there was some symbolism in the mermaid more than we are aware of now.

Among the beasts represented the lion is naturally a favourite, as he lays himself open to many symbolical meanings, though the attempts at representing his outward form and dignity are hardly successful. It is somewhat of a surprise to come on the elephant, and to find him treated with a good deal of vigour in a carving from Exeter, though the feet are not quite right. Where, one wonders, did the mediæval carver see an elephant? Among birds, the pelican (of course) and the owl come. The pelican from Beverley Minster is a really fine piece of conventional carving—or what seems conventional to us; perhaps with the original carver it was as near as he could get to realism. The griffin is one of the favoured fabulous animals. The one from Cartmel is a good example of the spirit of mediæval carving.

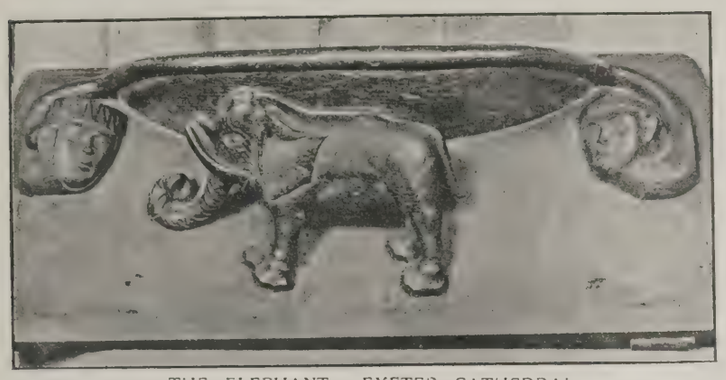
THE MERMAID AND THE FISH: EXETER CATHEDRAL.

(From Bond's "Misericords." By permission of Mr. Henry Frowde.)

In addition to the animals, real or fabulous, there is a whole series of stories, legends, seasons of the year, agricultural operations, etc., represented in these misericord carvings, which we have not space to mention in further detail. There are 241 illustrations of these in Mr. Bond's book, which is, we believe, the first devoted to this special subject. It is an exceedingly interesting volume, both in illustrations and subject matter, and full of curious information.

Wood Carvings in English Churches. I.—Misericords. By Francis Bond, M.A. Henry Frowde; London, New York, Toronto, and Melbourne: 1910. 7s. 6d.

THE PELICAN: BEVERLEY MINSTER.



(From Bond's "Misericords." By permission of Mr. Henry Frowde.)

The Notable Buildings of East Ham.

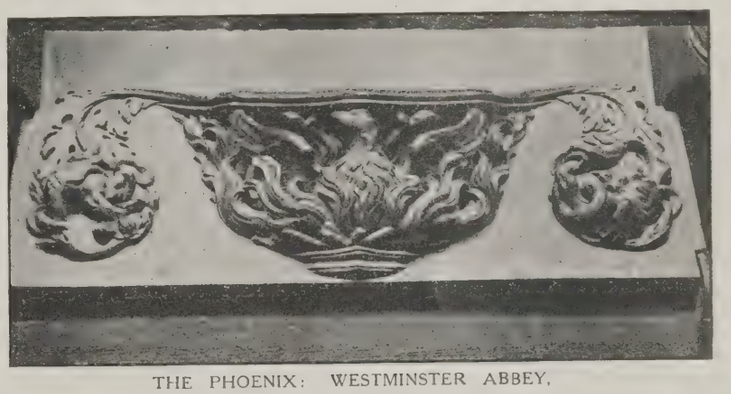
The "Borough" Guide to East Ham, compiled by Frederick Bingham, includes twenty-three illustrations, a street plan of the borough, and a map showing railway communications. It is well produced, and the illustrations include, we suppose, all the notable buildings, old and new, in the borough. Among them are Anne Boleyn's tower, house, and gardens, the Municipal Technical College, the Passmore Edwards Hospital, the old and the new parish churches, the Manor Park and Plashet branch libraries, electric power station, municipal dwellings, etc. Of these the oldest is the parish church of St. Mary Magdalene, which possibly may have been built in Saxon times. It is built of flint and stone, and of the low but massive square tower the lower part is no doubt of Norman construction, while the upper portion is probably much later. The list of vicars extends back to 1328. Greenstreet House is locally known as "Anne Boleyn's Castle," from a tradition that the unfortunate Queen was once confined in its tower. With regard to the modern buildings, we regret to notice that in only one instance, so far as we have been able to find, has the compiler thought it worth while to mention the name of the architect. From our point of view, this very common but very regrettable practice is as indefensible as would be that of omitting to mention the name of the author of a book, painting, or piece of sculpture. In other respects the guide is useful and commendable. It is issued by the East Ham Corporation.

Byzantine Art.

The author of this very painstaking account of Byzantine art deprecates, at the outset, the very common notion that it is a sterile and stereotyped if not altogether dead art. It is, on the contrary, as this volume proves, an art that is at once complex and flexible, having in it all the elements of vigorous vitality, and still capable, as we in England have good reason to know, of impressing itself deeply on the minds of men. Indeed, its growing popularity—or, rather, its increasing power—is signalised by the production of this stout volume, which probably owes its origin to its author's and publishers' perception that such a work would be welcomed as possessing current practical interest. The book is itself one of the many striking portents that Byzantine art, so far from being barren and stagnant, is prolific and mobile—a force that counts. "It is," says M. Diehl, "a living art, of

THE ELEPHANT: EXETER CATHEDRAL.

(From Bond's "Misericords." By permission of Mr. Henry Frowde.)



which the development follows a logical curve, continuous and progressive, and of which it is necessary, as with all living organisms, to study the evolution and the successive transformations." These considerations have determined the plan and character of the work under notice, which, conformably to the author's conception of his subject, is, notwithstanding its modest title, less a manual than a history of Byzantine art. At all events, the historical method of presentment has been followed. The author believes that, for instance, it is both more instructive and more scientific to present the history of Byzantine architecture in the chronological sequence of its development, rather than to analyse and compare the divers forms and details of different times. If a choice must be made, the chronological method is, no doubt, that which seems to be more simple and natural; but comparison is essential to completeness.

The book, however, does not pretend to be a treatise on Byzantine architecture, although that subject is handled with considerable fulness in its proper place, while illustrations of its details, coming frequently into other specific classifications, may almost be said to pervade the volume; and illustrations of more or less strictly architectural character form the bulk of the 420 process engravings which constitute the most interesting, if not the most valuable, feature of the book. One can quite understand that the selection of these illustrations has been for him, as he confesses, "a serious and constant preoccupation." One of the most quaintly interesting of the collection is Fig. 179, which is taken from the Barberini Psalter, in the Vatican library, and represents Macedonian builders at work.

It must not be inferred, however, that the text is subservient to the illustrations. Its 800 and more pages are written in no superficial or perfunctory spirit, but represent the patient research and the judicious conclusions of a genuine historian of art, who, moreover, writes in a plain and straightforward style, and with characteristic French neatness and clearness of expression. Summing up the results of his labours, M. Diehl writes: "The discoveries of recent years have revealed to us the marvellous efflorescence of art which, between the fourth and the fifth centuries, spread itself over Syria, Egypt, Asia Minor—in the great Hellenistic cities penetrated by the spirit of the ancient Orient. It is impossible to say how much Byzantium owes to this powerful artistic movement; but it is necessary to add—and it cannot be emphasized too strongly—that the point at which these various influences met and merged was Constantinople; and that is why the new Christian art of the East is legitimately termed Byzantine." Nor does he fail to note that: "In the sixth century, that art created a *chef d'œuvre* of architecture, Santa Sophia, a marvel of science and audacity, an incomparable work, in which is materialised in wonderful perfection the characteristic form of Byzantine construction, the cupola. In this typical monument, Byzantine art manifests at the same time the taste and the feeling for decoration which must for ever be counted as among its essential qualities, while it satisfies the demand that art should be creative.

Every catholic-minded art lover will be glad to accord this book an honourable place in his library; but he will first see that it is bound in accordance with his own taste, for, in accordance with French practice, it is put up in paper covers. This is really an advantage, as it gives the book an opportunity of "ripening," to the benefit of the ultimate binding in boards. There is a good index.

Manuel d'Art Byzantin. Par Charles Diehl, Correspondant de l'Institut, Professeur à la Faculté des Lettres de l'Université de Paris. Paris: Librairie Alphonse Picard et Fils, Libraire des Archives des Nationales et de la Société de l'Ecole des Chartes, 82, Rue Bonaparte. Pp. xii.—838. 15 francs.

THE PHOENIX: WESTMINSTER ABBEY.

(From Bond's "Misericords." By permission of Mr. Henry Frowde.)

Some Venerable Yorkshire Churches.

The author of "Richmondshire Churches" approaches his task in a properly sympathetic spirit. "If it be true," he writes, "that the houses in which we dwell and the public buildings with which we are brought in contact exercise a certain influence over our minds, for good or for evil, for our pleasure or for our distress—how much more is that the case with the churches in which we worship? . . . . It is not too much to say of our ancient churches that they express the permanent sub-consciousness of the life of the English people. In their varied styles they reflect the changes which have passed over our national history." He claims to have traversed "a new and untrodden district in describing for us the ten church fabrics in Richmondshire, which present, collectively, an epitome of English ecclesiastical architecture from the eleventh to the sixteenth century." Nor, in illustrating the book, has he been contented, as are so many of the writers of popular books about buildings, merely to give picturesque elevations and views. He differs from the superficial "populariser" in realising that "nothing is, perhaps, so useful, for the proper understanding of a church, as a study of its ground-plan," and he has himself drawn the plans to the uniform scale of 5ft. to the inch. Believing that such terms as "late Early English" and "early Decorated" are not only vague and indeterminate, but are rapidly becoming obsolete, he has discarded them in favour of round dates—"about 1260" conveying a more definite idea to the mind of the casual reader, and being quite sufficient for the serious student of architecture. In a few cases there is historical evidence of the date, as at Catterick, where the original contract is in existence and is dated 1412. It is a quaint document, and Mr. McCall has done well to reproduce it in full.

The ten churches dealt with are those of St. Lambert, Burneston; St. Anne, Catterick; St. Mary, Hornby; St. John-the-Baptist, Kirkby Wiske; St. Michael, Kirklington; St. Patrick, Patrick Brompton; All Saints', Pickhill; St. Mary, Wath; Holy Trinity, Wensley; and St. Nicholas, West Tanfield. St. Gregory, Bedale; and St. Mary, Masham, are omitted, not because they lack interest, but because the author has dealt with them elsewhere, which seems to us to be an insufficient reason for their exclusion.

Of course, the interest of the book is not wholly, nor even chiefly, architectural; and the author (whose casual observations on art in architecture are invariably sound and judicious) is obviously well equipped for a comprehensive view, as he has more than a relish for the archæology, heraldry, and ecclesiology, which, when dexterously dealt with, invest the subject of ancient buildings with an indefinable charm. Mr. McCall, in fact, is not only well acquainted with his subject in all its bearings, but knows how to handle it, and in "Richmondshire Churches" he has produced a book that is interesting as well as informative.

Richmondshire Churches. By H. B. McCall. Illustrated. London: Elliot Stock, 62, Paternoster Row. Pp. xiv.—226. 10s. net.

THE LEGALITY OF EXTRAS.

By OUR LEGAL EDITOR.

Among the questions which most frequently arise in relation to building contracts, there is none more important to the builder than this: "Can I claim for extras?" Extras may be defined as work not expressly or impliedly included in the original contract. The matter has to be considered from several points of view. The building owner, who probably reckons on the work being done for a fixed sum, does not want the limit to be exceeded. The builder may find the task he has undertaken to be impossible unless he is allowed to charge for extras. Consequently the architect, who is in a middle position, is often in a dilemma. On the one hand, he does not want to make a slovenly job by refusing to allow as an extra something which has been inadvertently omitted from the specification; for unless his skill be something more than human, it will be almost impossible to provide for everything when executing a very large contract. On the other hand, he does not like to ask the building owner, who has employed him, to pay a large bill for extras.

Grave Liability.

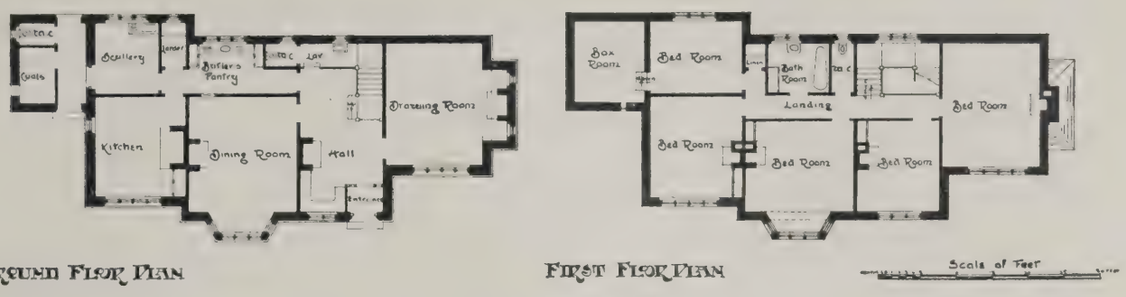
The gravity of the liability which may be imposed on a builder by extras is well illustrated by the case of Rigby v. Bristol (Mayor), 1860, 29 L.J. Ex. 359. There an Act empowered a corporation to scour an inland harbour, and they did so by taking up the mud in barges and letting it out at the mouth of the harbour, so as to be carried down the river. The corporation employed the plaintiff to excavate and remove certain estimated quantities of earth down the river at certain prices, the contract (not noticing the scouring prices) providing only for extra work ordered by the engineer of the corporation in writing. In consequence of the cleansing process, which was continued while the plaintiff was engaged in the work, the quantity of soil he had to remove was vastly increased by great deposits of mud. The plaintiff applied for and was refused any additional remuneration, and after the work was completed sued the corporation for compensation. The case of the plaintiff as stated at the trial did not show that the method of cleansing adopted by the corporation was unusual or unreasonable, and, on the contrary, it appeared rather to be a proper mode of carrying out the powers of the Act. It was held that as it did not appear that the process was unlawful or wrongful, there was no cause for action.

The Position of the Architect.

The first thing an architect should do when called on to decide as to extras is to look at the terms of the contract. Sometimes it defines his duty very clearly. Thus it usually provides that the builder shall have no claim for extra payment beyond the contract price in respect of any work done by him for the employer, whether executed before or after the completion of the contract, unless such payment is expressly ordered. The duty of ordering payment is left to the architect, the contract providing that he is to grant a written order expressly stating that the work is to be the subject of an extra charge, and then only for the amount which the architect in his final certificate shall certify to be due to the builder in respect of such alterations and additions. The contract should also provide that extras shall be executed subject to the same conditions as the other work specified for, and that the prices contained in the bill of quantities shall be applicable as far as possible.

The Burden of the Building Owner.

It often happens that when proceeding with the work something occurs to increase the burden which may have to be placed upon the building owner. In order that the architect shall be kept informed of any such additional expense, it is well to provide that the builder, in proceeding with the works in accordance with any supplementary detail or other drawing, sketch, or instruction, that will cause any additional expense, he shall immediately intimate the same to the architect.



Lump-sum Contracts.

If the contract is a "lump-sum" contract, it is obvious that anything extra must be done and paid for under some contract express or implied which is distinct from the original contract. Unless there is such an express or implied contract, the builder does the extra work at his peril; he cannot recover the price of it. For instance, if work is to be done at a given price, and the builder does the work better or uses better materials, the employer is not liable to pay any greater price (Wilmot v. Smith,

This house is situated upon the Warley House Estate, about three miles from Halifax, Yorkshire, in the middle of the stone district. The outside walls are of the best delf-dressed wallstones, walled random, and the dressings are of coarse millstone-grit ashlar. The roof is covered with grey stone slates. The windows are of metal casements and leaded lights.

HOUSE, WARLEY TOWN, NEAR HALIFAX. JOSEPH F. WALSH, F.S.I., AND GRAHAM NICHOLAS, F.R.I.B.A., ARCHITECTS.

HOUSE, WARLEY TOWN, NEAR HALIFAX: PLANS.

JOSEPH F. WALSH, F.S.I., AND GRAHAM NICHOLAS, F.R.I.B.A., ARCHITECTS.

1828, 3C. and P. 453). But the "extra" clause does not apply to work wholly outside the original contract. Thus, where plasterers who were employed to do the inside of a house under a written contract were verbally requested to do the entablature outside, it was held that they might sue for the price of this without producing the written agreement. (Reed v. Batte, 1829, M. and M. 413.)

Contracts Under Seal.

Where the contract is under seal, as where, for instance, a builder agrees to do work for a corporation or other local authority, the original contract cannot be varied or altered except by a new contract under seal. Consequently, if the builder, at the verbal request of the local authority or one of their officers, does some extra work, he could not recover anything in respect of it. But where such a contract contains the usual clause allowing the extras to be ordered by the architect, his order need not be under seal. In Williams v. Barmouth Urban Council (1897, 77 L.J. 383), where the plaintiff contracted to do certain sewerage works for the defendant council, there was the usual power for the engineer who had control and supervision of the works to vary, alter, enlarge, or diminish any of them. It was held that all variations coming within the terms of the power conferred on the engineer could be validly made without being under the common seal of the urban authority.

Authority for Extras.

It is a general rule that the architect cannot order extras without authority. In other words, the cost of extras done pursuant to an order which the architect has no authority to give, cannot be recovered from the employer. For instance, in Cooper v. Langdon (1841, 9 M. and W. 60), a builder was sued for not building a house in accordance with his contract. He pleaded that he deviated from the drawings, etc., by the direction of the architect. It was held that this was no answer to the claim, as it was not proved that the architect had power, under the terms of the contract, to bind the employer by allowing deviations from the drawings.

Further, he must authorise extras in the manner in which he is directed to authorise them. If an express order or direction in writing is necessary, nothing less than an express order or direction will suffice. (Russell v. Sa Da Bandeira, 1862, 13 C.B.N.S. 149). So, a mere sketch made by an architect was held not to be a sufficient written direction for extras. (Myers v. Sarl, 1860, 30 L.J.Q.B.9.) These cases will show that the architect who is called upon to allow for extras should exercise the greatest care in complying with the requirements of the contract.

Architect's Liability.

In Sharpe v. San Paulo Railway Co., (1873, L.R. 8 Ch. 597), during the excavation for a railway, the engineer promised that he would make alterations so as to effect a diminution in cost in order to make up for work which turned out to be more expensive than had been supposed, though the work was actually included in the entire contract. It was held that the contractor could not recover anything on the promise. The architect, however, may become personally liable for extras if he orders them on a representation that he has authority to do so. The authority of the architect to order extras does not extend to things wholly outside the contract. This point was illustrated in Russell v. Sa Da Bandeira (1862, 13 C.B.N.S. 149). In that case there was a contract for the building of a ship. It was provided that no charges should be demanded for extras, but that any additions which might be made, by the order in writing of the employer's agent, should be paid for at a price previously agreed upon in writing. During the progress of the building of the ship, several additions and alterations were made by the direction of the employer's agents, but no written order was given for them. Goods were also ordered for the use of the ship. It was held that the shipbuilder could not recover for extras, alterations, or additions made during the course of the performance of the contract, unless where he had received previous written orders, agreeably to the contract. The goods ordered for the use of the ship were, however, held not to be extras. The extra clause must not be construed as authorising the architect to allow the contractor to depart materially from the general design of the work under execution. Dealing with the "extras" and "omissions" clause in the old case of Rex. v. Peto (1826, I.Y. and J. 53), Alexander C.B. said: "Everyone who is at all conversant with building knows that, in the course of building, it occurs sometimes to add, and sometimes to desire, that certain things may be omitted; this appears to have been in the contemplation of those who prepared this instrument; and accordingly they have introduced that clause, which was clearly inserted to prevent in the first place any such direction affecting the rest of the contract, and in the next place to provide for the manner in which the contractor was to be paid in case that event should happen." After reading the clause, he said: "Is it possible that this clause was intended to give to the surveyor, a person who ought to be in general but an overlooker of the owner, to see that the work is accurately performed, a power to vary the whole scheme of the building? Or, if it were so intended, that it could have been expressed in such language? In sound construction it should be limited to that to which the condition has confined it, namely, to such extra work as may be done, or something which is to be omitted; but it cannot refer to the substitution of one thing for another, more especially anything so important as the making of the foundation on which the whole validity and security of the building depends."

Employer Ordering Extras.

If it can be distinctly proved that the employer ordered extras, he will be liable to pay for them, as in that case a new contract will have come into existence. But an allegation that he assented to alterations will not be sufficient. In Lovelock v. King (1831 1 Moo. and Rob. 60), a carpenter had agreed to alter certain premises for a fixed sum. Considerable deviations were made from the original plan, which it was alleged the employer had seen and had not objected to. The carpenter sued for the "measure and value" price of all the work done. It was laid down that the employer was not liable for any larger sum than that fixed by the contract, by reason of his assenting to deviations unless he was expressly or impliedly informed that such deviations would increase the cost.

The Final Certificate.

The architect's final certificate may have an important bearing upon the question of extras. The result of many cases appears to be that even where extras must be ordered in writing, the final certificate of the architect is conclusive, both in the case of the employer and the contractor, whether the order in writing was actually given or not. As an illustration, reference may be made to the Irish case of Connor v. Belfast Water Commissioners (1871, 5 Ir.L.R. C.L. 55). There the plaintiff contracted to do certain works for the defendant commissioners. The contract provided that no extras should be made without an order in writing, and that such extra works should be valued by the engineer, and that the valuation should be final. It also provided that if extra works were ordered, the contractor should send in accounts within a month, and that in default of his so doing, the defendants should not be bound to pay for them. It was also provided that the defendants should not be bound to pay for any works, except upon the production of a certificate signed by some principal or resident engineer, and that the principal engineers or engineer for the time being should be the exclusive judges of the execution of the works and of everything connected with the contract; and that the certificates under their hands or hand should be binding and conclusive on both parties. It was

held that the engineers having given a certificate for the extra works, the defendants were precluded from setting up as defences to the action for the price of the extra works; that the extra works had not been ordered in writing, and that no accounts had been sent in for them, as required by the deed.

The final certificate may also amount to a determination by the engineer as to whether certain things are extras or not. This was held to be so in a case arising on a contract which provided that all extras or additions should be paid for at the price fixed by the surveyor appointed by the contractor's employer. It was held that his certificate awarding a certain amount to be due for extras was conclusive (Richardson v. May, 1883, 10 Q.B.D. 400).

PROPOSED MEMORIALS TO KING EDWARD.

At a public meeting at Aberdeen, it was resolved to erect a memorial statue in the city. A dispute as to the site it shall occupy is already in progress.—The East India Association, at a meeting held in Caxton Hall, Westminster, Lord Lamington in the chair, a project was put forward of erecting as a memorial to King Edward an Indian museum. It was suggested that a site belonging to the India Office, on the Surrey bank of the Thames, next to the site of the new London County Hall, would be eminently suitable. Mr. Chisholm, formerly Government architect at Madras, who has prepared plans for the proposed building, estimates the cost at £600,000 or £700,000. He proposed a building 370ft. long, 210ft. broad, and 130ft. high; the whole area (exclusive of corridors or staircases) being 157,251 superficial feet.—At Eastbourne it is proposed to erect a hospital on a central site.—Erith has formed a committee with the object of raising a fund for a statue.—At Bristol, the governors of the Royal Infirmary have adopted an extension scheme, involving the expenditure of £70,000, towards which they have £35,000 in hand. It was agreed that the new wing should form a memorial to King Edward.

Ipswich proposes to build a sanatorium. A public meeting was held on June 17th. About £2,500 was then subscribed, and Alderman Paul offered, if £10,000 was raised, to add £5,000 to that sum. £20,000 is the amount proposed to be collected.

As we announced recently, it has been decided to build the south transept of Selby Abbey as a memorial to the late King. The amount required is £8,000, of which Mr. Wm. Liversedge, J.P., has given £1,000.

The inhabitants of the Royal Manor of Enfield, which forms part of the Duchy of Lancaster estates, are formulating ideas for a memorial of the late King. "The Enfield Observer" of June 17th gives some commendable warnings on the subject of memorials in general.

A public meeting at Norwich on June 18th decided to raise a fund for the endowment of the Norfolk and Norwich Hospital, as a memorial. King Edward laid the foundation stone of an extension there last October.

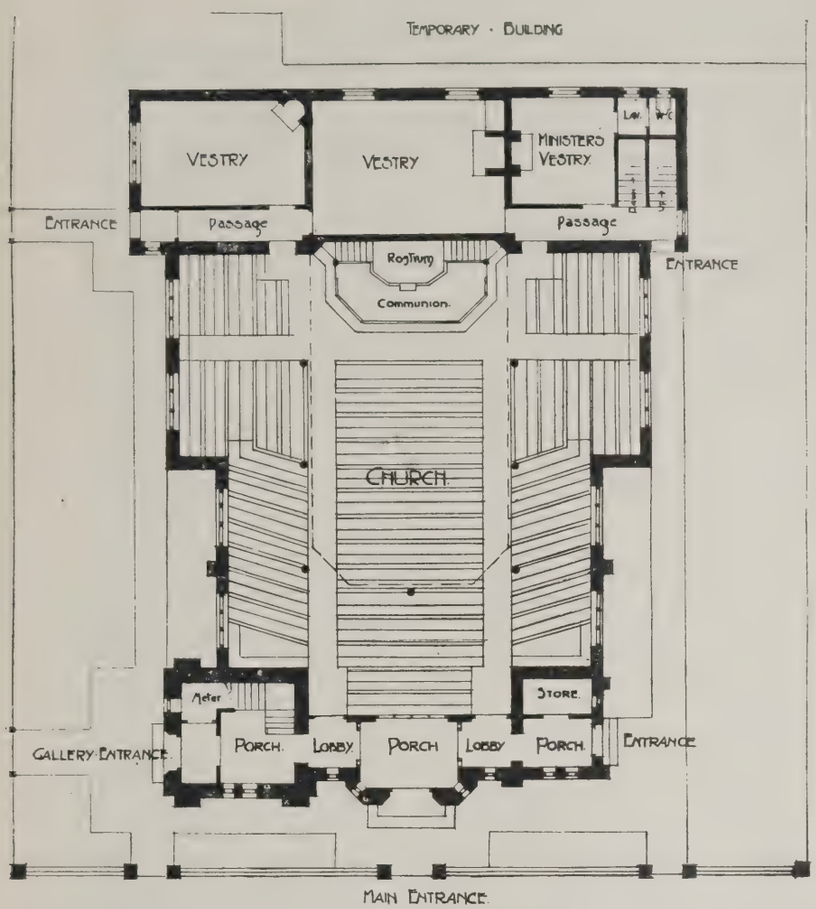
At a meeting of the Council of Armstrong College, Newcastle, a letter was read from Sir Arthur Bigge, asking the Council to suggest for the King's approval a title for the new buildings in connection with the art department of the college. It was unanimously resolved that the title of "King Edward the Seventh School of Art" be submitted to his Majesty.

EXHIBITION.

The Goupil Gallery.

The exhibition of works by Mr. W. Rothenstein at the Goupil Gallery contains one of his most important pictures, "Carrying the Law," which has been exhibited before. The best things there are his small portraits in black and white, which are excellent. The landscapes are very crude in style, and will hardly improve the painter's reputation. Some of the jewellery by Mrs. Koehler is very good, especially the enamelled gold and emerald necklace, No. 4. The "Summer Exhibition" in the upstairs room is not a very remarkable one; there is a fine painting by the late J. M. Swan, and some good small landscapes by Cazin, Diaz, Harpignies, Le Sidaner, etc.

ART NOTES.



Monument to François Coppée. A monument in memory of the poet François Coppée was unveiled on June 5th in the Place St. François Xavier in Paris. A committee, of which the poet M. Jean Richepin was the chairman, was formed about a year ago to obtain funds for the monument, and nearly £1,000 was collected without difficulty. Coppée's popularity still remains considerable among the middle classes in Paris. M. Paul Déroulède presided, and among the others who delivered addresses were the poet and novelist M. Jean Aicard, the president of the Société des Gens de Lettres, M. René Doumic, and M. Robert Defiers.

Art Exhibits at Brussels. The gallery of modern art (the Palais du Cinquantenaire) at the Brussels Exhibition contains a fine and comprehensive selection, in which all nations are represented with the exception of Germany, whose art exhibits are housed in the German Pavilion. The finest section is probably the French, which is most tastefully arranged and embraces all the phases of contemporary French art. The Belgian section, comprising the Salon Triennal of 1910, contains specimens of the work of almost every one of the leading artists M. Oleffe's "August," representing a summer garden in which three women are sitting, has been especially admired. Holland, Spain, Italy, Switzerland, and Russia are also represented. In the British section are landscapes by Messrs. Alfred East, Priestman, Macaulay, Stevenson, Grosvenor Thomas, Forrester

This church had to be built as economically as possible. It contains seats for 700 on the floor and in the gallery, with about 50 in the choir above the vestry behind the rostrum. The walls are of brick covered with roughcast, with a base of red pressed bricks about 4ft. 6 ins. high. The main front has stone dressings and tracery window over centre porch.

WESLEYAN CHURCH, CHOPWELL, CO. DURHAM. BOYD & GROVES, ARCHITECTS.

GROUND · PLAN

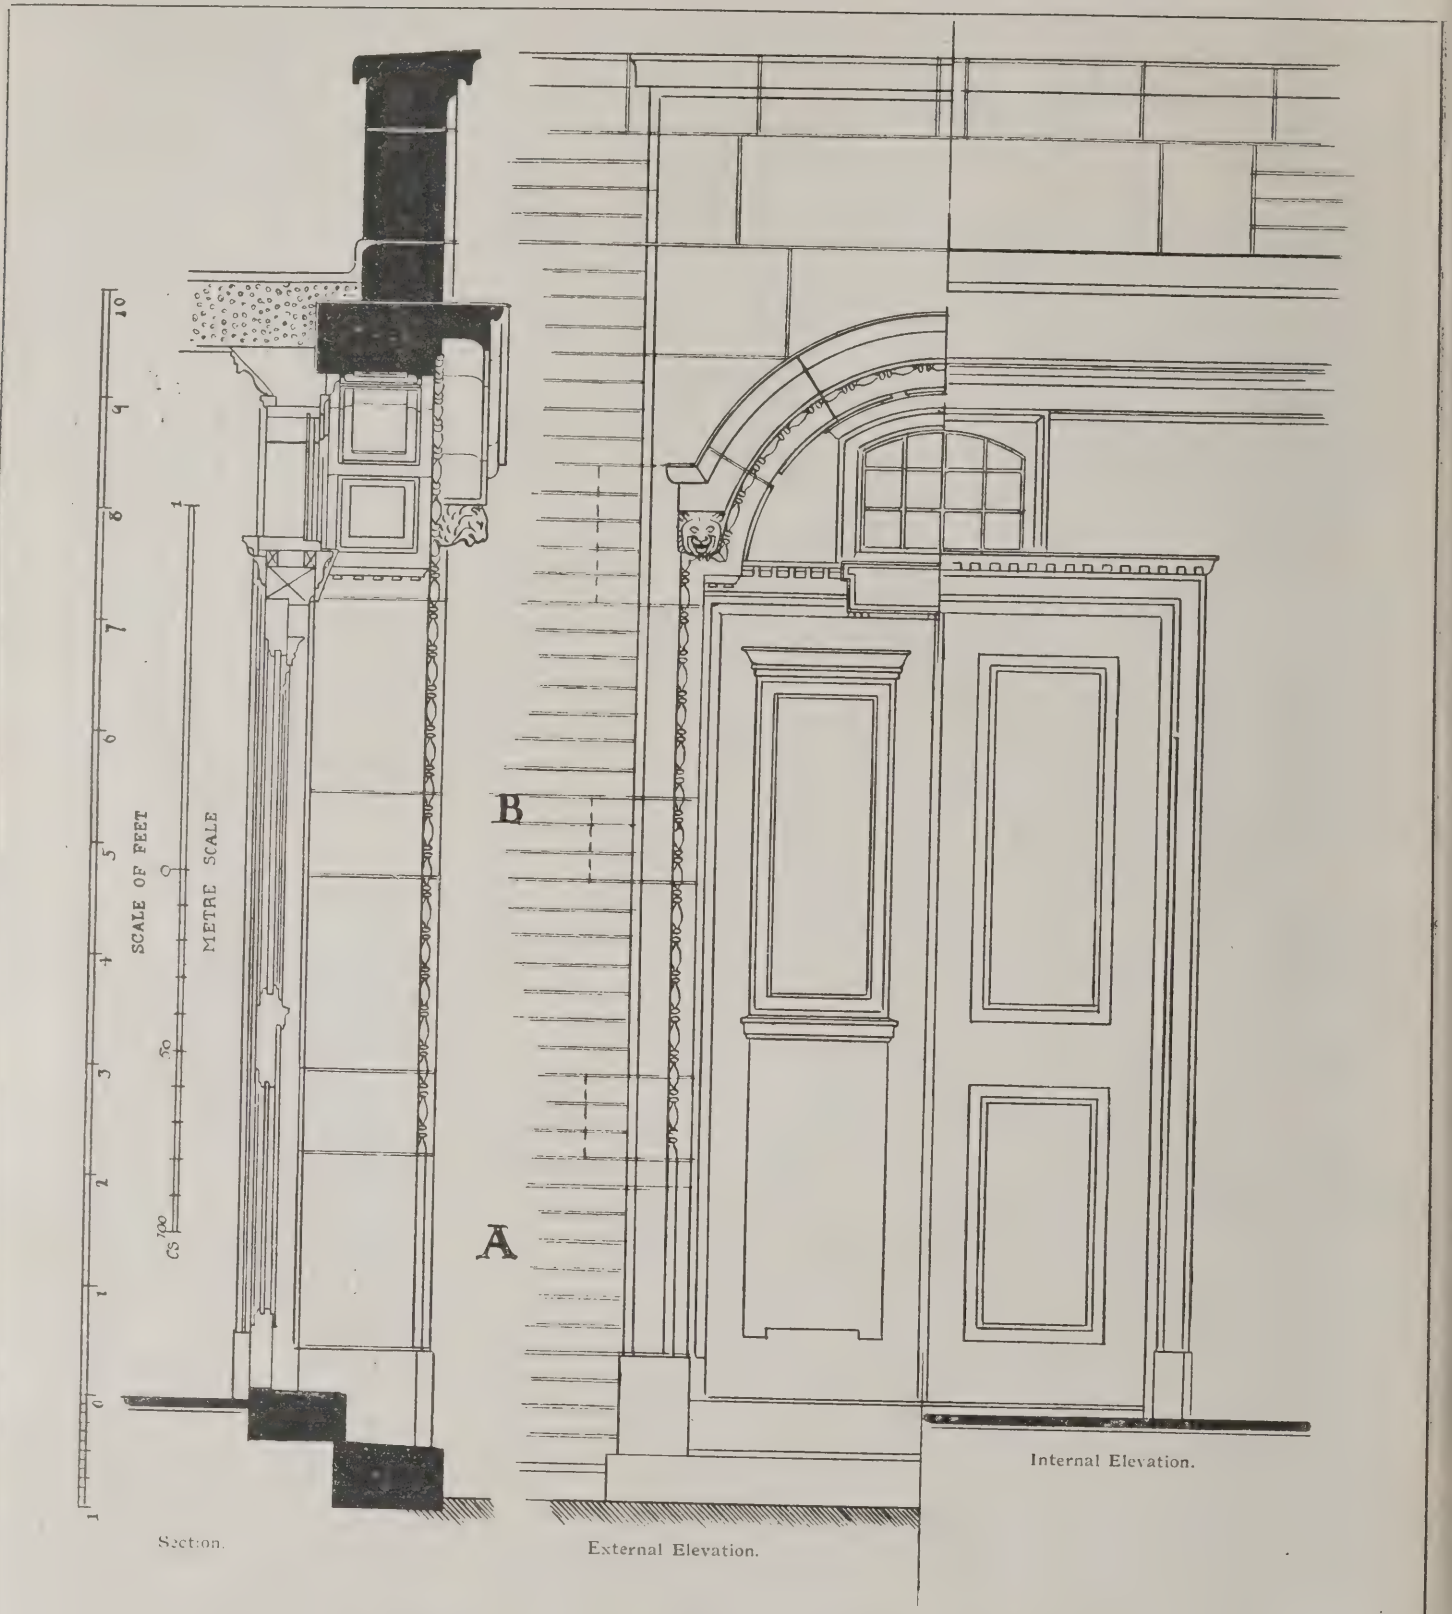
The side elevations have wood frames filled with lead glazing. The wood work internally is executed in pitch-pine, stained and varnished, the exposed timbers in roof being left clean from the plane. The cost was £2,700.

WESLEYAN CHURCH, CHOPWELL, CO. DURHAM. BOYD & GROVES, ARCHITECTS.

Wilson, Hornel, and Austin Brown, and portraits by Mr. John Lavery and Mr. Newberry. Mr. Shannon shows a fine picture on a mythological subject.

George du Maurier Exhibition. There will be held during the present season an exhibition of the work of the late George du Maurier, of "Punch" and "Trilby" fame. A very representative collection is being got together, and it will comprise some of his most famous drawings. The exhibition will cover a period of over twenty years from 1874 to his death in 1896, and will be held under the title of "Society in late Victorian days," at the Leicester Galleries, Leicester Square.

Far Eastern Art. The exhibition of Chinese and Japanese paintings which has been for some time in preparation in the Print and Drawing Gallery at the British Museum was opened to the public on Monday week. It will include the best examples acquired by the recent purchase from Frau Olga Julia Wegener; as well as specimens of the recent discoveries of Dr. Stein in the cave temples of Eastern Turkestan, and others acquired by purchase from Dr. Anderson in 1881. In addition to these, the exhibition will comprise single examples of Chinese and Japanese paintings acquired by purchase, gift, or bequest during the last 30 years.

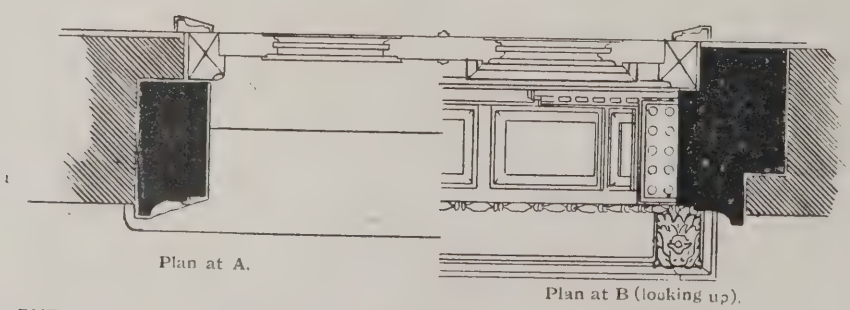


Venice Art Exhibition. The Venice Chamber of Commerce has bought Mr. Lavery's picture of "The Sok (Market Place), Tangier." The oil painting "Bed Time," by Mr. L. C. Taylor, of Oxford, has been bought by the Minister of Public Instruction for the National Gallery in Rome. This is the only picture by a foreign artist purchased so far for the gallery this year. Last year the only foreign work bought for this gallery was Mr. Lavery's picture "Polymnia." Mr. Lavery has sold his picture, "The Coronation of Edward VII. at Westminster" to an Italian purchaser.

Sale of a Famous Rembrandt. It is announced that Rembrandt's "Portrait of a Young Polish Cavalier of the Lysowski Regiment," commonly known as the "Polish Rider," has been purchased from the family of Prince Tarnowsky, through the agency of Messrs. Carfax and Co., by Mr. Henry Clay Frick, the millionaire collector of New York, at what price is not stated. Dr. Bode has the following note on the picture, which is regarded as Rembrandt's finest figure subject: "Whole length figure, nearly half the size of life. Signed on the right on a stone: Re. . . Painted about 1655. Canvas: H. 1m. 15cm. 1m. 33.5cm. A strip of about 12 centimètres has been added at the bottom, while on the right a strip of at least the same width has been cut off and replaced by a narrow strip about the width of a finger. Exhibited at Amsterdam in 1898."

LEGAL.

Corporation Trading.



In the High Court of Justice (Chancery Division), last week, Mr. Justice Neville delivered judgment in the case of the Attorney-General v. Corporation of Leicester, which, at the instance of a ratepayer, raised an important question as to the corporation's powers with respect to their electric light undertaking. Under the Electric Lighting Acts, 1882 and 1888, for the County Borough of Leicester, and under a Provisional Order of the Board of Trade, confirmed by a special Act, the corporation were authorised to supply electricity within their borough. Briefly, the contention of the plaintiff was that the corporation were exceeding their powers by "carrying on the trade or business of providing, selling, supplying, erecting, installing, altering, and repairing electric light cables, wires, fittings, electric bells, and motors for working various machines, in connection with houses and buildings, both within and outside their area." Plaintiff claimed a declaration to the effect that defendants had no power to carry on such business, and he asked for an injunction restraining them. The defence was a denial of the allegations, and a claim that under Section 10 of the Electric Lighting Act, 1882, and the Order and Special Act, "they were entitled to do all such things and acts as were necessary or incidental to their duty and right to supply, and the supply of energy within their area." Defendants had showrooms in one of the principal streets of Leicester, with windows in which were exhibited for sale all kinds of electrical fittings and appliances.—For the plaintiff, Mr. Felix Cassel, K.C., and Mr. M. Drucquer contended that defendants' powers were restricted to the business of generating and supplying electrical energy, and did not extend to carrying on generally the business of electrical engineers and contractors.—For the defendants, Mr. Danckwerts, K.C., and Mr. McCardie, argued that the supply of electricity did not cease at the consumer's terminal, but continued to the lamps on the consumer's premises, and included all fittings and appliances. —Mr. Justice Neville, in delivering judgment, said that if the right to supply energy does not itself include the right to wire and fit the premises supplied, he thought the right could not be claimed as incidental. In his Lordship's opinion, "supply within the meaning of the Act and Order is completed at the consumers' terminals. The installation of electricity and provision of fittings," the judgment continues, "is in my opinion a separate business incidental to the use, but not to the supply, of energy. I think that the defendants have misinterpreted their powers and have been carrying on a business in excess of them. I think the plaintiff is entitled to the declaration and injunction asked for, and that the defendants must pay the costs of the action."—A stay of the injunction was granted, pending appeal.

ENTRANCE DOORWAY, THE CLERGY HOUSE, WESTMINSTER CATHEDRAL.
THE LATE J. F. BENTLEY, ARCHITECT.

One of the outstanding traits of the late Mr. Bentley was his thoroughness—a quality shown throughout the whole fabric of the new cathedral at Westminster, from the initial conception of the scheme down to the smallest detail of it. And, like every other part of the building, this doorway to the Clergy House exhibits the most careful consideration in its design and construction. The door itself is painted a soft green colour, in harmony with the red brick walling and the Portland stone surround. The consecration of the Cathedral takes place this week

PLAIN BRICKWORK.

By EDWIN GUNN, A.R.I.B.A.

A building compulsorily plainly built is too often abandoned as hopeless, without the expenditure of any thought from the point of view of design. Such a building can be, and (one is pleased to acknowledge) frequently is, made interesting by careful and appropriate detail, not necessarily expensive. One or two points to which attention may be profitably directed are suggested in the accompanying illustration, representing a "window unit" of a brick factory or warehouse building. In such buildings the essential external facts are the piers running continuously from ground level to top floor. These are the construction—between them is a mere curtain; part brick, part glass. Their lines may therefore well be emphasized by recessing the curtain (slightly, to avoid waste of floor space within). There is no form of brick arch so economical, practical, and generally satisfactory as the header arch in rings, provided a good rise is given—1 in 5 is a satisfactory ratio of rise to span. A slight recessing of each ring below the topmost adds interest to such an arch; 1½ins. is quite sufficient—as it is for most minor brick projections, which look coarse if more is given them. The skew-backs of the arch, as shown, cut into the pier as dotted on the right. Cheap steel sashes, built of T sections, can now be obtained, of quite pleasing appearance. The frames should be constructed of L section, except at the bottom, where a T section may be used in conjunction with a blue Staffordshire cill-brick of the pattern shown, to form a satisfactory water-bar joint, much better than the customary finish. The head and water-bar should run through clear of the sides of the frame, to serve as lugs for building in, and additional angle cramps on the sides should also be provided. To prevent the risk of the glazing being blown in, holes for metal sprigs should always be provided in the steel tees. Where a string or band is required, something of the type shown makes a satisfactory treatment.

The effect of a plain brick building such as this is often marred in the attempt to improve it by the introduction of "better" bricks in band and arches. It is best when the whole is of similar bricks, i.e., if the building is faced with stocks, let the arches be of stocks also—though of course an alternated-course treatment throughout is often a great success, and patterns in dark headers are always appropriate.

THE TREATMENT OF PLAIN BRICKWORK.

ENQUIRIES ANSWERED.

N.B.—Owing to the very great increase in the number of enquiries received the Editor desires to give notice that answers to the following enquiries can no longer be undertaken :—

(1) Enquiries about buildings to measure in particular towns and districts.

(2) Enquiries embodying questions which have been set in examination papers.

(3) Enquiries which ask for or require the preparation of special designs as part of the answer.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but the enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd. and crossed, and stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable, and it must be understood that both question and reply will, as a rule, be published in these columns.

Books on Mixing Paints.

O. G. (HECKMONDWIKE) writes: "Can you recommend a book dealing with mixing paints, to be used for steam pipes, also for painting iron-work outside. One or two paints that I have mixed have lost their colour as soon as the steam pipes got hot."

—The subject of painting hot-water pipes and ironwork is referred to in Pearce's "Painting and Decorating," to be obtained from Batsford, 94, High Holborn, London (price 10s. post free). We are not aware of any book dealing specially with the subject.

Gothic Work near Wilmslow for R.I.B.A. Intermediate Exam.

A. R. M. (OLDHAM) writes: "Can you recommend any Gothic work in the neighbourhood of Wilmslow, Cheshire, for the testimonies of study R.I.B.A. intermediate examination?"

—Wilmslow Church has fairly good windows of Decorated and Perpendicular dates, one of which would be a suitable subject for measurement. At Mobberly, four miles west of Wilmslow, the church has a very fine rood loft, which would also make an interesting subject. G.

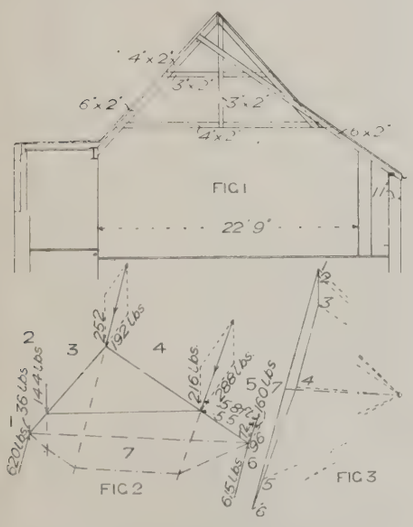
Notice Clause in a Lease.

BARTHOMLEY writes: "I enclose copy of a clause (not reproduced) from a lease, and a notice which has been sent to terminate the same at the end of the first seven years. Please inform me if the notice is quite in order. The original lease is between B and P, but the premises have been sublet to T on exactly the same terms. The lease says six months' notice must be given. You see by the date of the notice that 7½ months' notice has been given to D as B's agent, who has acknowledged receipt of notice."

—The facts appear to be that B let the house to P, and P sublet to T. T having given notice to vacate the premises at the end of the seven years, P now gives notice to D as B's agent in accordance with the clause in the lease, to terminate the lease at the same date. This is more than a six months' notice, but is dated to expire on the right day. This is a perfectly good notice, and as it has been accepted by the landlord's agent everything is in order. X.

Calculating Thichness of Walls for Tank.

OMAR (BATLEY) writes: "I should be obliged if you could give me a method of calculating the necessary strength and thickness of brick walls forming a tank to contain a given quantity of water, such as five to ten thousand gallons. Please say, also, which you consider the more efficient, brick or reinforced concrete, for the purpose."



—It is not possible in these columns to give a reply that will cover all possible cases of tank construction. It is necessary to know whether the tank is on the surface of the ground, partly sunk or wholly below ground level, also the depth and length of sides, as all these points affect the question of construction. As to efficiency both brickwork and reinforced concrete may be equally efficient and the comparative cost in the two materials would depend upon the circumstances of the case. The only general statement that can be made is that the thrust upon the side of a water tank will vary directly as the depth from the surface, $p=wh$, where p=pressure per square foot in lbs., w=weight of water in lbs. per cubic foot=62.5, h=depth from surface of water in feet. The total pressure per foot run upon the side of tank will be $P=\frac{1}{2}wh^2$, and the centre of pressure will be at one-third the height.

HENRY ADAMS.

Collar-Beam Roof Trusses.

G. N. (NORTHANTS) writes: "Kindly advise with regard to plan of roof at Greens Norton, with transverse and longitudual sections [not reproduced]. Owing to our client desiring (1) a hipped end to balance with the end of the other wing of the house (we are adding about 30ft. to one wing), and (2) a height of 10ft in the upper room, yet we are still to keep the eaves level with other wing and roof of wing we are lengthening. We cannot put heavy purlins to carry the rafters, and principals cannot be inserted owing to the bay and ingle opposite. We purpose constructing the roof as shown, timbers spiked together, but we are uncertain owing to inexperience whether the construction—each rafter forming a truss so to speak—is sound, or if not strong enough, where it may be improved so as to relieve the walls of any undue thrust."

—The method of roofing proposed, as shown in Fig. 1, has a very makeshift appearance. On the long side the trusses will

"COLLAR-BEAM ROOF TRUSSES."

be equivalent to collar-beam trusses, for which the span is far too great. With 6in. by 2in. rafters the stress in them will reach 24 cwt. per sq. in., and unless they have diagonal braces to the tie beams, they will require a section of not less than 9in. by 3in. to bring the stress down to the usual limits, but at any rate 7in. by 2½in. would be the least that could be used. The following is the mode of working adopted: Draw out the frame diagram Fig. 2, which also shows the loads calculated from 21lbs. per ft. sup. structural load and 28lbs. per ft. sup. normal wind pressure. The load line, Fig. 3, may be set down, and the reactions found by means of a funicular polygon. The maximum bending moment on the long rafter will be at the junction with the collar and equals $(615\times5.5)-(160\times5.8)=2694.5$lb.-ft. or $\frac{2694.5\times12}{112}=288.7$ cwt.-ins. The section modulus of the 6in. by 2in. section proposed $=\frac{bd^2}{6}=\frac{2\times6^2}{6}=12$, therefore the stress per sq. in. $C=\frac{M}{Z}=\frac{288.7}{12}=24$ cwt. per sq. in.; with the 9in. by 3in. section $Z=\frac{3\times9^2}{6}=40.5$ and $C=\frac{288.7}{40.5}=7$ cwt. per sq. in. which is still a little above the usual limit.

HENRY ADAMS.

Charges for "Extras."

ANXIOUS (DRAYCOTT) writes: "The builder's estimate accepted for a small house from plans, details, and specifications are, say, £600. The client, during the course of erection of the house, orders many extras, such as electric bells, more expensive fire-grates, bath, heating apparatus, etc. Am I entitled to charge the client on the full amount on completion of house, say, £675, or should my charge be based on the original estimate of £600?"

—It is presumed, from the statement of facts, that there is no architect employed. As a rule there is an "extra" clause in a building contract, which provides that no extras can be charged for unless approved by the architect; and such a provision must be strictly followed (Thames Iron Works v. Royal Mail Steam Packet Co., 8 Juv. N.S. 100). But if there is no extra clause, and it can be proved that the employer ordered something which was not included in the specifications, it is clear that the builder can recover the value of the work done and materials supplied (Buxton v. Cornish, 1 D. and L. 585). But if the builder has done the extra work without an order, the building owner is not liable to pay for it (Dobson v. Hudson, 1 C.B. N.S. 659). It would seem that, in the present case, there should be no difficulty in proving orders for the extra and better work. X.

Right of Authority to Examine Drains.

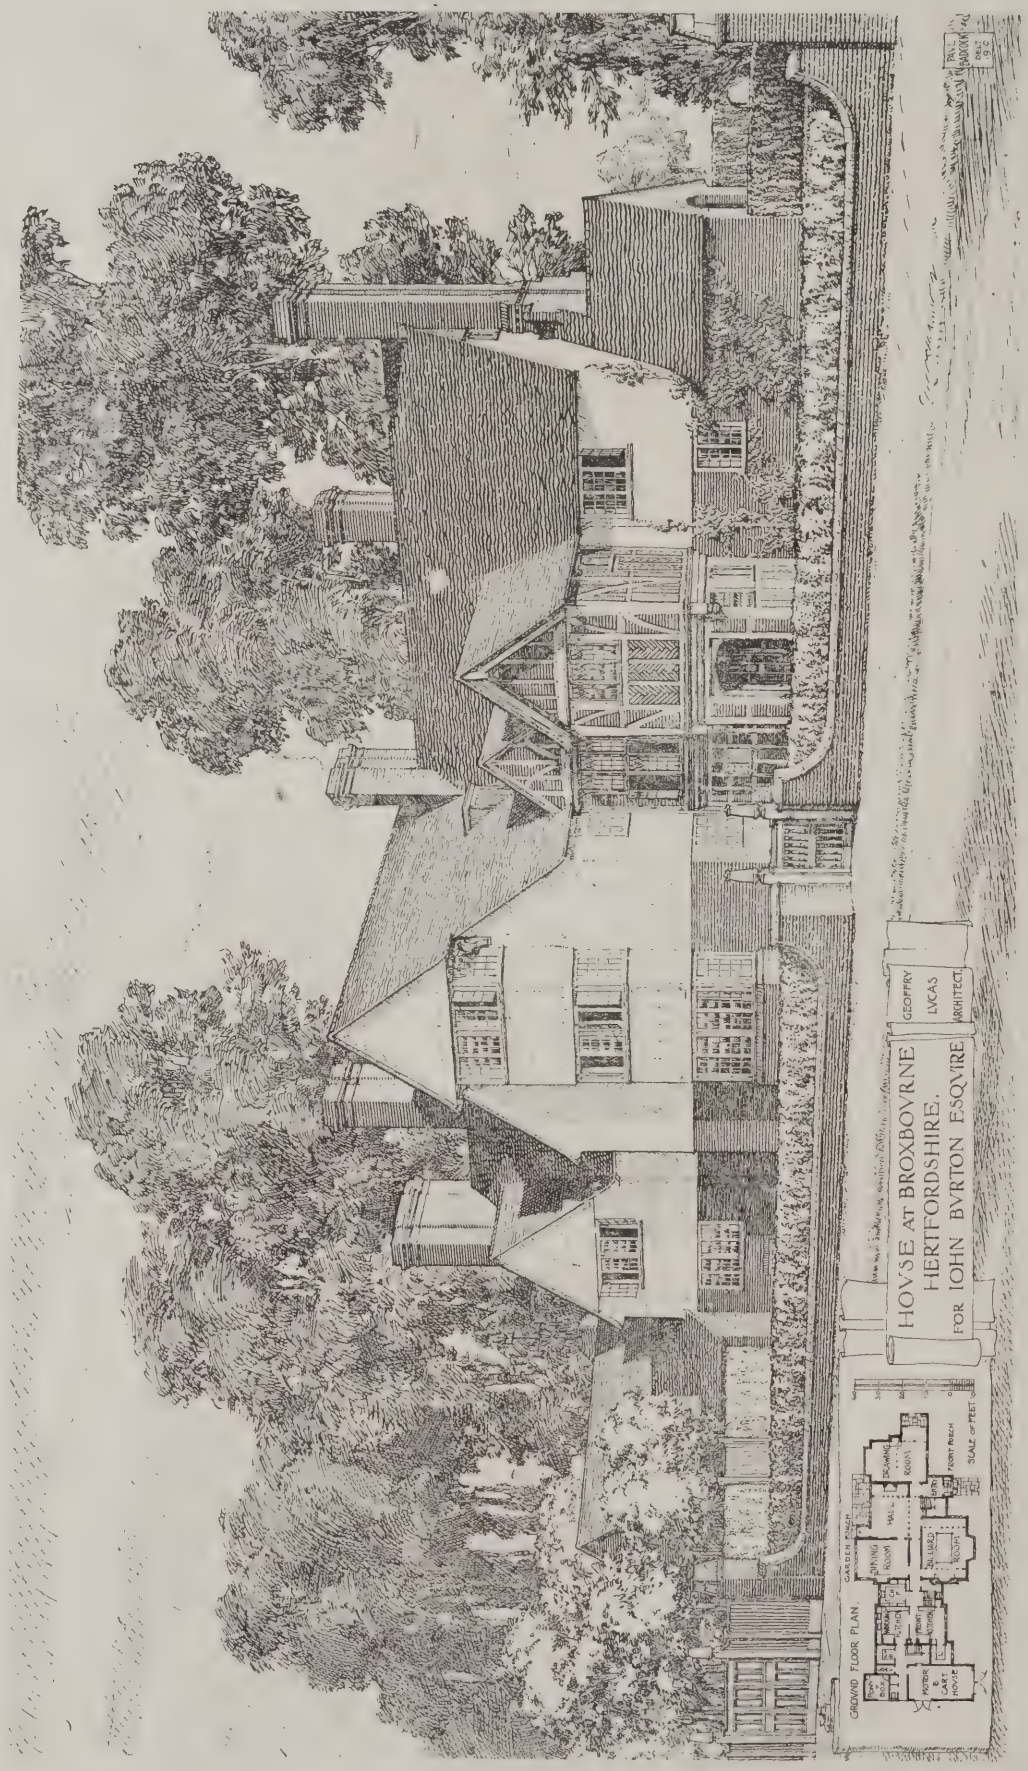
E. S. W. (WANDSWORTH) writes: "Please state (1) Under what acts and by-laws do the district surveyor and sanitary inspector of a certain borough work, and from whom can copies of such acts and by-laws be obtained? (2) Has a district surveyor or sanitary inspector the authority to enter premises to examine drains or fittings without first showing to the satisfaction of the owner or occupier that there is a nuisance existing, or that owing to there being illness in the house there is every cause to believe that the drains or fittings are defective? (3) There being no apparent defects in the drains or fittings of certain domestic premises, are the facts that the drains and fittings are out of date and the drains without manholes sufficient for the district surveyor or sanitary inspector to demand the right to examine and test the same?"

—As to (1) having regard to the other queries, it is probable that the authorities of the borough in question are acting under the powers conferred on them by the Public Health Act, 1875, as amended by the Public Health Act, 1907, an "adoptive" measure, which has probably been adopted by the borough. As to the by-laws, these can be obtained from the town clerk gratis or at most for a few pence. As to (2), the borough surveyor has extensive rights in the matter of inspection. Section 41 of the Public Health Act, 1875, as amended by section 34 of the Act of 1907, provides that on the written application of any person to a local authority stating that any drain, water-closet, earth-closet, privy, ashpit, or cesspool, on or belonging to any premises within their district is a nuisance or injurious to health, or where on the report in writing of their surveyor or inspector of nuisances the local authority have reason to suspect that any such drain, water-closet, earth-closet, privy, ashpit, etc., is a nuisance or injurious to health, the local authority may empower their inspector either with or (in cases of emergency) without notice to enter any such premises and cause the drains to be opened up. If the drain, or etc., is found to be in proper condition, the damage must be made good at the cost of the local authority. If the drain, etc., "appear on examination to be in bad condition, or to require alteration or amendment," the owner or occupier may be called upon to put it right, and if he fail to do so, the work may be done by the local authority at his expense. As to (3), the fact that drains and fittings are out of date may justify inspection; but the occupier cannot be compelled to go to the expense of bringing them up-to-date, as the section does not apply to structural defects (Fulham Vestry v. Solomon, 1896, 1 Q.B. 198). It should, perhaps, be mentioned that if the surveyor says that he has good grounds for believing there is a nuisance, he may apply the smoke test to the drains either with the consent of the owner, or by order of the court. X.

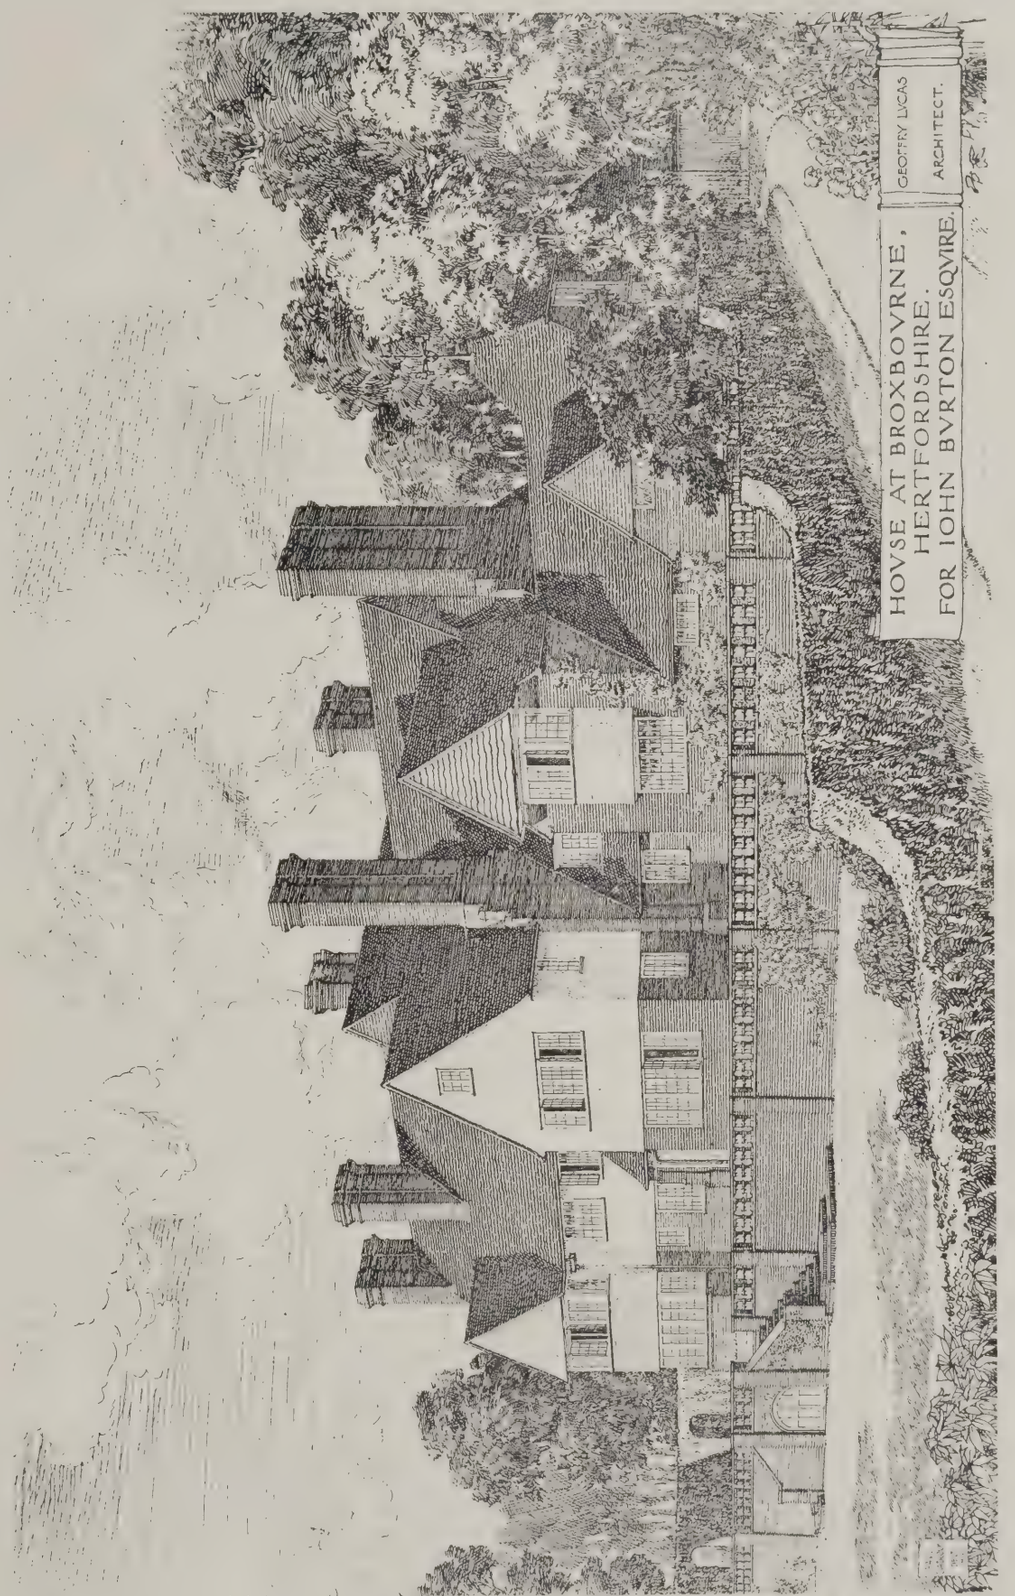
Cold Storage of Beer.

NEMO (CLECKHEATON) writes: "Kindly inform whether sketches [not reproduced] of proposed walls and roof for a conditioning store for bottled beer are suitable. If not, would you please suggest improvements? Is it necessary for the floor to be insulated in a manner similar to the roof, but slag wool not as thick? The floor will be 3ft. above ground. Do you think a flat concrete roof is preferable to a slated roof? Specification No. 7 gives the temperature for beer from 33 degs. to 45 degs. Fah. I am informed that it should be 54 degs. Fah. Which is correct?"

—The section on cold storage in "Specification No. 7" was written by experts, but there may be a difference of opinion as to the best temperature. For the walls the proposed section A would be suitable. For the roof slate boarding and felt would be better than battens. It would be desirable to provide some insulation for the floor, but this need not be so elaborate as that for the walls or roof. Probably a double floor would be suitable, formed by putting 4in. by 2in. joists the opposite way to the present joists, filling in with slag wool and boarding over.



HENRY ADAMS.



Colourless Preservative for Old Woodwork.

A. D. R. (RUGBY) writes: "Could you tell me of a reliable restorative and preservative substance for the external woodwork of an old Gothic porch of the fifteenth century. I want some substance that will not destroy the present grey colour and texture so fascinating in these delightful old examples."

It is very difficult to recommend anything for the purpose you mention. It will be necessary to experiment with a very small portion. Probably oiling with raw linseed oil would be the best thing to do under the circumstances. This will make the colour considerably more mellow, but will affect the general appearance less than any other preservative of which we know. For old oak picture frames a mixture of equal parts of spirits of wine and glycerine rubbed over the surface has an excellent effect, and it is just possible that this might prove satisfactory, although we expect it would be necessary to renew fairly frequently.

HOUSE AT BROXBOURNE, HERTS.

This house has just been completed at Broxbourne, Herts., for Mr. John Burton, on a site adjoining the New River, which flows at the bottom of the garden. The materials are unpicked red-brick facings, cream-coloured roughcast, and hand-made roof tiles. The half-timbered porch is solidly built of English oak with brick nogging. The staircase is of oak, and the hall and staircase are oak panelled. The drawing-room and hall have oak floors. J. Willmott and Sons, of Hitchen and Hornsey, were the general contractors for the work, while Wainwright and Waring, Ltd., of Chiswick, supplied and fixed the lead glazing and wrought iron casements. The Artificers' Guild, Ltd., of Maddox Street, W., supplied the weather vane, ironmongery for front and garden doors, and gas fittings for ground floor rooms, Ramsey and Co., Ltd., of Victoria Street, S.W., the general ironmongery; Bolding and Sons, Ltd., of Davies Street, W., the sanitary fittings; Messrs. Thos. Elsley, Ltd., Bratt, Colbran and Co., and Clark, Hunt and Co., furnished grates, etc. The quantities were prepared by Messrs. J. Gandy and Bennison, of 22, Essex Street, W.C., and the architect was Mr. Geoffry Lucas, A.R.I.B.A., of 14, Hart Street, Bloomsbury Square, W.C.

NEW BUILDINGS.

PROPOSED.

Aberdeen.—At a recent meeting of the Aberdeen University Court, a plan was submitted of the proposed site for building an additional library, classrooms, and examination hall accommodation at King's College, which was generally approved by the Court.

The plan showed the site of the classrooms at the north end of the ground, fronting High Street, formely occupied by the Old Aberdeen Brewery, the library being extended to the north of the present library and at right angles to it. The cost of the building is expected to be upwards of £14,000. Alterations on Professor Harrower's house were authorised, at an estimated cost of from £230 to £250.

Four sets of plans, involving an expenditure of £10,440, have been submitted to the Plans Committee of the Aberdeen Town Council, including a plan of a dwelling-house for six tenants, plans for stores, and a plan for alterations and additions to Holburn Street Public School. The great bulk of the estimated expenditure is in connection with the enlargement of Holburn Street School by Howburn Place.

It is understood that the contract for the new block of buildings to be erected at the corner of Union Street and Huntly Street, for the Royal Insurance Company has been secured by Mr. Alexander Anderson, builder. The contract will involve something like £6,000.

Barnard Castle.—The plans of the new chapel proposed to be erected at the North Eastern County School, at Barnard Castle, have been prepared by Mr. W. D. Caroe, F.R.I.B.A., London, and a view of the interior is on exhibition at the Royal Academy. The new building will be 100 feet in length, and will provide room for between 300 and 400 worshippers. The seating will be arranged lengthways as in many school and college chapels, and a stained-glass window will be placed in the chapel in memory of the late Mr. Thompson Richardson, one of the original benefactors and governors of the school. As Provincial Grand Master of Durham Freemasons, Lord Barnard will shortly lay the foundation-stone.

Barnet.—The workmen's dwelling scheme of the Barnet Urban District Council, which has now been before the public for some three years, formed the subject of an inquiry at the local town hall last week before Mr. W. H. Collin, Local Government Board Inspector. It is proposed to build, as a first instalment, twenty-nine houses at £190 each—a total of £5,510, to which must be added £2,800, the cost of the eleven acres of land to be acquired for sites. The matter will duly be reported on to the Local Government Board.

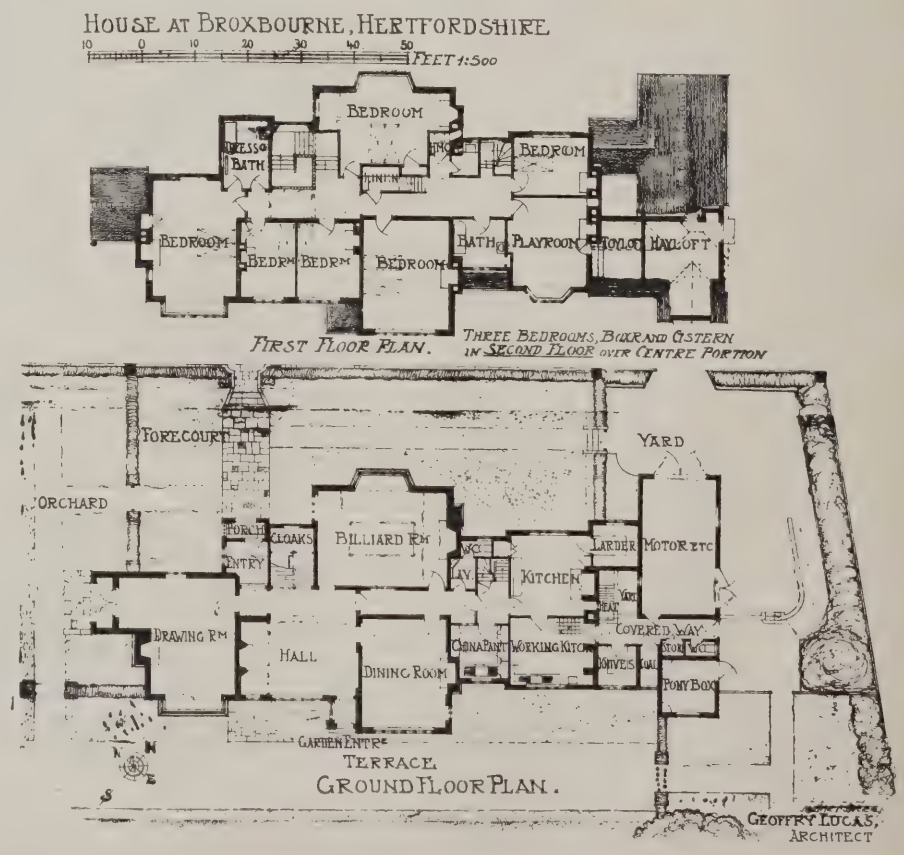
Bedford.—The Town Council has approved the following plans:—Alterations to "Engine and Tender," Midland Road; eight houses, Firbank Road, additions to out-buildings, 65, De Parys Avenue, extension to Vulcan Works, additions to Newnham Rooms, shop and premises, Midland Road.

Bexhill.—An enquiry has been held at the Town Hall by Mr. H. Shelford Bidwell, M.I.C.E., into the application of the Bexhill Council, for the sanction of the Local Government Board to a loan of £6,700 for the defence works on the west parade.

Blackrock (Ireland).—Mr. P. C. Cowan, Chief Engineering Inspector of the Local Government Board, has held an inquiry into the application of the Blackrock Urban District Council for a supplementary loan of £500 for the purpose of erecting working-class lodging-houses.

Brixham (Devon).—An enquiry has been held by Mr. F. H. Tulloch, M.Inst.C.E., at Brixham, on behalf of the Local Government Board, into the application of the Urban District Council for sanction to borrow £800 for alterations and additions to the Town-hall.

Cambridge.—The Town Council has approved the following plans:—Alterations, Panton Street, and Coronation Street, bay window, Trinity College, house Priory Road, shop front, 39, Regent Street, cloister, Grange Road, seven houses, Paradise Street and Grafton Street, workshop and w.c., Grafton Street, three houses, Mawson Road, store house, Caius Street.



Clydebank.—The Clydebank Dean of Guild Court has passed the plans presented by Messrs. John Brown and Company, Limited, shipbuilders, for a new boatshed to be erected in Clydebank Shipbuilding yard. The boatshed will really be a covered building berth, and is designed to facilitate the construction of smaller craft such as torpedo-boat destroyers. The building will be 400 feet in length, and 113 feet in breadth. Messrs. Brown also received permission to make an addition to their offices.

Dublin.—Mr. P. C. Cowan, M.Inst.C.E., Chief Engineering Inspector to the Local Government Board, has held an inquiry in the Council Chamber, City Hall, to consider the details of an application which is being made by the Municipal Council for the sanction of the Local Government Board to a loan of £18,207 for the carrying out of an improvement scheme, under Part 1 of the Housing of the Working Classes Act, 1890. The area of the proposed scheme is known as the Cook Street area.

Dundee.—The St. Andrews Provincial Committee for the Training of Teachers have now secured a site in Dundee for the proposed new Training College and Demonstration-School. The site, is situated in Park Place, in the vicinity of University College, and the properties acquired for the purpose include the Caird Nurses' Home and several villas on the east side of Park Place, and to the north of Harris Academy. Possession of the ground, which extends to about 268 poles, is to be had in May next, and it is expected that the new buildings will take a couple of years thereafter to complete. The total cost of the new buildings is estimated at about £60,000 including £13,700 for the site.

Eton.—The Rural District Council has approved the following plans:—New house at Marsham Waye, Gerrard's Cross, new entrance lodge at Iver, four lock-up shops, Oak End Waye, Gerrard's Cross, upper part to be built at some future time; new house near Potter's Cross Road, Iver, new house, Orchehill Avenue, Gerrard's Cross, additions to the Red House, Taplow.

Halifax.—At the Halifax Town Hall, Mr. M. Keppel North, M.I.C.E., has held a public inquiry on behalf of the Local Government Board into the application of the Watch Committee of the Corporation, for power to borrow £2,045 to erect a district police station at Warley Road, King Cross.

GEOFFRY LUCAS, A.R.I.B.A., ARCHITECT.

Leven.—At a recent special meeting of Leven Dean of Guild Court, plans were submitted by Messrs. Haxton and Walker, architects, Leven, for a higher grade school to be erected for Scoonie School Board, at Mitchell Street, Leven, which were passed by the Court. The School Board have accepted contracts for the erection of the school, the total cost of which will be £5,200

London, N.—The Hornsey Borough Council has approved of the following plans:—Dwelling-house in Stormont Road, Highgate, dwelling-house in Southwood Lawn Road, Highgate, motor and conservatory, dwelling-house in Stormont Road, Highgate, dwelling-house in Duke's Avenue, Muswell Hill, plans for two dwelling-houses in Rookfield Avenue, Crouch End, alteration in and additions to No. 44, Wightman Road, South Harringay, alterations in and additions to No. 1, Fairfield Gardens, Hornsey, dwelling-house in Cholmeley Park, Highgate, and two dwelling-houses in North Hill, Highgate.

London, S.E.—Messrs. F. and E. Davey, Ltd have obtained the contract for the building of a new L.C.C. school, at Manor Lane, Lewisham, the sub-contractors being Messrs. Matthews and Company, 61, St. Mary Axe, E.C. The heating arrangements for the new schools will be in the hands of Messrs. H. J. Cash and Company, Limited, Caxton House, Westminster.

The London County Council has decided not to proceed further in the matter of building a new secondary at Dulwich to replace the county secondary schools at Forest Hill and Sydenham Hill Road.

The Bishop of Southwark has written the Vicar of St. Nicholas, Deptford, that he will recommend the Ecclesiastical Commissioners to make a grant of £1,000 towards the restoration of St. Nicholas Parish Church, which has been condemned by the London County Council.

Long Melford.—A new ferro-concrete bridge is being constructed across the Stour, near Long Melford, by Messrs. Holloway Brothers (Limited), of London. The structure will consist of three spans of 31ft., the ends being supported upon four rows of ferro-concrete piles. The piles are 16in. square by 35ft. long, and the two end rows are placed about 9ft. from the abutment walls. Arched main beams 3ft. deep at the haunches and 1¼ft., in the centre by 9in. wide are supported directly upon the piles, and across beams 9ft. 9in. long by 5in. wide and 12in. deep are placed at 5ft. intervals. The bridge which is to cost £1,100, will provide a 20ft. roadway between kerbs and a footpath 2ft. 6in. wide at each side. The footpath is supported by corbels placed at every 10ft., with an overhang of 18in. The ferro-concrete decking will be 5½in. deep under the roadway and 4in. under the footpaths.

Richmond.—The Town Council has approved the following plans:—New parish hall, Church Road, amended plan of new house, Beechwood Avenue, conservatory, No. 30, Kew Road.

Slough.—The following plans have been approved by the Urban District Council:—Four houses in Montague Road, two in Martin Road, one in Ledger's Road, mill, stables, and cart shed in Colonial Road, additions and alterations at the "Crown" hotel, and a secondary school in William Street.

Swansea.—The Christian Science Society, Swansea, have purchased a site on Walter Road, for a church and lecture hall, and the latter is to be built immediately. The cost of the buildings when completed will be £10,000, Mr. Glendinning Moxham, F.R.I.B.A., Swansea, having been appointed architect.

Teignmouth.—An inquiry has been held at the Town Hall, Teignmouth, by Mr. Reed M.Inst.C.E., for sanction to borrow further moneys for works of sea defence. The Clerk to the District Council, having given the details as to population, rateable value, etc., said the amount required would be £4,750, of which sum £2,000 had already been sanctioned on account.

IN PROGRESS AND COMPLETED.

Balby (Doncaster).—The corner-stone in connection with the extension and enlargement of Balby Church, near Doncaster, has been laid. The present church was built in 1847, and 30 years later was enlarged by the addition of a north aisle, thus bringing the accommodation up to 270. The present enlargement scheme provides for the extension of the nave and north aisle 60ft. in an easterly direction, with vestries, and the erection of a south aisle, which would cost about £3,000, but at present the building of the south aisle and one vestry is left in abeyance, though should funds be forthcoming the full scheme will be carried out. It is now only proposed to lengthen the nave and south aisle, to erect a new chancel, and to make a vestry on the north side, which will add 60ft. to the length of the church. The plans were drawn by Mr. Temple Moore, the well-known church architect, and the building contract is in the hands of Messrs. Mullins and Richardson, builders, of Balby, whose estimate for the work is £1,850, though the furnishing, heating, and other details will bring the total cost up to £2,100. The subscriptions already received amount to £1,400.

Birmingham.—The new public baths just erected by the City Council in Nechells Park Road were opened by the Lord Mayor on Wednesday last. The new baths, which are intended to serve the Nechells Ward, containing an estimated population of 32,218, are built upon a site purchased by the Corporation in February, 1903, at a cost of £1,373 10s., and contains an area of 1,709 square yards, with a frontage of 87ft. to Nechells Park Road and 183ft. to Aston Church Road. The buildings, which involved an estimated expenditure of £21,995, exclusive of site, were designed by Mr. Arthur Harrison, F.R.I.B.A., and are in the modern Renaissance style of architecture; the walls are built in red brick, with stone colour terra-cotta dressings and facings to windows, porticoes, turrets, copings, etc. The internal walls are lined with coloured glazed bricks forming skirtings and dadoes, with ivory white glazed brick filling and terra-cotta treatment to cornices, windows, etc. The floors are laid with marble Terazzo paving, and the major portion of the woodwork has been carried out in pitch pine, and varnished. The main building, containing the swimming bath, measures 109ft. in length and 59ft. in width between walls, and the water area of the swimming bath is 82ft. 6in. in length by 35ft. in width, the floor constructed with a gradient giving a depth of from 4ft. 6in. at the shallow end to 7ft. at the deep end. The bath contains about 95,000 gallons of water. There are promenades on all sides, 7ft. wide, and 63 dressing rooms. A spectators' gallery has been constructed over the dressing rooms on all sides, giving seating accommodation for upwards of 400 persons. The builders are Messrs. John Bowen and Sons, Balsall Heath, and the engineering work has been designed and carried out under the directions of Mr. Job Cox.

Byfleet (Surrey).—The foundation-stone of the new Church of St. John the Baptist has been laid, the temporary iron church having become quite inadequate for the needs of the residents. The proposal is to build a church to seat 600, at an estimated cost of £10,000, but as it will take some time to raise such a large sum, it was deemed advisable to proceed at once with the erection of a portion of the building. The present undertaking comprises the chancel, chancel aisle, north and south transepts, one bay of the nave, the spire and two vestries. The estimated cost of this is £7,000, of which £4,500 has been received. The new church is from the designs of Mr. W. D. Caröe. F.R.I.B.A., architect, London, and is being built by Mr. W. G. Tarrant, of Weybridge. It is to be of Doulting stone, with flint facings, having a red tiled roof, Gothic tracery windows, and oak doors. Its total length will be 133ft., and extreme width across the transepts 84ft., whilst the height will be 41ft. Over the chancel there will be an oak shingle spire, 38ft. high. On either side there is to be a nave arcade with arches. The arcades are to be semicircular, with stone vaulted ceilings, and large pillars of Ridge Park stone. The ceiling will be panelled in oak, whilst inside and out there will be a mediæval finish to the stone work. Accommodation for 300 people will be provided; the paving will be of wood block and red tiles, and the heating by hot water. Foundations have been laid for the whole of the church, the portion left over comprising three bays of the nave and the narthex.

Colchester.—Sir Thomas Barrett-Lennard has laid the foundation-stone of the new lunatic asylum which has been necessitated by the want of accommodation in Essex. The buildings, which are now nearly half-finished, are being erected at a cost of over £248,000 on a site about two miles north of Colchester, and they will accommodate 2,000 patients. The new buildings include a large recreation hall with stage and proscenium, and it was mentioned that one of the finest cricket grounds in the Kingdom would be laid out.

Crumlin (Mon.).—The new miners' rescue station, situate in a field adjoining the Great Western Railway, has been completed, being built of red brick. The building includes galleries representing the passages of a coal mine for the purpose of training squads of men, rooms for cleaning, overhauling, repairing, and storage of the apparatus, and residential quarters for the instructor and his family. Men from each colliery will be trained in squads to form brigades for rescue purposes in the event of accidents. The contractors are Messrs. Gregory Brothers, Pontnewydd, and the architect Mr. Webb, Blackwood. It is estimated that the cost of the erection and the equipment of the station will be about £2,000.

Dunblane.—The Memorial Chapel of the Queen Victoria School, Dunblane, the foundation-stone of which was laid by the late King Edward, has been formally opened by the Moderator of the Church of Scotland. The chapel, which is rectangular in plan, forms the chief architectural feature of the school buildings, and is of the late Gothic style, of a distinctly Scottish character. There is one transept and a small chancel, with a nave and two aisles. There is also a small back gallery primarily intended to accommodate a band. Seating accommodation is provided for 400 people. At the junction of the transept with the nave there is a massive central tower and spire. The exterior of the building is rough-cast, with stone base and stone dressings at the entrance door, windows, etc., and the roofs are covered with special slates selected to harmonise with the stone and rough-cast. The architects are Messrs. John A. Campbell and A. D. Hislop, Glasgow.

Eastbourne.—The foundation-stone of extensive additions to St. John's Church, Eastbourne, was recently laid, the architect being Mr. A. R. G. Fenning, F.R.I.B.A., of Lincoln's Inn-fields, London. The whole cost of the work will be borne by Mr. and Mrs. Rube, who intend it as a memorial of their late son, Lieutenant E. A. R. Rube, of the King's Dragoons, who died at Lucknow. In the chancel there will be a new oak reredos designed by Mr. Arthur Blomfield, F.R.I.B.A., and at the south side of the sacrarium a marble monument to Lieutenant Rube will be erected. The nave is to be lengthened, two new aisles (taking the place of the existing ones) will be built, and there will be a new clerestory. Rising to a height of about 110ft., the new tower will have four pinnacles and an oak shingle spire.

Market Harborough.—The Cottage Hospital which has been erected on a site given by Mr. George Green, J.P., C.C., on the Coventry Road, Market Harborough, has been formally opened. The cost of the building was £2,100.

Meltham (Huddersfield).—The memorial-stones of a new school, to cost £2,000, have been laid at Meltham, towards the cost of which, £1,080 has already been raised.

SOCIETIES' REPORTS.

Manchester Society of Architects.

Manchester Society of Architects paid a visit to Peover Hall, near Knutsford, Cheshire, on June 11th, under the leadership of Mr. Isaac Taylor. By the courtesy of Sir H. S. Mainwaring, Bart., arrangements had been made for the members to be conducted through the Hall and adjoining buildings. The main portion of the Hall, a red brick building, of Georgian date, is hardly an inspired piece of work, although it has a very simply and effectively treated staircase. The large Elizabethan wing, however, containing a huge kitchen and five upper rooms, has delightful charm. The fine colour of the old brickwork and stone, the stone mullioned and transomed windows, the grouping of the chimneys and sharply pointed gables all contribute to an effect of the utmost beauty. It was this portion of the group of buildings that figured most prominently in members' sketchbooks. The stables are extremely interesting, especially the earlier block, containing Jacobean stalls sumptuously adorned with oak columns and characteristic strapwork of the period. The adjacent church contains in the side chapels some fine tombs of the Mainwarings.

On the Tuesday evening following a number of members visited Middleton, and inspected two elementary schools, by Messrs. Edgar Wood and Sellers, under the guidance of Mr. Sellers. While it is quite the usual thing nowadays to find elementary schools planned with every requirement and convenience, duly supplied with good lighting and proper aspect, it is rarely that one finds these qualities combined with so serious an attempt at architectural expression as in the case of the Elm Street and Durnford Street schools. At Elm Street the treatment of the entrance court, with groined cloisters at the sides and a semicircular sweep of low buildings in front of the central hall, and the striking treatment of the interior of the central hall and its fenestration are the outstanding features of a remarkable design; while at Durnford Street, where the plan is on more usual lines, the building towers up in great masses, the dignity of which is immensely enhanced by the severity and restraint of the design.

The Junior Institution of Engineers.

At the last meeting of this Institution a paper entitled "Notes on the running of an Electricity Works," by Mr. L. Marshall Jockel, winner of the Durham Bursary of 1908, was read and discussed. The paper contained an account of the author's observations during the time he held a subordinate position in an electricity works supplying current for lighting and traction purposes, etc.

A recent visit of the Institution was to the "Daily Mail" printing office, Carmelite House, and was very largely attended. The operation of the Linotype machines, "Autoplate" casting machines, and the printing presses in the machine room were all shown, and the details of the work explained to the members. Mr. Chas. F. Hart, Mechanical Manager, kindly arranged the necessary facilities.

The last visit was held on Saturday last, to Letchworth for inspection of the Garden City, when its features of architectural and engineering interest were pointed out.

The Institution of Mechanical Engineers.

A southern district meeting was held at the committee room, Royal Pavilion, Brighton, on Saturday, June 18th. The following papers were read: "Some Aspects of the Housing and Town Planning Act, 1909," by Mr. T. C. Barralet, surveyor to the Godstone R.D.C. (member), and "Notes on the Use of Concrete," by Mr. Spencer Sills, assistant city surveyor, Rochester (member). After lunch specially conducted visits were paid to the Corporation Destructor Works and the Falmer Waterworks, by kind permission of Mr. H. Tillstone, the borough surveyor, and Mr. J. Johnston, M.Inst.C.E., the borough waterworks engineer.

TRADE AND CRAFT.

A Double Flush Cistern.

A demonstration was given recently of a new double flush cistern (Newland's patent) at the premises of Messrs Sibley and Co., 171, Queen Victoria Street, E.C. The tank consists of two compartments which are operated by the same handle, and which can, if desired, be flushed in rapid succession. The internal mechanism, which is quite simple in character, is all worked from one central axis; and the parts being interchangeable, and thus allowing of the inlet valve being placed upon either side of the cistern, the apparatus, unlike the ordinary type, can be fixed in any required position. The cistern is oblong on plan, and is divided roughly into two square chambers, each of which contains two gallons of water. The tank in which is inserted the inlet valve (and this, as already explained, can be either) naturally fills first, and the water, passing over the internal division, enters the second, and fills that also, when the supply is automatically cut off. The cistern works mechanically, the striking handle being thrown into position after each flush. At the conclusion of the second flush the operation has, of course, to be repeated. The two float balls have a somewhat greater lifting power than the single ball, and thus render more certain the proper shutting off of the water supply. A chamber fixed below the syphoning tubes contains an anti-syphoning tube which is said entirely to overcome the noise and trembling which usually accompany the ordinary type of cistern. Among the advantages claimed for this new invention are that it is practically silent, is least liable to be affected by frost, and, in consequence of the improved syphoning plunger, renders unnecessary a second operation of the handle. The invention is protected in every civilised country.

COMPETITIONS.

New Bridge, Rochester.

At a meeting of the Rochester Bridgewardens, seven schemes and tenders were received for the construction of Rochester Bridge. These were submitted to the consulting engineers, Messrs. Baker and Hintzig, who strongly recommended that the tender of Messrs. William Arroll and Sons. should be accepted although the price was £7,000 above the lowest tender. The difference, it was stated, was mainly due to a provision for making the bridge fit for traffic during the reconstruction work. The Bridgewardens accepted Messrs. Arroll's tender, subject to the approval of the Charity Commissioner.

LIST OF COMPETITIONS OPEN.

JULY 9. PROPOSED USHER HALL, EDINBURGH. Particulars given in our issue of April 20th. Inquiries to be addressed to Thomas Hunter, Town Clerk, City Chambers, Edinburgh.

JULY 20 YSTRADGYNLAIS SEWERAGE SCHEME. The Rural District Council will pay £20 for the most suitable scheme for sewering Ystradgynlais Lower. Particulars from Mr. T. Watkins, surveyor to the Council, Ystradgynlais.

JULY 25. NEW ELEMENTARY SCHOOL, WINCHESTER. Designs are invited from Hampshire Architects for Elementary School Buildings to accommodate 330 children. Particulars of Thomas Holt, Town Clerk, Town Hall, Winchester.

AUGUST 23. COUNTY OFFICES AT NAVAN for the Meath County Council. Inquiries to the Secretary, Meath County Council, Ireland.

AUGUST 31. COVENTRY. NEW ELEMENTARY SCHOOL in Centaur Road. Limited to Architects practising in Coventry. Particulars given in our issue of March 16th.

SEPT. 5. THE QUEEN'S UNIVERSITY OF BELFAST. Enlargement of the present buildings at a cost of about £52,000. Particulars in our issue of June 1st.

NO DATE. ASHTON-ON-MERSEY. WESLEYAN SUNDAY SCHOOL. Limited to Architects practising within ten miles of Sale. Inquiries to Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

NOTES ON PAINTING AND DECORATION.

By A. S. JENNINGS.

I should like to supplement my hints on varnish-testing with a few further notes. The subject is brought back to my mind by hearing of oak varnish being offered at the astonishing price of 2s. 6d. a gallon! Considering that the best oak varnish costs at least 10s. to 12s. a gallon, the question occurs, How can the superiority of one over the other be ascertained? I have already explained the method of varnishing painted boards and making a comparison between the varnish to be tested and one which is known to be of first-class quality. But one may go further and make a comparison with a very cheap varnish. Take a sheet of glass and support it at an angle of 45 degrees. Pour on the middle of it at the top a little of the varnish to be tested and spread it out right and left with the finger, allowing it to run down the glass without further interference. Leave a space on each side, and to the left pour on a little of a really good varnish, and on the right a little of the two-and-sixpenny quality. Now watch the behaviour of the three varnishes, and you will obtain some valuable information concerning the probable durability of the varnish under test. The one that is of good quality will probably run down and flow out quite smoothly, while the inferior stuff will in every likelihood separate and probably become cracked, "alligatored," and go wrong generally. Another very useful test is to apply one or two coats of varnish to a sheet of non-absorbent black paper. Allow a week for it to become quite dry and hard. If the paper is then bent or folded the film will, if the varnish be a good one, be so elastic as not to be affected, but if of inferior quality it is certain to crack or at least chip.

Although "paint removers" or paint solvents have now been on the market for some years, it is curious to note how few people, other than decorators, know anything of their qualities. Architects, as a rule, when spoken to concerning this class of specialities, imagine that reference is made to the old-fashioned and very nasty paint solvents which consisted of a mixture of soda and quicklime. These, however, have now given place entirely to a mixture of liquids of which acetone or fusil oil is the chief ingredient. The liquid is brushed on the paint, which in a very short time is rendered so soft that it may readily be scraped off. The surface is then wiped down with a piece of "waste" dipped in benzine or turpentine, and the work is ready for repainting. When these mixtures are used outside they are apt to evaporate too quickly, and to prevent this in the best brands wax is mixed with it, which holds the fluid. I have used these paint removers on old painted work consisting of perhaps a dozen coats. In very hard cases a first coat may only take off a portion of the paint, and a second coat of the "remover" may be required.

COMING EVENTS.

Saturday, July 2.

EDINBURGH ARCHITECTURAL ASSOCIATION. —Annual Excursion to Floors Castle and Kelso Abbey.

Thursday, July 7.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS. — Excursion meeting to Blyth. Leaves Newcastle-on-Tyne Central Station, 1.42 p.m.

FEDERATION NEWS.

National Federation.

The annual meeting of the Joint Committee of Appeal under the agreement between this Federation, the National Association of Master Plasterers and the National Association of Operative Plasterers, was held in London on June 20th. The business was of a formal character, and it was reported that no disputes were pending. An interesting discussion took place on the question of the desirability of setting up arbitration committees under the Workmen's Compensation Act to settle compensation cases.

Mr. A. G. White and Mr. T. Otley were re-elected joint secretaries to the Board. Mr. S. Smethurst was re-elected chairman, and Mr. A. J. Scrivener vice-chairman.

Meeting of the Administrative Committee.

A meeting of this committee was held in London on June 21st. In addition to the usual routine business, the committee considered the following matters of general interest.

Contractual Referees in Building Contracts, with special reference to the further steps to be taken to put an end to the practice of appointing officials employed by Municipal and other public authorities in the dual capacity of architect, surveyor, or engineer for works, and of sole Contractual Referee in regard to disputes that may arise in connection with the work they are directing.

Protection of Members.—The meaning of accepting a tender "for the sum of £——, as per quantities," is commonly understood to make the quantities part of the contract, and to involve the measuring-up at completion with payment for the work actually done. By the recent decision in re Wallace v. Douglass, it would appear that a contract in the terms indicated is a lump sum contract.

The case arose between a sole contractor and his sub-contractor, the latter tendering to do certain work for a certain sum as per quantities, and the former accepting the tender in similar terms. On completion, the sole contractor wished to measure up the whole work and pay for what had actually been done, but the sub-contractor refused, claiming that the contract was for a lump sum and that only the variations should be dealt with. According to the decision of the county court judge, the sub-contractor is right.

The matter is deemed of importance to the trade, and has been sent forward by the Northern Centre with a view to asking the National Federation to contribute to the cost of an appeal. The committee has made a recommendation accordingly to the Executive Council.

Annual Conference of Secretaries.—The annual conference of secretaries was authorised, and it is proposed to hold it about the 20th October in Manchester. Suggestions for subjects for discussion and promises of contributions in the shape of papers are desired, and will be appreciated. In order to afford more time for discussion, it is proposed to have the papers set up and distributed beforehand to those who intimate their intention to be present.

Recommendations to and subjects for discussion at the general meeting, on 27th July, were considered, and the following approved:—

Proposed Addition to Rules of Conciliation.—"That it be a recommendation from the National Board to the parties to the Conciliation scheme, that members of the various Conciliation Boards who may be members of any Board having considered a case, shall not sit personally on any subsequent hearing of the said case, but shall send substitutes."

P.C. Sums in Quantities.—Discussion on the principles underlying the present practice in regard to P.C. sums in quantities.

Quantities and Specifications.—Discussion on "Are architects justified in endeavouring to enforce the literal interpretation of obsolete specification descriptions in respect to materials."

Any other subjects which may be approved by the President.

Summer Meetings at Chester.—It was intimated that the Lancashire, Cheshire, and N. Wales Federation, which has the local arrangements in hand, are giving a dinner on Tuesday evening, July 26th, to the representatives attending.

It is hoped that a Mayoral reception may be arranged for Wednesday morning, the 27th July, also an excursion to Llandudno or some other place in North Wales, for Thursday, the 28th July.

Secretary's Report.—The Secretary submitted his report for month ending 31st May, from which we hope to give extracts in a future issue.—A. G. WHITE, Secretary.

South-Eastern Centre Conciliation Board.

The annual meeting of the South-Eastern Centre Board of Conciliation was held in London on June 13th. The business was of a formal character, there being no disputes before the Board. Mr. W. F. Wallis was re-elected chairman, and Mr. Somerset vice-chairman. Mr. A. E. Hatcher was re-elected operative secretary, and Mr. A. G. White undertook to continue to act as employers' secretary pro tem. pending a definite appointment. A discussion took place on the question of the advisability of setting up arbitration committees under the Workmen's Compensation Act.

Northern Counties Federation.

A meeting of the Executive Council of the Northern Counties Federation of Building Trade Employers was held at Sunderland on June 2nd, Mr. A. Ross presiding.

The draft circular for distribution among the members respecting the Executive Council's recommendation to renew their members' workmen's insurance with the official company (the Federated Employers' Insurance Association, Ltd., Manchester) was approved of.

Attention was drawn to the decision given by Mr. Justice Ridley in the case of Wallace v. Douglass and its effect upon members of the Federation. The decision makes a tender "as per quantities" a lump-sum contract, which is in direct conflict with the practice of builders and contractors, who, having incorporated the bills of quantities in their contract, have relied upon their being the basis of the contract and upon being paid for their work in accordance with such bills. An appeal against the decision has been lodged. A summary of the facts, and the interpretation placed upon the National form of contract when the bill of quantities is incorporated into the contract, was given by the secretary, who mentioned that Mr. Stephen Easten, of the Newcastle Association, of which the defendants are members, had brought this question before this Federation and the Northern Centre, which latter body had arranged to draw up and forward the case to the National with a request that they will prosecute the appeal, as the question is of vital interest to the building trade. Mr. Hope said he had seen London agents and interviewed the National secretary, and discussed the matter with him. It was unanimously resolved:—"That this Federation approve of the action of Mr. Easten in bringing this case before this Federation and the Northern Centre, and thank him for the pains he has taken in the matter. They also thank the Northern Centre for the decision arrived at by that body. Further, that this Federation is of opinion that the case is a legislative matter affecting the building trade, and urge upon the National Federation the importance of dealing with the matter on those grounds, and giving their utmost support to financing the appeal. Further, that pending the consideration by the National Federation, Messrs. Ritson and Hope take all necessary steps in connection with the appeal, and that the steps already taken by Mr. Hope be approved of."

The secretary reported that arrangements had been entered into for the organisation of a branch at Bishop Auckland. He hoped to be able to make similar arrangements in connection with the Durham and Chester-le-Street Districts.

The proposed amendment forwarded to the National Federation by the Lancashire, Cheshire, and North Wales Federation with respect to Clauses 30 and 31 of the National form was discussed. It was agreed that the proposed amendment is desirable without expressing any opinion as to the time being opportune to seek this and other amendments.

Attention was drawn to the lamented death of Mr. Wilfon A. Rycroft, secretary of the Newcastle Association, and it was resolved: "That letters of condolence be sent to his family expressing this Federation's sympathy" It was agreed to hold the quarterly meeting at Darlington.—W. H. HOPE, Solicitor, Secretary.

Barrow-in-Furness.

At the monthly meeting of Barrow-in-Furness Master Builders' Association, the secretary read a notice of matters the operatives desired to bring before the Conciliation Board, but it was pointed out that as the matters had not been previously discussed by the local representatives of masters and men, it was out of order.

The annual meeting of the Conciliation Board was held, at which the officers for the year were appointed, and a statement of grievences by the operatives was made, but was not discussed, as the rule had not been observed as to local committee dealing with them first. A meeting of the local committee was arranged for.

At a meeting of the Local Committee of Employers and Employees, the questions which the operative joiners wished to be discussed were introduced by their secretary, but the matter had to be postponed for further inquiry.

The question as to whether the airship shed at present in process of erection came under the category of ordinary building construction was next discussed, but as a final decision could not be arrived at, and as the building was so near completion, it was decided that where an erection was again taking place of a special character, such as this, the contractor should notify the secretary of the Operatives' Society, and the matter duly be considered, so as to meet the views of the operatives and avoid breaking any of the accepted local rules.

The secretary of the operative bricklayers introduced the question of plasterers encroaching on their work, which it was stated was done to a considerable extent. It was pointed out by the employers that in small jobbing work it was almost impossible to avoid this, but agreed that it should not be done to any extent, and the matter would be brought up at a special meeting to be held.

At a special meeting of the Association held immediately after the close of the foregoing meeting the result of the meeting was reported, and the secretary was instructed to write to the master plasterers asking them to see to it that in future they carefully avoid encroaching on the work of the bricklayers.

A representative was appointed to assist the committee of the Local Hospital Saturday demonstration.

The remainder of the evening was spent in consideration of matters in relation to workmen's compensation insurance.—J. BAKER, Sec.

Manchester, Salford, and District.

The quarterly meeting of the General Committee of the Manchester, Salford, and District Association was held on May 26th, Mr. Samuel Gerrard presiding.

Messrs. J. Hibbert and Co., builders, Messrs. Huntingtons, Ltd., slaters; and Albert Riley, painter, were considered, and they were duly elected to membership.

The half-yearly report drafted by the secretary was considered, and adopted for presentation to the annual general meeting of the association, and was also the annual statement of accounts.

A notice to amend rule 31 of the L.C. and N.W. Federation by making provision for the names of hon. members to be included in the official lists of Federation members, was considered and unanimously agreed to.

The annual general meeting was held at the Boardroom, Blackfriars Street, on May 26th, Mr. Samuel Gerrard presiding.

The minutes of the half-yearly meeting held in November last were read and confirmed.

The half-yearly report as presented by the Committee was considered and duly adopted for circulation amongst the members. This report, though showing a slight decrease in membership (the cause of which is attributed to bad trade, necessitating several members giving up business), places before the members the good work the association has been carrying on during the past half-year. The number of meetings held in connection with the association for the half-year totalled 39. The relations between the association and the various operative societies are reported to be of the happiest nature.

The master concretors' separate society are considering the advisability of disbanding their association, with a view to transacting their business in future as a branch of the general organisation.

As regards unsatisfactory conditions of contract, the association have been very successful in approaching architects and public bodies in getting such objectionable conditions amended, notably with respect to the Salford Town Hall extension, many sole arbitration clauses, and applications for priced schedules to accompany tenders.

Mr. Harry S. Daniels, of the firm of Messrs. James Daniels and Sons, of Pendleton, was elected president of the association for the ensuing year. Messrs. W. Tinker (Messrs. Young, Tinker and Young) and Mr. James Higson, J.P., were elected the senior and junior vice-presidents respectively. Mr. William Green (Messrs. Megarity and Co.) was elected the hon. treasurer, and Messrs. John Gibbons and James Daniels were duly elected hon. auditors for the ensuing year. The General and Emergency Committees of the association were re-elected with the substitution of Mr. Wm. Davies for Mr. James Daniels, now member ex-officio. The branch trade committees were duly elected, as were the representatives on the Executive Board of the Lancashire and Cheshire Federation, and the Standing Trade Committees of the same Federation. The representatives of the Local Conciliation Board were also re-elected.

On the recommendation of the General Committee, a new rule was adopted to provide for the admission of manufacturers, merchants, and dealers, commercially interested in the building or allied trades, to become associate members of the association.

A draft set of rules as sent up by the stonemasons' branch, to be binding on the members of their branch, were before the meeting, but as they did not receive support no action was taken thereon.

The following was adopted as a new rule of the association:—"That no member of this association shall deposit open schedules with architects or public authorities for any work within the Manchester area except with the consent of the General Committee of the association."

A proposal was considered from the stonemasons' branch for the adoption of a rule to prevent a member of the association from going on to the job of another member until such member has been fully paid off for the work he has done, or has given his consent in writing. As this had not been before the General Committee, it was decided to defer consideration thereof until the committee have had an opportunity of discussing the same.—JOHN TOMLISON, Secretary.

York.

An executive meeting of York Association was held at the Old George Hotel on May 31st, the president (Alderman J. Birch) in the chair.

The question of builders refusing to tender for work above a certain figure unless quantities were supplied, which had been referred to the executive, was adjourned, pending receipt of particulars as to action taken on the same subject by the Yorkshire Federation.

The official forms of sub-contract were considered and approved, and it was resolved to purchase a supply for use by the members.

The forthcoming revised rates of tariff offices for workmen's insurance, together with the cover given, were considered. It was felt that the heavy increases proposed were in many cases unduly excessive. The secretary was in communication with reputable offices, and he was instructed to obtain full particulars from non-tariff offices as to cover afforded and rates, and report to a future meeting of the executive.

It was resolved to hold an excursion, and the place selected was the Lake District. The secretary was instructed to carry out all arrangements.

Mr. W. Mansfield was placed on the executive, vice Councillor G. Mansfield, deceased. Mr. W. Birch was placed on the local Board of Conciliation vice Councillor Mansfield, deceased.

A new member was elected.—J. HAGUE, Solicitor, Secretary.

Sheffield.

The monthly meeting of Sheffield Master Builders' Association was held on June 9th, the president, Mr. W. Longden, in the chair.

Mr. Davidson, secretary of the Yorkshire Federation, attended, and gave some particulars of the Federation insurance scheme, through which members were recommended to effect their insurances.

It was mentioned by the secretary that the date for the projected excursion to Paris and Brussels appeared to have been inconvenient, and as the number of replies received did not warrant its going forward at present it had been cancelled.

A report was given of the deputation to the City Council in regard to by-laws, more especially as affected the sizes of roof timbers, this deputation having taken very strong exception to the excessive increase of sizes. (Since the meeting the deputation have met a representative of the Architects' Society who was primarily responsible for the insertion of the sizes objected to, and, as a result, the sizes suggested by the association have been confirmed to the City Council. It is expected, however, that the deputation, along with a representative of the architects, will have an opportunity of further discussing the matter with the Council before the by-laws are formally passed.—THOS. SMITH, Secretary.

Nottingham.

The Local Conciliation Board having failed to come to an agreement on the proposed working rules, of which notice had been given by the Builders' Labourers' Society, the matter was referred to the decision of a Board of Trade arbitrator on the application of both parties.

The Board of Trade appointed Mr. A. A. Hudson, and Mr. Hudson attended at the Nottingham Exchange on June 8th, when representatives of the Association of Building Trades Employers and of the Builders' Labourers' Society laid the case before the arbitrator.

The arbitrator's award has now been received, and is as follows:—

WORKING RULES OF THE BUILDERS' LABOURERS IN NOTTINGHAM AND DISTRICT.

RULE 1.—WAGES.

The standard rate of wages for builders' labourers shall be 6½d. per hour all the year round.

Labourers shall carry 9 common bricks, 8 facings, and 8 blues, all round until the walls of any building are 30ft. from the ground level, and one brick less above that height. The labourer when working on chimney shafts when they exceed 50ft. from the ground level, repairs to boiler seatings and flues, and to bakehouse ovens, and bridge foundations, and culverts when working in water, shall receive ½d. per hour extra.

This rule not to apply to excavators, unless engaged on buildings or building operations. In the case of any aged workmen not being considered efficient, it is open to the employer to make arrangements with the Society for a lower wage.

RULE 2.—WORKING HOURS.

From the nearest Monday to the 1st March to the nearest Monday to the 31st of October:—Monday, 8 a.m. to 5 p.m.; Tuesday, Wednesday, Thursday, Friday, 6 a.m. to 5 p.m.; Saturday, 6 a.m. to 12 noon. Total, 51½ hours.

Note.—The labourers undertake to agree with any change of the working hours of the bricklayers.

From the nearest Monday to the 31st of October to the nearest Monday to the 31st of January:—Monday, Tuesday, Wednesday, Thursday, Friday, 8 a.m. to 4.30 p.m.; Saturday, 8 a.m. to 12 noon. Total, 41½ hours.

From the nearest Monday to the 31st of January to the nearest Monday to the 1st of March:—Monday, Tuesday, Wednesday, Thursday, Friday, 8 a.m. to 5 p.m.; Saturday, 8 a.m. to 12 noon. Total, 44 hours.

One hour for dinner throughout the year from 12 noon to 1 p.m.; half-hour for breakfast for the eight summer months, from 8 a.m. to 8.30 a.m. (Mondays excepted).

RULE 3.—OVERTIME.

A full working day to be made before overtime be charged. For the time worked after the ordinary day is concluded till 8 p.m. time-and-a-quarter shall be paid; after 8 p.m. until starting time on the following morning time-and-a-half shall be paid. From 12 noon on Saturday to 12 midnight time-and-a-half shall be paid. From 12 midnight Saturday to starting time on Monday morning double time shall be paid; and double time for Christmas Day.

Note.—In urgent cases where found necessary to employ two gangs, the day rate shall apply to night gangs the same as day gangs, with an addition of ¾d. per hour.

Note.—Where the works are stopped from any cause over which the workman has no control, the full working day shall not be required to entitle to overtime rate.

This rule does not apply to slaters' labourers.

RULE 4.—OUT-OF-TOWN WORK.

Any workman being discharged when working out of town, or not paid on the works, shall have notice given him to take his tools with him, and in default of such notice he shall be paid for his time in going over and bringing them home, and third class railway fare.

RULE 5.—PAYMENT OF WAGES.

Payment of wages to commence as soon as work has ceased, and if more than half-an-hour elapse between the time of leaving work and the commencement of payment of wages the time shall be paid for as if actually at work. (See Rule 3.)

RULE 6.—AUTHORITY OF EMPLOYERS.

Each employer shall have power to conduct his own business in any way he may think advantageous, in the matter of letting work, in using machinery and implements, and in all details of management, not infringing these rules.

RULE 7.—CONCILIATION.

Should any difference arise between employer and employed, either party may require the same to be laid before a meeting of six persons chosen by the employers and six by the employed, and their decision shall be final and binding on both parties. In case such persons fail to meet or to come to a decision within fourteen days from the difference arising, the question shall forthwith be referred to the Local Conciliation Board, and should this Board fail to come to a decision within fourteen days from the date of reference of such question to it, the secretary of the Building Trades Employers' Association or the secretary of the Federated Builders' Labourers of Great Britain and Ireland (Nottingham Branch) shall be at liberty to call upon the Board of Trade to appoint an arbitrator, and the decision of such arbitrator shall be final and binding on both parties. No strike or lock-out, nor other suspension of work, shall take place until such procedure has been followed.

RULE 8.—SHEDS AND MESS-HOUSES.

That there shall be a lock-up shop provided for workmen to get their meals in, and to put their tools in with safety.

RULE 9.—NOTICE.

That these rules be considered binding, and if either party wish for any alteration they shall give the other six months' notice.

The above are the working rules referred to in my award published this 13th day of June, 1910.—(Signed), A. A. HUDSON.

W. J. BARTON, Secretary.

Sunderland and District.

A general meeting of the Sunderland and District Building Trades Association was held on May 25th, Mr. J. Morice Wright in the chair.

The recommendation received from the Executive Council of the Northern Counties Federation recommending the continuance of the Federated Employers' Insurance Association, Ltd., of Manchester, as the official insurance company of the association, was considered, and it was resolved:—"That this association fall in with the recommendation of the Executive Council of the Northern Counties Federation; at the same time, should any member desire to insure with another company, that he be requested to insure through the association's agency, otherwise that he pay to the association a sum equal to the commission on his insurance placed through another agency, and thereby lost to the association."

The recommendation from the Executive Council of the Northern Counties Federation with respect to the affiliation of Allied Trades Associations with the local associations was approved of, as was also the recommendation with respect to quantities being supplied for all jobs of over £500, and over, becoming the Federation rule.

The proposed amendments forwarded to the National Federation by the Lancashire, Cheshire, and North Wales Federation with respect to clauses 30 and 31 of the National form of contract were considered, and, with the exception of the time suggested for the payment of the balance of the contract sum, were approved of.

A report was given as to the proceedings of the annual meeting of the Northern Centre Conciliation Board, at which the matter of the violation of the local stonemasons' working rules was considered, and at which a resolution was passed that the member in question should be requested to conform to the working rules. — W. H. HOPE, Secretary.

Plumbers v. Heating Engineers.

Operative plumbers frequently protest against work to which they (the plumbers) lay claim being done by heating engineers, and recently the matter has been brought to a crisis at Sheffield, where upon several occasions the plumbers have upon this account struck work. Consequently a joint conference of all parties concerned was arranged, and this was held on June 8th at the Builders' Exchange, Sheffield. The Master Builders' Association was represented by Messrs. William Longden (president), A. J. Forsdike, and T. Eshelby; Sheffield Architects' Society, by Messrs. Mitchell Withers, J. R. Wigfull, and W. C. Fenton; the Master Heating Engineers, by Messrs. F. Biggin, H. S. Moorwood, and Thos. H. Firth; the Operative Heating Engineers, by Messrs. M. Brummitt, L. Green, and R. Sewell; the Sheffield Master Plumbers, by Messrs. C. Hickson, J. Baxter Corrie, and H. A. Ward; and the Sheffield Operative Plumbers, by Messrs. T. Walton, W. H. Hall, and E. Robinson. Mr. A. J. Forsdike was voted to the chair.

In opening the proceedings the chairman pointed out the disinterestedness of the architects and builders, whose sole desire was the avoidance of the friction to which the rival claims had given rise. In these days of conciliation boards, the stoppage of works by means of strikes was not the best method of settling disputes.

Mr. Hall, on behalf of the Operative Plumbers, contended that the placing of pipes for the conveyance to and from domestic utensils was plumber's work. If it had been found that for large installations copper was a better material than lead, that was no reason why another set of men should be employed on the work. Fitters had been employed to place certain pipes, and plumbers were called in to finish the work. If the plumber was necessary at all, he was necessary from the commencement, and therefore the work should be in the hands of the plumbers.

Mr. Walton, supporting, laid stress on the point that the change of men was not a necessary consequence of the change of material, and deprecated the tendency to connne the work of the plumber to the small domestic jobs in which lead pipes were employed.

Mr. Robinson, following on the same side, said that the fitters were encroaching further by carrying the pipes for cold supplies.

Mr. Ward, speaking on behalf of the Master Plumbers, said that latterly they had not been allowed many opportunities of quoting for work which the operative plumber was able to do in a more systematic manner than the fitter.

Mr. J. B. Corrie said it seemed to have become the custom for the heating engineers to submit schemes to the architects, instead of architects specifying what they should do, otherwise the plumbers might jointly be taken into consideration. He did not see why the duties of the heating engineer should not cease at the installation, or not necessarily at the installation if that was governed by steam.

Mr. C. Hickson said that this trouble had only become acute during the past five or six years. He thought that there would always be friction until a line of demarcation was drawn by the architects, defining precisely where one trade should end and the other begin.

Mr. L. Green, speaking on behalf of the Operative Heating Engineers, said that he did not think that the operative plumbers had, during the last six or seven years, done a quarter of this kind of work as compared with the fitters, who claimed a right to do copper work without interference from the plumbers.

Mr. L. Brummitt said that as an operative heating engineer he had been for fourteen years accustomed to work on all kinds of domestic supplies, except lead. He held that plumbers could not handle copper or iron as well as fitters could.

Mr. F. Biggin, speaking for the Master Heating Engineers, said that he understood that the claim of the plumbers was to do all the pipe work from the heaters or calorifiers, but nothing had been said as to the size of pipes. He denied that it was correct to say that the plumber was called in to finish the work of the fitter. If the plumbers tendered for and obtained heating and hot-water service work, no objection would be raised by the heating engineers. The formal claim of the heating engineers was that the plumbers had no right to claim a monopoly of the fitting and fixing of pipes in hard metals to the exclusion of every other trade. Heating engineers had carried out work in connection with pipes in hard metals for a long period of years, and employed a class of workmen thoroughly trained and specially qualified, and they claimed the equal liberty to do in all metals other than lead all domestic engineering, including water supply, warming, ventilation, cooking, and laundry work. Mr. Biggin produced a number of plans showing the intricacies of heating installations, and, commenting on these, he contended that it was absolutely untenable and altogether unreasonable for the plumbers to claim that after the engineers had submitted such plans, and worked out all the calculations respecting boiler capacity, calorifier, mains, pumps, etc., the plumbers should come in and claim the work of the fitter for whom the specification had been prepared, and say that they alone should have the monopoly of fixing all the pipes from the calorifier.

Mr. Moorwood and Mr. T. H. Firth supported, the latter urging that the matter should be settled on a national basis as early as possible.

The representatives of the architects being asked for their views, Mr. J. R. Wigfull said he questioned whether the master plumbers were competent to design such engineering work pure and simple as Mr. Biggin had shown. He knew that plumbers were competent to do hot water supplies in lead or copper, and the only solution he could see was one of compromise, whereby neither side would forbid the other from doing his own trade. No architect, he said, claimed to be competent to design and carry out such plans as had been shown them; they had enough in sanitary plumbing, without interfering with hot water. He thought it ought to be agreed that leadwork was purely plumber's work, and that in regard to copper and iron pipes, neither side should attempt to debar the other from doing such work as came in their way.

Mr. Mitchell Withers said that it would be better to have the matter settled once for all by arbitration than to go on fighting in guerilla fashion.

Mr. W. C. Fenton agreed that with regard to large installations, the architects had neither the time nor ability to design them, and they looked to heating engineers to design and carry out the work.

Mr. E. Robinson said that Webster defined plumbing as the art or trade of piping buildings, formerly exclusively done in lead. In the case of roofing, the slater was not done out of his job where tiles are substituted. Copper work on large buildings had come to stay, and as it would be used more and more, plumbers must protect their industry, or there would be nothing left for them to do.

Mr. Sewell said that the operative plumbers had advanced no valid argument showing their right to monopolise the work.

After further discussion, Mr. Fenton moved: "That the Operative Plumbers be requested to suggest to their members the desirability of an early national conference or arbitration between the master and operative heating engineers and the master and operative plumbers, and that in the meantime no stoppage of work take place, and any strike in operation be cancelled." This was carried with only one dissentient.—THOS. SMITH, Secretary, Sheffield Master Builders' Association.

(For further Federation News, see p. xiv)

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** or longer after the date of this issue. Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders. The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the Contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 30. **ROMFORD (Essex).**—Erection of a new Council school and mentally defective centre at Romford, for the Essex Education Committee. Send names with a cheque for £2 2s. (as deposit), to the Committee's Architect, A. S. R. Ley, 54 and 55, Bishopsgate Street Without, London, E.C., by or before June 30. Any tender recommended for acceptance will be subject to the approval of the Essex C.C. and the L.G.B. A bond for the due and proper completion of the work will be required from an approved guarantee society

June 30—July 12. — **NORHAM-ON-TWEED.**—Erecting a new Council School, to accommodate 144 scholars, at Norham-on-Tweed, for the County of Northumberland Education Committee. Send name and address to C. Williams, Secretary to the Education Committee, The Moothall, Newcastle-on-Tyne, not later than June 30, together with a deposit of £2 2s. for specification and bills of quantities. Plans for the work may be inspected at the office of the Education Committee, at the above address, or at the office of A. H. M. Weddell, Town Clerk, Berwick-on-Tweed, and tenders must be forwarded to the Secretary.

July 4. **DARLINGTON.** (See "Engineering.")

July 4. **DENBIGH.**—Alterations to the Denbigh Free Reading Rooms. Plans and specifications may be seen on application to James Hughes, architect, Denbigh, to whom tenders are to be sent.

July 4. **SOUTHEND-ON-SEA.**—Alterations and additions to Leigh Road and Brewery Road Council Schools, for the Education Committee. Plans, specifications, and conditions may be seen, and form of tender obtained, on deposit of a cheque for £1 1s., upon application to Ernest J. Elford, C.E., borough engineer and surveyor. Tenders to be delivered at the office of J. W. Barrow, Clerk to the Committee, Education Offices, Municipal Buildings.

July 4. **TRIM (Ireland).**—Erecting 16 houses in the Urban District of Trim, according to the plans and specifications prepared by C. K. Douglas, A.M.Inst.C.E., which may be inspected at the office of the Town Clerk, Town Hall, Trim, where copy of specification, bill of quantities, and form of tender can be had on deposit of £1. Tenders, addressed to Chairman of the Council, will be received by the Town Clerk. The work must be completed within six months from date of Architect laying out plots. The contractor whose tender may be accepted must be prepared to enter into a bond with two solvent sureties for the due performance of contract.

July 4. **FOOTSCRAY (Kent).**—Enlargement of Longlands Council School at Footscray, Kent, for the Kent Education Committee. Plans and specification, prepared by the Committee's Architect, (Wilfred H. Robinson, M.S.A.), and conditions of contract may be inspected at the office of the Committee. Send name and address, accompanied by a deposit of £1, to Fras. W. Crook, secretary, Caxton House, Westminster, S.W. The person whose tender is accepted will be required to provide two sureties who will enter into a bond to the Committee for the satisfactory completion of the contract. Tenders must be addressed to Thos. Beeton, Corner House, Church Avenue, Sidcup.

July 4. **GORAGHWOOD (Ireland).**—Erection near their Goraghwood Station of a timber-framed storage bin, etc., about 50 feet x 50 feet, and averaging about 35 feet high, with timber roof, covered with corrugated iron, for the Directors of the Great Northern Railway Company, Ireland. Also an engine and boiler house, etc., about 75 feet long by 36 feet wide. Sides and roof to be steel framed and covered with galvanised corrugated iron. Drawings and specifications may be seen at the office of F. A. Campion, chief engineer, Amiens Street terminus, Dublin, or copies of them at the office of the district engineer, Belfast, and forms of tender can be obtained. Tenders should be delivered to T. Morrison, secretary, Secretary's Office, Amiens Street terminus.

July 5. **MITCHAM.**—(a) Erection of a tool house, etc., at the Burial Ground; and (b) about 100 yards of paving in granite setts and about 150 yards of tar-paving for footways, for the P.C. Drawings, etc., can be inspected on deposit of £1, at the office of R. M. Chart, Clerk to the Council, The Vestry Hall, Mitcham.

July 5. **LONDON, W.**—(a) Works of alteration at, and painting, etc., of Turnham Green School; and (b) painting, etc., of certain schools, for the Chiswick U.D.C. Forms of tender and copies of the specification, may be obtained by application to Edward Willis, A.M.I.C.E., Surveyor, Town Hall, Chiswick, where the plans, form of contract, and other documents may be inspected. Tenders are to be delivered to Ernest F. Collins, Clerk of the Council.

July 5.—**WHITLEY BAY.**—Erection of a new station at Whitley Bay, for the Directors of the North Eastern Railway. Plans and specification may now be seen and quantities and further information obtained upon application to William Bell, the Company's Architect, Central Station, Newcastle-on-Tyne. Quantities supplied on personal application to parties tendering for the whole of the works. Tenders to be sent to the Secretary at York.

July 5. **WOKING.**—Erection of a new sorting office at Woking for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Woking. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered addressed to the Secretary, H.M. Office of Works, etc., London, S.W.

July 5. **MAIDSTONE (Kent).**—Erection of offices, workshops, stores, etc., upon the Council's wharf in St. Peter Street, Maidstone, for the Bridges and Roads Committee of the County Council, in accordance with drawings and specification, which may be seen at the office of the County Surveyor, West Borough Chambers. Bills of quantities can be obtained upon a deposit of a cheque for £3 3s. Tenders to be forwarded to W. B. Prosser, Clerk of the Council Sessions House, Maidstone. Fair wages clause.

July 5. **BELFAST.**—Erection of engine and accumulator house, also water storage cistern, at "The Abbey" Auxiliary Workhouse, Whiteabbey, for the Guardians, in accordance with plans and specifications prepared by Young and Mackenzie, Engineers, etc., which can be seen at the office of Joseph W. Robb, Clerk of the Union, Clerk's Office, Union Workhouse, where copy of schedule of quantities and form of tender can be had on payment of 10s. not returnable. Tenders to be lodged in the Tender-box, Boardroom, Workhouse. The tenders should set forth the names of two sureties who are willing to enter into a joint and several bond for the due performance of the contract.

July 5. **LONDON, E.**—Erection of proposed nurses class-room and addition to drug stores, etc., at the District Sick Asylum, Devons Road, Bromley, E., for the Managers, in accordance with plans and specification prepared by their architects, J. and W. Clarkson, 136, High Street, Poplar, E. The drawings and conditions of contract may be seen at the offices of the architects, and a copy of the specification and form of tender obtained upon payment to the architects of a deposit of £5. Tenders to be addressed to Walter R. Foskett, Clerk to the Managers, at the Asylum, Devons Road, Bromley-by-Bow, E. Parties tendering will be required to declare that they pay the rate of wages and observe the hours of labour that are generally recognised by the trade unions and considered fair in the trade, and will be required to provide two approved sureties, each bound in the amount of the contract, for the proper fulfilment thereof.

July 6. **LONDON, S.E.**—(a) alterations to Bermondsey Town Hall, Spa Road; (b) internal painting and decorating of same, for the B.C. See advertisement in this issue for further particulars.

July 6. **PEMBROKE (Co. Dublin).**—Construction of shelters for hackney cab and car drivers, at Morehampton Road and Pembroke Road, in the Urban District. Plans, specifications, etc., can be seen at the office of J. C. Manly, Clerk to the Council, Town Hall, Ball's Bridge, Pembroke, Co. Dublin, to whom tenders must be sent. The work to be completed within three months of acceptance of tender, and security will be required for the execution of the contract.

July 6. **DARENTH (near Dartford).**—Erection of work-rooms at Darenth Asylum, Dartford, Kent, for the Metropolitan Asylums Board. Specification and plans may be seen by intending contractors at the office of T. W. Aldwinckle, 20, Denman Street, London Bridge, S.E. Bills of quantities, with form of tender, may be obtained at the office of the Board, Embankment, E.C., on deposit of £2. Tenders must be delivered at the office of the Board.

July 6. **LONDON, N.**—Repairs to certain chimney stacks and for constructing an escape staircase at the North-West Block at their Additional Workhouse, Hazleville Road, Hornsey Rise, N., for the Shoreditch Guardians. Specifications and drawings can be seen at the office of F. J. Smith, F.R.I.B.A., Parliament Mansions, Victoria Street S.W. Tenders must be delivered to the Guardians at their meeting to be held at the Temporary Boardroom, 213, Kingsland Road.

July 6. **LONDON, S.E.**—Alterations and additions to certain staff buildings at South Wharf Small-pox Shelter, Rotherhithe, for the Metropolitan Asylums Board, in accordance with drawing, conditions of contract, and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Drawing, conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board.

July 6. **CHIPPING ONGAR (Essex).**—Execution of (a) general painting and repairs, (b) tiling and roof repairs, and (c) alteration to kitchen in administrative block at the children's homes at Chipping Ongar, for the Hackney Guardians. Specifications, conditions of contract, and forms of tender can be obtained of Frank R. Coles, Clerk to the Guardians, and the drawing relating to the alteration to the kitchen in administrative block may be seen at the Guardians' offices, Sidney Road, Homerton, N.E. The contractor will be required to give approved security in a bond, the form of which may be seen at the Guardians' offices. Tenders must be delivered at the office of the clerk. Tenders are, so far as they relate to section (c)—i.e., alteration to kitchen in administrative block—conditional upon the sanction of the Local Government Board.

July 7. **SOUTHEND-ON-SEA.**—(See "Engineering.").

July 7. **NORTH CURRY (Somerset).**—Erection, during August, of a new class-room at the National school. Plans and specification can be seen on application to Cecil Dennis, at North Curry, to whom tenders must be sent.

July 7. **LINGDALE (Yorks.).**—Alteration to shop premises at Lingdale, and for shop fixtures, for the Skelton-in-Cleveland Co-operative Society. Plans and specifications can be seen at the Society's office at Skelton upon application to Mr Videan.

July 7. **WHISTON (Prescot, Lancs.).**—Repairs and alterations at Cumber Lane farm house and buildings, Whiston, for the Guardians. Specifications and plans may be seen at the office of James Gandy, architect, Masonic Buildings, St. Helen's, on deposit of 10s. Tenders to be sent to A. F. Mann, clerk, Union Offices, Whiston, Prescot.

July 8. **MEXBOROUGH.**—Whole or separate tenders for Mexborough new mixed and infants' school, and special subjects block (builder, joiner, slater, plumber, plasterer, painter), for the West Riding Education Committee. Plans may be seen, and specifications, with quantities, obtained on application to the Education Architect, County Hall, Wakefield. A deposit of £1 in each case must be sent by separate letter to the West Riding Treasurer, County Hall, Wakefield. Tenders must be addressed to Francis Alvey Darwin, Clerk of the County Council, at above address.

July 8. **MATLOCK.**—Alterations and additions to Smedley's Hydropathic, consisting of 32 bedrooms, etc., etc., for the Directors. Tenders are invited for work connected with the following trades:—Mason, bricklayer, concretor, excavator, and drainage, joiner, plasterer, plumber, glazier and painter. Persons desirous of tendering will please inspect the site and take their own quantities from plans and specifications, which will be on view at the Secretary's Office of the Hydro, from June 24 to July 5. Tenders to be sent addressed to the "Chairman of the Board of Directors."

July 9. **NAAS (Ireland).**—Erection of a house at Naas. Drawings, etc., may be seen at the house of Mrs. H. E. Sargent, 1, Victoria Terrace, Naas

July 12. **ASHINGTON.**—Erection of their proposed Council chambers, offices, and caretaker's house in Station Road, Ashington, (whole tender), for the U.D.C. Names at once to Osborne Blythe, Architect, Ashington, with a deposit of £2 2s., when quantities will be forwarded to them. Drawings, etc., can be seen at the Architect's office

(*Continued on next page.*)

July 9. **NELSON.**—Various works required in connection with car shed extension, for the Electricity and Tramways Committee. Plans and specifications may be seen and forms of tender obtained on application at the office of W. Shackleton, A.M.I.C.E., borough engineer and surveyor. Tenders to be sent to J. H. Baldwick, town clerk, Town Hall, Nelson.

July 9. **WICKLOW.**—Rebuilding of Aughavannagh Bridge, including the removal of the old arch, etc., and the erection of a temporary wooden bridge, for use during rebuilding, for the Wicklow C.C. Cost not to exceed £330. Plan and specification can be seen at the County Surveyor's Office, Wicklow. Tenders must be addressed to the County Surveyor, Wicklow.

July 12. **LONDON, S.W.**—Pointing, painting, and executing certain other repairs, at "A" and "B" Blocks, of the Workhouse, "C" Block (Guardians' Offices), and the Arthur Street and Britten Street Blocks of the Workhouse., Chelsea, for the Chelsea Guardians. Copies of the conditions and specification and form of tender may be obtained from C. W. Shepherd, Clerk to the Guardians, 250, King's Road, Chelsea, S.W., 22nd June, 1910, to whom tenders must be sent.

July 14. **CHESTERFIELD.**—Enlargement of Chesterfield Post Office, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster, Chesterfield. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on deposit of £1 1s. Tenders must be delivered, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W.

July 14. **GOODWICK (Pembroke).**—Erection of a new Council school building at Goodwick, for the Pembrokeshire Education Authority. Drawings and specifications may be seen on application to Captain Phillips, "Stop-and-Call," Goodwick, and also at the office of the Authority's architect, D. E. Thomas, 17, Victoria Place, Haverfordwest. Bills of quantities and forms of tender may be obtained at the architect's office upon deposit of £1 1s. Tenders must be delivered to William Davies George, Clerk, County Education Offices, 9, Quay Street, Haverfordwest.

July 17. **MERTHYR TYDFIL.**—Erection of a pair of cottage homes for children at Hirwain, for the Merthyr Tydfil Guardians. Plans and specification may be seen, and bills of quantities obtained at the office of the architect, Thomas Roderick, Clifton Street, Aberdare. The contract to be entered into between the Guardians and the contractor whose tender is accepted will contain a Trade Union clause involving employment of Trade Unionists, payment of Trade Union wages, and no subletting. Tenders must be sent to Frank T. James, Clerk to the Guardians, 134, High Street, Merthyr Tydfil.

July 20. **SHIPTON BELLINGER (Hants.).**—Erection of a new Council school, for ninety-nine children, and teachers' house at Shipton Bellinger. Plans, specification, and conditions of contract may be seen, and bills of quantities and other information obtained at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, after July 6. A deposit of £2 2s. will be required for a copy of the bills of quantities and form of tender, which must be made by cheque payable to the Hants County Council and crossed Bank of England, or particulars will not be sent. Each tender is to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

No date. **KENILWORTH.**—Erection of proposed new Parochial Hall. Names to Harry Quick, Architect, 35, Hertford Street, Coventry.

ENGINEERING.

July 4. **DARLINGTON.**—Enlargement of Hopetown Subway, Darlington, for the directors of the North Eastern Railway. Plans may be seen, and specifications, etc., obtained, on personal application at the office of C. F. Bengough, the Company's Engineer at York.

July 4. **DUBLIN.**—Construction and erection of twin Scherzer rolling lift bridges across the entrance to the Royal Canal, North Wall Quay, Dublin, for the Port and Docks Board. Specification and drawings can be seen at the office of the Engineer of the Board, John P. Griffith, M.Inst.C.E., East Wall, Dublin, from whom any further information required can be obtained. If on examination of the specification and drawings, intending contractors should desire to obtain copies, these, together with the special printed form of tender, can be obtained on deposit of £5. Contractors are required to state whether they have constructed Scherzer rolling lift bridges, or other opening bridges, and to give full particulars of such works and the names of engineers under whom these were carried out, and to whom reference may be made. Tenders must be on the special form, and addressed to the Secretary, Port and Docks Office, Westmoreland Street, Dublin.

July 5. **BELFAST.**—(See "Building.")

July 5. **MEXBOROUGH.**—Heating Mexborough Garden Street Council School, for the West Riding C.C. Copy of specification may be obtained of W. R. Hudson, Education Offices, Mexborough, on receipt of a stamped addressed foolscap envelope. Tenders to be sent to the above.

July 5. **MANCHESTER.**—Reconstruction of Brook Bridge, Barlow Moor Road Chorlton-cum-Hardy, for the Manchester Corporation. Plans may be seen and specification, bill of quantities, and form of tender obtained on application at the City Surveyor's Office, Town Hall, Manchester, on deposit to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of the Corporation of Manchester. Tenders, enclosed in the official envelope and addressed to the Chairman of the Withington Committee, are to be delivered at the City Surveyor's Office.

July 5. **MANCHESTER.**—Manufacture, delivery, and in some cases the transport and erection of the steelwork and ironwork required for nine bridges and one subway on the Aqueduct between Walkden and Audenshaw, the weight being about 700 tons, for the Corporation Waterworks Committee. Specification and form of tender may be obtained on application to G. H. Hill and Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque for £2 2s. as deposit. Tenders, addressed to the Chairman of the Waterworks Committee, must be forwarded to the Secretary, Waterworks Offices, Town Hall, Manchester.

July 5. **BIRKENHEAD.**—Construction of a new landing stage, and placing the same in position at the end of the new ferry pier, for the Corporation. Drawings of the proposed deck arrangement, etc., and a statement of sundry dimensions and requirements to be observed and included in specifications and tenders to be submitted by builders tendering for the building of the stage, may be obtained on application to the Ferries Manager, Woodside, Birkenhead, on deposit of £1 1s. The contractor will be required to execute a formal contract for the execution of the work, to be prepared by the town clerk, the draft of which can be seen at the office of the Ferries Manager, and also together with two approved sureties to execute a bond or bonds for the performance of contract. Rate of wages, etc., clause to be observed. Designs, drawings, specifications, and tenders, to be sent to James Fearnley, town clerk, Town Hall, Birkenhead.

July 6. **PENKRIDGE.**—Contract No. 1.—Supply and delivery to Penkridge Goods Station, London and North Western Railway, of 362 tons (or thereabouts) of 6in., 4in., and 3in. cast-iron spigot and socket pipes; also for five tons (or thereabouts) of specials, for the Cannock R.D.C. Specifications and form of tender may be obtained from Herbert M. Whitehead, Engineer to the Council, Penkridge, Stafford, on deposit of a £5 Bank of England Note. Tenders, on the prescribed form, must be sent to A. W. Carver, Clerk to the Council, Union Offices, Cannock, Staffs.

July 6. **PENKRIDGE.**—Contract No. 2.—Carting, laying, and jointing of 12,139 yards (or thereabouts) of 6in., 4in., and 3in. cast-iron water mains, including the supply and fixing of all necessary fittings, valves, and appurtenances. Plans, sections, and detail drawings may be inspected at the office of the Engineer to the Council, and specification, bill of quantities, and form of tender may be obtained from Herbert M. Whitehead, Engineer to the Council, Penkridge, Stafford, on deposit of a £5 Bank of England Note. Tenders on the prescribed form must be sent to A. W. Carver, Clerk to the Council, Union Offices, Cannock, Staffs.

July 7. **SOUTHEND-ON-SEA.**—Extension of Southchurch Esplanade, for the Corporation. The esplanade will be approximately 1,260 feet in length, 69 feet in width, and will be protected by an apron wall. Copy of the general conditions, specification, and duplicate copies of the bill of quantities and form of tender may be obtained and plans inspected on application to Ernest J. Elford, M.Inst.M.E., borough engineer, Municipal Buildings, Southend-on-Sea, on deposit of £5 5s. Tenders to be delivered to H. J. Worwood, town clerk, Town Clerk's Office, Southend-on-Sea.

July 8. **BEDFORD.**—Construction of cast-iron water mains (varying in size from 15in. diameter to 9in. diameter), from the reservoirs to Bushmead Avenue, Bedford, a total length of about 1½ miles, for the Corporation. Drawings and specification can be seen, and bills of quantities and forms of tender and all information obtained, upon application to N. Greenshields, A.M.I.C.E., Borough and Waterworks Engineer, Town Hall, Bedford. Tenders, addressed to the Chairman of the Waterworks Committee, to be delivered at the above address.

July 12. **LONDON, S.W.**—Alterations to the superstructure of and new steelwork for Battersea Bridge, for the L.C.C. Drawings, specifications, bills of quantities, form of tender, etc., may be obtained on application to the Chief Engineer of the Council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon deposit to the Cashier of the Council of £3. Full particulars of the work and conditions of contract may be obtained at the County Hall before the payment of this fee. Tenders must be upon the official forms, and the instructions therein must be strictly complied with. Fair wages clause.

July 14. **LONDON, S.W.**—Constructional schemes and tenders based thereon for the erection in reinforced concrete of vaults and retaining wall for the public offices extension, Westminster, S.W., for the Commissioners of H.M. Works and Public Buildings. Any system or systems of construction may be adopted for the whole or part of the work, and full details must be furnished immediately for examination, if necessary. Drawings, specification, and a copy of the conditions and form of contract may be seen on application at H.M. Office of Works, Storey's Gate, London, S.W., and copies of the plans, specification, and form of tender may be obtained upon deposit of £2 2s. Contractors tendering will have to satisfy the Commissioners as to their capacity to erect reinforced structures. Tenders must be delivered to the Secretary at above address.

July 16. **BURNLEY.**—Construction of an impounding reservoir, with catch-waters, aqueducts, meter houses, etc., at Hurstwood, near Burnley, for the Burnley Corporation. Plans may be seen, and specification, schedule of prices, form of tender, and all other particulars obtained on application to J. Diggle and Son, engineers, 14, Victoria Street, Westminster, S.W., and Hind Hill Street, Heywood, Lancashire, on deposit of £5. Tenders must be sent to Peregrine Thomas, town clerk, Town Hall, Burnley.

July 28. **LONDON, S.E.**—Construction of exit iron staircases and the necessary structural alterations in connection therewith at their St. George's Workhouse, Mint Street, Borough, S.E., for the Southwark Guardians. The specification, conditions of contract, and forms of tender may be obtained of their architect, A. J. Wade, 104, Harvist Road, Brondesbury, N.W., on deposit of £1 1s. Tenders should be addressed to the Guardians and delivered at the offices of Sydney Wood, Clerk to the Guardians, Union Offices, Ufford Street, Blackfriars Road, S.E. Fair wages clause.

SANITARY ENGINEERING.

July 5. **GUISELEY.**—Making of about 146 yards of 9in. pipe sewer, with the necessary manholes and appurtenances thereto in Ings Lane, for the U.D.C. Plans and specification may be seen and bills of quantities and full particulars may be obtained from 9 a.m. to 10.30 a.m. on application to Joe Battye, surveyor, Town Hall, Guiseley, on deposit of 10s. Tenders must be sent to M. Rennard, clerk, Guiseley, near Leeds.

July 6. **LITTLEHAMPTON.**—Provision of a refuse destructor in connection with their intended sewage pumping station, for the U.D.C. Detailed particulars and plan may be obtained on application to the Clerk to the Council, and further information will be supplied by the engineer, H. A. Johnson, M.I.C.E., The Exchange, Bradford. Tenders to be sent to Arthur Shelley, clerk, Littlehampton.

July 6. **MIDDLETON.**—Sewering of Cheetham Street, Middleton. Plans may be seen and specification, quantities, and form of tender, which will contain a fair wages clause, may be obtained on application to W Welburn, borough surveyor, Town Hall, Middleton. Tenders, addressed to the Chairman of the Surveyor's Committee, must be delivered to Frederick Entwistle, Town Clerk, Town Hall, Middleton.

July 7. **LYMINGTON.**—Cleansing of the outfall sewer on the Mudlands outside Lymington for the T.C. Specifications may be seen at the office of J. Davis Rawlins, Town Clerk, 38, High Street, Lymington, and it will be desirable for persons tendering to inspect the outfall. Tenders should be sent to the above.

GLAZING.

July 4. **DUBLIN.**—Roof glazing (wooden sash bars and putty) of their new engine shed and offices at Adelaide and Windsor, near Belfast, for the Great Northern Railway Co. (Ireland). Parties wishing to tender may see the drawings and specification at the office of F. A. Campion, chief engineer, Amiens Street terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and can obtain forms of tender and bills of quantities at those offices. Tenders, made out on the forms supplied by the company, should be delivered to T. Morrison, secretary, Amiens Street Terminus, Dublin.

July 4. **BELFAST.**—Roof glazing (wooden sash, bars, and putty), of their new engine shed and offices at Adelaide and Windsor, near Belfast, for the Directors of the Great Northern Railway Company (Ireland).—Drawings and specification may be seen, and forms of tender and bills of quantities obtained, at the office of F. A. Campion, Chief Engineer, Amiens Street Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast. Tenders, made out on the forms supplied by the Company, should be delivered to T. Morrison, Secretary, Secretary's Office, Amiens Street Terminus, Dublin.

IRON AND STEEL.

July 4. **DUBLIN.**—(See "Engineering.")

July 6. **PENKRIDGE.**—(See "Engineering.")

July 4. **NOTTINGHAM.**—Supply and delivery at Nottingham of 400 tons of steel rails of the British Standard Section No. 4, for the Tramways Committee of the Corporation. Drawings may be seen, and copies of the specification and form of tender obtained, on applying to Arthur Brown, M.InstC.E., City Engineer, Nottingham, on deposit of £1 1s. Tenders to be delivered to J. A. H. Green, Town Clerk, Guildhall, Nottingham. Fair wages clause.

July 28. **LONDON, S.E.**—(See "Engineering.")

PAINTING.

July 4. **BURY (Lancs.).**—Painting required at the various recreation grounds and cemetery, for the Corporation. Specifications and forms of tender may be obtained upon application being made to Arthur W. Bradley, A.M.I.C.E., borough engineer, Bank Street, Bury. Tenders to be delivered to the Town Clerk, Bury.

July 4. **ENNISKILLEN.**—Painting the Town Hall, for the T.C. Specification may be seen on application to Thomas Elliott, borough surveyor, from whom all information may be had. Tenders will be received by A. W. G. Ritchie, town clerk, Town Hall. Parties tendering for the work must give the names of two solvent persons who will join the contractor in a bond for the performance of contract.

July 4. **GRIMSBY.**—Painting 48 almshouses, Weelsby Street, for the Fishermen and Sailors' Harbour of Refuge Almshouse Trust, Weelsby Street, Grimsby. Specification may be seen with James Davis, Grimsby Port Missionary, Mission House, Freeman Street Market, to whom tenders should be sent.

July 5. **LONDON, W.**—(See "Building.")

July 5. **POOLE.**—Painting required to be done at the workhouse, for the Guardians, according to specification, which may be seen on application to Ed. Van Schepdael, architect, Wimborne Road, Poole. Tenders to be sent to P. E. L. Budge, Clerk to the Guardians, Union Offices, 139, High Street, Poole.

July 6. **CHIPPING ONGAR (Essex).**—(See "Building.").

July 6. **LONDON, S.E.**—(b) Internal painting and decorating of Bermondsey Town Hall, Spa Road, for the B.C. See advertisement in this issue for further particulars.

July 6. **LONDON, S.W.**—Painting, distempering, general repairs, etc., at their administrative block, Prince's Row, S.W., for the Guardians of the St. George's Union. Specifications may be obtained from Thomas Worlock, Clerk to the Guardians, Guardians' Offices, Prince's Row, Buckingham Palace Road, S.W., to whom tenders must be sent.

July 6. **LONDON N.E.**—Cleansing various wards, etc., at their Infirmary, High Street, Homerton, N.E., for the Hackney Guardians. Specifications, conditions of contract, and forms of tender can be obtained at the Guardians' offices, Sidney Road, Homerton. The contractor will be required to give approved security in a bond, the form of which may be seen at the Guardians' offices. Tenders must be delivered to Frank R. Coles, Clerk to the Guardians.

July 12. **LONDON, S.W.**—(See "Building.")

July 14. **LONDON, S.E.**—Painting work and repairs at their casual wards, Great Guildford Street, S.E., for the Guardians of Southwark Union, London. Specifications and conditions of contract may be obtained at the offices of Sydney Wood, clerk, Union Offices, Ufford Street, Blackfriars, S.E. Tenders should be addressed to the Guardians and delivered at the Clerk's offices. Fair wages clause.

July 26. **DRINGHOUSES.**—Painting and colour-washing the Dringhouses Council School, for the Bishopthorpe District Education Committee. Specifications may be obtained from F. Parker, West Riding Education Office, Selby.

ROADS AND CARTAGE.

July 4. **GRIMSBY.**—Construction of a high level footpath at the Wintringham Road subway, for the T.C. Plans and quantities may be obtained at the office of H. G. Whyatt, borough engineer and surveyor, 170, Victoria Street, Grimsby. Tenders to be addressed to the Chairman of the Highways Committee, and delivered at the office of the Town Clerk, West St. Mary's Gate.

July 4. **EAST DEREHAM.**—Supply of 350 tons (more or less) of 2½in. broken granite, and 350 tons (more or less) of 1½in. broken granite, to be delivered free at the East Dereham Station of the Great Eastern Railway Company before the end of November, 1910, for the U.D.C. Forms of tender may be obtained on forwarding a stamped addressed foolscap envelope to the surveyor, H. G. Himson, Theatre Street, East Dereham. Tenders to be sent to B. H. Vores, clerk to the Council.

July 4. **WAKEFIELD.**—Re-paving of the roadway over and approaches to Maudland Bridge, situate in Westgate, in the City of Wakefield, for the West Riding Highways Committee. General conditions, specification, bill of quantities, etc., may be obtained at the office of F. G. Carpenter, West Riding Surveyor, County Hall, Wakefield. A deposit of £1 will be required. Cheques, etc., must be forwarded and made payable to "The West Riding Treasurer," at the County Hall, Wakefield. Tenders to be delivered at the office of the above.

July 4. **TEDDINGTON.**—Making-up of part of Udney Park Road:—247 lineal yards of 12in. by 6in. straight Norwegian granite kerb, and laying; 244 lineal yards Tees Scoriæ sett channel, and laying; 1,233 super. yards roadway formation; 440 super. yards tar paving. Plan and specification may be seen, particulars and form of tender obtained, on application to Marshall Hainsworth, Surveyor, Council Offices, Tedington. Tenders must be delivered to G. H. Salmons, Clerk, Council Offices, Teddington.

July 5. **MITCHAM.**—(See "Building.")

July 5. **TYNEMOUTH.**—Laying whinstone chip paving in lanes north of Morpeth Terrace and east of Elsdon Terrace, High Chirton, and in Mill Street, North Shields. Plans and specification may be seen at the office of John F. Smillie, Borough Surveyor, Tynemouth, to whom tenders are to be sent.

July 5. **COWES (I.O.W.).**—Supply and delivery of broken granite and gravel, or other suitable road material, as may be required during a period of one or three years, for the U.D.C. Further particulars may be obtained at the office of John W. Webster, Engineer and Surveyor to the Council. Tenders to be delivered at the office of H. C. Damant, Clerk to the Council, High Street, Cowes.

July 5. **CUDWORTH.**—Supply and delivery of about 150 tons 2½in. granite, about 800 tons 2½in. slag, for the U.D.C. Tenders are also invited for steam rolling and scarifying for about six weeks during the year ending March 31, 1911. Forms of tender can be obtained from W. T. Lynam, Surveyor, Council Offices, Cudworth, upon receipt of a stamped addressed envelope. Tenders to be addressed to the Clerk to the Council, Council Offices, Cudworth.

July 5. **CHINGFORD.**—Making-up, paving, kerbing, lighting, etc., the Bateman Road and Royston Avenue,, for the U.D.C., in accordance with plans and specifications prepared by the surveyor, J. T. Griffin, copies of which and form of tender may be obtained on application, and upon deposit of £2 2s. The contractor will be required to enter into a bond for the performance of contract. Tenders to be delivered to Leonard C. Bowen, clerk, 34, Station Road, Chingford.

July 5. **LONDON, S.W.**—Wood paving and other works at the Pavement, Clapham, Clapham Park Road, and Lower Richmond Road, Putney, for the Wandsworth B.C. Forms of contract, specifications, and drawings may be seen, and forms of tender obtained, at the Borough Engineer's Office, No. 215, Balham High Road, S.W. Tenders must be delivered at the Council House, East Hill, Wandsworth, S.W., and may be placed by the persons tendering in the tender box provided for the purpose. Fair wages clause.

July 5. **RISHTON (Lancs.).**—Labour and part materials in sewering, paving, etc., the following streets or parts thereof, for the U.D.C.:—Back Bridge Street South, back Shuttleworth Street South, back Stourton Street South, back Spring Street West, back Commercial Street West, back Clifton Street North, and back Cliffe Street East. Plans may be seen and specifications and forms of tender obtained on application to the Surveyor at the Council Offices, Brook Street, Rishton. Tenders must be sent to J. J. Adams, clerk.

July 6. **FLEUR-DE LIS.**—Construction of a new road, etc., for the Mynyddislwyn U.D.C. Specification, etc., can be obtained, and plans inspected, upon application to the Engineer, E. Watkin Edwards, Council Offices, Pontllanfraith, upon deposit of £1 1s.

July 6. **WANSTEAD (Essex).**—Annual supply of 3,000 tons (more or less) of Guernsey granite or Quenast stone, broken to 1½in., 1⅝in., and 2in. gauge, delivered at Snaresbrook Station (G.E.R.), by such instalments and in such quantities as may be directed in writing from time to time by the Surveyor, beginning August 1, for the Wanstead U.D.C. Forms of application may be obtained on application to the Surveyor, Council Offices, Wanstead. Tenders to be delivered at the Council Offices.

July 5. **FEATHERSTONE (Yorks.).**—Street works in Albert Street, Post Office Road (part of), Newport Terrace, Wilson Street, and Whiteley Street, within their district, which include kerbing, flagging, channelling, macadamizing, etc., for the U.D.C. The plans may be inspected, and copies of the specification, bill of quantities, form of tender, and general conditions obtained, on application to Samuel Chesney, engineer and surveyor, Council Offices, Featherstone. Applications must be accompanied by a deposit of £1. A fair wages clause will be inserted in the contract. Tenders, together with the priced quantities, must be received by J. A. Haigh, clerk, Council Offices, Featherstone.

July 6. **HOVE.**—Paving and other works in Hove Street (from Church Road to South side of the Connaught Hotel). Further particulars may be obtained and plan and specification seen at the office of the Borough Surveyor (H. H. Scott). Tenders, on forms supplied, must be addressed to H. Endacott, Town Clerk, Town Hall, Hove.

July 6. **LONDON, W.**—Making up of Pleydell Avenue and Vaughan Avenue, for the Chiswick U.D.C. Forms of tender and bills of quantities may be obtained by application to E. Willis, A.M.I.C.E., Surveyor, Town Hall, Chiswick, where the plans, specifications, form of contract and bond, and other documents may be inspected. Tenders to be delivered to Ernest F. Collins, Clerk of the Council.

July 6. **HERNE BAY.**—Paving, etc., of the following streets, for the U.D.C.:—Oxenden Square, Marine Drive East, Section 1; Marine Drive East, Section 2; Marine Drive East, Section 3. Plans, sections, and specifications can be seen, and forms of tender obtained from F. W. J. Palmer, Surveyor to the Council, Town Hall, Herne Bay. Tenders to be addressed to Joseph Jubb, Clerk to the Council, Town Hall, Herne Bay.

July 6. **LONDON, S.W.**—Forming new roads and paths, and laying out grounds at the new infirmary, St. James Road, Wandsworth Common, for the Wandsworth Guardians, in accordance with the drawings and specification prepared by their architect, J. S. Gibson, 5, Old Bond Street, W. The drawings, specification, and conditions of contract may be inspected, and form of tender obtained, at the architect's office, on deposit of a £10 Bank of England note. Tenders to be delivered in the envelope supplied, at the offices of the Guardians, Union Offices, St. John's Hill, Wandsworth, S.W.

July 6. **EASTLEIGH (Hants.).**—Grading, draining, and tar paving the playgrounds at Cranbury Road Girls' and Infants' Council Schools, Plan and conditions of contract may be seen, and specification and other information obtained at the office of W. J. Taylor, County Surveyor, The Castle, Winchester. The plan and conditions of contract can also be seen at the school. A deposit of 10s. 6d. will be required for a copy of the specification and form of tender, which must be made by cheque payable to Hants. County Council, and crossed Bank of England, or particulars will not be sent. Tenders to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

July 6. **EASTLEIGH (Hants.).**—Grading, draining, and tar paving the playgrounds at Winchester Road Council School. Plan and conditions of contract may be seen and specification and other information obtained at the office of W. J. Taylor, County Surveyor, The Castle, Winchester. The plan and conditions of contract can also be seen at the school. A deposit of 10s. 6d. will be required for a copy of the specification and form of tender. Deposits must be made by cheque payable to Hants County Council, and crossed Bank of England, or particulars will not be sent. Tenders are to be delivered to H. Barber, Clerk of the County Council, The Castle, Winchester.

July 11. **CHURCH (Lancs.).**—Supply of 1,200 superficial square yards of 2½in. concrete flags, for the U.D.C. Tenders to be sent to W. E. Wood, surveyor, Church.

July 12. **GRANGETOWN.**—Completion of the channelling, crossings, footpaths, and carriageway in Roberts Street, Grangetown, for the Eston U.D.C. Plans, specification, and bill of quantities may be seen and form of tender and any further particulars obtained on application to C. McDermid, District Surveyor, Council Offices, Whitworth Road, Grangetown, S.O., Yorks. Tenders to be delivered at above offices.

July 12. **WEMBLEY.**—Making-up of Ecclestone Mews and Mostyn Avenue, for the U.D.C. Drawings and specifications may be seen at the office of Cecil R. W. Chapman, surveyor, Public Offices, Wembley. Copies of quantities for both contracts, with forms of tender, may be obtained at the office of Fredk. W. Rodd, clerk, Public Offices, Wembley, upon deposit of £2 2s. Tenders, in the envelope provided, must be delivered at the Clerk's office.

July 13. **TWICKENHAM.**—Forming, levelling, kerbing, paving, channelling, metalling, and making good portions of the footpath on the west side of London Road, between Ivy Bridge and The Limes, for the U.D.C. Plans and specification may be seen, and bills of quantities and forms of tender obtained, on application at the office of Fred W. Pearce, F.S.I., Surveyor to the Council, Town Hall, Twickenham, and the deposit of £1 1s., at the office of H. Jason Saunders, Clerk to the Council, Town Hall, Twickenham, to whom tenders must be sent.

MISCELLANEOUS.

Separate tenders for each road (on the forms supplied only), to be sent to T. W. Scott, Clerk to the Council, Public Offices, Enfield. The tenders must be accompanied by a schedule of hours of labour, and of prices and wages to be paid for different classes of work, which schedule will be embodied in the contract. Fair wages clause.

FEDERATION NEWS.

(See also pages 693 and 694.)

Wakefield.

A meeting of the members of Wakefield and District Association was held at the Great Bull Hotel, Wakefield, on June 2nd, Alderman Judge (president) in the chair.

The president and Mr. Fallas reported on the business dealt with at the meeting of the Yorkshire Federation Executive Council, recently held in Huddersfield, which they had attended on behalf of the association, and a discussion took place on workmen's compensation insurance and the suggested increase of the rates of insurance by the various insurance companies, and it was decided that further enquiries should be made as to the proposed new rates, and a special meeting held before July 1st, when many of the present insurances expire.

Certain correspondence with the Yorkshire Federation was read dealing with the objections of the members of the association to the new form of sub-contract which the Federation had issued, and a resolution was passed expressing the opinion that the form of sub-contract was unfavourable to sub-contractors, and asking for certain amendments to be made therein.—J. Beaumont, Secretary.

Wigan and District.

ALTERATION OF WORKING RULES.

Disputes having arisen between the employers and operatives in joiners', plumbers', and painters' branches of the trade, and the two first-named being unable to come to any agreement, the Board of Trade were asked to appoint an arbitrator to settle the questions in dispute. The arbitrator, Mr. A. A. Hudson, of London, after hearing the employers and operatives, has given his award, and the following are the chief alterations to the old rules:—

Carpenters and Joiners.—Hours of work for summer months.—Working hours on Mondays to be 7 a.m. to 5.30 p.m., on other days from 6.30 a.m. to 5.30 p.m., and on Saturday from 6.30 a.m. to 12 noon. Hours of work for winter months.—Winter months start 12th day of November to 2nd day of February (both days inclusive); inside workmen start 8 a.m. to 5 p.m., with one hour for dinner; and men working outside start 8 a.m. to 4.30 p.m., with half an hour for dinner, Saturday, 8 a.m. to 12 noon. Rate of wages.—The rate of wages to be 9d. per hour, overtime to be 10d. per hour for first five hours; all overtime afterwards to be paid at the rate of 1s. per hour; Sundays and Bank Holidays to be paid double time; first week in August to be 10d. per hour.

Plumbers.—Hours of work for summer months.—The working hours for summer months from 1st March to 31st October shall be: Mondays from 7 a.m. to 5.30 p.m., on the four following days from 6.30 a.m. to 5.30 p.m., and on Saturday from 6.30 a.m. to 12 noon. Hours of work for winter months.—The working hours for winter months from 1st to 30th November, and from 1st to end of February, shall be 7.30 a.m. to 5 p.m., Saturday 7.30 to 12 noon; from 1st of December to 31st January shall be 8 a.m. to 5 p.m., Saturdays 8 a.m. to 12 noon. Rate of wages.—The rate of wages to be 9d. per hour, overtime to be paid at the rate of time and a half for the first three hours and double time after that until starting time next morning; Sundays and Bank Holidays to be paid at the rate of double time. Country jobs.—Men sent out on country jobs to have their railway fares and lodging paid by the employer.

Painters.—Wages.—The rate of wages has been increased from 8½d. per hour to 9d. per hour. Hours of labour.—The working hours from 1st March to the 31st October shall be for the first five days from 7.30 to 6 p.m., on Saturdays from 7.30 to 12 noon. During the months of February and November the working hours shall be 7.30 a.m. to 4.30 p.m., on Saturdays 7.30 a.m. to 12 noon. From 1st December to 31st January from 8 a.m. to 4 p.m., Saturdays 8 a.m., to be at the boundary at noon. Breakfast to be had before starting work.

A new rule has been inserted to the effect that all priming must be done by a practical painter or his apprentice.

The new rules have been signed by the employers and operatives, and came into force on the 1st of May.—J. N. Rigby, Secretary.

Hours and Wages.

At Rochdale, in accordance with the rules coming into force after June 30th, the winter working hours for building trade operatives will be 43½ per week. At Preston the wages and hours for labourers are:—Masons' labourers, 49½ in summer, 42½ in winter, at 5½d. per hour; bricklayers' labourers, 49½ in summer, 44 in winter, 6d. per hour; plasterers' labourers, 49½ in summer, 41 in winter, 6d. per hour. These items should be noted in connection with the tabular lists issued to Federation members.

For other Federation news, including reports from the National Federation, the Northern Counties Federation, Barrow-in-Furness, Manchester and District, York, Sheffield, Nottingham, and Sunderland, as well as a special report of the conference at Sheffield with respect to the demarcation between plumbers and heating engineers, see pages 693 and 694.

* * *

One or two Federation reports to hand are held over for want of space.

* * *

A legal case with respect to corporation trading is reported on p. 681, and is commented upon in an editorial note on p. 669.
